INTRODUCTION

We had the great honor of organizing the CBU International Conference 2017 (CBUIC 2017): Innovations in Science and Education in Prague, Czech Republic. It was truly a great pleasure for us to greet a lot of participants from many different countries attending CBUIC 2017! We firmly believe that the conference will become an important international event in the field of crossindustry discussion about innovations in Education and Science.

CBUIC 2017 was organized by Central Bohemia University and Unicorn College, Prague, Czech Republic. Proceedings were published by Central Bohemia University.

Two cooperating organizations supported the three-day conference. There were 222 papers accepted and another 22 abstracts for presentation at CBUIC 2017, contributed by 522 authors from 27 countries. We had four plenary speeches and several well-known scientists and experts, to give invited talks at different sessions.

The purpose of CBUIC 2017 was to provide a forum for the participants to report and review innovative ideas, with up-to-date progress and developments, and discuss the novel approaches to application in the field of their own research areas and discuss challenges of doing science and education.

We sincerely hope that the exchange of ideas on doing research, science and improving education will help the participants, and international cooperation sharing the common interest will be enhanced.

On behalf the Organization Committee of CBUIC 2017, we would like to heartily thank our cooperating organizations for all they have done for the conference. We would also like to thank the authors for their contribution to the proceedings; the participants and friends of CBUIC 2017, for their interest and efforts in helping us to make the conference possible; and the Editorial boards for their effective work and valuable advice, especially the CBUIC 2017 Secretariat and the CBU staff, for their tireless efforts and outstanding services in preparing the conference and publishing the Proceedings.

Petr Hájek, Central Bohemia University  
David Hartman, Unicorn College

PROBLEMS OF IMPLEMENTING A BALANCED SCORECARD AS A MANAGEMENT TOOL IN UNIVERSITIES

Maria Arzamastseva,¹ Marina Khayrullina²

Abstract: With the globalization of the economy, close attention should be given to the strategic management of higher education institutions as representatives of one type of company. The main problem of university management lies in the gap between current results and ultimate goals of the university. Therefore, tools to link strategic plans to operational activities are needed for average employees. This article describes conditions and problems of implementing a balanced scorecard at different levels as a modern management tool both in foreign and Russian universities. The given study has practical value and can help to increase the efficiency of university activities.

JEL Classification Numbers: P41, I21, I28; DOI: http://dx.doi.org/10.12955/cbup.v5.892

Keywords: BSC, tool, university, education, management, strategy.

Introduction

A balanced scorecard is an important tool for developing and implementing organizational strategies. It is a relatively new instrument for Russian universities and needs further development because of the need to shift to market principles of functioning with tightened performance requirements on the part of regulatory authorities and the business community. Thus, the improvement of this instrument and its adjustment to the educational environment are of academic and practical significance.

Theoretical Basis of the Study

In the most general sense, the balanced scorecard (BSC) is a concept for managing strategic development of an enterprise in regard to its performance. As Lawrie and Cobbold demonstrated (2002) the concept has undergone three successive stages of development.

Norton and Kaplan (1997) stressed a basic list of BSC mandatory characteristics on which modern researchers still base. BSC is always a combination of financial and non-financial scores. The number of scores being limited and varying within 15–20–25. The scores are grouped into four blocks called ‘Perspectives’: ‘Finance,’ ‘Customers,’ ‘Internal Processes,’ and ‘Innovation and Training.’ The latter two have been subsequently renamed as ‘Internal Business Processes’ and ‘Training and Development.’ The scores are selected according to an organization’s strategic objective. Typically, one or more types of scores are associated with one target. In selecting the scores, the expert evaluation given by the company’s top managers is taken into account. For the company management, forming BSC provides not only the opportunity to use information available to them only, but also ensures their approval and support through personal involvement. There are special causal relations among the four ‘Perspectives’ that were not clearly described in the early works of Kaplan and Norton (1997), though their existence is noted, as well as the interdependence between measures to improve productivity (lead) and indicators of the measures efficiency (lag).

The initial absence of a clear definition of BSC resulted in numerous attempts to change the original model. These changes mainly considered increasing or decreasing the number of scores and renaming of ‘Perspectives’ or blocks. In general, this revealed flaws in the earlier development of BSC and encouraged Norton and Kaplan (1997) to develop a second generation BSC. This next version differed to the original in regards to two features:

- Each score type related to a definite strategic objective. That is, the new design aimed to match the strategic objectives with one or more score types and group these into one of the four ‘Perspectives’; and
- Causal relations among the strategic objectives were visualized in a ‘strategic map.’

A distinct feature of this second BSC version was that it specified and visualized how the perspectives of ‘Training and Development,’ ‘Internal Business Processes,’ and ‘Customers’ connected to the final unit of ‘Finance.’ It was this change that gave rise to a new wave of disputes and BSC versions. The

¹ Faculty of Business, Novosibirsk State Technical University, Russia, mariaarzamastseva94@gmail.com
² Faculty of Business, Novosibirsk State Technical University, Russia, khayrullina@corp.nstu.ru
second-generation model did not suit many organizations. The four blocks (or Perspectives) either excluded important organizational blocks or contained ones that were irrelevant.

There were certain other drawbacks of the second model. Firstly, the second BSC model assumed that the company’s mission and strategic plan, on which the balanced scorecard was built, was clear to all members of the management team. Most often, this assumption failed to correspond to what ensued in practice. Secondly, the model did not consider the range of individuals responsible for choosing the above mentioned strategic objectives. Finally, the initial strategic objectives were selected prior to defining their interconnections. That is, the objectives were selected and then their links were depicted in the diagram.

The first-generation model was aimed at the selection of the scores, while the second-generation model focused on the links between the scores and the manner in which they are grouped.

Today the third BSC generation consists of two modules. The first is the Target Report (the Report), which is the reference point for defining strategic objectives. The Report includes several categories to allow those responsible to concentrate and chose specific objectives efficiently easily. For each category, experts forecast and assess the probability of achieving certain objectives by a specific date (typically three years ahead). The second module represents the first-generation mode (Kaplan, 2010). The BSC may seem rather multidimensional and difficult to perceive and build. However, considering the correctly compiled elements of the system and a well-balanced set of scores in unison can achieve a single strategy in any organization. The BSC is a flexible system in terms of opportunity to change its components, and any organization can tailor it for specific goals and objectives.

Relevance of BSC for Universities

For Russian universities, the introduction of BSC is governed by the following critical conditions of the current development stage:

- The opportunity to coordinate strategic objectives with operational activity aimed at implementing the strategy for international competitiveness;
- The relevance of non-financial scores, intangible assets and up-to-date information to ensure the university’s business reputation and image;
- Increase in the importance of stakeholder concept due to the significant role of higher education in developing an individual and the society as a whole; and
- A timely response to inconsistencies in business to achieve expected results.

The stages for introducing the BSC into the university management system can be identified as follows:

1. The choice (formulation) of the development strategy;
2. Design of the strategic map;
3. Identification of causal relations;
4. Selection of strategic scores;
5. Development of the motivation and staff encouragement system;
6. Assessment of the extent to which the objectives have been achieved; and
7. Monitoring and adjustment of the strategic plan.

For the leading Russian universities, the strategic objective is to ensure international competitiveness and a listing in world rankings to prove high-level educational quality and graduate demand. Therefore, for universities, the ‘Perspectives’ need to be linked to the main areas of activity that determine the international competition ranking.

The aim of this study is to ‘superimpose’ the first generation BSC model on the scorecard defining the position of the best known international rankings. The objective is to build a balanced scorecard for a university to ensure its place in global rankings and provide a solution for current activities.

**Data and Methodology**

The first stage involved an analysis of scores of four international rankings: the Quacquarelli Symonds (QS) World University Rankings, the Times Higher Educational World University Rankings (THE), the Academic Ranking of the World Universities (ARWU), and the Ranking Web of universities (Webometrics), as well as two Russian ratings: the National Ranking of Universities and the Ranking of Higher Education Institutes in Russia.
This analysis identified areas that could be developed to promote international competitiveness and global ratings. These included:

- Education;
- Research work and innovative activities;
- International activities; and
- Entrepreneurial environment.

In the second stage, a sample of leading Russian universities and Novosibirsk State Technical University were assessed for areas that directly or indirectly promoted international competitiveness and global ratings. The former involved 10 Federal and 29 National Research Institutes of Russia included in the Project for enhancing international competitiveness, known as ‘5/100’. The Novosibirsk State Technical University held the status of a regional support university.

In the third stage, the content of ‘Perspectives’ for a higher educational institution was analyzed using the traditional BSC model and the strategic objectives defined. Each ‘Perspective’ had at least one strategic objective in the context of areas defined at Stage 1.

In the fourth stage, the score system obtained in Stage 2 was superimposed on the ‘Perspectives’ (Stage 3) and areas (Stage 1).

**Results and Discussion**

A total of 30 scores was obtained (Table 1). A BSC was developed that met the strategic objectives of international competitiveness and ensured integrated development of current activity aimed at promoting local competitiveness, with the university regional specificity considered (Table 1).

</table>

It is noted that the perspective of ‘finance’ denoted the key focus of fundamental change in the Russian universities funding structure, i.e., an overriding proportion of extra-budgetary sources from educational, research, international, and innovative business.

The term ‘customers’ was applied to students and their parents (as the main customers of educational services) and to business as a consumer of human resources, educational services (additional
education), and research results. ‘Internal business processes’ reflected the efficiency of the university management as a whole. This was the weakest point for Russian universities, especially public universities with conservative views of change. ‘Capacity’ was primarily associated with staff and the environment in which they perform their professional tasks.

Problems of the BSC introduction in Russian universities

The process of Russian universities adapting to new management technologies is affected by attitudes, customs, approaches to the strategic management of public organizations, and other factors. These concerns are fully realized with the introduction of BSC.

The first and main problem is the non-applicability of the classic score set, especially with the perspective of ‘finance’ in the university environment. The main objective of the public university is to provide educational services and social development and subsequently, the BSC emphasizes scores related to academic activity in contrast to that emphasized for commercial organizations. Thus, the selection of key performance scores for universities is a new and individual process.

The second problem follows on from the first. The methodologies of evaluating any university activity, including national and international rankings, involves a high proportion of qualitative scores, which are less evident and tangible, and thus, difficult to quantify measure and analyze. These include the relevance of research areas carried out by the Chairs, the quality of the subject training, and student satisfaction. There is a problem of objective analysis and evaluation of a significant part of the university performance.

Other classic problems connected with introducing BSC into the management system typical of almost all Russian organizations include the lack of linking strategic objectives with operational activities and inadequate support from upper management.

Conclusion

The article presents concepts of the mechanisms for integrating the classic BSC model with strategic activities of Russian universities that deal with the challenge of being listed in international rankings. As a result, a balanced scorecard was developed to achieve strategic objectives and integrated growth of current activities.

The study also shows that there are certain problems with introducing BSC in Russian management system. Nevertheless, this tool can form the methodological basis for the management, building, and streamlining of all university processes, indicating a need for further methodological development and follow-up studies.

A TURBULENT BUSINESS ENVIRONMENT AS A CRITERIA OF OPTIMAL STRATEGY TO ENTER INTERNATIONAL MARKETS

Ludmila Bahmane

Abstract. This work provides an analysis of marketing solutions and developments algorithm for Latvian enterprises entering into foreign markets based on an example of 185 studies made under the supervision of the author. The proposed algorithm is a part of the pedagogical activities in higher education institution of Latvia (RISEBA) over the last 10 years and it suggests the training of new marketing solutions development techniques in conditions of the turbulent business environment. The application of the proposed algorithm assumes the use of modern marketing technologies, including matrix methods, cluster, and screening analysis. The algorithm proposed is being analyzed on the example of Latvian enterprises. This work describes the use of the author’s proposed matrix of “consumer’s demand for creativity (novelty),” that is relevant in the development of creative marketing management solutions of such business spheres, where the novelty of products (services) is an important competitive advantage. The high versatility, simplicity and availability is proven for mastering and using the proposed algorithm.

Introduction

Marketing management – for over 100 years, management has been forming the science of organization management, including business structures. Up to the middle of the fifties in the 20th century, marketing was considered to perform almost the same functions as sales. The sixties and the beginning of the seventies have become a golden era due to the new concept of marketing, which has become a basic philosophy of business at the time. Let’s try to focus on a few aspects of organization marketing factors (Kotler & Keller, 2012) that specify an external business environment. The external business environment can’t be constant, it is changing. As of such, it is possible to distinguish between the environment with slow changing parameters and the environment with fast and unpredictable changes. When some time has passed from that day, such an environment can be defined as the “calm” environment. Managers at that time were to organize their enterprises in such a way, that all opportunities of such an environment have been utilized completely. The situation of business structures becomes more complicated due to new conditions. With each year company management must consider not only increasing the number of environmental factors influencing the organization, but their global nature as well. Due to globalization with the increased number of management factors and their new features, there has been a new realization that management situations become unpredictable. There has been a new recognition of marketing managements in conditions of unpredictable, rapidly changing, and turbulent environments. New conditions require an understanding of an entirely new field of jurisprudence, marketing, and recognition of new cultural values. For the small and medium business of small states, such management requirements are especially difficult to realize. To achieve success, companies must compete in foreign markets and withstand competition with foreign companies at home as well. For Latvian entrepreneurs, an important and objective factor is the size and development level of the national market. Per the latest data, there are at most 1.97 million inhabitants in Latvia (2016).

Turbulent business environment as a new factor of marketing management

In modern marketing, several authors have been researching the factor of environmental changes as specific organization factor. Thus, Charles F. Sabel and Jane E. Prokop (1997) have stated in their work “Stabilization through reorganization” (Sabel & Prokop, 1997) and Michael Hammer and James Champy in their book “Reorganization of corporation” (2009), that up to about 1975, the environments of organizations have been stable with uncommon global cataclysms and the changes in such environments were insignificant. Rapidly changing environments can be characterized by increased instability, unpredictability, and the behavior of managers has become greatly complicated

1 RISEBA University, Riga, Latvia, ludmila.bahmane@inbox.lv
when compared to the behavior in conditions of the “calm” environment. In time, the quantity changes into a new quality, i.e. global changes arise, which lead themselves to the new concept of “global environment” (Lambin, 1994; Porter, 2008). Because of environments transitioning from “calm” state to rapidly changing, global changes of main economic environmental indicators have occurred.

As a consequence, the following characteristics may be noted: the rapid shortening of product’s life cycle; decreased products development time; maintaining warehouses becomes unprofitable; changes in requirements of technical subsystem of organization; increased complexity of products; changes in relationships between customers and manufacturers (confidence in competence); impracticality of maintaining own expert science intensive services; consumer dictates suppliers; increased toughness of competition; and pricing is not the most important factor in cooperation. As a result, the management attempts to find new methods and ways to manage businesses.

So, marketing management shows up. This means, that alongside to P. Kotler, new gurus of marketing appear such as Lambin J. J. (Lambin, 1994), and for instance, Sweden marketing school (Best, 2014). However, not always new management opportunities could reach small and medium business before old market economy problems are transformed. The crisis has become global. The fragmentation of markets continues to grow; the bounds of traditional markets become blurred due to substitutes and new technologies. Purely national markets transform into global and crisis management appears (Kotler & Keller, 2012). Specialists begin to mention that during the last 10 years, the business environment has changed entirely (Porter, 2008; Best, 2005). The concept of turbulence came from physics, which soon enough has been transformed into the concept of “turbulent business environment” (Lambin, 1994; Bahmane, 2010). There are not only forecasted changes of environmental factors, but the rules themselves alter as well, which describe how organizations should operate. And these rules change rapidly and unpredictably. The latest example of such changes are: withdrawal of Great Britain from the EU, new American policies of Trump, political factors (sanctions and counter-sanctions of the Russian Federation), which require to dismiss or to reprofile entire fields of the food industry of Latvia completely. What will happen to Latvian companies? Nobody knows that. How should management of these organizations operate for small and medium business?

It is considered, that in such turbulent environments the most important thing is the increased ability of organizations to adapt and survive (Hammer & Champy, 2009). A turbulent environment dictates specific requirements, which should be obeyed by enterprises. The conditions may be confused with requirements, because managers of a new company, irrelevant of its strong position, must “catch up” onto changes of the environment and make changes to their company in due time, otherwise, after some rather short time it will be too late to take such actions and former positions will be lost to more modern competitors. In short, these requirements are as follows: decreased the size of the organization; reorganization (reengineering); constant monitoring of the environmental situation; the immediate response to changes of the environment; the launch of “in time” production systems. In conditions of turbulent business environments, the enterprises must have clearly recognizable advantages, which should be developed for the organization to operate in advance by using a proactive marketing strategy instead of a reactive one. Such competitive advantages can be estimated by using a “Demand for novelty” matrix (Bahmane, 2005).

The ability to see new opportunities in the big global market becomes the most important conditions of survival for small and medium business, especially in small countries. The analysis in strategical marketing decision making and generation allows the author to state that: by using known (but little used) technologies to generate marketing solutions, it is possible to find an adequate solution for turbulent environments, including a strategical one (Bahmane, 2010).

**Algorithm of marketing decision making in a turbulent business environment**

For the criteria of optimality for marketing decisions generation in conditions of a turbulent environment, the following factors are considered:

1. decreasing risks;
2. direct search of maximum possible number of solution variants;
3. reliance upon developing competences.
It is important to formulate an algorithm as a sequence of logical activities to solve specific tasks and to teach modern analytical methods that provide a fast and direct search of possible marketing solutions, the choice of the effective one, and if there is none, to develop and offer one’s own solutions without fear. To achieve this, the manager should be able to consciously make:

- Decisions of the 1-st type – environment is developing predictably, thus solutions have a predetermined algorithm already known to manager.
- Decisions of the 2-nd type – from a set of multiple possible solutions, the manager must choose the most appropriate one. It is necessary to know the existing criteria to choose effective solutions.
- Decisions of the 3-rd type – solving untypical tasks. Manager can analyze unfamiliar situations and information, and generate new information.
- Decisions of the 4-th type – the ability to see new connections and opportunities, as well as the ability to generate completely new information based on this information in conditions of a turbulent business environment. For problems of this type the elements of creativity become absolutely required.

It is important, that in addition to these widely used and well-known matrices (Porter, Ansoff, Boston, McKinsey, SWOT) (Ansoff, 2007), the possibilities of the author’s matrix, “solutions novelty – demand for novelty by consumers”, application are investigated (Bahmane, 2005) (see. Figure 1).

**Algorithm of securing strong position in foreign market**

The survival of small and medium businesses in the turbulent and rapidly changing conditions of the Latvian market depends entirely on the targeted search for new exporting opportunities by enterprises themselves. An example of a small Latvian company SIA ProBaltic has shown, that in conditions of market internationalization, the use of previously built databases, as well the application of screening analysis and matrix methods, allows finding and choosing the optimal marketing strategy to secure a niche in international markets by method of cabinet studies (Bahmane, 2010). The method of screening analysis, that has been mastered by example of studying 183 Latvian enterprises, indicates that there exists a specific searching algorithm to find the optimal solution with the choice of specific countries and markets, where products (or services) of a company will be able to secure a competitive niche. The main purpose of the company is to secure strong positions in foreign markets, by using the fastest direct search of possible marketing solutions.

Algorithm implementation stages.

1. Screening-analysis method (Cherenkov, 2006) allows for the solving of practically almost unsolvable task: to analyze market opportunities in the most comprehensive way with limited possibilities of the company (staff, time, resources). This can be used to define a list of high priority countries for further analysis.
2. If the environment is turbulent or rapidly changing, the screening analysis allows change of search criteria and to define multiple lists of high priority countries, which enable additional corrections to the international marketing strategy. So, when choosing some specific criteria and adapting them to specific conditions, the strategies of segmentation and positioning can be developed.

3. The environmental scanning method (Cherenkov, 2006) allows to separate specifics of the macro-environment and micro-environment, which can be used to determine a niche in potentially attractive countries, where the specific company can be competitive.

4. The Marketing-mix model use -7P(9P), which allows the company to ensure a full match in the needs of the target consumers in each of the chosen countries with the marketing capabilities of the company.

Screening analysis allows creating a list of high priority exporting countries by using a direct search among the 236 countries in the world in MS Excel software with conditional formatting tools. This method has been successfully used in RISEBA for 5 years in home tests of International marketing by students of the 3rd year for a wide variety of business structures – from small gambling business to banking. More difficult variants, which include the search for optimal selection criteria, comparative analysis of selected countries, and in-depth research of competitive niches, become bachelor’s or master’s degree thesis works.

The realization stages of optimal niche searching algorithm for a specific company in market globalization conditions can be summarized as follows below:

1. The object of the research is determined – a real company operating on the Latvian (European) market. The situation of the company is analyzed in conditions of the Latvian (or other national) market. The symptoms of problems, the base problem, and its research design are determined. A graph of the problem and solutions is designed.

2. The influence of micro-environmental factors on the operation of the company is determined with the PEST methods. The business environment type is determined: Stable? Changing? Turbulent? What is the company’s vision in these conditions?

3. The base market is conceptualized. The macro segmentation of the market is performed by using one of the well-known methods (Abel’s method, “fish,” “net,” 3D matrix).

4. Based on the matrix of “solutions novelty – demand for novelty by consumers” (Bahmane, 2005) an active marketing development strategy can be defined for the analyzed company based on the company’s competence and specific business development trends.

5. The base for further analysis is determined: the features of the company’s activities that make products (services) unique and competitive.

6. Based on the matrix of “local-global forces” the trends of advancement in international markets can be determined. The condition for search of new markets is defined – the strategy of the company is formed – standardization or adaptation, and the target of further research is determined: finding new markets, which are ready to accept the products of the company or finding the products, which are in high demand in markets known to the company. This decision is determined by the competitive (unique) features of the company’s products (services).

7. The screening analysis is performed to determine a list of high priority countries for further analysis. The screening analysis makes use of 4 filters which remove from a set of all countries those not matching the specific criteria.
   - 1-st filter. Potential is evaluated – macro-environment.
     - Review: socially-cultural norms, politically-legal norms, the economical state of countries, the geographical location.
     - Supposed selection criteria: customs tax, average income level per capita, the distance between exporting and importing countries, the population size of importing country, political disagreements between states (economic sanctions, embargoes).
   - 2-nd filter. Particularities of accepting specific products at the given location
     - Selection criteria evaluated: religious factors, informational provisions, historical premises, ethnicnal norms and traditions, market development stages.
3-rd filter. Specific factors influencing export.
  o Selection criteria evaluated: competition at the local market, similar substitutes of specific product, forecasts and real data on similar product sales at the market, acceptance rate by consumers, market entering expenses.

4-th filter. Target markets. Thus, a list of high priority countries is created for the search of a specific niche. From 236 available countries, only few are considered further, which is much easier.

8. Based on a list of selected countries (one, two and three) the environmental scanning analysis is performed by sections: economical, politically-legal, socially-cultural, technological.

9. Based on the McKinsey matrix (Kotler & Keller, 2012), the exporting strategy to the specific list countries is determined (from export to investments).

10. Competition analysis (per Porter) allows defining the most dangerous factors and risks for a company in conditions of the unstable environment. SWOT is constructed (TOWS).

11. Micro segmentation of the market is performed; the most attractive segment of the market is determined. VALS2, GLOBAL SKAN, (Kotler & Keller, 2012). By using a correlation or cluster analysis, the variants of product positioning are proposed in general and for the selected segment.

12. The distribution channels of the product are determined – how they match requirements of the target market segment in the selected country.

13. The price policy is determined and company tactics with an orientation to the selected market segment by maximally using a “price-quality matrix,” common competition matrix (Porter, 2008).

14. Communications strategy is developed considering specifics of the target consumer segment in the selected country.

Let us study one of the examples of the screening analysis application for exporting Latvian bakery “Lāči” products to potential (it is limited liability company founded in 1993) markets. The main activities: baking high quality bread per old-time Latvian traditions and making original confectionery. From a small bakery, “Lāči” has grown into a modern and stable enterprise with 200 employed persons and makes about 5 tons of bread daily. Net turnover is over 7.5 million EUR. Bakery “Lāči” creates and improves new products which are in high value not only in Latvia, but also abroad. The list of partnering countries of “Lāči” is: Russia, Ukraine, Estonia, Great Britain, Australia, Japan, the United States of America. The main market of “Lāči” products is ethnic. The niche for ethnical trading is open in markets when demand for exotic products from native populations allows immigrants to convert their contents and symbols of their ethnicity into products for profit. Selling exotic products and services is a rather profitable direction of business development, since immigrants offer products not readily available to get or be presented from anyone else. This is the advantage of “Lāči” products (especially of rye bread), which in the US and Great Britain markets is of high demand among immigrants from post-soviet states.

The product is standard for Latvia however, for exporting purposes a partial adaptation can be made; for example, the sugar amount in the product can be altered, depending on the customers’ preferences. The trademark is not about to be changed however, sometimes the products are sold under private trademarks of partners, which can be more recognizable by local customers. The package of products can be altered as well. The price is determined by considering expenses, logistics, and risks in Europe, while for non-European countries additionally customs taxes are included, and when necessary corrections by the market are made. Air transportation is used for making deliveries to far countries: Japan, USA and Australia. The bread is frozen; other products can have a storage life of up to one year. Delivery of products to the USA takes from one month to 6 weeks, and to Australia – about 2 months. Based on the matrix of “Local-global forces,” the company plans to work with standard Latvian products and adapt them only for the end consumers, instead of the target markets. In other words, it is more logical for the company to enter the transnational environment.

Based on the matrix of “Market attractiveness – development costs” (Cherenkov, 2006), the least expensive way to enter new markets has been determined – export sales via agents, importers and distributors. The company “Lāči” offers high quality products, which have multiple awards and quality certificates, so a standardization strategy should be chosen during a search for new
markets. It is necessary to find markets, which would be ready to accept the already existing products of the company. Presently the company has realized the “Strategy of proven quality” for products from the matrix “Novelty attractiveness.” In the future, it will be possible to develop a strategy of “Quality improvement, company image.”

The Screening analysis makes it possible to create a list of high priority exporting countries by choosing from the 236 world countries with a targeted search based on statistics from the World Bank.

- 1-st filter determines market potential and includes: GNI per capita with high income level (over 15265$), product import bans, the population of at least 3 million, distance (less than 3500 km).
  - The list of countries satisfying these conditions: Belgium, Denmark, Greece, Germany, Italy, the Czech Republic, France, Ireland, Slovakia, Spain, Sweden, Finland, Poland, Turkey, Belorussia, Croatia.
- 2-nd filter. Particularities of accepting a specific product at a given location. Selection criteria evaluated: insufficient information, import below average, customs taxes, the worst forecast of market development
  - The resulting list of countries: The Czech Republic, Denmark, Ireland, Slovakia, Croatia, Germany, and Sweden.
- 3-rd filter. Specific factors influencing export. Analysis of main competitors, business conduction problems, bad forecasts of market products.
  - The resulting list of perspective countries: Denmark, Ireland, Germany.
- 4-th filter. The target markets are determined, in which a company can find the strongest competitive niche, based on its competence.

Thus, only 2 countries remain: Denmark, and Ireland.

Conclusions of screening analysis

The method of screening analysis leads to the choosing of Denmark and Ireland as candidate countries for exporting. The base competition strategy for SIA “Lāči” in new markets is focused on niche differentiation. The comparison of “Lāči” with its main competitors in the target markets – “Lāči” is competitive in its pricing, despite the fact it is higher than prices of the local manufacturers. The company can position their product as a specially made product with ECO ingredients. From the International McKinsey matrix for estimation of exporting to foreign markets by SIA “Lāči” (determining an integral indicator of country attraction): the market of Denmark is highly attractive and competitive for “Lāči” while, the Irish market is highly attractive and medium competitive for “Lāči.” The main strategy here is exporting via company’s own representatives. In Ireland, the local population does not understand the concept of rye bread entirely however, in this country there are over 185 thousand immigrants from post-soviet countries that are familiar with this product, and they make the niche market for supplies of such a product. By using industry trends, ECO products should be introduced to target markets and benefit from low VAT rates (value added tax). When exporting products of “Lāči” to the markets of Denmark, the emphasis should be given to unique features of the product, such as high quality and handwork. When exporting products of “Lāči” to Irish markets, the high quality of the product should be emphasized, as well as the exporting country when advertising the product. In markets of Denmark the competition between trading networks and local manufacturers is high, and Germany is in close vicinity as well. On the other hand, the purchasing ability is high, and this market can be entered with niche food products. When competition increases, it should be stressed, that the product is exclusive and of Latvian origins.

Conclusions

In turbulent conditions– unpredictably and rapidly changing business environmental factors –active adaptation becomes a valid marketing technology, especially for small and medium businesses in Latvia.

The use of algorithms for standard marketing solutions allows for fast and adequate research of specific business environmental features and provides an active and adaptive marketing solution for the organization.
The higher the turbulence in a business environment is, the more actively small and medium businesses search for new niches by using specific selection criteria.

The authors proposed algorithm is rather simple for securing international markets by small and medium businesses’ marketing technologies, it shows its practicality in different businesses, times, and even the different abilities of managers.

The use of controllable solutions creativity – real opportunity to find variants for achieving goals of a business structure in conditions of a turbulent environment.

The use of a matrix of “Solutions novelty – demand for novelty by consumers” by specialists in the process of developing marketing solutions, allows them to find new aspects for development of adaptive marketing solutions.

In the presented work, the strategy development for an enterprise entering international markets has been described, the stages of decision making and choice of new target market have been analyzed. Based on an example of the enterprise “Lāči,” the search for the most attractive international market has been made for this specific Latvian company.

NIKE ON INSTAGRAM: THEMES OF BRANDED CONTENT AND THEIR ENGAGEMENT POWER

Carmen Balan¹

Abstract: Instagram is the fastest developing new media of high interest to marketers. As at December 21, 2016, the community included 600 million Instagrammers. This paper explores the problem of whether various themes of branded content differ significantly in their engagement power (ability to generate likes, views, and comments). The methodological approach consists of online monitoring of content in posts of a leading brand, Nike, for its 17 verified-badge Instagram accounts. The study focused on posts during the month of February 2017. The chi-square goodness of fit test (for one variable) was applied in the data analysis stage of the research. The initial hypothesis of significant differences between branded content themes as regards their engagement power was accepted. The practical implications of these findings for marketers include better selection of brand messages for Instagrammers and an increase in engagement levels.

JEL Classification Numbers: M30, M31 DOI: http://dx.doi.org/10.12955/cbup.v5.894

Keywords: Instagram, branded content, engagement, likes, views, comments, followers

Introduction

The dynamics of Instagram reveals one of the most rapid growth areas among social media. Instagram first launched on October 6, 2010. The interest in this new communication channel was overwhelming. The first day had 25,000 people signing for membership (Instagram, 2010, October 6). According to the 2016 press news of Instagram (2016, December 21), 100 million people had joined the community by the end of the second semester of 2016. The same source reported the number of Instagrammers had then surpassed 600 million members.

Nike is a highly recognizable consumer brand present on Instagram. It is a leading brand in the global sportswear market with a market share that was worth 17.2% in 2015 (Euromonitor International, 2016). The brand consistently held the leading position in every year of 2010–2015. According to the report published by Interbrand in 2016, this brand ranks eighteenth in the Top 100 best global brands and its market value reached USD 25034 mil. (Interbrand, 2016). As a comparison, one of its strongest competitors, Adidas, ranks sixtieth in the same top 100, with a brand value of USD 7 885 mil.

This paper presents the findings of research into the engagement power of branded content themes of Instagram posts. The Nike brand was chosen for this purpose because of its global ranking, as mentioned above. To the best of the author’s knowledge, this research has two unique features compared to studies with findings published in academic literature: 1) the present research is the first to address the topic of the engagement power of branded content themes on Instagram, and 2) it is the first to focus on Instagram posts of a leading brand such as Nike.

Literature Review

Since its launch in 2010, Instagram has not gained a high status as a priority field of study for academic researchers. A search of the Thomson Reuters database, Web of Science Core Collection, on March 19, 2017, using the keyword ‘Instagram’ as a research topic, revealed a total of 353 published studies, of which 165 were articles. A search of the same database using the same keyword, this time as a ‘title,’ revealed 90 results of which 44 were articles. These numbers indicated an opportunity for designing and implementing a future study relating to Instagram as a communication tool used by individuals and companies.

Many of the 90 title results were studies in categories that were related to computer science. The business, management, and economics categories of the academic literature had a lower contribution to the academic literature focused on Instagram topics. The vast majority of studies relating to Instagram focused mainly on the use of this tool by individuals and to a lesser extent by companies. Those relating to the content posted by brands on Instagram were uncommon. Consequently, the findings relative to the branded content posted on another online social media site, Facebook, were used to form the hypothesis for the current research paper relating to Instagram.

¹ The Bucharest University of Economic Studies, carmen.balan@mk.ase.ro
Lee et al. (2015) identified five primary social and psychological motives for using Instagram. Based on the findings of a survey of Instagram users, the main motives were the following: social interaction, archiving, self-expression, escapism, and peeking. Instagrammers seem to use the platform to escape from their everyday lives and connect with friends, family members, and other people via an online realm of existence.

Instagram has provided brands with a social media platform for visual communication with their target market. Various brands have experimented with the viral marketing of content in the form of videos. Examples include the brands of the fashion sector, especially the luxury brands (Wolny & Mueller, 2013). Brand-sponsored videos aim to attract the attention of visual influencers and to engage the target customers. Within the fashion sector, major brands such as Zara, Mango, and El Corte Ingles actively use social media as a communication channel (Gonzalez, 2015).

Many research studies of Facebook show that this type of brand content influences engagement on that particular site. Examples of such studies are those carried out by Taylor et al. (2011); De Vries et al. (2012); Chauhan and Pillai (2013); and Tafesse (2015).

Beukeboom et al. (2015) found that brand evaluations may improve with audience exposure to Facebook posts. However, their findings underlined that exposure to more of the same content does not generate a difference in terms of brand evaluations.

The study of Coelho et al. (2016), which related to 680 Facebook posts and 1169 posts on Instagram, measured the effect of post type (advertising, fan, events, information, and promotion) on audience likes and comments. The findings disclosed that post types focusing on events and promotion led to a higher involvement of followers, especially on Instagram.

According to the findings of Jahn and Kunz (2012), valuable content, either functional or hedonic, is an important driver that attracts users to fan-pages. Based on their research, the content must be interesting, entertaining, and innovative to be impactful.

Luarn et al. (2015) found that the type of post content (information, entertainment, remuneration, and social) of brand pages on Facebook significantly influenced the engagement of users. They found that the post content that focused on entertainment generated higher levels of commenting and sharing than other types.

The survey by Yuki (2015) showed that, on Facebook and other social media sites, the posts that were shared the most were those that conveyed the emotion of happiness. In addition, the content that involved usefulness increased the sharing likelihood among women and people over 55 years.

The various research findings relating to social media such as Facebook has led to the conclusion that branded content type influences engagement. These results lead to the hypothesis that Instagram content themes will differ in the engagement that they generate among followers.

**Data and Methodology**

The aim of this research was to determine whether various themes of branded content were significantly different in their engagement power (ability to generate likes, views, and comments). The initial hypothesis was as follows: there are significant differences between various themes of branded content in regards to their engagement power. The research focused on the Nike accounts existing on Instagram. The method of data collection involved observations of the online environment.

The scope of this research involved themes corresponding to the branded content posted by Nike, not by consumers and fans in their Instagram accounts. Thus, accounts were carefully selected to avoid systematic errors due to unclear ownership of the various ones that focused on Nike Sportswear on Instagram. The selection of each account was based on proof of ownership by Nike. This proof was the existence of a verified badge on the Instagram account associated with a Nike theme. A total of 20 verified-badge Instagram accounts resulted from the selection process.

Data of all photo and video posts by the Nike brand during the interval February 1–28, 2017 were collected by observing each verified-badge Instagram account. From the 20 verified-badge Instagram accounts of Nike, only 17 had content posted during February 2017. The three accounts that had no posts during this month were Nike Lab, Nike Toronto, and Nike Young Athletes.

In the case of each post, the following data were monitored: the theme of the branded content, the number of likes (for photo posts), the number of views (for video posts), and the number of comments
(associated with both photo and video posts). The themes were defined by qualitative analysis of the post content. Thus, the themes were not pre-defined before the design of the study, but they were developed during the research process, based on results of content monitoring of posts by the Nike brand. In the case of the video posts, the online monitoring included viewing the content for theme identification.

A total number of 121 posts in the study interval of February 2017 were recorded for the 17 verified-badge Instagram accounts of Nike. These were analyzed in terms of engagement power. In essence, the indicator 'engagement power of a post' was the sum of all reactions generated by that specific post among the Instagram followers. In the case of a photo post, the engagement power was reflected by the number of likes and comments, while in the case of a video post, the number of views and comments indicated the engagement power. Overall, the engagement power of a branded content theme was the sum of likes, views, and comments generated by the Nike brand followers.

A database was created to ensure a systematic approach to data collection from online monitoring. For each post, both qualitative and quantitative information were registered. Qualitative information consisted of the type of post (photo or video) and the theme of the post content. Quantitative information included entries relating to the number of likes, views, and comments generated by each post. Evidence of the posts was kept chronologically according to the date of the post.

Data were analyzed using the chi-square goodness of fit test (with one variable). This test determines whether certain models fit the observed data (Malhotra, 2010). The value of $X^2$ was calculated as follows:

$$X^2 = \sum \left[\left(EP_o - EP_e\right)^2/EP_e\right]$$

where:

- $EP_o =$ engagement power resulted from observation,
- $EP_e =$ expected engagement power.

**Results and Discussion**

The metrics for content posted on 17 verified-badge Instagram accounts of the brand Nike are listed in Table 1.

On March 19, 2017, the studied accounts reached a total of 12,118 posts by Nike (since the date of the setting-up of each account). The total of followers of these accounts was 227.57 million.

Some accounts were more active than others, from the perspective of the total number of posts. Five of the 17 accounts received 56.5% of the total posts. These accounts were nikesb, nikefootball, nikesportswear, nikesbau, and nikerunning.

In February 2017, the 121 photo and video posts to the 17 verified-badge Instagram accounts generated an engagement level consisting of 9,247,138 likes, views, and comments (Table 2). The average engagement power per post was 76,423 likes, views, and comments. This statistic varied among the content themes presented by the photo and video posts on the verified-badge Instagram accounts. The strongest posts in terms of engagement power were related to those of user experience (194,350 likes, views, and comments), while the weakest were those relating to sport and style or fashion (3365 likes, views, and comments).

Degrees of freedom: 6
The critical (theoretical) value of Χ²: 12.59 (p = 0.05)

Source: Author

The comparison between the critical (theoretical) and calculated value of the chi-square statistic showed that the calculated overpassed the critical value. Thus, the null hypothesis that the observed and the expected were the same was rejected. Therefore, the results indicate the differences between content themes regarding their engagement power shown were statistically significant.
The research results present a twofold perspective for discussion. The first pertains to previous research findings for Instagram; and the second about the existing research into Facebook as a major social media with high popularity. Relating to Instagram, the results of this study align with the findings of Coelho et al. (2016), according to the types of posts differing in the level of engagement they generate. Relating to Facebook, the findings of the research presented in this paper are similar to those of Luarn et al. (2015) and Yuki (2015) in regards to the different impact of post types. At the same time, there are similarities with the findings of Taylor et al. (2011); De Vries et al. (2012); Chauhan and Pillai (2013); and Tafesse (2015), from the viewpoint of brand content type influencing engagement, as in the case of Facebook.

Conclusion

The findings of this study revealed statistically significant differences between the content themes of Instagram posts by the brand, Nike. In addition, content that focused on user experience and aspirational values appeared to have more engagement power than other themes approached by Nike. The implications of these findings for the research domain is that they lead to more detailed studies of the engagement power of themes of branded content. The present study focused only on the posts of the brand, Nike. Further research could consider the engagement power of themes corresponding to posts of competing brands or by brands from other markets. In this respect, several new research questions arise. Examples include: Do the posts focused on user experience always have more engagement power compared to all other branded content themes? What aspirational values have the highest engagement power? Does the engagement power of a specific theme differ among the brands existing in the same sector? Is the engagement power dependent on the share held by the theme in the total number of posts made by the brand on various themes? Is the engagement power of a theme influenced by the type of product or market? How does the execution of each photo or video post influence significantly the engagement power? For practitioners, this study shows that impactful Instagram strategies that generate high levels of engagement require careful selection of branded content themes. Based on the present findings, practitioners are recommended to favor posts referring to user experience, aspirational value, and sports competitions, rather than posts focused on branded product. The brands present in the Instagram community need to be creative and differentiate their content not only from competitors but also between accounts. The number of Instagrammers is increasing rapidly. Undoubtedly, their expectations will evolve and continue to challenge the creativity of brands in more engaging and memorable experiences.

Social initiatives are often disconnected and fragmented. Many SMEs have a job and salaries payment can already promote different perks, such as medical insurance, present a marketing tool of promoting the business as socially responsible. Besides paying salaries, implementing long-term socially responsible programs can gain a strong reputation of a company’s image, especially in the service sector, which directly deals with its clientele. Though, both marketers and managers are aware that sustainable activities will not immediately increase sales and further innovation. Corporate social initiatives are often disconnected and fragmented, which causes constraints to analyze their prospects to cut expenses and increase revenues. The statistical data of a period of over four years show the continual growth in Russian service sector which can provide resources for “world-positive” business initiatives. Though authorities traditionally and usually force the ways of engaging business in financing social programs, the image of a socially responsible and environmentally friendly business provides opportunities for a sustainable upturn in Russian service sector.

**JEL Classification Numbers:** M00, M14; **DOI:** http://dx.doi.org/10.12955/cbup.v5.895

**Keywords:** Corporate Social Responsibility (CSR), service sector, sustainable business, upturn.

**Abstract:** Though evidence of socially responsible behavior of companies appeared to be indisputable, the most problematic for any company is to align it with the employed marketing strategy and enhance the opportunities it can provide for creating competitive advantage and further innovation. The development of socially responsible marketing (SRM) appeared in opposition to the strategy focused on excessive consumerism and as an intrinsic response to business operations that caused environmental damages. The concept SRM itself is sometimes viewed as a constituent of Corporate Social Responsibility (CSR), its ambient extension. SRM constitutes abandonment of even legally accepted deceptive marketing practices in defining a marketing mix for any product or service.

The universal general trend mentioned by Skorobogatyh (2014) is dominating in social marketing over liberal methods in corporate social responsibility. The concept SRM itself is sometimes viewed as a constituent of Corporate Social Responsibility (CSR), its ambient extension. SRM constitutes abandonment of even legally accepted deceptive marketing practices in defining a marketing mix for any product or service.

The philosophy behind the concept is in balancing the aspiration of maximizing profit and ethical aspects of business activities and moral standards of society. Therefore, SRM can be defined as “an obligation of an organization's marketing management towards the welfare and interests of the society in which it operates.” (Businessdictionary, 2017)

**Evaluating CSR impact**

Companies usually prefer to invest in short-term projects with high publicity as was illustrated by Taylor (2015). Long-term programs to ensure the social and economic development of a region do not have the same media coverage and seem to be less attractive. Following Ferrell and Hartline (2011), we can admit that sponsorship of some big event creates an immediate response and may result in remarkable improvement of a company’s image.

Socially-oriented investments can be defined as forms of financial support allocated by business for implementing long-term programs, usually organized in the mode of cooperative partnership, objected at easing social tension in the area of a company operation and raising living standards for all groups of the population.

Primarily, companies develop strategies of investing in their personnel what is also supposed to present a marketing tool of promoting the business as socially responsible. Besides paying salaries, different perks, such as medical insurance, fitness, and training facilities are financed. Many SME (small and medium size enterprises) and large holdings representatives consider that an opportunity to have a job and salaries payment can already promote a socially responsible image. (Financial Times, 2016)

1 Plekhanov Russian University of Economics, barsov2@mail.ru
Having provided their staff with merited living standard, a company may ponder over investments in a local society, which can provide resources for further development and expansion and is very important for their successful operations in the area (Fig. 1). Undoubtedly, a business’ degree of involvement in socially responsible projects depends on the affordability of required resources. Every company’s marketing strategy should optimize the balance of investments in social programs and the company’s profitability.

![Figure 1: Types of Socially-Oriented Investments](source: Author)

To expand studies made by Bonini et al. (2009) for marketers to improve scaling of sustainable business practices the following guidelines can be offered:

- the demand of consumers to be aware of the positive environmental and social impact (in this case they are ready to pay more for the goods and services);
- people working in companies pursuing socially responsible strategies are more committed and demonstrate better effectiveness;
- being engaged in socially and environmentally responsible activities helps businesses to enhance partnerships to retain market share and enter or develop new markets with stronger support;
- a company staff engaged in different CSR programs are reported to develop communication, collaboration, innovation and leadership skills;
- the reputation of a socially responsible business can improve access to capital as “Impact Investing” is increasingly supported by all types of financial institutions.

Besides all aspects mentioned above, there is also a moral imperative which seems to have no benefit for the bottom line. Although a going concern business may offer not only resources but expertise, leadership, and management to design the contingency strategy, that may lead to further development of company operations. A well-run business can easily mobilize the necessary resources and instantly channel the information or deliver assistance to the specific recipients or areas.

**CSR development in Russia**

In contrast to methodologically defined tendencies of corporate social responsibility (CSR) evolution in countries with developed economies, especially the USA by Armstrong and Kotler (2008), CSR in Russia is a relatively new marketing concept. The process of developing new approaches to interaction with society through being in trend with international tendencies, analyzed by Saginova et al. (2014), has peculiarities in establishing under the considerable government supervision as was emphasized by Karpova (2014). While business through CSR activity realizes its corporate interests, the state tends to integrate the socially responsible projects of companies in government social policy through stimulation and active involvement of companies both locally and nationally.

In Russia business is historically seen by government officials as a dependent and temporary source of raising capital for co-financing sustainable projects, as was stated by Novatorov (2015). Despite the very complicated current economic situation in Russia, investments in socially responsible projects,
especially regionally, may at this stage – as never before – contribute to further capitalization and promote the image of a socially responsible company – a long-term strategic partner of social development policy.

The lack of institutional norms for CSR in the Russian Federation has logically been derived from pre-revolutionary forms of philanthropy and charity and the system of social support in the Soviet period when all programs were initiated and totally controlled by the state, as was stated by Novatorov (2015). Following the period of privatization and prompt accrual of funds by some entrepreneurs resulted in firm distrust of citizens towards the level of justice in government-vs-business relationships. Moreover, social inequality and fierce stratification of the society has not contributed to generating loyal citizenry in our country. Till now the rate of our country’s integration in the world informational systems and, especially with the economic sanctions from the European Union and the USA, in the world economy through unstable interaction channels and necessity to employ flexible tactics is very low. Besides, the absence of traditional corporate governance is intensified by the poor state of infrastructure.

Regarding legislation improvements to formalize integration of the Russian Federation in the international CSR programs the following highlights might be mentioned:

- the foundation of the Russian Union of Industrialists and Entrepreneurs (RSPP) – 1991
- RSPP initiated a set of programs in socially responsible field, among which was establishment of the Charter of Corporate and Business Ethics (2002)
- the Social Charter of Russian Business adoption by the Congress in 2004 with amendments of 2008
- the Anti-Corruption Charter of Russian Business was promulgated by RSPP in September 2012 at the summit with the country’s prime minister
- following the appointment of Entrepreneurs’ Rights Ombudsman (June 2012) the president of the Russian Federation, introduced an ombudsman’s office for Russian national business in (December 2012)
- RSPP headed the process of B20 at the term of Russia chairing G20

Since 2014 introduction of new sanctions and strengthening complications, in spite of remaining influence of Russian governance and economic development in the world economy, most of the integration was transferred to the East. As for further participation in international associations in CSR activities, RSPP, for example, continues cooperation as an observer.

Markit Economics survey reveals extensive growth in Russia’s service sector by July 2014. The Purchasing Managers’ Index (PMI) for the upturn in the sector reached 55 points, the highest results for the previous 40 months. Analysts stated considerable increase of employment in the service sector, especially noted in hotel, restaurant and retail industries as a reimbursement of it in manufacturing and finance sectors. In May 2016 a survey of 300 firms indicated sustainable expansion in employment, sales and a range of other factors of service providers in Russia: Markit’s index was 54.2 in April reflecting the improvement in demand. (HIS, 2016). By December 2016 Russia Composite Output Index rose to the highest level of 56.6 within 50 months, alongside with the stabilization of the workforce figures and marginal growth in selling prices of service providers (RT, 2016).

Analyzing the dynamics of overall reported data, all areas of business activity demonstrate steady growth. In particular, Russian retail, railway, professional services and airline sectors have strong positions in comparison with other world countries, according to Organisation for Economic Co-operation and Development (OECD) reports. (OECD.org., 2016)

Some other peculiarities of socially responsible behavior rooting historically in the “soul impulse” transformed into voluntary aid, organized as a spontaneous response to natural or social catastrophes. This type can be qualified as collective social help without any particular company, fund or state guidance, and governance. Or these initiatives can be regarded as CSR uniting people of some universities, institutions or enterprises if organized under the patronage of companies or legal authorities. Spontaneous donations of goods and money for people in Syria or Donbass may be a good example. These volunteer initiatives, especially in contingency situations, emerge a sense of social responsibility, uniting people’s reaction to tragedy: “who else would help?”
Political scientists believed that Russian model of social responsibility was based on “informal and often not transparent interaction between large corporations and government authorities.” However, it should be admitted that nowadays the process of transition from bargaining practices to formalizing business liaising with government officials, the switch to the mutually beneficial partnership, though mostly regionally, is strongly developing. At federal level, sustainable business efforts are evaluated by the state authorities and supported by necessary legislation reforms. Regionally local power clearly aims at involving enterprises in solving social problems in the area to expand opportunities for implementing programs in social and economic spheres not only at the expense of companies’ resources but in co-financed programs with federal and local budgets.

Conclusion

Even before the economic downturn, not many companies in service industry have considered investments in long-term socially-oriented programs as a marketing strategy leading to a substantial increase in an enterprise’s compatibility and capitalization (intangible assets). In current conditions of service-oriented economy alongside with the economic sanctions towards the Russian Federation from Western countries, a persistent upturn in service sector’s indicators can be stated. Although there is a tendency of curtailment of some socially-oriented programs by businesses in connection with focusing mainly on cost effectiveness and profitability, it can be noted that they become better targeted in crisis periods, especially at local levels.

Abstract: A dam, in most cases is a large, impressive concrete structure. A commanding number of large dams exist with over 45000 estimated in the world. It is important to understand such a concrete structure not only from a technical perspective, but also from the view of local community in the region of the dam. Also, it is important to know the international impact of a dam on a river basin and the measures necessary for implementing a dam, as well as the positive and negative effects of dam construction itself. Preliminary measures aim to characterize a river regarding natural, geological, geographical patterns, human geographical distribution, and food production. Prospective trends, such as the need for augmented water volumes for a water-fed agriculture, industrialization, energy, and river transportation, can influence decisions connected to dam building. Recently, climate change, a phenomenon considered as human-induced, at least partially, and the prospect of a water-stressed world, are another elements that affect decisions about build dams, especially regarding water security and green energy and a renewable resource under threat. This paper presents the main administrative requirements for a team involved in dam construction, including their specific tasks and interactions. The main aim of this paper is to establish political meaning of dams, and their capacity to influence economics, society, and the environment in an interconnected world.

JEL Classification Numbers: L94, O13, Q25; DOI: http://dx.doi.org/10.12955/cbup.v5.896

Keywords: dam, energy, environment, water

Introduction

A dam affects two vital and interrelated resources: water and food, with the latter depending on water availability. Water and human civilization are inseparable, especially in the light of the direct relationships between the evolution of human civilization and rivers. A dam is an engineering feat that helps humans control and influence nature but often interferes with the river’s normal course, and at times creates adverse effects. Whereas in the past dams were built to prevent floods or were conceived as a component of an irrigation plan for providing water in drought-prone regions, the last century has witnessed dam construction for multiple purposes, from flood mitigation and water storage to energy generation, transport facilitation, recreational activities, and tourism. The hidden part of this story is that dams have been used as instruments to demonstrate national rise and power and as a means of political control upon minorities located in the region of the dam or in other states adjoining the river, known as ‘riparian’ countries, as defined by the Danube Commission. In these specific cases, dams have become instruments of foreign policy.

It is well known that water availability is a barrier to broader economic development. As mentioned by Chellaney (2013), water availability of less than 2000 m³ per person per annum results in little expansion for sustainable economic development and environmental protection. Rising powers that are geographically located to control the flow of the rivers onto other countries with riparian rights, regard dams as necessary instruments for political control. Their thinking is that where they can control water flowing onto other countries, the can influence their political and strategic decisions. Turkey and China are such states. For example, Syria and Iraq are potentially affected by Turkey’s decision regarding the dam development program in south-western Anatolia. As well, China has domination over Tibet, which is named The Third Pole, because of the water that flows from its glaciers. In this respect, China can use dams and other schemes to control the flow of this water onto another 13 riparian countries, and thus influence these countries’ behavior (Chellaney, 2013).

Nevertheless, before a dam is built, there are necessary specific steps to be taken, from the decision adopted at highest political level to creating administrative constituencies, and technical and administrative structures that operate the dam.

Data and Methodology

This study considered both positive and negative aspects, concentrating on features that define a dam, and the main steps involved in building one. The main sources are materialized in books covering subjects connected to water, agriculture, energy, sustainable development, diplomacy and geopolitics.
and climate changes, while the part of the paper regarding the actual construction of a dam results from direct researching the way some dams were built. Iron Gate System built on Danube River fits perfectly this category. The method used for writing this paper is both descriptive and the comparative, with comparative method being used especially when there are analyzed positive and negative aspects of dams’ construction.

The Multiple Features of Dams

The obstruction of river flow and creation of artificial lakes through dam building provide a means to manage water resources. There are numerous existing dams in use. Some are small, while others are large and impressive.

A dam has multiple benefits, most of them which relate to water use in agriculture, energy, transportation. In brief, a dam can provide these functions:

- Regulation of water flow to prevent floods;
- Supply of water during drought. The water of the dam’s reservoir, which accumulates during rain periods, is extracted or released for industry, households, and agriculture;
- Provision of clean and renewable energy by transferring water (hydro) power into electricity;
- Recreation or commercial use. The water reservoir created by dam’s construction could be used for fisheries (sport or food source), and tourism (providing money for the service sector);
- Waterway transport. The raised level of the water from dam construction can improve conditions for navigation, and thus the dam could provide for a safer and a more efficient mode of transport; and
- The role of a bridge. The reinforced part of the dam can serve as infrastructure in future roadways.

A particular ‘benefit’ of dam building is one involving its use as a political weapon. For example, a country in the upper river basin could build a dam close to an adjoining country with riparian rights and choose to manipulate the river flow by either limiting flow during drought or by greatly enhancing flow to a level that would damage the lower riparian area during particularly important times, such as harvesting. These actions are possible scenarios that are likely to cause long-term friction between countries. Furthermore, large dams constructed to divert water from the natural drainage of rivers, can negatively influence biodiversity and change the distribution patterns of water in the basin, especially where inter-basin transfers are involved. As Shiva (2016) mentioned, this interference can generate conflict that easily escalates into disputes between states, especially where water stress becomes the everyday norm in the future.

There is considerable debate regarding a dam’s usefulness. Much discussion hinges on the disadvantages relating to dam building. For example, locating dams on rivers that flow through more than one state’s territory can create animosities between riparian states about water allocations. Maximum impact of this scenario arises where a state in the upper river reaches decides to build a dam and thus, gain power over other riparian states by way of controlling their water supply. One such case involves the region crossed by Tigris and Euphrates rivers where the Turkish state intends building more than 20 dams under the Turkish program known as ‘GAP’. This action will undoubtedly affect Syrian and Iraq whose political survival depends heavily on water flow from these rivers. For Turkey, the dams in the south-eastern part of the country represent a means for political control over the Kurdish population, as well as Syria and Iraq. As emphasized by de Villiers (2000), dams mean power. However, such dam building will further complicate an already complex situation in this region of tension in the world.

Dam emigrants are another negative aspect caused by a dam’s construction. Large dams not only disrupt natural ecosystems but also adversely affect human populations and thus have a social cost. Since 1949, China has relocated a total of at least 23 million people because of Chinese water projects.

In summary, for more than sixty years in China each day some 1035 people have been forcibly moved for reasons of water projects’ construction (Chellaney, 2013). A dam’s construction demands concentrated effort from its inception to the last ‘brick’ installed, while rising water levels will flood large areas previously used for agriculture, transport, and industry. Forced mass migration is an ever-present element in these cases, especially where, on the upper side of the dam, populations existed prior to dam construction. Nonetheless, topography influences this aspect greatly, with low river banks
providing a large land surface area for water coverage, while mountainous areas result in less land surface area being inundated, and (generally) fewer water emigrants.

In addition, Lei (2011) identifies the threat caused by the race to build dams. Lei maintains that while the race to build dams can amplify the already strained relationships among riparian states, over-damming can create direct damage: where several large dams located in a region trigger dam-induced earthquakes.

The costs and time needed for completing dams are high. They align with the dam’s size. Even though the source of energy is inexpensive and renewable, being generated from flowing water, the costs for all materials and technical elements that transform water power into electricity (especially turbines and electric equipment), and their assembling, are enormous. It is important to note the contribution to cost involved with the expected time needed to complete a dam’s construction and the daily high probability that a large dam’s construction will run over budget and require a greater span of time than first calculated. However, when compared with large projects, the World Commission on Dams Report (2000) reveals that projects for dams with a height less than 30 m and a reservoir area less than 10 km² tend to meet predicted targets and demonstrate less variability for major area development, such as irrigated areas and intense cropping.

The next point is dam’s efficiency. Where it produces high energy with low investments and maintenance costs, the dam fits the category of an efficient project. This category is mostly influenced by the dam’s emplacement and the area where it is located. Where the river has a natural pronounced declivity on the upper side of the dam, its capacity to generate power is greater than in the case where the declivity is small, and investment costs in both cases are possibly similar. This situation is especially observed with run-of-river hydroelectric systems.

Since rivers in mountains are relatively narrow in most cases, dams can be built in these areas to create artificial lakes, where water is captured and transported through tunnels to a hydropower plant at the base of the mountain. However, this use will likely threaten areas previously untouched by a human civilization and its potentially destructive effects. On the list of few advantages, in this case, is the possibility of a short electrical network that could connect (over short distances) hydropower with the needs of the military. Strategic energy and industry are best protected by nature, and mountains offer the ultimate shelter for these types of activities.

The Momentum of a dam
First, long before a dam is under construction, a political decision occurs at the highest level of the state overseeing the dam construction with full deliberation. That individual dam, where it comprises turbines, would become a hub in the national energy infrastructure, a part of that state’s national energy capacity. That national energy capacity is decided upon at the highest political level and depends on many variables, some of them which are natural features while others are created. Natural variables are connected to the river’s characteristics or potential to create artificial lakes, e.g. topography, geology, geography (physical, human, and economic), and other available energy resources at the national level, as well as existing resources in other countries and the prospective access to them.

In addition, a large part of the political decision is driven by fears as well as expected benefits over the long term. International context is an important factor that has a significant influence over this process. Present and expected global and regional contexts are both critical, but most crucial are the evolving relations among riparian states. Dam building in one country, similar to an arms race, can trigger a race to build dams in another within the same river basin. Expecting fossil fuel prices to rise (especially for natural gas), or worst, their fluctuation, and the likelihood of political dependence can greatly influence such decisions. Political dependence is especially the case where an upper riparian state manipulates river flow through dam building to affect the water allocation of downstream riparian countries and thus, their food production. Climate change is a current issue that needs greater consideration when a state analyzes its available solutions for future energy production, with water-stress adding complexity to its decisions.

As one can observe, for certain natural attributes (variables) there are superimposed human actions that are influenced by fear, constraints, and opportunities. At the same time, technological
developments and new discoveries provide a rising the number of opportunities (e.g. offshore drilling or shale fossil fuels).

When a nation chooses a strategy to build dams and that state’s national territory and rights allow this path, it means that this state has become aware of its natural potential, wants to use it for its well-being, has the will, determination, and access to the resources from the financial, technical, and human perspectives. However, the state also needs to be aware of its influence on the natural river flow, and the possible adverse effects that the state’s actions could trigger for other riparian states as well as biodiversity. It could heighten tensions among riparian states. Nevertheless, where the decision to build a dam involves two or more countries from the same river basin, the dam could become a project to unite those interested states. Therefore, it could represent a starting point for open political relations in the future. For this to happen, there must be a political will from the part of the states that are likely to be involved in such a project. They would need to understand that unilateral measures could only be a short-sighted solution, with long running deficiencies, while a long-term perspective with benefits for all riparian states would contribute to solving tension, and greatly improve international relations with dams, in this case, being the technical elements that sustain a broader process of fostering peace.

The political decision regarding a dam’s construction involves three important elements:

1. Technical capability required to complete the project;
2. Managing resources for successful project end (human, financial, and logistical), and
3. Sustainable integration of the dam in a national (or regional) electricity grid and managing effects on the overall river basin, especially effects on downstream riparian states.

Technical capability can be considered from two angles: 1) original engineering techniques and methods, and 2) new chemical compounds that generate fresh opportunities for novel materials in dam construction. These apply to historical dams built to create water reservoirs and prevent disastrous effects of floods, as well as those of the last century that focus on energy production. Dams, energy, urbanization, and industrialization have become highly interconnected.

Mobilizing human resources needed for dam building is a highly complex activity. First, after the decision to build a dam, specialist teams need to be united under a collective umbrella. These specialized teams are organized into different types of activities. One team will focus on economic-financial issues regarding the financial resources involved, compensation in case of expropriation, damping and efficiency of the dam, and its financial rate of return. Another team would exist for terrain, topography, environment, and geological issues to analyze the best place for the future dam, how to least disturb the environment through the dam construction, and to understand precipitation and the water flow regime during and after the dam construction. Another would cover technical issues, focusing on the best technologies and materials to be used, the best location for the dam, considering the type and shape of the dam, and ultimate features such as height, the number of turbines, and connection to the national or regional electricity grid. Another team would cover legal issues around the application of pre-existing laws and conventions during the dam construction and its exploitation, compensations paid to those affected by the dam construction, or legislation to be applied after dam completion.

The legal arm is of utmost importance where a dam is built on an international river (which could be an international waterway) and where two or more countries participate in the dam project. It will be the main team, which will work on details regarding the construction of the ‘legal’ bridge involving international accords and conventions that precede the technical construction of the dam. Furthermore, apportioning the future electricity production, adjustments to borders in the case of dams being located on a river that acts as a border, amendments because of water level rises, participant costs and burdens and their apportionment, solutions for unforeseen events, as well as other legal matters, are the focus of domestic and international law specialists.

Where two countries unite to build a dam, representatives from both countries are grouped into different national teams (specializing in economic-financial, technical, technical terrain documentation, and legal issues). These groups form the pillars of the one unique mixed international team (or international commission) that unites specialists under individual aspects of the one umbrella.
International context is critical in the context of there being a commonality in building a dam by two or more countries. In this case, negotiations precede the conventions, agreement signature, and ratification, as legal basis for the constructing of the dam as a joint endeavor. In the future, the international context may be influenced by climate change and water shortage considerations. With this in mind, all riparian states would need to be involved in decisions. However, such actions and decisions may be affected by water nationalism. The first situation could bring long-term benefits for riparian states, whereas the second, only deep distrust and conflict.

In the first case, negotiations with the objective of innovation are needed. As Ikle (1964) mentioned, the main subject of innovative negotiations pertains to creating new institutions. Since two countries decide to unite to build a dam, the creation of a mixed specialist team or teams is a natural prerequisite. This progression points to the need for innovative negotiations where two countries unite with the common aim of constructing a dam. At the same time, these negotiations are intended, as Malita (2007) mentioned, to exploit common interests. Countries determined to build the dam together will gain net benefits in the field of energy independence, low pollution, and greater water allocation for agriculture, tourism, and fishing, as well as possible improved navigational conditions. Where the river being dammed crosses more than two countries, all riparian states could benefit. All would have lower navigational costs and trade could be stimulated using the river, meaning lower congestion and transportation risks for land transport, coupled with lower emissions, lower pollution, and greater mobility and integration at the river basin level.

However, to achieve this outcome, an international system for the transnational river is required beforehand. This system would need to be under a special umbrella and cover all bi- and multilateral negotiations including those for dam building and involving all riparian countries. For such a regime to operate smoothly, a lengthy span of time would be required.

The best example of a transnational case involves the Danube River, which flows through ten countries, making it one of the most international rivers in the world. The Iron Gate System of dams involves a gorge located on the Danube on the ex-Yugoslavian-Romanian border. It is noteworthy that negotiations for this dam building had a very technical character, meaning a high degree of complexity and requiring the participation of several specialists over a long period. As well, the diversity of issues to be solved demanded a series of parallel negotiations.

Moreover, this is an ever-present peculiarity of dam construction. However, the building of a large dam by a nation on its own is a sign of that nation’s emergence and desire to affirm itself on the international stage. It could be proof of its technical, financial, engineering, management, and human competencies, and its determination to modernize. However, it could also denote a sign of its desire to manipulate the environment. Added to this list is energy independence, as well as climate change and water shortage motivations, and intelligent water management, which will mark the agenda of the state that modernizes its existing or future dams.

Needless to say, a dam can be constructed as a political weapon, aiming at extracting unusual behaviors from other riparian states. Through the creation of reservoirs in their territory, an upstream riparian state can reduce the river flow reaching countries in the lower river basin that greatly depend (especially for agriculture and urbanization) on that river flow. The two greatest examples of this occur with Turkey and China. These countries view water on their territory as a natural right to use as they deem fit, without much concern for other riparian countries along the same river. This creates concern and increasing distrust between the countries involved. Not only are they unaware of the environmental impact of such projects and the social costs of relocating people, but they also contribute to future instability in transnational river basins. Hence, water could become a trigger for conflict, and not an integrative natural resource for all countries and people to share in their water.

**Conclusion**

Life is impossible without water. For this reason, water and civilization are inseparable. If in the preindustrial era people had been unaware of the sustainable economy concept, using nature without harming such, then the Industrial revolution has changed this. Humans have started to view nature and natural resources as fully and readily exploitable elements, without much concern about possible future evolution. However, the recent decades have proved this path to be inappropriate. As a natural resource, water has been used inappropriately also; and the damming of rivers has occurred without
much concern for the effect on the environment, or on populations being displaced. Dams were viewed as technical faculties that proved a state’s political clout and became known as instruments of social modernization.

New developments and recent evolution have changed this view; water has become a natural resource under threat, marked by a lower quality and quantity partially attributed to environmental change and partly to pressure due to a more populous, industrialized, and urbanized world. Water crisis and associated food emergencies are future problems that will plague humans. Water is becoming a scarce resource and water stress will crucially influence future developments.

In this context, dams could be connected to water nationalism, becoming instruments of political control over other countries and societies and rising instability in international river basins. Alternatively, they could become technical instruments built by two or more riparian states in unison and facilitating cooperation among riparian states. This latter scenario would contribute to a deeper regional integration of societies and economies. The first setting would complicate further an already conflicted world; the second would contribute to greater international stability and multilateral gains. Humans are at historical crossroad and their future will be partially influenced by decisions about water use, and the integration of dams into this context.

DANUBE AND THE FACILITATION OF NAVIGATION ON DANUBE

Ciprian – Beniamin Benea,1 Adina Secară Onița2

Abstract: With 2857 km in length, the quiet Danube quietly tells Europe’s history. We only must be aware of its story. Since ancient times it was connected with empires, expansion, and navigation. The Romans fully understood its role, and proceeded accordingly. They made it their border, but used it for transporting goods and military, too. After the Dark Ages, all European affairs have been in one way or another connected and influenced by the Danube. Romania’s modern history was influenced by the evolution of international problems connected to this river. The Moldavia and Wallachia 1859’s unification in a single state – Romania – had lot to do with the Danube and it was involved in London’s interests in the Oriental Question. The paper presents shortly the way the legal framework regarding the Danube was developed, and what was Romania’s role in facilitating navigation on the Danube. The main data which inspired this work – regarding both the political-legal aspects, and the technical solutions used to facilitate navigation on Danube – are based on earlier writings and studies of Romanian thinkers such as Antipa, Baicoianu, Dascovici and Gogoanu. The evolution of these aspects has a direct or an indirect connection with the evolution of political events and the economic development in all European states, but their importance is crucial especially for those countries which are located in the Danube’s basin. The main text regarding the political aspects related to the Danube is the Belgrade Convention, which has been the general framework under which riparian countries come together to collaborate and to solve the technical impediments for navigation, such as those imposed by the building of the Iron Gate System. At the same time, this paper signals the role of education in understanding the Danube’s role for riparian countries, and for their possible evolution in connection with this river.

Introduction

Danube is a river which flows from Western Europe to its Eastern part, creating a natural corridor through its middle; in fact it is the only natural route passing through the center of the European continent to its Easter region. Exactly due to its location and geographical position, it has constituted as a “battle-field” among main powers in different historical periods. They have recognized its key-position for controlling the Danube’s riparian states, and for promoting their narrow interests. But after the Enlightenment, and especially after the Crimean War in 1856, different countries started to look at the Danube in a manner which was quite different from the situation peculiar before.

This is exactly the period when Romania started to “appear” on Europe’s map, with its great geopolitical potential. In fact, Romania’s geopolitical position and her economic and national advances depend in a crucial manner on the free navigation on the Danube. Even her appearance on the map as a modern state was directly connected with this river. Furthermore, between 1856 and 1948 there was a period when different European states manifested their special interests regarding the Danube, especially its strategic Delta. Of course, there were general interests from their part, which went hand in hand with those of the riparian states located on the lower Danube, regarding navigation conditions.

This results in the creation of legal and technical instruments and means for this aim. But the main decision regarding technical facilitation was taken in Belgrade in 1948, when the Danube Convention was concluded by the riparian states. With this occasion, it was the first time that non-riparian states were excluded from participating in the affairs regarding the Danube. After this situation was created, the “obligation,“ was mentioned, for the riparian states, which had to remove all obstacles which could hinder or affect navigation of the Danube river. Synthetically, there are three different means of improving the navigation on the Danube river: one is legal, the second is technical, and the third – which I consider of utmost importance – is that one which is correlated with the consciousness of the people from the riparian states, regarding the importance of the Danube for their country. Using this river’s potential is connected not only to international conventions regarding navigation and transport, or technical improvements focusing on dams, locks, and ships, but to the people from the riparian states and their deep understanding of the Danube’s importance for their country; and this has to do with their education.

What the Danube means

There is no doubt of European interest related to the Danube; and this is not new at all. Since ancient times different emperors and kings aimed at controlling this river. The great Romanian romantic writer – Mihai Eminescu – recalled in one of his best known poems, “The Third Letter,” the interest on Danube for Darius, son of Histaspes. While establishing the Danube as the political border of the Roman Empire by the Roman Emperor Augustus recalls the military, cultural and political separation between the parts of Europe situated north, and respectively south, of this great waterway. In the late part of the Middle Ages the Ottoman Turks used this waterway to penetrate into Central Europe, after Moldavia lost its fortresses (Chilia and Cetatea Alba, in 1484); the great battles between the Turks and the various European powers followed the great line described by the Danube: Sabac, Belgrade, Mohacs, Budapest, and Vienna (twice) are the best witnesses in this regard. The geographical turning point in European history, when Sobieski played a key-role, was connected with Danube: the second siege of Vienna marked the beginning of the decay of Turkish power, and the ascension of Europe’s power. The line marked by the Danube again became the confronting interests of those involved in this great policy.

Even the evolution of Romanian states is directly influenced by their freedom of using the Danube; with the Treaty of Adrianopole (1829) the Turkish possessions on the left bank of Danube were attached to Wallachia’s territory. All these were in connection with the English interests, in this period London guarding carefully to provide for a free navigation on Danube, which until then were hindered by the Turks. In 1856, after the Crimean War, France and England being aware of Russia’s interests in the Danube Delta connected to Eastern Europe approved the attachment of Bessarabia to Moldavia. Furthermore, the union between Moldavia and Wallachia was considered necessary. In order to control the Danube, there was needed for a bigger country close to its delta, ruled by a unique hand, indebted to London, and especially to Paris.

Between the two world wars a brilliant Romanian diplomat with a great vision – Nicolae Titulescu – focused on the conception of interwar Romania’s foreign policy connected to the Danube and the Black Sea straits.

As we can see, the importance of this river is connected to geography: it is the only big river which flows from West to East, cutting Europe through its middle. As in other situations, geography determines and compels people to adapt to it, to compete, or to collaborate in a predetermined geographical environment, which hasn’t been changed. Nowadays with its 2850 kilometers, the Danube is the river which crosses the biggest number of countries in the world from its spring to its Delta, ten countries, respectively; in comparison the Nile crosses the territory of nine countries.

What is important in the present paper’s context is to recall the Danube’s role to promote cooperation among its riparian states.

There is a European interest connected to the freedom of navigation on the Danube. All its riparian states would benefit from its flowing waters only when navigation is free, while hindering navigation or seizing it by hidden or niggardly interests is a serious obstacle for different riparian nations’ normal and legitimate aspirations. As always, history becomes the best witness in this regard; but in order to avoid unjust developments it needs to become the teacher of the Danube’s riparian states’ people. In this context, education and the facilitation of understanding of Danube’s role for the riparian states’ evolution plays, and will always play a crucial role in their destiny.

As humanity surpassed the Middle Ages there were changes, both in diplomacy and in the technical field. Humankind’s history is directly connected to sciences’ development, and in its evolution, humankind has always made its first leap in sciences. A discovery in this field generates deep changes in technical, social, legal, and political fields. Galileo’s thesis marked this turning point in human history. It prepared the way for a new diplomacy and a new legal system.

As mentioned by Nicolson (1955), between Rome’s falling (476 a.d.) and 1575 a.d., diplomacy was totally disorganized but, between 1573 and 1914 diplomacy was under the newer umbrella of “European states’ system”, while the third period in diplomacy’s evolution has to do with “democratic diplomacy”, one of its expressions being multilateral and conference diplomacy (Malița, 1975).

The situation regarding the Danube followed the same path: before the end of the 15-th century, the relations among the different entities related to the Danube were accidental; after that, there was
diplomacy which facilitated the permanent maintenance of contacts among different powers involved in one way or another in the Danube’s affairs.

The invention of steam engine’s invention and as a consequence – the expansion of railways and steam navigation – had facilitated the appearance and consolidation of nation states, and also that of multilateral diplomacy.

The Danube, as a geographical element, started to be more and more regarded through these new angles, due to the evolution registered in both, diplomatic/legal and technical areas. The Danube was regarded as a geographical element which could facilitate the creation of a brotherhood among different nations.

The Treaty of Paris (ending the Crimean War-1856) was of outmost importance from Romania’s point of view, and from the European angle too. It was this treaty which consecrated the freedom of navigation on the Danube, and as an appendix, the Black Sea’s neutralization. The Danube’s regime was guaranteed and put under the surveillance of Europe’s interest. With this treaty, Danube’s navigation entered under the European system of public law (Bâicoianu, 1915). This new regime was a great opera of progress and civilization, and it was of outmost political importance and foreseeing: it provided free navigation on Danube for vessels registered under any nation’s flag – a visible proclamation of promoting nations’ brotherhood on international rivers.

From Romania’s national point of view, it is noteworthy to mention the remark made by Carol the 1-st related to the Danube: being counseled to refuse the crown of a country without any future, he looked to Europe’s map and to that of the Danube, and said that because Romania is crossed by this river, which is “the most direct line between Europe and the Indies, this country has a great role to play in the world trade” (Antipa, 1921).

The institutional mean for promoting freedom of navigation was Danube’s European Commission. It promoted and provided surveillance for free navigation and the identification of all technical obstacles hindering navigation, especially between Isaccea and Black Sea.

For the Romanian nation, the Danube guarantees its future and its development in the great competition among different nations, and as a consequence, the Danube dictates Romania’s special interests and its policy. The manner Romania understands how to play its role in the Danube Delta and Iron Gate System areas crucially influences the Romanians’ destiny among other nations in the world.

Romania has the greatest interest in free and unhindered navigation on the Danube, and this interest is the same with that of all other Danube riparian states. Dașcovici said (1936) that Romania depends in such a measure on Danube’s navigation that Romania’s “future, as well as her past”, is influenced in such a way that this old Danube has been “the force of protection, renaissance, and then of Romanian nation’s consolidation, as well as European interests related to free navigation on it, which coincided with” Romania’s “best understood interests”.

Anyway, it was only after 1948 when Romania started to play a decisive role in the Danube’s affairs. Even if it had been “allocated” to the communist block after the WW II, it would have been only then that all powers with no territory connected directly to Danube were excluded from the “administration” of this river. There were only left the riparian states with the right to collaborate in order to provide smoother navigation (from a technical point of view) and free navigation (from a legal point of view). For promoting this aim, the Danube’s Commission was created (its first headquarter was in Galatzi, then it was changed to Budapest, where it is still today).

It was at Belgrade in August 1948 that a Convention was concluded with a huge political impact upon the Danube’s riparian states, as Gogeanu mentioned (1970); this convention facilitated cooperation among Danube’s riparian states, facilitating the removal of obstacles for navigation, but eliminated non-riparian states from these processes. The Danube riparian states’ sovereignty was consolidated in connection with the general interests connected to free navigation, while the special administrations of peculiar areas were to be provided under a special status, by the riparian states with direct access to those areas. There were created the Special River Administration for the Lower Danube (having at its base the bilateral agreement between USSR/Ukraine and Romania) and the Special Administration of the Iron Gates (having at its base the bilateral agreement between Romania and Yugoslavia/Serbia), both of them being in relation with Danube’s Commission in Budapest.
These were the legal and administrative means for promoting cooperation among Danube’s riparian states aiming at the facilitation of navigation, bringing benefits to them all. Where the Danube marks the border between two states, the rules of navigation were to be established by those peculiar states, and not by the Commission of Danube, giving a new meaning and significance to national sovereignty, and to the general interests connected to free navigation on the Danube. The Commission of Danube has had a very high utility for riparian states, for it created the institutional forum which facilitated the continuous coordination of activities which have promoted the expanded collaboration among Danube riparian states’ economies and societies (Gogeanu, 1970).

From a technical point of view, there were identified two areas of outmost importance: the Danube Delta, and the Iron Gate sector. There were established legal means for countries neighboring these two areas, and their obligation to remove all obstacles for navigation on this international waterway (art. 20, Convention of Belgrade, 1948).

One special area where permanent dragging is needed concerns Sulina’s arm of the Danube. The special bilateral institution aims at managing this part of the Danube in a sustainable and continuous manner this aspect. Furthermore, between kilometer 1821-1791 (between Gabcikovo and Gonyu) there is a permanent changing of river bed and water depth.

The greatest obstacles for navigation were to be found in the Iron Gate sector, where the shallow water coupled with a high water speed, created the most dangerous conditions for navigation on the whole Danube. These obstacles were technical hindrances between the lower part of the Danube and the countries situated on its middle and superior course. Even starting in 1838 some Germans, Austrians, and Hungarians tried to resolve these impediments, but missing technical means, coupled with some narrow interests, their solutions were not effective. In 1895 Hungary received the right to work in this sector in order to remove the obstacles for navigation, but, even after four years of steady work, the aim was far from being definitively achieved. Cutting a canal of 2840 meters, while refusing to adopt the technical solution with locks, as mentioned by Băicoianu (1915), rose the water’s speed to 3-5 m/s, and with all these efforts, the difficulties for navigation were still complex. The navigation in the Iron Gate sector had remained dangerous, and more expensive than in the past.

The technical solution which proved to be the best was the locks system. What is important to mention here is that the Iron Gate System was created under the stimulus and umbrella of the Convention of Belgrade, but it was the direct result of Romanian and Yugoslavian effort. In fact, the technical solution of the Iron Gate System has two interconnected principles and parts: facilitating cooperation among riparian states through improving the navigation conditions, and using the water’s potential to generate electricity by two neighbouring and friend countries. This solution was the best, it combined the general interests of navigation with the special interests of Romania and Yugoslavia related to energy production (and independence in this strategic field).

**What should the Danube mean for Romanians**

Tacking account of these historical, political and technical realities, we must never forget that free navigation on Danube represents a key-stone of Romania’s domestic and foreign policy.

Now, to utilize the Danube’s potential, something must be done more than just connecting things to international law and the general interests of all riparian states; the technical and human means for navigation must be created. Ships, personal, technical facilities in ports, and shipping companies are of outmost importance in this context. Under this view point, shipping companies (even if they are private) are geopolitical instruments used for promoting national interests. Even if a riparian country had excelled in international cooperation facilitating the navigation on the Danube, missing its national flag on this river’s waters, and beyond it, is not only a sign of technical incapacity, but of political weakness, and administrative impotence. States rise as their transport means evolve, while the decay of the states is first encountered in the transportation area.

That for, Romanians must be aware of the role Danube plays in Romania’s destiny; history is a very good teacher in this regard. Becoming familiar with the Danube’s influence upon Europe, the role Romania could play in this river basin could be well improved. Educating Romanian pupils having this in mind will bring benefits in the future for all the Danube’s riparian states. Without understanding this, Romanians could very carefully guard other states’ interests on the Danube, but they still miss the capacity to benefit from this river great potential fully.

32
As we can synthetically note, for Romania, there are already legal means which sustain transport on the Danube, technical means which removed the impediments in the most dangerous areas of the river, the Iron Gate, but the cultural, educational, and technical elements which could make Danube the most important corridor for transporting Romania’s goods are missing.

Put in another way, Romania is very open when it comes to international collaboration and the rule of law, but when it is about Romania’s destiny and guarding its national interests, it is a national disappointment.

The Danube remains a river with an ideal potential, far away from daily realities.

**Conclusion**

As was stated above, it is important to note the peculiar role Danube has played in the history of Europe. This should be the focus of present generation, and through education, of future generations too. This river is the quiet witness of how geographical elements and peculiarities have been used by different powers of the moment, to promote their narrow interests to the detriment of others. While the changing context after the 2nd World War, with promoting regional integration, totally reoriented the way Europeans see the Danube. The European integration process cannot be imagined without the Danube as its main artery of trade. The Danube becomes the natural pathway for political integration and cooperation among all its riparian countries and among them and other countries which this river indirectly connects, from the Middle East and Central Asia to the Rhine’s riparian countries. In Romania’s particular case, it is necessary for all Romanians to understand the Danube’s role in their history, in order to transform the Danube’s potential into real life benefits.

THE ASSESSMENT OF CORPORATE TRAINING AND THE EVALUATION OF SELECTED WORK ATTRIBUTES

Zuzana Birknerová,1 Miroslav Frankovský,2 Eva Benková3

Abstract: The contemporary economic environment including the context of work is characterized by unusual turbulence and an unflagging stream of changes. The effective operation of organizations in these conditions is more and more conditioned by the quality of human resources. Corporate training represents one of the significant factors of increasing this quality. In this paper, we present the results of our research which specifies connections between the assessment of corporate training and the evaluation of selected work attributes. Based on the data which were obtained by the original SBES methodology, it is obvious that there are significant connections between the perception of corporate training factors and the evaluation of work attributes. The most evident were the connections between the assessment of the corporate training factor ‘Significance for performing a profession’ and the attributes of ‘Interesting work, Delight from work and Possibility of being promoted at work.’

Introduction

Nowadays, the educational level of employees belongs to the basic aims and priorities of each organization. At the same time, it is a requirement and a necessity so that an individual can be successful in the contemporary labor market, and be able to perform the working duties and vice versa, so that the organization could their growth, continuous improvement, and development of their educational level. Fitzgerald (1992) defines corporate training as a tool which helps an individual to support the organization and to succeed at their current position as well as the acquisition of knowledge and skills which are related to the existing tasks.

The essence of corporate training is the effort to improve knowledge, attitudes, and skills of employees. Corporate training can also increase the employees’ trust, their motivation and subjective satisfaction with their job (Fill and Mullins, 1990). Milkovich and Boudreau (1991) define this training as a systematic process of the change of employees’ behavior, knowledge, and motivation with the aim to increase the level of agreement between the employee’s features and the requirements put on them.

Modern and contemporary organizations relate their success and competitiveness to the preparation and creation of employees’ working potential so that they could reach a high level of talent, skills, knowledge, and motivation. They are searching for capable, professionally, and psychologically prepared job applicants or they ensure a professional preparation for their employees. Corporate training is a significant technique leading to the productivity increase (Goldstein and Goldstein, 1990).

An employee’s corporate training is carried out as a direct result of the requirement of their superior. We can find out educational needs by the means of the so-called “analysis of educational needs.” According to Milkovich and Boudreau (1991), the given analysis is carried out at several levels. According to Srivastava (2002), training follows continuous innovation by creating the connection between the external and internal organization world which helps the organization to keep its competitiveness.

The organization survival depends on its ability to equip its employees with the right skills and competences completed with the right attitudes. In this way, they serve the aims of the organization, especially by the means of increasing the adaptability and ability to react to the changes in the economic and business environment.

Gould et al. (2004) state that the analysis of educational needs is a first step in the strategy of organizational training and it is crucial to satisfy the needs of the employee’s permanent professional development. The analysis of educational needs must be therefore carefully planned, managed, and

1 The Faculty of Management, Slovakia, zuzana.birknerova@unipo.sk
2 The Faculty of Management, Slovakia, miroslav.frankovsky@unipo.sk
3 The Faculty of Management, Slovakia, eva.benkova@unipo.sk
directed towards clear results so that the educational actions are ensured to be applied effectively and they could lead to meaningful changes, e.g. in the quality of services provided by the organization.

An inevitable part of the concept of corporate training is an evaluating analysis which is carried out continuously. Hamblin (1974) understands the evaluation of corporate training in the context of information (feedback) about the effects of a training programme and the evaluation of the training in the light of this information. Evaluation should give a comprehensive reply to a question whether training fulfilled its purpose from the point of view of acquiring new skills and knowledge but also from the point of view of subjective perception of work attributes. The position of corporate training is determined by the fact that training is a tool not a goal. To be effective, corporate training has to respect the organization requirements as well as the employees’ possibility (Sadler-Smith, 2006). The mentioned attributes of corporate training are reflected in the concepts of this issue of several authors (Spector, 1997; Russ-Eft, 2008; Fitzgerald, 1992 a i.).

Research

The research sample was created by the employees of a private and public sphere operating in the sector of production, administration, and a school system. We addressed 152 respondents, from which 87 were men (57,20%) and 65 women (42,80%), in the age from 21 to 62 years (the average age was 40,84 years, standard deviation was 10,510). The employees had an average length of practice of 17,36 years (standard deviation was 10,806 years). The minimum length of practice was 1 year and maximum length 44 years. From the total number of employees, 92 operate in a private sphere (60,50%) and 60 in a public sphere (39,50%). We addressed 51 employees working in the sector of economic production (33,60%), 36 in administration (23,70%) and 21 in a school system (13,80%).

The data in a presented research were acquired by the means of SBES methodology (Frankovský et al., 2015; Birknerová et al., 2016a, 2016b). The methodology contains 22 items, based on which the respondents were assessing different aspects of corporate training. The individual items were evaluated on a 5-point scale, where 1 = certainly no, 2 = rather no, 3 = neither no, nor yes, 4 = rather yes, 5 = certainly yes. Corporate training was assessed by the means of factors which explain 65,6% variances.

The Principal Component Analysis with Varimix Rotation was used to extract 4 factors the content of which may be described as follows:

- **F1: Significance for the profession.** Respondents scoring high in this factor attach greater importance to education for the profession; they perceive a greater personal significance of education and see a higher degree of relation to the work performance (Cronbachova alpha – 0,899).
- **F2: Benefits for the employees.** Respondents with higher scores in this factor attach greater importance to education for career development, positive evaluation, improvement of relationships on the workplace, and for motivation increase (Cronbachova alpha – 0,844).
- **F3: Expectations of the employees.** Respondents scoring high in this factor provide positive evaluation of the education program, utilized methods and forms of education and the training course, and have also higher expectations (Cronbachova alpha – 0,860).
- **F4: Satisfaction of the employees.** Respondents with higher scores in this factor evaluate education as more comprehensible, acceptable, and adequate time-wise (Cronbachova alpha – 0,771).

Selected work attributes were evaluated from the point of view whether they contribute or not to the achievement of good results at work. The respondents had a possibility to assess the following work attributes: interesting job, delight from the results at work, thrilling situations, free working time, wage, the possibility to be promoted, competition among co-workers, social usefulness of the work, appreciation from co-workers, and appreciation from a superior. Individual attributes were assessed at a nominal bipolar range yes – no.

The differences in assessing corporate training from the point of view of evaluating selected work attributes were analysed by the means of a mathematic-statistical method of t-test for two independent selections in the statistical program SPSS 20. The results of the analysis are presented in Tables 1 – 4. The tables show only those attributes by which statistically significant differences were found out.
The results of the mathematical-statistical analysis proved the existence of significant differences in assessing the corporate training factor of the Significance for performing a profession between the respondents who agreed that work attributes Interesting work, Delight from work and the Possibility to be promoted at work contribute to reach good results at work and the respondents who did not agree that Interesting work, Delight from work and the Possibility to be promoted at work contribute to reach good results at work. It proves the fact that the respondents who assessed the mentioned corporate training factor more positively also agreed that interesting work, delight from work and the possibility to be promoted significantly influence the achievement of good results at work (Table 1).

The acquired results from the analysis in assessing the corporate training factors of the Advantages for employees and the Expectations of employees proved similar findings. But the significant differences between the respondents who agreed or did not agree with the influence of work attribute on work results only proved from the point of view of the attributes of Delight from work and the Possibility to be promoted at work (table 2 and table 3). Also in this case, the respondents who assessed the mentioned corporate training factors more positively agreed that the delight from work and the possibility to be promoted at work influence the achievement of good results at work.

The development of employees put attention is focused on not only face changes but also to suggest to create a change (Fitzgerald, 1992). In connection to understanding the economic environment as turbulent with a never-ending flow of changes (Drucker, 1999), the attention paid to the development of human capital is inevitable.

The analysis of the differences in assessing the corporate training factor of Employees’ Satisfaction proved the significant differences between the respondents in the examined context from the point of view of work attributes of Interesting work and Delight from work. As already mentioned, the respondents who assessed the corporate training factor of Employees’ satisfaction agreed that the delight from work and interested work influence the achievement of good results at work (table 4).

**Discussion and conclusion**

If an organization wants to make a progress, it is inevitable to pay attention to the corporate training of employees; the character, the level and the intensity of which can be different according to the needs of the organization (Sadler-Smith, 2006) and the employees’ possibilities. One of the important aspects of the corporate training effectiveness is the perception and evaluation of this training by the employees (Lelková and Lorincová, 2017; Várová et al. 2012) and thus also a question of getting a feedback (Rajnoha et al. 2016) and other work aspects (Štefko and Gallo, 2015). A crucial factor of the development of any organization are its employees, a human capital. The performance and the competitiveness of an organization is from the point of view of its employees conditioned by the development of their competences and self-management (Russ-Eft. 2008). In this context, the attention is focused not only on the evaluation and remuneration, but also on a development and training. The development of employees puts an organization into a position when they can directly not only face changes, react to changes but also to suggest, to create a change (Fitzgerald, 1992). In connection to understanding the economic environment as turbulent with a never-ending flow of changes (Drucker, 1999), the attention paid to the development of human capital is inevitable.
The presented results prove the meaningfulness of thinking about the significance of corporate training also from the point of view of assessing the work by employees. The identified and specified connections between assessing the corporate training attributes (significance, advantages, expectations and satisfaction) and perception of the work (delight from work, interesting work, the possibility to be promoted) prove the mentioned thinking. (Fill and Mullins. 1990). The employees who assessed the individual corporate training attributes more positively agreed also with the mentioned work attributes as significant prerequisites for good results at work. In the context of corporate training, these findings focus the attention not only on the aspects of the development of findings, knowledge, and skills, but also on a possible influence of this training on a psychic aspect, experiencing one’s own work. Such an approach enables a more complex view on the position of corporate training also from the point of view of motivation, loyalty and other work attributes which are connected to a subjective work picture. The research results proved the findings which are connected to specifying the external and internal motivation factors of education. These findings correspond with the findings which are presented by Buckley and Caple (2007). From a methodological point of view, the presented results prove the legitimacy of a structural approach (significance, advantages, expectations and satisfaction) to discovering a feedback assessment of corporate training. At the same time, it is possible to consider the results of this study as a contribution to verifying the use of the SBES methodology (Frankovský et al. 2015; Birknerová et al. 2016a. 2016b).

MANAGEMENT OF RESEARCH PROJECTS – LESSONS LEARNED

Jan Betta,¹ Joanna Jastrzebska²

Abstract: Project management assists many areas of human activities and recently has been considered as a way to ensure the success of scientific research projects. A primary problem is the need to identify the project’s success factors, which include phenomena, actions, events, and parameters that contribute to the success. The purpose of this study is to identify the management issues and oversights that pose a negative effect on scientific research projects. The study involves a questionnaire, distributed to several managers of research projects conducted within Polish universities. This paper presents the results of assessing responses to two questions of this survey. These questions about project management deal with goals achieved by marginal projects and an analysis ex post. The responses to each question are grouped into five types, on which a frequency analysis is performed. For each group, several conclusions and recommendations are proposed. The results are a first attempt to construct a set of suitable practices for the management of scientific research projects.

JEL Classification Numbers: Y2; DOI: http://dx.doi.org/10.12955/cbup.v5.s899

Keywords: research project, research project management, factors of success, good practices

Introduction

There has been growing interest in project management of scientific research. The issue has remained neglected for many years, leaving the management of scientific research projects lagging behind that of other areas such as information and technology. Awareness is needed on the history of project management and the specifics of research projects since those requiring a high level of innovation and creativity may not fit within the rigid framework of algorithms and quantitative tools.

The work conducted in this paper is empirical, based on the experiences of many scientists who implement and manage scientific projects, and results from the scientist’s perceived need to change. The intention is to find the starting point for future development of project management research, or at least to identify a set of ‘good practices’ in this field. The aim of the work is to show the areas considered unfavorable for research projects where appropriate improvements could lead to eliminate the most common mistakes for better project management in the future. The target audience includes individuals managing scientific research projects, as well as other stakeholders.

Literature Review

Success and Failure in Research Project Management

There exists broad divergence of opinions on the subject of what constitutes ‘research project success.’ Success, considered primarily as project success in general and not only in reference to research projects, refers traditionally to three basic criteria for successful projects in an ‘iron triangle’ or ‘golden triangle’: cost, time, and quality (Atkinson, 1999; Baccarini, 1999; Cheng, Tsai, & Sudjono, 2012). In general, the understanding of a successful project appears obvious and yet, project management literature reveals inconsistencies of an omnifarious nature. As Cameron (2016, p. 1) writes, relatively little systematic attention has been given in the literature to the meaning of “success and failure of research/innovation projects.” For formulating assessments of success and failure, there is a need to define the nature of the notions in more detail. Considering the impact of particular research project, Cameron (2016, p. 6) argue that “research projects must be judged on their longer term programmed effect, perhaps on a stream of products which take time to manifest their full impact” and analogously “take a longer term of the results of a new innovation” instead of restricting assessment to a single product. Success and failure are always relative concepts in the sense that a project can generate significant revenue even if its status is ‘failed’, as demonstrated in Cameron’s work with the case study of Betamax versus Video Home System (Video Home System; Buisseret, Cameron, & Georghiou, 1995; Cameron, 2016). Gryzık and Knapińska (2012) in their broad study of research projects claim that there is no universal way to manage a research project to guarantee success. The nature of the project, its environment, competencies, and predispositions of the team, and team skills of the manager need to be taken into account. According to Gryzık and Knapińska (2012),

¹ Wroclaw University of Technology, Poland, jan.betta@pwr.edu.pl
² Wroclaw University of Technology, Poland, joanna.jastrzebska@pwr.edu.pl
delays, overruns, lowering the quality of the work, and the inability to continue project arise from the following:

- Incorrect or no specification of the roles and responsibilities of the project team;
- Lack of rules and channels of communication within the team; and
- Inefficient planning (creating overly generalized plans prevents the functioning of management, and exceedingly detailed plans are unrealistic to execute within the given time).

Research project management literature offers some important guidelines as success criteria for research projects. Kamińska (2014) argues that evaluation of the project should be based on the following criteria:

- Relevance (the process of project implementation is correct, according to identified problems);
- Efficiency (the extent to which its objectives are realized or steps and actions are taken to fulfill the objectives and implementation indicators contained in the logical framework);
- Effectiveness (the measures taken are effective and lead to the growth of innovative research and development projects or create a new business start-up or spin-off; what has been achieved, was also planned);
- Perception (the project meets the expectations of stakeholders; academic, business and public community perceive these activities as helpful and contributing to the development of their regions); and
- Durability (the extent to which the beneficiaries of the target have a wider overall impact on other regions in terms of innovation and entrepreneurship.)

Interesting conclusions are formulated by Lazzarotti and Manzini (2011), who raise a formal model for assessing success and failure of research and development (R&D) projects. The model is based upon a balanced and synthesized evaluation of quantitative indicators from five different perspectives of performance: financial, customer, innovation and learning, internal business, alliances, and networks (Lazzarotti, Manzini, & Mari, 2011). A similar formal model for measuring R&D performance was proposed by Cameron (2016) who writes about dimensions for creating a typology of criteria for assessing success and failure of research projects. According to this author, based on four dimensions, 11 different types of criteria should be defined, among which 38 criteria should be differentiated. Then, a subjective opinion is formed on the importance of each type of criterion from three perspectives: commercial, customer, and social and environmental. In this model, Cameron (2016) formulated these criteria: accounting and financial measures, market-based, counterfactuals, technical or market innovativeness, time, technological performance, standards, environmental, competence, skills, research results, productive capacity, and social impact.

**Data and Methodology**

The research was conducted by a project team at the Department of Computer Science and Management, Wrocław University of Science and Technology. The project team’s objective was to apply success factors to Polish scientific research projects. Forty-two research project managers were involved. A questionnaire of 58 open and closed questions was developed and addressed to these managers, who supervised research projects at Polish scientific institutions. This paper focuses on the following two questions asked of the managers:

A. Did you find any side-effects of the project (both favorable and unfavorable)?

B. If you had the opportunity, what would you change in project realization (e.g., organizational structure, schedule, budget)? Why?

**Results and Discussion**

Question A was answered by 15 respondents (33%), who listed 13 side-effects. Statements, quoted literally, are grouped into 5 types of side-effects:

1. Scientific research side-effects (6 posts; 40% of all answers)
   - new projects
   - new doctorates
   - development of a new technology
   - other side-effects in terms of scientific research
   - the unexpected discovery of interesting properties of protein
noticed a pattern which we would like to examine later on

2. Context side-effects – relationship with the external environment (3 posts; 20% of all answers)
   - established beneficial contacts and co-operation for use in future projects
   - beneficial cooperation, further projects
   - cooperation with INCO company

3. Personal development side-effects (2 posts; 13% of all answers)
   - new ideas
   - increase creativity

4. Behavioral side-effects – internal relationships in the project team (1 comment; 7% of all answers)
   - the team, although skilled, cannot work together due to character differences

5. Other – negative (3 posts; 20% of all answers)
   - only 50% of the project objectives achieved
   - renouncement from further research
   - the problem with the use of materials

Figure 1 shows the proportional distribution of these responses according to the five groups.

</tbody>
</table>

Question B was answered by 38 respondents (90%) proposing 42 amendments. Statements are quoted literally and classified into five proposal types:

1. Change of administrative procedures (18 comments; 42% of all answers)
   - formalization level of the application process was too high
   - any change to the project required submission of the application, long time waiting for a response (2–3 months)
   - cooperation with the administration (contact with only one person was flawless)
   - difficult to prepare the correct application in accordance with the requirements, a lot of applications rejected, complicated procedures
   - I would expect (Polish National Science Centre (NCN) gives the opportunity of expression to the project team
   - there was a possibility to submit an official letter, but there is no opportunity to comment on the criteria for evaluation
   - I would like to make some comments to NCN if they see that some people have similar demands, then maybe they could see it is worth looking at it
   - the most important factor is administrative support
• amateur activities related to the selection of adequate reviewer
• too formalized procedures
• incompetent reviewers
• too much bureaucracy and too little interest in scientific values of the project
• in new projects, no one can be paid for their work, this possibility disappeared
• bureaucracy in NCN projects
• better placement of project in the direction of financing and supporting institutions; implementation of the project in the institution, which supports the administrative project manager
• support of other units of the University
• administrative support
• NCN should consolidate the scientific community, and not support unhealthy competition

2. Project management (8 comments; 19% of all answers)
• I would re-define project goals
• independence in search of contractors, translations
• organizational changes
• the project should be realized as a consortium
• disclosure of research results should not take place
• the amount of research topics should be limited. Otherwise, funds are dispersed
• management should be more professional

3. People in the project (7 comments; 17% of all)
• more contractors, tighter control of results
• the way of managing people should be better
• manager predispositions
• the most important factor is an efficient team
• larger team
• improve the recruitment of team members
• personal relationships with managers of academic units

4. Other resources (5 comments; 12% of all answers)
• bigger budget
• budget changes
• financial support
• greater importance should be attributed to budget planning, which will be implemented in the next project
• the budget was ‘not enough’

5. The duration of the project and scheduling (4 comments; 10% of all answers)
• more time needed
• schedule
• longer duration of the project
• better allocation of tasks to consortium members

Figure 2 shows the proportional distribution of responses according to the five groups. Only every third respondent claimed to experience side-effects. The classifying of responses distinguished five groups relating to side-effects. The result was dominated by research side-effects (40%). This outcome confirmed a general opinion among the Polish scientists that an essential attribute of a research project is its high unpredictability in outcomes. Thus, possibly an agile approach would benefit research project management. At this stage, the question remains open as to whether it is better to use a well-known agile methodology, develop a new, universal agile approach or use a specific agile type as may be required in a variety of research projects. Context side-effects or otherwise external relationships (20%) rated as the next highest response group for Question A, alongside negative side-effects (20%). Project managers stated side-effects involved establishing new
valuable contacts and cooperating with other research centers and enterprises. Negative side-effects related to the partial failure of projects. Possibly, managers need to focus more on risk management of research projects. The remaining responses to Question A related to personal development (13%) and behavioral goals (7%).

Group 1: Change of administrative procedures
Group 2: Project management
Group 3: People in the project
Group 4: Other resources
Group 5: The duration of the project and scheduling

Source: Authors.

The manager’s responses regarding suggested changes for managing future projects (Question B) were mostly about administrative procedures (42%). This outcome reflects the general opinion within the scientific environment that scientists perceive excessive formalization and complicated administrative procedures as a major obstacle inhibiting proper realization of research projects. Among the eighteen statements in this group, most pertained to NCN, though there were also comments about the internal administration. The second most popular response group for Question B referred to the management of the project (19% of opinions). This area covers various aspects of management. The result reveals that management problems occur and are recognized. The third group referred to people in the project (17%), including aspects of leadership abilities of the project manager, selection of team members, and the team members’ work in the project. A relatively high awareness of the effect of personnel (‘soft’ resources) in the outcome of the project was evident. This was followed by other resources (e.g., budget; 12%) and then the time and scheduling group (10%), which is considered ‘hard (hard means measurable, like time, quality, money, risk)’ resources. This shows that the ‘hard’ resources are necessary, though not of primary importance.

Conclusion

The study serves an empirical point as it examines the experience of 42 managers of research projects, in the area of achieving the objectives of projects, unexpected side-effects, and ex-post analysis of the project in terms of “what would I change in management of the already ended project?” The research component presented in this paper is relatively small, being part of a larger NCN project that is ongoing. More research results are expected as the project progresses. Nevertheless, already a predominant direction of the desired changes in managing research projects is visible, though further research is necessary to substantiate these findings.

COMPETITIVENESS OF THE FISH PROCESSING SECTOR IN LATVIA

Inese Biukšāne 1

Abstract: In the development of Latvia’s economy, the fish processing sector has played an important role, historically and traditionally, because of its ability to produce competitive products for the world market. The aim of this research is to evaluate the competitiveness of the fish processing sector in Latvia. Methodology involving the Model of Factors Influencing Competitiveness of the Fisheries Sector Cluster and the Index of Fish Processing Sector Competitiveness are developed as part of the research. The study also identifies the spheres influencing competitiveness, as well as the possibilities of further development. The methodology created in the study can be used to evaluate competitiveness of the fish processing sector in any country. It may also assist institutions involved in developing Fisheries’ policy to work more successfully and improve the common policy in the Fisheries sector.

Introduction

Latvia has a border length of 1836 km and a coastline of 494 km, which is 0.7% of the total EU coastline of 66 000 km (European Commission, 2014). The territorial waters of the Baltic Sea, up to 12 nautical miles from the coast, as well as the economic area, and the continental shelf of 28 000 km² fall under state jurisdiction (Agriculture Ministry, 2014). The internal waters comprise 2.543 km² or about 4.1 % of the country’s land mass (Agriculture Ministry, 2013). These waters include 12 500 rivers with a total length of 37 400 km. As well, there are 2 256 lakes with a total area of approximately 0.1 M ha and 800 artificial water bodies (Agriculture Ministry, 2014). Environmental pollution and inimical spawning conditions, as well as intensive fishing and other factors, have been detrimental to fish stocks. As a result, catch quotas and fish numbers in the Baltic Sea have diminished, and this has adversely affected the operation of fishery and fish processing companies in Latvia, but at the same time, increased the role of the aquaculture sector in the acquisition of alternative fish resources (Finance Ministry, 2003). The future of the fish processing sector in Latvia depends on the development of the fisheries and aquaculture sector.

In 2015, the Latvian fish processing sector involved 112 economically active companies with 4190 employees. These companies specialized in producing sterilized and unsterilized canned fish, smoked and salted fish, refrigerated and frozen fish, as well as mixed fish products. Raw materials in the production of canned fish and other fish products comprise fish caught mostly in the Latvian territorial waters of the Baltic Sea and the Gulf of Riga. These fish are primarily sprat and Baltic pilchard. Processing companies also use oceanic fish: herring, mackerel, sardine, sardinella, and tuna-fish to diversify their product assortment. In recent years, to produce canned fish, these processing companies have started to use freshwater species, such as pike, catfish, carp, and salmon bred locally in aquaculture, as well as salmon imported from foreign countries. The volume of canned fish and other fish products sold in 2014 reached 83.43 thousand tons, with a total market value of EUR 155.71 million. From 2005 to 2014 the volume of sold products reduced by −30.52% and to a great extent was related to a worsening market and an embargo introduced by Russia. The most popular product in the fish processing sector is the canned fish ‘Riga sprats’, which due to their specific taste peculiarities, ensured by a traditional smoking method using alder wood, has been a beloved consumer dainty for more than 100 years. Fish processing companies produce canned fish and other high-quality fish products and follow market tendencies and consumer demand. In general, in 2015, fish products and canned fish were exported to more than 60 countries (the main markets being Lithuania, Morocco, Russia, Belarus, and Ukraine). A portion of the exports went to the markets of the Commonwealth of Independent States (CIS), thus subjecting the fish processing companies to additional administrative risks, which had not existed in the common European market.

1 Riga Technical University, inese.biukshaene@inbox.lv
The Common Fisheries Policy of the European Union (EU) strives to ensure ecologically sustainable fisheries over a long-term and fisheries management that corresponds to the objective of ensuring benefits in economic, social, and employment spheres, to facilitate the availability of food (European Parliament and Council, 2013). The Common Fisheries Policy should foster increased productivity, a fair standard of living for the people employed in the fisheries sector and stable markets, and it should ensure the availability of resources and that product reach consumers at reasonable prices (European Parliament and Council, 2014). Using the support opportunities provided by the EU funding instruments and participating in the formation of the Common Fisheries Policy of the EU have enabled broad opportunities of enhancing competitiveness to promote the Latvian fish processing sector. Facilitation of competitiveness has become a major objective of the development strategy of companies, branches, and countries (Skapars & Sumilo, 2006). Evaluation of competitiveness provides an opportunity to judge impartially and allows a better understanding of the need for structural reforms and choice of priorities. This research aims to evaluate the competitiveness of the fish processing sector in Latvia. To achieve this aim, the study focused on the following objectives: 1) develop the methodology for the competitiveness of the fish processing sector; 2) evaluate the competitiveness of the fish processing sector in Latvia, identifying the spheres ensuring competitiveness. The novelty of the research is that it develops a methodology for evaluating competitiveness in the fish processing sector and thus potentially aids institutions involved in developing the fisheries policy to work more successfully and improve the common policy in the fisheries sector.

**Data and Methodology**

The qualitative and quantitative research methods used in the study included general scientific, statistical, mathematical, and sociological research methods. Microsoft Excel (2017) was used in the processing and analysis of the study results.

Figure 1 shows the Model of the Factors Influencing Competitiveness of the Fisheries Sector Cluster was developed to identify various influencing factors. These were internal and external social, economic, political, natural, and cultural environmental factors (including random events) and the
ability to adapt or modify these. As well, the model showed the mutual interaction and collaboration between factors and the involvement of affiliated companies and supporting infrastructure institutions.

A Fish Processing Sector Competitiveness Index was developed to evaluate the competitiveness of the Latvian fish processing sector at the level of microeconomics. The development of the Index was based on the Model of the Factors Influencing Competitiveness of the Fisheries Sector Cluster (Figure 1). The calculation of this index involved six sub-indexes in functions of their relative proportions (Equation 1) and with normalized values of indicators of the factors influencing the competitiveness (Equation 2).

where:

\[
SI = \text{Sub-Indexes}
\]

\[
\alpha = \text{relative scales}
\]

\[
I_{1}^{nv}...I_{n}^{nv} = \text{indicators with the normalized values}
\]

Overall, the study involved 22 indicators to evaluate competitiveness. These were selected from literature (Biuksane, 2016a) and involved more than 35 sub-indicators. As well, several were chosen using the main conditions for indicator selection (Biuksane & Judrupa, 2016). The indicators were normalized using minimum-maximum algorithm values of −5 to 5.

The Index of the Fish Processing Sector Competitiveness was used to assess the fish processing competitiveness, to identify the facilitating and promising spheres as well as the procrastinatory and stagnating ones influencing competitiveness. The Index was used as a basis for developing specific strategies (Table 1) for implementing an appropriate investment policy.

Table 1 shows the four promotional strategies: 1) the penetration strategy, mostly for implementing measures to strengthen the spheres involved in procrastinating competitiveness, where cooperation plays a significant role; 2) the enlargement strategy for mostly implementing measures to strengthen the spheres that stagnate competitiveness; 3) the development strategy for implementing measures to strengthen spheres that promise competitiveness; and 4) improvement strategy for implementing measures to strengthen spheres that facilitate competitiveness.

Results and Discussions

The results indicated that the competitiveness of the Latvian fish processing sector from 2005–2014 was medium-high (0.46), apart from 2010, which was after the socio-economic crisis in Latvia when the competitiveness of Latvian fish processing sector was the lowest (−0.15). Over this period, the competitiveness of the fish processing sector in Latvia decreased by −45%, from −1.36 in 2005 to 0.74 in 2014 (Figure 2).

For competitiveness in the fish processing sector, the facilitating spheres comprised the availability and quality of production factors (AQPF) and the production competitiveness (PRC). The promising spheres involved the marketing and management efficiency (MME) and the financial stability (FS), while the procrastinatory spheres encompassed product competitiveness (PC) (Figure 2). In the fish processing sector don't have cooperation (producer organizations), depicted in Model (Figure 1).

The companies that operated in the fish processing sector in Latvia and the representatives of the institutions involved in the fishing sector and in developing and implementing fisheries policy believe that the growth of the sector competitiveness can be promoted by applying certain interrelated and subordinated measures (Figure 3).
The competitiveness of the Latvian fish processing sector may be facilitated by applying innovative technologies in production and producing qualitative and innovative products with high added value as well as carrying out regular cost optimization. According to the opinion of the companies and the representatives of the institutions involved in developing and implementing policy of the fisheries sector, the competitiveness of the fish processing sector in Latvia can also be promoted by other measures.

The measures proposed by the fish processing companies and those involved in policy development to promote competitiveness of the fish processing sector in Latvia are useful. However, the author believes that the promotional measures need to be structured and implemented according to the chosen development strategy and investment policy. There are several types of strategies. However, the author believes that to facilitate the competitiveness of the fish processing sector in Latvia a strategy of corresponding approaches should be developed. The Latvian fish processing sector has a medium-high competitiveness, but has a tendency to disimprove. Consequently, to facilitate competitiveness of the sector, a development strategy is highly recommended. In the framework of the development strategy, one should primarily implement measures that strengthen the spheres of promising competitiveness in the fish processing sector, and only then strengthen the other spheres.

**Conclusion**

The fish processing sector has always played a significant role in the economic development of Latvia. In Latvia, the fish processing has not only a long-standing history and tradition but also the ability to produce competitive products in the world market. Using supporting opportunities provided by the EU financial instruments and participating in developing the EU Common Fisheries Policy, Latvia’s fish processing sector gains a broad range of possibilities for its growth and increase in competitiveness. Competitiveness of the Latvian fish processing sector is currently evaluated as medium-high, which is ensured by the availability and quality of production, product competitiveness, marketing and management efficiency, and financial stability factors. To facilitate the competitiveness of the fish processing sector in Latvia, the author recommends implementing a development strategy. The evaluation methodology of the fish processing sector competitiveness developed in this study can be used to evaluate the competitiveness of the fish processing sector of any country. Furthermore, the methodology developed for evaluating competitiveness may assist the institutions involved in the Fisheries’ policy formation to work more successfully and improve the common policy in the Fisheries sector.

CORPORATE SOCIAL RESPONSIBILITY AND CONSUMERS’ WASTE SORTING HABITS

Solveiga Blumberga,1 Ance Saulīte2

Abstract: The transition to circular economy shifts attention to re-use, repair, restoration and recycling of materials and products. What was previously considered to be waste can be turned into resources. The transition to a circular economy where the value of products, materials and resources is maintained for as long as possible and where as little waste is generated as possible is a significant contribution to the common effort in the European Union to create a sustainable low-carbon economy in which resources are used efficiently. Such an approach allows to transform the EU economy and generate new advantages for it (European Commission, 2015). Our individual action and provided support may help peers notice an opportunity and a solution for the future. The aims of the study are: To investigate the evaluation of the significance of the consumers’ corporate social responsibility and waste-sorting habits and to provide recommendations for improved access to the separate waste collection service. The research questions for achieving the objectives of the study were the following: How do consumers evaluate corporate social responsibility of companies in general? What are the waste-sorting habits of consumers? Are there statistically significant differences in the waste-sorting habits between various consumer generations? The authors prepared a unique consumer survey in which economically active inhabitants of the capital of Latvia, aged 15 to 71 years, participated. The results of our survey showed that the respondents rated the corporate social responsibility of companies as essential and emphasized that it was important for the large-size enterprises to operate ethically. The waste-sorting process itself creates disbelief among the respondents and also suspicion that all sorted waste is lumped together and removed to disposal sites.

UDC Classification: 159.9; DOI: http://dx.doi.org/10.12955/cbup.v5.901

Keywords: CSR, waste sorting, habits, generations, circular economy

Introduction

Up until now waste-sorting and citizen’s habits of waste-sorting have been a little-studied topic. Single individual’s view on the importance of corporate social responsibility is unusual subject for research in comparison with the popular corporate-level approach. Just a small part of Latvians is sorting their waste on a daily basis. Latvia faces a huge challenge to be able to meet requirements placed by the European Union of implementing principles of circular economy. Latvians need to change their habits of purchasing commodities and waste-sorting. The research of corporate social responsibility and habits of waste-sorting is valuable for both – waste management sector and to any socially responsible company. It finds significant correlations between habits of various generations and evaluation of the importance of corporate social responsibility within the economically active population. The research will primarily be used by “Latvijas Zaiļais Punkts” to develop various public awareness campaigns.

Literature review

S. Rahmann (Rahmann, 2011) describes corporate social responsibility (henceforth referred to as CSR) as a duty in front of the society, inclusion of the parties involved, improvement of the quality of life, economic development, ethical business practices, compliance with the law, voluntarism, human rights, environment protection, transparency and responsibility. Nowadays, social responsibility, responsibility for the environment and economic responsibility are the fundament of CSR (Crane, Matten & Spence, 2014). A new way of thinking in the management of the company, creation of shared values and social responsibility in it is being integrated into the overall strategy of a company (Rahmann, 2011; Wang, Tong. Takeuchi & George, 2016).

A habit is one or multiple activities performed regularly, automatically and frequently without our intentional involvement (Duhi gg, 2012). Making a decision, we start repeating the chosen activity daily until our behavior and action becomes habitual. Society members feel the responsibility for the direct impacts of their activities on them, others and the environment differently (Barrett, 2004). The age of the individuals influences their lifestyle and values, habits and consumption (Olson & Brescher, 2011).

For the Baby Boomers (born between 1945 and 1962), it is essential to maintain the traditional cultural values. Having concentrated the power (the experience, money and power accumulated through

2 RISEBA University, Riga, Latvia, saulite.ance@inbox.lv
hardship) in their hands, representatives of this generation are not able to give away their legitimately leading positions and values to the young that easily (Mullins, 2005). It is a generation which had experienced considerable changes, is very hard-working, careful and forbearing. For the Generation X (born between 1962 and 1980) is the motivation for work self-esteem, recognition and status. Since they are slightly cynical towards work, they search for opportunities to develop themselves and their skills and knowledge. Independent (no need for feedback), adaptive, efficient and profit-oriented people (Parker, 2007). The Y Generation (born between 1980 and 2000) is the socially fully integrated generation which is considerably different from the generation of their parents and grandparents. This generation is particularly considered to be the generation of outstanding managers. Very confident about their professional advantages which include knowledge of several languages, command of technologies, and a social capital which is well built on the social networks (Tolbize, 2008). Then comes the Z Generation whose description and tendencies have not been scientifically studied much so far.

Methods

The strategy of a quantitative study was chosen for the conduct of the study. Two surveys were used for the acquisition of the primary data: a survey regarding the rating of the significance of corporate social responsibility, supplemented with the perspectives of environmental sustainability, and a survey regarding the waste sorting habits of consumers in the context of awareness and motivation to sort waste, which materializes in concrete action. The research questions were the following: How do consumers evaluate corporate social responsibility of companies in general? What are the waste-sorting habits of consumers? Are there statistically significant differences in the waste-sorting habits between various consumer generations? Are there statistically significant correlations between the ratings of corporate social responsibility and waste-sorting habits? The overall sample for the study formed economically active inhabitants of the capital of Latvia, aged 15 to 71 years. By making calculations to verify the sufficiency of the sample, it has been determined that the study sample N=171 has been sufficient. Assuming a possible error of 6.3 %, the credibility of the results is 90%.

The age structure of the respondents by generations has been determined as follows: 51 respondents were between 15 and 36 years of age, 120 respondents were between 37 and 71 years of age, with higher education and higher vocational education.

Results

Along with the economic aspects, the social and ecological matters have become more topical. A vast majority (91%) of the respondents responded affirmatively regarding their awareness of the necessity to preserve the natural resources for the future generations. As the authors interpret it, this statement does not answer the question regarding the readiness of the respondents to act actively to conserve the natural resources. However, the authors theoretically assume that a marketing message which is based on future values might be efficient and powerful. One of the aspects of a sustainable environment is awareness of the limited quantities of the resources and the loads on the ecological systems caused by human activities. The level of responsibility of the respondents and the ratings provided by them for the importance of sustainability are evaluated based on the statement regarding the duty of the respondents toward the environment. Most (89%) of the respondents agree affirmatively that care for the environment around them is one of their own obligations. In the statement regarding the involvement of the society to educational events, this corporate social dimension is noted as significant by a majority (77%) of the interviewees. A small part (22%) of the respondents partly agree with the statement that it is a significant step towards a better future, which may be defined as an approving evaluation for the education of the society as such. Saving of various resources is a matter of corporate social responsibility and sustainability of a contemporary organization, resources may be saved by economizing them, not using them, or by replacing them with other, more environmentally-friendly resources, and a majority (77%) of the respondents claim that they pay attention to such action.

The Latvian waste management companies do their business in conditions of fierce competition, create new vacancies, invest money into the infrastructure, the latest technologies and science. Only one third (31%) of the respondents agree with the statement that waste management companies provide their contribution to the general economy. Almost one-half (47%) of the interviewees partly accept this statement; this means that they have a certain degree of doubt regarding this, and this means that there is little information and understanding relating to the significance of the service itself in the context of
the circular economy. According to a statement in the survey regarding ethical business practices, almost one third (26%) of the respondents agree that waste management companies have ethical business practices, yet a larger part (46%) of the interviewees agree with this statement only partly, and this suggests that the respondents have some level of doubts regarding the ethicalness of the business practices of the enterprises in this sector. When explaining the difference between the ratings provided by the generations for the dimensions of CSR, the authors used the Mann-Whitney U criterion and found out that there are statistically significant differences on the scale “Motivation” (r = .028, sig <0.01) between the respondents in the generation groups X & Y and the respondents in the generation groups Baby Boomers & X, and this suggests that older people have more motivation to sort waste (Table 1).

Table 1: Mann-Whitney U criterion for both age-groups

To determine the scales with the most significant impacts on the closeness and significance of the correlations between the CSR dimension “Society” and the CSR dimension “Business” the Pearson Correlation Coefficient was calculated for the Y&Z generation group of respondents. The Y&Z generation groups of respondents have several statistically significant correlations of the scales CSR Society and CSR Business with the scales Awareness, Emotions, Action, Habits and Sustainability (see Table 2). There is a statistically significant correlation between the CSR Business dimensions with Emotions (r = .037, sig < 0.01). Even though the correlation is weak, the evaluation provided by respondents for the significance with regard to enterprises is sufficiently emotional. This means that every time there is positive or negative information regarding the corporate social responsibility of an enterprise in the media space, the consumer evaluates it sufficiently emotionally and associates with opting for a service or product offered by this company. There are statistically significant, but weak correlations between the CSR Business dimensions and Habits (r = .135, sig < .01), and this means that corporate social responsibility measures have significant impacts on consumer habits, the stronger the consumer habits, the higher the rating for the significance of CSR. Weak, but statistically significant correlations can be seen between the CSR Business dimensions and Action (r = .011, sig < .01) and Sustainability (r = .001, sig < 0.01), which means that the respondents of the Younger generation do not yet find Sustainability as significant as the Older generation. Statistically significant, very weak correlations can be seen between the CSR dimensions Society and Sustainability (r = .005, sig < .01), and this means that there is a possibility that particularly the consumers with the higher ratings for the significance of sustainability have higher ratings for the CSR Society dimensions (Table 2).

To determine the closeness and significance of the correlations between the CSR dimensions Society and the CSR dimensions Business, the Spearman’s Correlation Coefficient was calculated. The obtained results show that the Y&Z generation group of respondents has a positive, statistically significant correlation between the scales CSR Society (r = .033, sig < 0.01) and CSR Business (r = .001, sig < 0.01) and the scale Motivation, and this means that the higher the significance rating provided by the respondent for the CSR dimensions, the higher their motivation to sort waste. Also, highly motivated respondents have higher significance ratings for the CSR dimensions. The CSR Business dimensions have a stronger correlation with Motivation to sort waste, rather than with the CSR Society dimensions.

To determine the closeness and significance of the correlations of the CSR dimensions Society, the Pearson’s Correlation Coefficient was calculated for the Baby Boomers & X generation group of respondents (see Table 3). There is a statistically significant correlation between the CSR dimension Society and the scales: Emotions (r = .023, sig <0.01), Motivation (r = .001, sig < 0.01), Habits (r = .001, sig < 0.01) and Sustainability (r = .001, sig < 0.01). The authors identified that in the Baby Boomers & X generation group, the corporate social responsibility dimension focused on the society increases the consumer’s significance ratings for sustainability, similar to what appears in the Y&Z generation group of respondents.

Table 3: Calculation of Pearson’s Correlation Coefficient for the Baby Boomers & X generation group of respondents

To determine the closeness and significance of the correlations of the CSR dimensions Society, the Pearson’s Correlation Coefficient was calculated for the Baby Boomers & X generation group of respondents (see Table 4). The results obtained for the Baby Boomers & X generation group show a statistically significant correlation between the scale CSR Society and the scales Emotions (r = .001, sig < 0.01), Action (r = .001, sig < 0.01) and Habits (r = .001, sig < 0.01). This means that the corporate social responsibility dimensions focused on the society have statistically significant impacts on the emotions of consumers regarding sorting of waste, facilitate action and strengthen waste-sorting habits.

Source: Authors

By calculating the T criterion for both age-groups on the scales Emotions, Action, Habits, CSR dimension Business, statistically significant differences can be seen on the scale CSR Business. The T criterion for the Y&Z generation is 19.039, whereas for the Baby Boomers & X generation it is 22.117. This shows that the significance ratings for corporate social responsibility are higher particularly among the respondents of the Baby Boomers generation. It is possible that individuals of this generation have more time to go deep into the flow of information and pass the information on to
their children and grandchildren. The Mann-Whitney U criterion for both age-groups on the scales Awareness, Motivation, Sustainability, CSR dimension Society shows statistically significant differences in the scale Motivation. The U criterion coefficient for the Y&Z generation is 11.118, whereas for the Baby Boomers & X generation it is 12.567. The authors consider that the Baby Boomers generation has more motivation than the Y&Z generation, which might be associated with the habits of the generations as such as well as the habitual tendency of the Y&Z generation to do what would be rewarded emotionally, financially, or socially (Duhigg, 2012).

With regard to the corporate social responsibility dimensions focused on business, statistically significant correlations can be seen on the scales Emotions (r = .037, sig < 0.01), Action (r = .011, sig < 0.01), Habits (r = .031, sig < 0.01) and Sustainability (r = .001, sig < 0.01). These data show that the corporate social responsibility measures focused on the alignment of the business environment have more significant impacts on the respondents’ significance ratings and have positive impacts in the scales which imply concrete action and waste-sorting habits themselves.

Conclusions and Recommendations

Most of the interviewees note that educating the society is a significant step towards a better future. The interviewees also find it necessary that companies in Latvia pay attention to the saving of resources. The respondents pay special attention to the enterprises that save resources. The corporate social responsibility of the large-size companies is rated as significant for the society in general, in assuring employment and new vacancies. Only one-third of the respondents claim that sorting of waste is a habit in their daily routine in the household, the family and the place of work and that they sort waste by using the publicly available containers for the disposal of sorted waste and separating glass containers from paper packaging. The Baby Boomers generation has more motivation to sort waste than the Y&Z generation. The significance ratings of the Baby Boomers generation for corporate social responsibility are higher than those of the Y&Z generation of consumers. There are statistically significant correlations between the waste-sorting habits of consumers and the significance ratings for corporate social responsibility. The results of the study show that consumers of the Y&Z generation have statistically significant correlations on the dimensions of corporate social responsibility which are focused on the society, awareness and the significance rating for sustainability, whereas specifically the business dimensions of corporate social responsibility appear to be stimuli for action and the formation of waste-sorting habits in the consumers of the Y&Z generation. The results of the study obtained for the Y&Z group of consumers show a positive, statistically significant correlation between the significance ratings for corporate social responsibility and Motivation, and this suggests that the society- and business-focused dimensions of the corporate social responsibility of companies have significant impacts on the motivation of consumers to sort waste. In the Baby Boomers group, there are statistically significant correlations between the society-focused dimensions of corporate social responsibility and the consumer’s significance ratings for sustainability, similar to what can be seen in the Y&Z group. Differently, from the Y&Z group of consumers, the CSR dimensions Society have statistically significant impacts on the motivation of individuals in the Baby Boomers group of consumers to sort waste and on their waste-sorting habits.

A particular offer should be made. The cooperation with retailer chains and offices should be strengthened to offer clients contemporary and convenient sorting of waste in their offices, including not only paper and waste paper, but also PET bottles, tetra-packs, tins. Waste management companies should develop an offer and a model for cooperation with the organizers of the large-scale sports events regarding PET bottle flattening facilities. Communication specialists should review the corporate communication strategies. Until now, communication has been informative and responsive. The strategy of communication (particularly in social networks) should be focused on the communication of the CSR values, such as purchase of a new, environmentally friendly system or discovery of a new unauthorized construction waste disposal site. Marketing specialists should do research and create business plans for the establishment of a new media platform to build common value on the national scale, including measuring the ecological footprint of the consumer, summarization of the habits, and recommendations for the reduction of the ecological footprint.

IMPACT OF UNCERTAINTY ON EUROPEAN MARKET INDICES
QUANTILE REGRESSION APPROACH

Mária Bohdalová,1 Michal Greguš2

Abstract: Contemporary Europe needs to make important collective economic and foreign-policy decisions. Many authors argue that uncertainty has influence on the markets’ behavior. Therefore, we have decided to analyze the impact of the uncertainty on the returns and the volatility of two major European market indices Germany (DAX) and the U.K. (FTSE 100) across selected quantiles. We present results for the time-period from January 3, 2000 to December 30, 2016. As influential factors, we consider the Economic policy uncertainty (EPU) indices for Europe, the United Kingdom, Brexit and low prices of the crude oil. In our paper, we have found an asymmetric dependence of the analyzed market indices on the selected factors. EPU Brexit had no or weak impact on the analyzed data. Our conclusion shows to investors how sensitive German and English markets are to the uncertainty in Europe.

JEL Classification Numbers: C21, C40, G11; DOI: http://dx.doi.org/10.12955/cbup.v5.902

Keywords: quantile regression, uncertainty, Brexit.

Introduction
Policy uncertainty in Europe has intensified because of the Global Financial Crisis, serial crises in the Eurozone, Brexit, etc. Following the recession in 2007-2009, the uncertainty of economic policy has increased as a result of uncertainty among businesses and households about future tax, regulatory, spending, health and monetary policies. However, dominant entrepreneurs and households decreased their spending on investment, consumption and rent following the recession, which resulted in slowing down the increase in policy uncertainty. Baker et al. (2015) investigated the role of policy uncertainty, and they have developed an index of economic uncertainty (EPU) for the United States. Bloomberg gives us an opportunity to analyze economic policy uncertainty for Europe, the United Kingdom and for Brexit in indices EPUCCEUM, EPUCUK, and EPUCBREX. The construction of these indices is based on newspaper articles regarding policy uncertainty concerning economy, uncertainty and information on spending, deficit, regulation, budget, tax, policy, or the Bank of England, or the ECB. We have taken EPU indices as risk factors for analyzing two major European markets – the DAX, Germany market and the FTSE 100, UK market. In addition to these indices, we have considered the volatility of oil prices and the volatility of the EUSTOXX European market.

In this paper, we have used a quantile regression method (Engle and Manganelli, 2004; Alexander, 2008; Birău and Antonescu, 2014; Naifar, 2016; Aymen and Mongi, 2016) to analyze the impact of uncertainty on major European market indices. Precisely, we propose a new model based on quantitative regression approach to explore how the individual mentioned risk factors affect the returns and volatility of the market index DAX and the FTSE 100. Our quantile regression model enables us to analyze the dynamics of the co-movement of the returns and volatilities through selected quantiles. Our findings give insight into the reaction of European equity markets to uncertainty and ultimately, they can help policy-makers, investors, and risk managers.

The paper is organized as follows. The next section shortly describes quantile regression and introduces our model. The section on data analysis presents analyzed data and results. The last section concludes our findings.

Methodology
The correlation coefficient measures the linear symmetric dependency between the analyzed variables. However, it cannot measure dependence between large and small movements of the analyzed financial time series. Therefore, we have used a quantile regression approach to analyze this complex dependence. Quantile regression gives us information not only about the average dependence in comparison to ordinary least square regression method (OLS) but we can learn also about lower and upper tail dependence (Koenker and Bassett, 1978; Alexander, 2008; McMillen, 2013; Mensi et al., 2014; Aymen and Mongi, 2016). The quantile regression model gives a set of regression curves that
differ across selected quantiles $q$ of the conditional distribution of the endogenous variable. QR is a distribution-free technique to estimate the effect of an endogenous variable on the quantiles of the response distribution. Its main advantage comparing to OLS regression is the flexibility in data modeling with different conditional distributions. The $q$-th conditional quantile function of the dependent variable $Y$ on independent variable $X$ (when variables $X$ and $Y$ are linearly dependent) is given as (Mensi et al., 2014)

$$Q_y(q|X) = \inf \left\{b \big| F_Y(b|X) \geq q \right\} = \sum \beta_i(q)X_i = X^T \beta(q)$$  \hspace{1cm} (1)

where $F_Y(b|X)$ is the conditional distribution function of $Y$ for given $X$. $\beta(q)$ is a vector of the quantile regression coefficients that determines the relationship between variable $X$ and the $q$-th conditional quantile of $Y$, $0 < q < 1$.

$$\hat{\beta}(q) = \arg \min \sum_{i=1}^T \left( q - 1 \cdot 1_{Y_i \leq X_i^T \beta(q)} \right) |Y_i - X_i^T \beta(q)|.$$  \hspace{1cm} (2)

where

$$1_{Y_i \leq X_i^T \beta(q)} = \begin{cases} 1 & \text{if } Y_i \leq X_i^T \beta(q) \\ 0 & \text{otherwise} \end{cases}.$$  \hspace{1cm} (3)

The dependence structure of $Y$ is determined by the values of $\beta(q)$. This structure is either constant when the values of $\beta(q)$ are the same for each quantile $q$ or monotonically decreasing/increasing, when the values of $\beta(q)$ decrease/increase for the increasing quantile $q$ or asymmetric/symmetric when the values of $\beta(q)$ are dissimilar/similar for lower and upper tail of the distribution of $X$ (Mensi et al., 2014).

To determine the impact of the uncertainty on the selected stock markets log returns (log returns are given by formula: $r = \ln P_t/\ln P_{t-1}$, $t = 1, \ldots, T$, excluding account dividends) or volatilities based on EWMA model (Alexander, 2008), we consider the following multivariable QR model.

$$Q_y(q|X) = X^T \beta(q),$$  \hspace{1cm} (4)

where

$\beta(q) = (\alpha(q), \beta_1(q), \ldots, \beta_b(q))$.

$Y$ are either log returns or volatility of the DAX stock index and

$X^T = (UKVolatility, COVolatility, SSXEVolatility, EPUCBREX, EPUCCEUM, EPUUK)$

or $Y$ are either log returns or volatility of the FTSE 100 stock index and

$X^T = (DAXVolatility, COVolatility, SSXEVolatility, EPUCBREX, EPUCCEUM, EPUUK)$

when EWMA model volatility is used for the DAX, the FTSE100, the SSXE stock index and Crude oil close prices.

**Data analysis**

Our empirical analysis examines impact uncertainty on major European markets represented by the DAX and the FTSE 100 stock market index. The DAX index includes 30 major issues traded on the German stock exchange in Frankfurt. The United Kingdom index FTSE 100 takes into account the value growth of the 100 largest market capitalization shares. The weighting of individual companies is determined by the “free float value” (market value of the freely traded number of shares) for both indices. Risk factors include the volatility of the European stock market represented by the EUSTOXX 50 stock (SSXE), volatilities of the DAX, the FTSE 100 and crude oil closing prices (CO). Then we have used the European economic uncertainty index EPUCCEUM, the U.K. economic uncertainty index EPUCUK and the economic uncertainty index due to Brexit EPUCBREX. The data were collected from a Bloomberg data provider, monthly from January 2000 to December 2016. The currency used is Euro. The analyzed time series are shown in Figure 1. As we can see, the evolution of the DAX and the FTSE 100 is similar during the analysed period (Fig 1, left). The gauge of economic
policy uncertainty in the United Kingdom has quadrupled in 2016. The uncertainty gauge for Europe also reached a record high (Figure 1, right).

We present results obtained using IBM SPSS software. We have decided to estimate the quantile regression coefficients across nine quantiles \( q = \{0.01, 0.05, 0.1, 0.25, 0.5, 0.75, 0.90, 0.95, 0.99\} \).

Table 1 provides the results for the log returns of the Germany market index DAX. Table 2 gives results for the EWMA volatility of the German market index DAX. Similarly, Table 3 gives results for the log returns of the U.K. market FTSE 100. Table 4 shows the results for the EWMA volatility of the U.K. market index FTSE 100. Tables 1 and 3 present the estimation of the quantile regression coefficients for model (4). Tables 2 and 4 give the estimation of the quantile regression coefficient for the market index volatility, see model (4). We have denoted by one asterisk ‘*’ the statistical significance of the QR coefficients at the 5% level and by two asterisks ‘**’ the statistical significance at the 10% level. We have found a significant negative effect of the FTSE 100 volatility on the index DAX log returns only for quantiles 0.01, 0.1 and 0.25. Slightly lower dependence is given by the 25% quantile, then the 1% quantile follows, and the strongest dependence is shown by the 10% quantile. The impact of crude oil volatility is positive and significant only for the 10% quantile. The volatility of the EUSTOXX 50 has a significant negative influence on the DAX log returns for quantiles from 0.01 to 0.25. However, for quantiles from 0.75 to 0.99, the volatility of the EUSTOXX 50 has a significant positive influence. Brexit influences positively only lower quantiles from 0.01 to 0.1. The Economic policy uncertainty index for Europe has significant negative influence from 1% to 50% quantiles and slightly positive influence from 90% to 99% quantiles. Only the high quantile is without influence of the EPUBLIC. Economic policy uncertainty index for the U.K. shows positive influence on the lower quantile and the median and negative influence for 95% quantile. The other quantiles do not show significant dependence (see Table 1).

Source: Authors
The impact of crude oil prices volatility on the DAX volatility is systematic with positive influence on the upper quartile and then it varies to negative influence. Volatility of the FTSE 100 does not impact the DAX volatility only for the 5% quantile. Otherwise, it has weak negative fluctuating impact on the median. Starting with the upper quartile, the positive impact grows. The impact of the volatility of the EUROSTOXX 50 is significant positive with the strongest impact on the median. EPUCBREX shows lower negative influence only for the 95% and 99% quantile. EPUCCEUM has a very small positive significant effect only for the lower quartile and the 99% quantile. EPUUK has no impact from the lower to the upper quartile. The dependence for the other quantiles is lower and significant (see Tab.2).

Source: Authors

The FTSE 100 log returns are significantly positively influenced by the DAX volatility only for the lower quantiles until the lower quartile with a decreasing impact. The effect of crude oil volatility is negative and the same for the 5% and 10% quantile, and it has a positive impact for the upper quartile. The volatility of the EUROSTOXX 50 has significant negative decreasing influence on the FTSE 100 log returns for the quantiles from 0.01 to 0.25. However, for quantiles from 0.75 to 0.99, the volatility of the EUROSTOXX 50 has significant increasing positive influence. Brexit influences positively only the lower quantiles from 0.01 to 0.1. The economic policy uncertainty index for Europe has significant negative decreasing influence from 1% to 25% quantiles and a slightly positive increasing influence from 50% to 99% quantiles. The Economic policy uncertainty index for the U.K. shows a lower positive influence only for the 90% and 95% quantile at a significance level of 90% (see Table 3). The volatility of the FTSE 100 is under systematic influence of the DAX volatility. This dependence is positive and smoothly decreasing across the analyzed quantiles to the upper quartile, and then it varies to negative decreasing influence. The impact of the volatility of crude oil prices on the FTSE 100 volatility is systematic positive to 95%. The impact of the volatility of the EUROSTOXX 50 is...
significant positive influence across all quantiles with the strongest impact at 99%. EPUCEUM shows a lower positive influence only from the 1% quantile to the 25% quantile. EPUCEUM has a very small positive significant effect only for the 1% and 5% quantile and the 75% and 99% quantile. EPUCEUM has a weak impact from the lower to upper quantiles (see Table 4).

Conclusion

Our paper has analyzed the impact of economic uncertainty and selected volatilities on the German and U.K. stock markets across selected quantiles of the return distributions. Empirical results presented in this paper indicate an asymmetric dependence between the EU stock markets and all considered influential factors for the period from January 2000 to December 2016. We have found that the volatility of oil prices shows an asymmetric dependence with the U.K. and German markets returns in bullish and bearish markets conditions. The U.K. market volatility is independent from the oil price during the bear market conditions. The EUROSTOXX volatility co-move positively with the DAX and FTSE 100 volatilities, and it has a negative decreasing impact when the market is bearish. Finally, the economic policy uncertainty Brexit index had a weak influence on the U.K. and German stock markets mainly for the quantiles of the lower quartile. Otherwise, it did not have any influence. Our findings can be helpful to international investors because it shows them how sensitive the German and English markets are to the uncertainty in Europe.

APPROACH TO SOCIAL ENTREPRENEURSHIP IN SLOVENIA

Barbara Bradač Hojnik

Abstract: In this paper, social entrepreneurship as a developing type of entrepreneurship is analyzed. On the level of the European Union (EU), social entrepreneurship is widely supported by different initiatives which aim to develop a suitable legal, administrative, and financial environment for social enterprises, but also allowing member states to regulate them individually. This paper focuses on the social entrepreneurship in Slovenia, where it is strictly shaped by the legislation. Consequently, social enterprises need to meet the legislation’s requirements which hinder their quantity and development. Additionally, the scope of social enterprises is narrowed to those companies that received the formal status of social enterprise. In the paper provided will be the data on social enterprises in Slovenia with some recommendation for further development of the framework for social entrepreneurship in the country.

Introduction

Social entrepreneurship is an innovative type of entrepreneurship, with a high level of responsibility to the society. It is characterized by the motives of resolving social, economic, environmental and other problems of society. The primary purposes of social enterprises are adding value to the society, improving conditions of the social environment, creating jobs for vulnerable groups, performing socially useful activities…etc. Similarly to profit oriented enterprises, social enterprises also operate on the market, but with the main difference that profits are returned to the enterprise to achieve social goals. Although social enterprises are diverse, they mainly operate in personal social services (medical and elderly care, health services, childcare services), work integration (integration of the unemployed and people with disabilities), in the development of disadvantaged locations (rural areas, problematic areas in urban locations), and in some other services (environmental services, culture, sports) (EC, 2017). As social enterprises depend on institutional and cultural contexts in which they operate, the barriers that they face are specific to those contexts. But, there also exist some common challenges, among which are legal frameworks, access to markets and to financial resources, business support and sustainability issues, and development structures.

As the social entrepreneurship is broadly defined, we will follow the definition by Mair and Marti’s article (2006, p. 37), that the social entrepreneurship is a process, where the value is created by combining resources in new ways, principally to exploit opportunities to generate social value by meeting social needs or stimulating social change. The Organisation for Economic Co-operation and Development (OECD) and European Commission each have their own definition for social enterprises. The OECD (1999) defined social enterprises as “any private activity conducted in the public interest, organized with an entrepreneurial strategy, but whose main purpose is not the maximisation of profit but the attainment of certain economic and social goals, and which has the capacity for bringing innovative solutions to the problems of social exclusion and unemployment”, while the European Commission (European Commission, 2011) defined a social enterprise as “an actor in the social economy whose main objective is to have a social impact rather than make a profit for their owners or shareholders. It operates by providing goods and services for the market in an entrepreneurial and innovative fashion and uses its profits primarily to achieve social objectives. It is managed in an open and responsible manner and, in particular, involves employees, consumers and stakeholders affected by its commercial activities”.

The European Commission (EC) considers several different types of businesses as social enterprises: (1) enterprises with social or societal objectives, (2) enterprises which reinvest their profits to achieve social objectives, and (3) enterprises with democratic or participatory principles of operating or focusing on social justice (European Commission, 2017). Defourny and Nyssens (2010) pointed out that there exist three key dimensions of social enterprises. The first one is the entrepreneurial dimension, which is expressed through the engagement in economic activity of social enterprises. The second one is the social dimension, which is seen as a primary and explicit social purpose of social enterprises.

---

2 University of Maribor,barbara.brada@um.si
enterprises. And the third one is the governance dimension which is expressed through the mechanism that encompasses social goals of organizational aspects of the enterprises.

However, legal forms of social enterprises are different across countries. Their forms include a range of different forms, such as solidarity enterprises, cooperatives or limited liability social cooperatives, collective interest cooperatives, social purpose or collective interest companies, community interest companies and similar. A review of the legal structures and legislation in European countries reveals that several countries have adopted national laws regulating social enterprises. Additionally, these laws focus on common issues among which are the definition of social enterprise, asset allocation, stakeholder and governance systems, and accountability and responsibility towards internal and external stakeholders (OECD/European Union, 2013). In general, three main models of organizational forms of social enterprises are present (Cafaggi and Iamiceli, 2009), namely the cooperative model, the company model and the open type model (without specific legal form). For the creation and development of social enterprises the appropriate legal framework is needed at a national level. It will represent the foundation for establishing social enterprises, their operation and development. A clear set of rules is useful for several reasons, such as to open up opportunities for fiscal relief, to govern access to public procurement, and to define the beneficiaries of other forms of public support to social enterprises, according to their organizational form, target group and activity (European Union, 2015).

**Approach to social entrepreneurship in the European Union and in Slovenia**

In the European Union, the importance of social entrepreneurship is growing in recent years. For several years, the European Commission aims to create an encouraging financial, administrative and legal environment for social enterprises so that they can be on an equal position with other types of enterprises in the same sector. At the EU level, the social economy represents enterprises and organizations that are economic and social actors and are present in all sectors of economy and society. They are marked by their goals and unique design. The social economy includes organizations such as cooperatives (cooperative) associations, mutual societies and foundations. These social enterprises are particularly active in areas such as social protection, social services, health care, banking, insurance, production activities, a variety of consumer services, brokerage, various crafts, housing services, supplying services to the local environment, education and training in the field of culture, sport and leisure activities” (Campos and Ávila, 2012). The European Parliament adopted the Resolution on Social Economy in 2009 which states that the social economy combines profit with solidarity, aim at creating high-quality jobs, strengthening social, economic and regional cohesion, generating social capital, promoting active citizenship, solidarity and economics, in which people are set on the first place. Additionally, to foster social economy and support social enterprises, the European Commission launched the Social Business Initiative in 2011 to identify actions to make a real difference and improve the situation on the ground for social enterprises (European Commission, 2017).

In Slovenia, the social entrepreneurship domain is regulated by the national legislation. In year 2011 the Act on Social Entrepreneurship (Official Gazette, 2011) was adopted, which regulates the activity of social enterprises. It also stipulates a series of measures aimed at fostering the development of social enterprises, including the requirement to set up the Council for social entrepreneurship and to adopt a national strategy for the development of social entrepreneurship together with the program of measures to implement the strategy every four years. The implementation of the legislation is the responsibility of the Ministry of economic development and technology.

The Act on Social Entrepreneurship is designed to enable an open model of social entrepreneurship. It allows the creation of a social enterprise regardless of the legal form of the company. The Slovenian Act on Social Entrepreneurship predicts for two forms of social enterprise, so called type A and type B. The type A of social enterprise is meant for companies with intention to achieve positive social, environmental and economic impacts. The Act, therefore, provides a list of suitable activities for this type of social enterprise, including activities such as social and family protection, protection of physical, sensory, mental or otherwise disabled people, science, education and childcare, care and health promotion, ensuring social inclusion, promoting employment and vocational training of people who are unemployed or threatened by unemployment. On the other side, the type B of social enterprise applies to employees and not to the activity provided for the recruitment of persons who for various reasons are excluded from the traditional labor market. So, a social enterprise of this type may be
established to employ disadvantaged people and has to employ at least one third of these employees. The concept of social entrepreneurship in Slovenia and its objectives are also defined by the Act on Social Entrepreneurship. Its definition is as follows (Official Gazette, 20/2011): “Social entrepreneurship constitutes a permanent activity of social entrepreneurship or permanently performs other activities under the specific conditions of employment in the manufacturing and selling of products or services on the market, while making a profit is neither the sole nor the principal objective of the activity. Social entrepreneurship strengthens social solidarity and cohesion, encourages people's involvement and volunteer work, enhances the innovative ability of the company to address the social, economic, environmental and other problems, provides an additional range of products and services in the public interest, developing new employment opportunities, providing additional jobs and social integration and professional reintegration of the most vulnerable groups in the labour market (the objectives of social entrepreneurship)”.

In Slovenia, the primary goal of social entrepreneurship is to create jobs for groups of people who are vulnerable and have fewer employment opportunities (older workers, first-time job seekers, former drug users, ex-convicts, persons with disabilities, physically disabled persons, etc.). In addition to creating jobs the feature of social enterprises is performing socially useful activities (e.g., social tourism, eco-food production, youth work, fair trade, and promotion of healthy lifestyle).

**Empirical evidence on social enterprises in Slovenia**

The share of formally registered social enterprises in Slovenia is very low, especially when compared with other developed countries. As there are approximately 130,000 active companies in Slovenia and only 251 of them have the status of social enterprise, then the latter represent only 0.2% of the population, which is a negligible share (Ministry of economic development and technology, 2017). The reason lies mainly in the restrictive legislative framework, which clearly defined the terms for obtaining the status of a social enterprise. Currently, in Slovenia there are registered 251 companies with status of social enterprises. Their distribution by the type of organization is represented in Figure 1. There are almost one third of institutions, followed by cooperatives, associations and limited liability companies. All other types represent minor parts.

Source: Author

However, as revealed some broader studies on entrepreneurship, businesses and other organizations with social aims and motives are considerably more in Slovenia. Those are not captured by the
statistics as they have not acquired the status of a social enterprise. The international study Global Entrepreneurship Monitor (GEM), for example, found that there are 3.2% of individuals who are currently involved in the creation of social enterprises, while there are 7.6% individuals involved in the creation of profit-oriented enterprises on average in the world (58 countries) (Bosma et al., 2016). The GEM research defines social entrepreneurship widely (wider than the Act on Social Entrepreneurship in Slovenia), like any business, organization or initiatives that have particular social, environmental or social objectives, achieving a substantial share of the total entrepreneurial activity. The GEM study revealed that in Slovenia 1.7% of individuals are involved in early entrepreneurial activity with a social purpose and this lags behind all of Slovenia’s neighbor countries, as there are in Croatia 6.1%, in Hungary 9.7%, and in Italy 2.3% of social entrepreneurs (Figure 2).

![Figure 2: Early-stage entrepreneurship activity with social purpose in Slovenia and its neighborhood countries](source: Author)

**Conclusions**

Establishing an enterprise requires a set of resources, skills and capabilities, which have to be even more sufficiently combined when establishing a social enterprise. Establishing, running and sustainably developing a social enterprise can be more difficult compared to for-profit oriented enterprises because of the skills needed to begin and manage it. Mostly because social entrepreneurs have to follow a social mission together with the economic one, and because of some other specifics of social enterprises such as difficulties in accessing capital and due to legislative and administrative requirements that social enterprises have to fulfill to retain their status. Therefore, the business ecosystem has to be well shaped and developed to offer support for this particular type of entrepreneurship. An enabling environment that supports social enterprises is even more important because of their specifics. However, particular countries use different approaches to formalizing social entrepreneurship. In Slovenia, the social entrepreneurship domain is formalized using rigorous legislation which is hindering the development of social enterprises. Additionally, the implementation of supporting mechanisms together with the legislation was delayed, including financial measures. Therefore, to support the development of social entrepreneurship in Slovenia, the primary governmental role is to prepare comprehensive implementing measures which will support existing social enterprises as well as motivate other companies to acquire the status of social enterprise.

MODELLING OF INVESTMENT PROCESSES IN THE SPHERE OF SOCIAL HOUSE BUILDING

Larisa Seliutina,1 Marina Egorova,2 Ksenia Bulgakova3

Abstract: The problem of not enough public housing for low-income citizens is very urgent in the entire world. This article is dedicated to the topical question; how do we select optimal investment projects and implement successful investment programs to fund public housing projects better. We have formulated basic principles for the formation of an optimal portfolio to use as a standard for investment programs for public housing construction projects. As selection criteria, instead of profitability and risk offered in classical portfolio theory to which private investors are paying attention, we propose the use of social satisfaction survey results and amount of available funding to determine the effectiveness of the programs. We have developed several mathematical models that help aid in the selection of investment projects based on these new requirements. The application of these models in the selected projects selection within the framework of investment programs of public housing construction will allow the most effective use of funds directed to the development of the public housing.

Introduction

Regardless of the form of government, comfortable housing is always high on the hierarchy of human needs (Heijden, Haffner, & Hoekstra, 2006). Originally, the role of the social housing sector was to provide universal access to adequate housing (Zhuk, 2012). Today, a majority of the population buy and rent housing based on a market that is a product of the state’s interaction with vulnerable citizens. Improving the interaction between all participants of public housing investment has occurred since the beginning of XVII century. This sphere differs in complexity and versatility. Therefore, it requires a scientific approach to its investigation (Selyutina & Bulgakova, 2014). Without competent control of investments, it is impossible to implement the programs of modern housing, form a favorable investment climate in the region, and carry out structural reforms and responsible housing policy (Berens & Havranek, 2007).

The principle of competent control also works in the opposite direction to increase of people’s quality of life, which is impossible without economic growth. Therefore, during the development of the programs for social housing one should not forget about economic efficiency.

Theoretical Frameworks

Financial theory became a science in the early to mid-20th century when the Fisher income discounting technique (2003) was used for the first time. In this economist’s opinion, to correctly assess future income in the present, one needs to relate the cost of services with capital cost. An evaluation of the main (capital) assets was central in the works of Williams (1995), a recognized investor in the United States of America.

Economists have offered several approaches to evaluate assets to allow controlling investment portfolios. However, all pre-war works were created with a hypothesis about the definiteness of conditions of financial solutions. Therefore, in financial analysis, elementary financial mathematics was used.

The work of Knight (1921) in ‘Risk, Uncertainty and Profit’ contains the first quality analysis of the probability-theoretic mathematical methods of risk events influence. In addition, the recommended set of projects was called investment programs. Some scientists reason that these two concepts are equal. Some economists complete the concept of the investment program, opening it as an element of the investment strategy of the state. For example, Tyrtyshev (2004) emphasizes that the program is a commitment that can create and mobilize resources for its implementation.

1 Petersburg State Transport University Emperor Alexander I Saint-Petersburg, Russia, ya.slarisa@ya.ru
2 The Bonch-Bruevich Saint - Petersburg State University of Telecommunications, Saint-Petersburg, Russia, egorova-mak@ya.ru
3 Saint-Petersburg State University of Economics, Saint-Petersburg, Russia, pierott_89@mail.ru
Possibly, the term ‘investment program’ has a wider meaning than the notion of ‘investment portfolio’ used more so today, but these terms frequently coincide in practice. Therefore, within the framework of this current research, the two terms are considered identical.

Modern investment theory is closely connected with Markowitz (1959; 1987). His models allowed investment projects that were selected because of risk and profitability to be translated into mathematical language. The main results of scientists-economists, acknowledged in the 20th century, are focused on the works of Markowitz, the essence of which being that a project’s portfolio is created using the relation of risk-profitability or certain combinations of risk and profitability (Markowitz, 1959; 1987).

To maximize profit and minimize risks, investors deal not only with one asset but allocate capital to different projects. A combination of projects creates new investment qualities and perspectives. Evaluation of separate assets and their portfolios. Modern investment theory considers two characteristics: risk and profitability, which are assessed quantitatively to allow the investor to form an optimal investment portfolio. The theory of ‘Efficient set of portfolios’ remains a summit of classic economic theory (Merton, 1969). As stated by Investopedia (2017), “Portfolio variance is calculated by multiplying the squared weight of each security by its corresponding variance and adding two times the weighted average weight multiplied by the covariance of all individual security pairs.”

**Data and Methodology**

Main Argument

Based on the assumption that, for the solution of the portfolio formation, the method and order of steps can be determined explicitly, a model is formed under a determined set of characteristics in various investment projects (Pr), where:

\[
\text{Pr = Pr}_1, \text{Pr}_2, \text{Pr}_3 \ldots \text{Pr}_n
\]  

Where the program of social house building (SPr) is derived from the suggested investment-building projects, the program was described as a subset of investment projects from the set, as follows:

\[
\text{SPr} \subset \text{Pr}
\]  

In the investment program, the characteristic vector, \(X (X_1, X_2, \ldots, X_n)\) was used to define the structure of the program. In this case, \(X_i\) was ‘1’ when the \(i\)-th project (\(Pr_i\)) was included in the program and ‘0’ when not.

For selecting optimal projects within the framework of socially-affordable housing, the new representation was social satisfaction (SS\(_i\)) by the \(i\)-th investment project (Pr).

This representation can be interpreted as direct, for example, by the number of citizens having improved housing conditions, as well as indirect, for example, the decrease of tension in society and the formation of new working places. Social satisfaction was evaluated subjectively by each expert based on hypotheses and formulations of this study.

All social investment programs balance the contradictive conditions of limited financing and social effect requirements.

The coefficient of social satisfaction, SS, was determined by experts by estimating the following local social satisfaction factors:

- The number of families who improved their living conditions;
- The features of social adaptation of citizens;
- The load on the existing infrastructure in the area; and
- Possibilities for further construction.

Representations of a social effect and, consequently, social satisfaction were subjective, and every expert calculated these independently.

Representations of social satisfaction were considered deterministic variables or random variables defined on the following probability space:

\[
< S, B, P >
\]  

where
The random variable, SS, of social satisfaction from every investment project available for evaluation was based on:

$$ r_i = (r_{i1}, r_{i2}, \ldots, r_{ik}) $$

where

- \( k \) = sample size of expert values, and
- \( r_{ik} \) = value \( \geq 2 \) derived by experts from the set of projects, characterized by a distribution function, \( F_i(t) \).

The study considered \( F_0 \) as a class of all possible distribution functions, \( F_i(t) \), from which a random sample, \( r_i \) (return of \( i \)-th asset), could be drawn.

Another criterion in selecting an investment project was the amount of financing for an investment program (\( V \)).

Based on the above-mentioned criteria, a mathematical model of the investment project was built for the program of social housing.

The characteristics and conditions of investment projects were defined, a task rarely performed in practice. Hence, every investment project was characterized by the following descriptions:

- \( SS \), a coefficient of social satisfaction of the project; and
- \( V \), the required amount of financial means calculated for the project.

The resulting models allowed one to determine optimal social projects with maximal social effect under a budget constraint.

Where \( V \) suggested financing of the program during a certain period, it was assumed that the total demand for financing should not exceed the possible financing during that fixed period. As a result, the social satisfaction of components of the program, consisting of various investment projects, were determined as:

$$ SS = \sum_{i=1}^{n} SS_i \cdot X_i $$

An investment program of social housing can be constructed using different approaches depending on the choice of criteria and constraints. Based on two key factors, two main models for forming a social housing program were proposed.

Model 1

This model was based on maximizing social significance under limited financing needs. From the set of investment projects, a subset of projects was chosen to form programs that satisfy the constraint of limited financing. Then, among those programs, the program with the maximal social significance was chosen. It was necessary to use a set of vectors \( X = (X_1, X_2, \ldots, X_n) \), where each \( X_i \) had a value of ‘0’ or ‘1’ and

$$ \left\{ \sum_{i=1}^{n} X_i S_i \rightarrow max \right\} $$

$$ \left\{ \sum_{i=1}^{n} X_i V_i \leq V_0 \right\} $$

Model 2

This model was based on minimizing finances based on the required level of social satisfaction. In this case, from the full set, the only investment projects selected to form the programs were those that satisfied constraints, in particular, those with the level of satisfaction at least or lower than \( SS_0 \).

Then, among those programs one with the minimally expected financing was identified. It involved a set of vectors \( X = (X_1, X_2, \ldots, X_n) \), where each \( X_i \) had a value of ‘0’ or ‘1’ and

$$ \left\{ \sum_{i=1}^{n} X_i V_i \rightarrow min \right\} $$

$$ \left\{ \sum_{i=1}^{n} X_i S_i \leq S_0 \right\} $$

The value for \( SS_0 \) represented the required level of social satisfaction of project components. The solution of the program formation resulted with the help of the typical optimization programs.
A mathematical expectation of return in classic theory of investment was an expected return and the variance of return represented the expected risks of investors or risks in general. In the suggested models, the mathematical expectation of significance for projects and programs defined the expected social satisfaction and the variance of significance the risk of investment program or risk in general (Modigliani, 1949).

In practice, investment projects were usually characterized not only by the determined demand in financing but by the random subjective value of social satisfaction, since it depended to a large extent on the experts’ opinion.

The value representing the sample of expert values was \( k \geq 2 \), and some general population were characterized by the distribution function \( F_i(t) \). In this, \( F_0 \) is a class of possible distribution functions \( F_i(t) \), from which sampling \( r \) can be derived as:

\[
    r_i = (r_{i1}, r_{i2}, ..., r_{ik})
\]

The evaluation of the mathematical expectation and dispersion of characteristics was applied to social satisfaction as follows:

\[
    m_i = \frac{1}{k} \sum_{i=1}^{k} r_{ik}
\]

\[
    D_i = \frac{1}{k} \sum_{i=1}^{k} (m_i - r_{ik})^2
\]

\[
    \sigma_i = \sqrt{D_i}
\]

where

\( m_i = \) a mathematical expectation of social satisfaction of \( i \)-th investment project;

\( D_i = \) variance of social satisfaction of members of \( i \)-th investment project;

\( \sigma_i = \) standard deviation of social satisfaction of the members of the \( i \)-th investment project.

The mathematical expectation of social satisfaction of investment program was determined by the formula:

\[
    R = \sum_{i=1}^{n} x_i^2 D_i
\]

For the case of dependent results of satisfaction regarding investment projects, the variance of socially oriented investment program was determined as:

\[
    D = \sum_{i=1}^{n} \sum_{j=1}^{m} x_i x_j D_{ij}
\]

where

\( D = \) the covariance between returns of two investment projects in the case of \( i = j \) being a variance.

It was assumed that \( V_0 \) was the potential amount for financing the socially oriented program during a certain period. Consequently, the total demand for financing of the socially oriented investment program could not exceed this potential amount.

Socially oriented investment programs can be formed and implemented within a day or in a few periods, depending on the established criteria. From this study, under random characteristics of social satisfaction, the following models of formation of optimal socially oriented projects were developed.

The first model of program formation is based on the maximization of expected social satisfaction of investment program under acceptable risk and financing limitations. Then, the economic and mathematical model will be formulated in the following way: it is necessary to choose from the given set of projects such a subset that form programs which satisfy the constraints of limited financing and limited risks. From those programs from the ‘feasible region’ chose the one with the maximal expected social satisfaction. In other words, it is necessary to find such a set of vectors \( X = (X_1, X_2, ..., X_n) \), where every \( X_i \) takes two possible values (0 and 1) to meet the following constraints and among them chose the one which satisfies the maximization criterion:

\[
\begin{align*}
    \sum_{i=1}^{n} x_i m_i & \rightarrow \max \\
    \sum_{i=1}^{n} x_i D_i & \leq D_0 \\
    \sum_{i=1}^{n} x_i V_i & \leq V_0
\end{align*}
\]

where
D₀ = upper bound of the investor’s risks;  
V₀ = upper bound of possible financing of the program;  
Vᵢ = financing of the i-Pr.

The model describes the optimization problem of finding the program, which gives maximal social satisfaction under the terms of limited risks, and limited financing. Its solution can be calculated with the help of typical optimization program.

The second model of program formation is based on the minimization of financing of the program under acceptable risk limitation and achievement of required level of social significance. Such conditions can be described by the following economic and mathematical model. From the given set of investment projects, it is necessary to choose such a subset of projects that form programs which fulfill the constraints. It means that the chosen programs do not need to exceed the maximally acceptable risk D₀ and in the same time their expected social satisfaction should be at least as high as minimally acceptable level SS₀. Those programs form a feasible set of the programs. Moreover, our task is to choose the one program from the feasible set with the minimal financing demands.

That is, the task is to find such a set of vectors \( X = (X₁, X₂, \ldots, Xₙ) \) to achieve for which constraints of achievement at least minimal expected significance of the program SS₀ and not to exceed maximal acceptable risk D₀ are mutually fulfilled. From the set of received programs choose the one with the minimal financing requirements. In mathematical language, this task can be described in the following way:

\[
\begin{align*}
\sum_{i=1}^{n} Xᵢ Vᵢ &\rightarrow \min \\
\sum_{i=1}^{n} Xᵢ Dᵢ &\leq D₀ \\
\sum_{i=1}^{n} Xᵢ SSᵢ &\leq SS₀
\end{align*}
\]

(15)

where

- \( SS₀ \) = minimal social significance, lower bound of the social significance to be reached;
- \( D₀ \) = upper bound of the investor’s risks, this level of risks cannot be exceeded.

**Results and Discussion**

Thus, for selecting social housing investment projects, one can apply the following principles:

- Social significance. To form project portfolio, the authors suggest using new representations of social significance that are of importance of the project for society.
- *a posteriori* return. Evaluation of investment projects of social housing is secondary and can be carried out *a posteriori*.
- Collective decision. Decisions on investment to any project should be made together with experts and investor, using subjective judgments about their advisability. Experts’ opinions and evaluations are considered as random values of some allocation.
- Adaptability. All chosen investment projects should react operatively to changes of external environment, and mainly to continue developing and realization in dynamically changing conditions of the external environment.
- Complexity. Investment program should be, first of all, oriented to complex socially-economic development of the region. Therefore, experts’ decision on projects should be systemic and consistent.
- Consistency (balance of interests). All members of the expert group should serve to the achievement of common goals, and personal goals of each member should not cause contradictions between the links.
- Transparency. The procedure of projects selection, formation, realization, and evaluation of program should be maximally transparent and available to ensure awareness of all desiring investors about the possibility of participation in the program, changes in projects, their possible social significance, return and risks.
- Rationality. Investment budget should be rationally allocated to maximally and minimally effective projects.
- Professionalism. Only competent members should be attracted to investment projects, e.g., government employees, investors, facility managers, appraisers, and other interested persons.
Objective evaluation. There is a need for introducing a united system of monitoring and accounting that will help to evaluate social and economic effects of project realization maximally.

Management resonance. The great value is assigned to identify investments and resonance in the system and maximizing economic and social effect.

Conclusion

The models produced in this study will help with forming an optimal portfolio of investment projects in the framework of limited budget and limited acceptable risks with maximization of social satisfaction. Consequently, to form an optimal package of projects with the minimal financing requirements will provide at least the required number of citizens with housing. Projects will form without exceeding acceptable risks. The key task for the realization of the social housing programs is an increase of regional quality of life from achieving the programs. As a result, more citizens will be provided with comfortable housing and thus, relations between society and state will potentially stabilize. With the most ‘vulnerable’ citizens protected social tension in society should automatically reduce (Selyutina, 2016).

HOW MIGHT CLIMATE CHANGE AFFECT MICROECONOMIC WELLBEING IN CENTRAL ASIA

Umar Burkhanov,¹ Feruza Saburova²

Abstract: Climate change may pose serious challenges to the economies of Central Asian countries, but in-depth studies on a national level are lacking. The paper is aimed to contribute filling this gap and devoted to assessing the economic impacts of climate change in selected areas of Central Asia. The methods of the desk study and documental analysis are used to summarize the adverse effects of climate change in rural livelihoods. Moreover, the preliminary results of the survey conducted in selected regions of Fergana valley within MikroKlima project used as a corresponding data for economic impact analysis on a household level. The results reveal that the effects of unfavorable weather conditions uneven for short and long term, and across Central Asia. Moreover, the most potential damage from climate change will affect the rural population, and there is also a high positive correlation between water shortage, increased aridity, and poverty, aggravated by climate change.

JEL Classification numbers: Q51, Q54, O11, O18; DOI: http://dx.doi.org/10.12955/cbup.v5.905
Keywords: climate change, household, income, agriculture, water, Central Asia, Uzbekistan.

Introduction
Central Asia (CA) is a sub-region of Asia. The sub-region covers about 400 million sqr km which constitute of the five former Soviet republics: Kazakhstan, Kyrgyzstan, Turkmenistan, Tajikistan, and Uzbekistan. The total population of people living in the region by the end of 2013 was 67.4 million of which 58% lived in the rural areas (Sommer, Glazirina & Yuldashev, 2012). The new World Bank classification placed the five Soviet republics among the countries with uneven income levels. The World Bank went ahead to classify Kazakhstan and Turkmenistan in the upper-middle-income countries and Uzbekistan, Kyrgyzstan and Tajikistan in the lower middle-income countries.

Kazakhstan and Turkmenistan are rich in oil, and they do not rely much on agriculture. However, the other three countries rely on agricultural production as their primary source of household income (Bobojonov & Aw-Hasan, 2014). The agriculture sector in these countries generates export revenues which are used in the development of their economies. However, these countries face complex environmental challenges, in particular in the areas of food security, healthcare, access to water and energy which made them be the most vulnerable regions in the world (Bucknall et al., 2003; Glantz, 2005). The table below is a summary of the economic statistics of the five CA countries in the focus of biodiversity.

Moreover, the study that was done by Bobojonov & Aw-Hassan (2014) showed a significant uncertainty about the effects of Climatic Change (CC) in Asia sub-regions such as CA. Thus, a

¹ Lecturer at Tashkent Financial Institute, Uzbekistan, uburkhan@gmail.com
² Master’s program student, Tashkent Financial Institute, Uzbekistan, ewulet93@mail.ru
detailed bio-economic characterization of the impacts of CC on households in CA is outstanding. However, there is a need for deeper CC related research at the country level. The paper is aimed to contribute to the filling research gap and devoted to assessing the impacts of CC on household wellbeing in CA.

Literature Review
The study uses the outcomes of different international projects including, "The Env-Linkages Economic baseline projections to 2050"(2011), “Zoi Environment Network project” (2016), Solomon, (2007), “The World Banks” (2009). Most of the scholarly studies reviewed during the research focused on water system management, agriculture and food security (Bezborodov et al., 2010; Siegfried et al., 2012; Sommer et al., 2012; Tirado et al., 2010; Ndamani & Watanabe, 2017; Bobojonov & Aw-Hassan, 2014).

Other studies devoted to the issues of health, adaptation, economics and environment particularly the economic growth, green tax and intergenerational environment cost burden sharing (Bernard, et. al., 2015, Bell et al., 2007; Dessai 2003; Fay et al., 2010; Flaherty, et al., 2016; Lecocq & Shalizi, 2007).

The environmental changes affect global scale effects are discussed by (Stern 2007; Fay et al., 2010; Metz 2007) and some predictions of these studies have been given in Appendix A. However, in recent years, economic impacts analysis on national level has emerged to demonstrate the value of country and city scale works. Despite the proliferation of research on different areas, the assessment of the economic impacts of CC at the national level has received little attention.

Methodology and data source
The methods of the desk study and documental analysis are used to summarize the adverse effects of climate change in rural livelihoods in CA. The research uses the results of the Integrated Model to assess the impact of CC on the main crops which have crucial importance for the households in CA (Bobojonov & Aw-Hassan, 2014). Further, the outcomes of simulation models based on Metz (2007) CC scenario projections, and the results of different modeling approaches, including a Bio-Economic model to assess the effects of CC on food production, Biophysical models at various crops using SOYGRO, CERES, DSSAT modeling are also employed in this study.

The research uses some of the results of the survey conducted by Bobojonov & Aw-Hassan (2014) among 97 respondents living in Osh oblast, Kyrgyzstan as the primary source of data on a household level.

Findings and discussion
The environmental changes add to the problems in the CA and increase the vulnerability of people living in rural areas. Notably, the recent increase in the frequency of droughts is resulting in severe damage to the livelihoods of farmers in semiarid and arid regions. For instance, the poorest population living in mountainous areas of CA droughts in 2000–2001 and 2007–2008 have caused significant socio-economic is hitting the hardest because of increased frequency of heavier rainfalls in winter and subsequent floods.

Rural populations are already severely suffering from the increasing sequence of extreme events, which will predict even to increase in future. The study by Metz (2007) indicates that the region may face declined precipitation during spring, summer, and autumn and slightly increased rainfall during the winter (Solomon, 2007). Further, the rise of temperature by 3.7 °C can occur on average by the end of this century. The followed extreme weather expected to occur during summer, which is the most important season in the vegetation period. The increased temperatures may cause a higher probability of drought during the vegetation period which may lead declining harvest in agriculture (Metz, 2007).

Table 2 shows the significant role agriculture plays in household income in CA countries with employment in the agricultural sector as over 25% in all CA countries. For instance, in Tajikistan, two-thirds of the population depends on agriculture for their livelihood, whereas in Kyrgyzstan more than half of labor force employed in agriculture sectors.

Within MikroKlima project we surveyed the importance of agriculture in household income, in October 2016. The household sources of revenue were ranked in the order of importance: wage, remittances from abroad, and sales of primary agricultural products (sales of farm products from the household plot account for 20% of family earnings). These findings are consistent with the earlier
(FAO, 2014) studies which indicated that even small farmers don’t wholly rely on agricultural produce. Although only 4 out of 97 respondents showed the sale of agricultural commodities as the primary source of income source, their earnings mostly come from sales of both plants and animal produce. Most of the plant output sale seasonally. Among the livestock production, animals and meat are mostly sold seasonally and even less rare than that, whereas dairy and eggs sale daily and weekly.

Source: Granit et al., 2010.

The study of the role of agriculture also reveals the dominance of cotton production in the sector. For instance, Uzbekistan is currently the second largest exporter of cotton in the world, selling over 800,000 metric tons every year (Bernauer & Siegfried, 2012).

The results of existing studies show the adverse effects of CC on the livelihoods of small farmers and households who are currently operating at a small margin of profits. Survey reveals that unexpected freezing in 2016 has impeded timely harvest of beats and ripening of tomatoes in Osh oblast. Such loss hits the revenue basket of the producers, as they only have a seasonal chance to obtain income.

Furthermore, the vulnerability of animal farming to CC lies in the perceptivity of animals to diseases with increasing temperatures and lack of drinking water with increasing aridity. Moreover, do not have access to financial resources and advanced technologies in the region raises the vulnerability of them.

The data for Europe and CA demonstrate substantiality of the economic impact of CC over the past 30 years; climate-related disasters have caused $70 billion in economic losses (Glantz, 2005). The existing studies at national or sub-national levels of the economic impacts of CC on agricultural production in CA are limited.

Water Resources & Irrigation system

CA already meets notable warnings from weather change, with some serious risks already in evidence. Today, traditionally critical sectors of economies in CA the water and agriculture became the most vulnerable area to CC (Solomon, 2007).

The value of water and agriculture hard to overestimate for the region. Those two sectors are acknowledged together since in the CA they are firmly interlinked – more than 90% of water in the area goes to irrigated farming. For instance, the results of a survey conducted in Osh oblast reveal that 90 respondents out of 97 irrigated at least a small chunk of their land, which means that the rest (only seven respondents) do not use any irrigation.

According to Glantz (2005), the agriculture sector contributes about 30% of the CAs GDP and hires more than 60% of the population. The studies of potential adverse effects from the unfavorable weather conditions evidence that suffer from such a changes will be more than 70% for the agriculture sector. One of the cases on how aridity, caused by weather change, may affect people's living, is the dryness of 2008 in Tajikistan (Anisimov & Ginsburg, 2008). Because of it, many families lost a considerable part of the wheat crop and had to sell their cattle as the grain harvest totals were short by 30-40% through the whole year.

3 According to data from Statistic Committee of Uzbekistan this indicator was 27% in 2016.
4 One of the first few assessments was done by Savoskul et al. (2004) for the Syr Darya river basin.
The studies reveal that the lack of fresh water may become the acutest problem in CA. According to Metz’s (2007) forecast, in western and southern regions of CA, where the farming facilities established, and the substantial amount of the people lives, the decline of yearly runoff may reach by 10-20%.

The situation aggravated by increasing unevenness of flow effected by the disappearance of icecaps as stream accumulators; consequently, seasonal floods expected to become more rapid and significant water shortage in the summertime. It seems contradictory as the global medium precipitation volume persists approximately the same level; the rainfall frequency is shifting more uneven regarding time and area.

In Uzbekistan, Amu-Darya basin covers 81.5 % of the country’s need for water, and Syr-Darya basin includes 13.5 % (Dukhovny & Sokolov, 2003). There are many irrigation constructions along the two rivers. These irrigation schemes significantly reduce the volume of run-off in both rivers and thus the inflow into the Aral Sea.

The research reveals that in the past century, Tajikistan’s icecaps have lost more than 20 km³ of the glacier. Iceberg decrease has transformed the water stream. As a result, during the last three decades, the average yearly water flow has declined by 3.3 km³ in Tajikistan (Alamanov et al., 2006).

The other primary factor which documented well in literature is the extremely irrationality of water use and archaic irrigation (“World Bank,” 2004) which contributed to the most catastrophic CC event - the disappearance of Aral Sea. According to studies of the reasons for Aral Sea disappearance, the only one-fifth is defined by physical stream deficiency, and 80% undisputedly associated to the inefficient treatment of water for agriculture demands).

The Metz (2007) 3rd statement presents a comprehensive examination of difficulties of the rainfall modeling and forecasting. Notwithstanding inconsistencies in the estimates for various models, it was feasible to make the aggregate prediction of variations in yearly runoff based on 12 models.

Uzbekistan is facing growing problems to satisfy future demand for water. By the 2040s, even with an increase in the flow of river basins of Amu-Darya and Syr-Darya, a general shortage of water for irrigation in Uzbekistan, according to estimates, could reach 8.0%, at constant drain – 15.4%, while reducing the flow of water deficit could reach 33.5%. Within short time due to increase in temperature on a global level, the water supplies of the big rivers in Kazakhstan may reduce by 20–40%.

Water in CA represents an extremely political subject due to its uneven allocation between upstream and downstream nations and can cause water conflicts (Glantz, 2005). Thus, the water challenges and political stability cannot be addressed independently (Bernauer & Siefgried, 2012). The study on water shortage factors in CA reveals that the existing obsolete irrigation system remains the primary cause of water loss and soil degradation. Further, insufficient funds mainly resulting from low collection rate do not allow modernization of the water supply systems and increases the maintenance costs. And finally, the lack skilled specialists, especially in the remote areas lead to inefficient water management.

The importance of irrigated agriculture in the region requires modernization of the irrigation system and enhance the effectiveness of water consumption. The farming practice should be adapted to combine new crops that are more proper to new weather circumstances and diverse soil structure and precipitation. One consequence of a declining agricultural area is the growing challenge of securing maintenance in the countryside, encouraging migration to city centers.

Conclusion

CA faces notable signals from weather change, with some severe risks already in evidence. The results of the study show that there is an increase of shortage of water resources and decline of water condition, the likelihood of appearance of critical and extreme climate events, such as dehydration, extremely high or low temperatures. Moreover, the results indicate that the chance of appearance of social disorder and pressure connected with CC and adverse effects on the current environment and a warning to biodiversity continues to increase. Being essential for food security and stable household income in CA, the water and agriculture, at the same time are the two of the most vulnerable sectors to CC.
The results of the surveyed Osh Oblast shows that sales of primary agriculture products are the second largest household income (20% of cash earnings) after remittances from abroad. The results of the assessment conducted by the National Accounts show that agriculture contributes about one-third of GDP in CA and supplies jobs for more than 60% of the people. However, unfavorable weather and climate conditions cause 70% potential damage on agriculture in the CA. According to Metz (2007) forecast, in western and southern areas of CA, where the farming facilities established, and the diverse population lives, one may assume yearly runoff to reduce by 10-20%. For instance, Uzbekistan is facing increasing problems to satisfy future demand for water, and by the 2040s, the water deficit could reach 33.5%.

As such, a better perception of the environment change impacts in CA requires to support the national governments to interact with other sub-national and local decision-makers, mobilize political will, assess options and design cost-effective and timely responses. In the face of general geographical vulnerabilities, nations in CA should collaborate in improving responses to weather impacts. To this end, mitigation and adaptation interventions need to be precisely planned not to aggravate or exacerbate tensions in the region. Finally, it is means to advance understanding of the dangers of CC in the regional scope and enables action across scales to address CC.

THE GENERAL TRANSPORT INFRASTRUCTURE - A KEY DETERMINANT OF COMPETITIVENESS OF TOURISM IN ROMANIA AND CEE-EU COUNTRIES

Mihai Costea,1 Cristian-Valentin Hapenciuc,2 Gabriela Arionesei3

Abstract: After the fall of communism, Romanian tourism was considered a sector which, by with relatively modest efforts, could be quickly restarted with the capacity to have a positive influence over the entire economic relaunch process. Although it has been more than 27 years, an economic revival through tourism has not yet occurred. Moreover, in recent decades, Romanian tourism has steadily lost some competitiveness in relation to other tourist destinations in the region. In this context, through this study, we tried to show that a major cause of the low level of competitiveness is represented by the significant deficiencies recorded in terms of the general transport infrastructure. The availability of a secure and fast transport network by road, air and water to the most important tourist centers of a country is vital. Without a general infrastructure no tourist resource, no matter how important, can be put forward in an efficient manner. Thus, we can unequivocally say that the absence or an insufficient development of infrastructure in Romania is the prime factor of the lack of development of tourism activity and of the serious deficiencies recorded when it comes to enhancement of the national tourism offer. This conclusion is supported by the analysis of the data provided by the World Economic Forum (through the Tourism Competitiveness Index) and EUROSTAT. To reflect Romania's position in the general picture of the competitiveness of the transport network, we performed a comparative analysis considering the results achieved by ten other EU countries in Central and Eastern Europe (hereinafter referred to as CEE-EU countries).

JEL Classification Numbers: L83, P52; DOI: http://dx.doi.org/10.12955/cbup.v5.906

Keywords: transport infrastructure, Romania, Bulgaria, tourism competitiveness, CEE-EU countries.

Introduction

According to Paicu and Hristache (2013) Romania can be proud of a variety of landscapes, a relatively rich cultural and historical heritage, and of the existence of some unique monuments and natural landmarks, some of them being UNESCO heritage sites. For this reason, in Romania many forms of tourism can develop: seaside, mountain, balneary tourism, hunting and fishing, itinerant tourism with cultural, religious valences, business tourism, rural tourism, ecotourism etc. However, the efficient development of tourism in Romania and the enlargement of its attractiveness towards foreign tourists and investors becomes literally impossible without an appropriate general infrastructure. We refer to the infrastructure of the air, land (road and railroad) transport, but also naval, especially because cruise ship tourism has been an ever growing segment in recent years. We proposed that through this study, we make an objective analysis of the transport infrastructure in Romania, in comparison with ten other member countries of the European Union, from Central and Eastern Europe (hereinafter referred to as CEE-EU countries). Throughout this study we emphasized the comparison with the neighboring country Bulgaria, because between these two countries the economic, geopolitical, historical and geographical similitudes are more evident. Including the tourism point of view, the potential is broadly similar, but, nevertheless, the degree of development of the tourism activity and the performances registered regarding the number of arrivals of foreign tourists, the number of nights spent or the average period of stay are clearly superior in the case of Bulgaria (Costea, Hapenciuc and Arionesei, 2016). Are there such differences also from the point of view of the general transport infrastructure, as determining factor of tourism competitiveness? This is the question for which we look for an answer in this study.

Literature review

The importance of transport infrastructure in the general picture of tourism competitiveness is confirmed by organizations like The World Economic Forum, and is the basis of the study of tourism competitiveness of 141 countries, including through the analysis of the pillars regarding the air, land and port transport infrastructure. Starting from the data obtained by the World Economic Forum through the Travel and Tourism Competitiveness Index, Kayar and Kozak (2010) make a comparison between 28 countries regarding tourism activity, concluding that air and land transport infrastructure are among the factors that influence tourism competitiveness the most of a destination. Another international organization that certifies the importance of transport infrastructure is the Organization

2 Ștefan cel Mare University of Suceava, Romania, valentinb@seap.usv.ro
3 Ștefan cel Mare University of Suceava, Romania, gabriela_arionesei@gmail.com
for Economic Cooperation and Development (OECD). With a vast expertise, including the tourism field, OECD published in April 2013, through the tourism committee coordinated by Dupeyras and MacCallum (2013), a list of indicators useful for national governments in the analysis of the competitiveness of the tourism sector, air transport being among them. In the context of the study of competitive advantage, Crouch and Ritchie (1999) are part of the category of authors that consider infrastructure as being an indispensable element for the development of tourism activity. Before them, Kaul (1985) is one of the first authors that recognizes the importance of transport infrastructure in the growth of tourism competitiveness of a tourism destination, by creating new attractions. The more recent studies reconfirm the importance of transport infrastructure in obtaining a competitive position on the tourism market. For example, Khadaroo and Seetanah (2007) study the role of infrastructure in the increase of the number of tourists in the famous destination Mauritius. They find that transport infrastructure contributes positively to the attraction of tourists, especially those from Europe, USA and Asia. Vila, Darcy and Gonzalez (2015) study the impact of different factors on the accessible tourism competitiveness from Spain and Portugal. In their opinion, infrastructure becomes extremely important in gaining a bigger share of this market. Among authors that don’t hesitate in their recent studies to discuss the importance of transport infrastructure in the growth of tourism competitiveness we mention: Cvelbar, Dwyer, Koman and Mihalič (2015), Khan, Qianli, SongBo, Zaman and Zhang (2017), Biemonte, Ferrini and Grilli (2016), Duval and Weaver (2016) and others.

Methodology
In order to analyse the disparities from the point of view of the transport infrastructure, we chose for comparison eleven countries: Romania, Estonia, Lithuania, Latvia, Slovakia, Slovenia, Hungary, Poland, the Czech Republic, Croatia and Bulgaria. Starting from the terminology proposed by the Organization for Economic Cooperation and Development – CEE, referring to the countries from the Central and Eastern Europe, we chose to refer in the study to the listed countries as CEE-EU countries, namely member countries of the European Union, situated in the Central and Eastern Europe. The comparative analysis was based first on the data obtained by the World Economic Forum through the Travel and Tourism Competitiveness Report, 2015. Practically, we chose to use the data regarding the Travel and Tourism Competitiveness Index (TTCI) and focus strictly on the pillars that assess air transport infrastructure and the land and port infrastructure. In order that the analysis is as complete as possible, we chose to process the data available from The National Institute of Statistics from Romania regarding the situation of public roads and EUROSTAT regarding the number of kilometers of highway or the length of railroads. In order to ensure comparability, the data obtained was processed with the help of Microsoft Excel, version 2007.

Results and Discussion
From the data obtained by the latest World Economic Forum Report from the year 2015, regarding the Travel and Tourism Competitiveness Index (TTCI), Romania is at the 66th position from 141 countries, while Bulgaria its direct competitor is in the 49th position. If we relate to pillars no. 10 (air transport infrastructure) and no. 11 (land and port infrastructure) of tourism competitiveness, we will see that Romania is by far the lowest placed country in the regional classification, especially from the point of view of land and port infrastructure (Table no. 1).

| Table 1: The 14 Pillars of Tourism Competitiveness at the CEE-EU Region Level |
|-----------------|-----------------|-----------------|-----------------|
| Country         | P10 Pos. | Score | P11 Pos. | Score |
| Bulgaria        | 79       | 2.5   | 79       | 3.3   |
| Croatia         | 53       | 3.1   | 44       | 4.2   |
| The Czech Republic | 51   | 3.1   | 18       | 5.2   |
| Hungary         | 69       | 2.7   | 36       | 4.5   |
| Poland          | 73       | 2.6   | 47       | 4.1   |
| Romania         | 87       | 2.3   | 91       | 3.1   |
| Slovakia        | 129      | 1.8   | 43       | 4.2   |
| Slovenia        | 82       | 2.4   | 19       | 5.1   |
| Estonia         | 59       | 3.0   | 37       | 4.4   |

| Latvia          | 52       | 3.1   | 42       | 4.2   |

Source: Author
Air Transport Infrastructure

Airborne connectivity is essential for carrying out air travels, that is why the role of this pillar is to measure the volume of air transport, the number of departures, the number of the airports, the number of airlines which operate in a country, the quality of the airport infrastructure for domestic and international flights. Considering this pillar, the lowest placed countries in the CEE-EU region are Slovakia (129th place with 1.8 points) and Romania (87th place with 2.3 points). In contrast, the most competitive countries in the region are Croatia, the Czech Republic and Latvia, all the three countries registering a score of 3.1 points. It’s worth mentioning that all the CEE-EU countries have deficiencies regarding their air transport infrastructure, as none of them was placed in the first 50 positions at the global level, with the top lead by Singapore and the United Arab Emirates.

In contrast to Romania, Bulgaria is placed on the 79th position, with 2.5 points. The superiority in comparison with Romania is in the higher quality of the infrastructure. From this point of view, Romania is placed on the 104th position globally, worrisome if we consider that countries like Nicaragua, Guyana, Senegal, Ghana or Rwanda have a more modern and efficient air infrastructure.

Having a more modern infrastructure than Romania, Bulgaria managed to attract more airlines that operate line, low-cost and charter flights. Thus, according to the data obtained by IATA for 2014, in Romania there were 43 airlines of different dimensions, whereas in Bulgaria the number of airlines had reached 45 (Table no. 2). Although the number of airlines that operate flights from and to Romania is smaller than in Bulgaria, the air traffic is more intense from the point of view of the number of departures of the airplanes per mile of inhabitants. This result is normal, because the population of Romania is much bigger than the population of Bulgaria, that is why the need of air transport and implicitly, the number of domestic and international flights is higher.

Table 2: Comparative Analysis Romania - Bulgaria from the Point of View of Pillar 10 - Air Transport Infrastructure

Another aspect where Romania has a better position in comparison with Bulgaria is the density of airports per 1 million inhabitants: 1.3 in Romania, in comparison with 0.8 in Bulgaria. This greater number was predictable because as we mentioned, the population and the surface in square kilometers of Romania are clearly greater than that of Bulgaria. In absolute values, Romania has now 16 operational airports at Arad, Bacău, Baia Mare, Bucharest (2), Cluj, Constanța, Craiova, Iași, Oradea, Satu Mare, Sibiu, Suceava, Târgu Mureș, Timișoara and Tulcea, and Bulgaria has 5 airports at Sofia, Burgas, Varna, Plovdiv and Gorna Oryahovitsa.

Land and Port Infrastructure

In order that a destination can assume a competitive position, it must have an appropriate network of roads and railroads. Also, it is necessary to ensure optimum conditions of naval transport. Therefore, for the first stage the existence of ports where the cruise ships can anchor in safe and comfort conditions for tourists is necessary. One must not underestimate the importance of country roads, usually not asphalted, that can, to a certain degree, be a picturesque tourist attraction, evidently in specific contexts of time and space.

From the point of view of the land and naval transport infrastructure, the most competitive countries in the region are: the Czech Republic (the 18th place worldwide with 5.2 points) and Slovenia (19th place with 5.1 points). In contrast, Romania is on the last place at the CEE-UE region level (91st place with 3.1 points). One of the biggest problems that Romania faces is with its quality of roads, being placed on the 121st place globally from this point of view. According to the World Economic Forum, Romania has, alongside the Republic of Moldova, the worst roads in Europe. Under these
circumstances, Romania’s claims for an increase in the domestic tourist flow in the coming years should be moderate, especially if we take into account that in the world classification of land and port infrastructure, Romania is placed lower than countries like Bangladesh (2,9 points), Cameroon (2,9 points), Sierra Leone (3 points), Zimbabwe (3,3 points), Malawi (3,3 points), Zambia (3,6 points) or Ethiopia (3,8 points).

![Table 3: Comparative Analysis Romania - Bulgaria Considering the Variables of Pillar 11 - Land and Port Infrastructure](image)

It is already more important for the economy of transport the existence of a modern road network. According to the National Institute of Statistics (2015), at the end of 2015, the public roads from Romania totaled 86,080 km, of which 17,606 km (20,5%) of them were national roads, 35,316 km (41,0%) county roads and 33,158 km (38,5%) local roads. From the point of view of this type of covering, Romania registered in the year 2015 32,641 km (37,9%) modernized roads (with heavy and medium-curing asphalt), 21,136 km (24,6%) roads with light blankets and 32,303 km (37,5%) paved and earth roads. It’s worth mentioning that, from the total of national roads 35,2% (6,193 km) are European roads, 4,2% (747 km) highways, 1,6% (281 km) three-lane roads, 10,3% (1,807 km) four-lane roads, 0,1% (22 km) six-lane roads.

Highways have a significant importance today because they are public roads which enable transport at higher speed and, at the same time, have the capacity to carry the increasing number of vehicles that run on public roads. By far the biggest network of highways is registered in Hungary and Poland (Table no. 4).

![Table 4: Numbers of Kilometres of Highway in the CEE-EU Countries](image)

Also, these countries are linked through highways to the neighboring countries. We find that in the case of Romania, the highway building is quite slow because within the period 2005-2014 only 455 km were built, whereas in countries like Hungary or Poland, within the same period, more than 1000 km were built.

We must mention that the real necessities of highways are also directly proportional with the country’s surface, respectively with the population and number of vehicles that run on public roads. Subsequently, relating the number of kilometers of highway to the country’s population will show us that Romania registers the lowest results, in comparison with the other countries in the region (except Latvia that doesn’t have any kilometer of highway) (Table no. 5)
Romania experiences deficiencies also regarding the port and railroad infrastructure, the results showing an inferiority in comparison with its neighbouring country Bulgaria. It is true that with the passage of time, railroads are less used. Table no. 6 presents the evolution of the railroads in the CEE-EU region countries, within the period 2005-2014. One can see that in the majority of the countries the number of kilometres of railroad is diminishing every year, except Lithuania, where one can see significant increase, Hungary, that managed to increase in the year 2014 the railroad network by nearly 4000 km in comparison with the previous year. In Romania, the railroad network has a total length of over 20,000 km, being the 7th network largest in the European Union from this point of view.

We think that the railroad transport will remain one of the main means of transport, especially for domestic travels. Also, all the transportation policies in the European Union present the advantages of railroad transport. These are also mentioned in the National Strategy for Sustainable Development of Romania - Horizons 2013-2020-2030.

The deficiencies of the passenger railroad transport in Romania are not related to the length of the network, but to its poor maintenance in the last decades, and the lack of modernization investments. These causes lead to the fact that the average speed of railroad transport is 50 km/h, lower than the registered speed within the interwar period (60 km/h). Consequently, most of the times the travels are slow and tiresome. The low speed and the precarious comfort conditions lead to the decrease in the number of passengers beginning with the year 1990.

Regarding the average speed of railroad transport in Bulgaria, it is approximately 55 km/h, reduced in comparison with the developed countries from the European Union, where a speed of 150 km/ hour is a decent speed. Recently, Bulgaria began a wide reform process in railroad transport. So that, this year,
the Ministry of Transportation opened a new line of railroad transport which links the second biggest Bulgarian city-Plovdiv to the border with Greece and Turkey. On this line, the train reaches speeds up to 226 km/h, but the average speed is 170 km/h.

An indicator which shows a clear superiority of Romania in comparison with Bulgaria is related to the density of railroads per 100 square kilometers, but as we mentioned before, the quality of the railroad transport (through comfort and speed) must prevail, not necessarily the quantity.

Regarding the port infrastructure, we must mention that Romania has, in Constanța, one of the most important ports from the Black Sea, situated at approximately 340 km North from the Bosphorus Strait and 160 km South from the flow of the Danube into the Black Sea. At present the Constanța port also has a cruise ship terminal, but the greatest part of the activity carried out here is related to cargo ships, and less to the passenger transport. Although the cruise tourism represents one of the segments with the fastest growth in the industry, in the year 2016 there is no major cruise line with a tourism program that includes Constanța/ Romania. In the last years there were few attempts to include Romania in such a program, but most probably, because of the lower demand, the cruise lines chose to give up putting our country on the map with ports to be visited. After a period of increase of the number of passengers processed by the Constanța port within the period 2010-2014, in the year 2015, there was a registered decreases of approximately 46 % in comparison with the previous year, as a consequence of the decrease of the number of the passenger ships which docked at the port (Table no.7).

| Table 7: Number of Passengers and Passenger Ships Processed by Constanța Port |
|-----------------------------|----------------|----------------|----------------|----------------|----------------|----------------|
| Passengers                  | 21.286 | 23.878 | 34.010 | 54.226 | 64.861 | 35.000 |
| Passenger ships             | 58 | 43 | 52 | 69 | 95 | 36 |

By comparison, the commercial port of Bulgaria from Varna processed almost 21.000 passengers in the year 2014, while being, like the Constanța Port, concentrated especially on freight transport and less on passenger transport.

**Conclusions**

The results of the comparative analysis unequivocally show that Romania does not excel at any of the tourism competitiveness pillars that assess, from the qualitative and quantitative point of view, the general transport infrastructure. The investments in general transport infrastructure are the ones that could offer Romania an interesting route in the actual European context. Because there are obvious disparities regarding both infrastructure, and the relative contributions of tourism to the national economy of the countries in the region, Romania must be placed better in order to capitalize on the predicted tourism demand, that is why it is necessary that in the context of international competition, investments in tourism is intelligent and well directed. In order to achieve intelligent investments, a close collaboration is needed between the public and private sector from tourism and the related fields, and also making efforts to become attractive as country for foreign investors. We consider that only breaking the barriers in the development of tourism infrastructure and the general infrastructure may contribute to a strong gain of the competitive position of Romanian tourism on the international market.

The development and implementation of projects with European funding that take into account the improvement of priority problems that the Romanian tourism industry is faced with may constitute a viable solution for the revitalization of Romanian tourism. But, at present the level of these projects is very low, Romania being one of the countries which are faced with a low rate of absorption of funds with European funding. The slow economic evolution of ex-communist countries, like Romania, can be ascribed to the galloping evolution of corruption, a phenomenon that both Romania and Bulgaria were faced with in the last two decades and which affected the credibility of the two countries internationally, reducing also the attractiveness for direct foreign investments and the efficiency in attracting European funds.

Though measures for the improvement of the rate of absorption are necessary, we can affirm that, in the last years, progress was seen. For the tourism industry, the structural funds represent a major opportunity regarding the areas that have potential for development, and those underdeveloped. More
than that, the European funding sources certainly help improve the competitiveness of tourism destinations on the traditional markets, but also on the emerging markets.

THE CLASSIFICATION AND CHARACTERISTICS OF CONTROL CHARTS
Izabela Dagmara Czabak-Górska

Abstract: Control Charts are the basic tool for quality control. They were developed in the 1920s when the dominant type of production was mass production. In order to properly use classic Control Charts, the data from the manufacturing process should meet the following assumptions: an empirical distribution of measurement data should be normally distributed or close to a normal distribution, measurement data should be independent, the manufacturing process should be capable of quality depending on the type of Control Chart, a sample that is large enough (sometimes made of several elements) must be taken. Currently, a shift can be observed from mass production towards short production runs, which causes the proper use of the traditional approach to be impossible. In recent years, control charts are once again in the spotlight, and consequently many scientists, i.e. Reynolds, Zimmer, Costa, Calvin and Chan have undertaken the task to adapt the classic idea of keeping Control Charts to modern conditions of production. The development of science in this area allows for the avoidance of making major mistakes in the conduct of Control Charts and for making the wrong decisions based on erroneous analysis. However, the appearance of new literature pieces implies the need to classify Control Charts, therefore, this article describes the idea of conduct, the most important assumptions and distribution of classical Shewhart's Control Charts, as well as a suggestion for the distribution of advanced Control Charts that meet the needs of the currently used production types. The work also contains a concise description of the chosen control charts as well as the threats resulting from their inappropriate selection. This elaboration is an extension to the article of Czabak-Górska (2017).

Keywords: SPC, the classification of control charts, Shewhart's charts, charts of the new generation, sequential charts, standardized charts, adaptive charts, special charts

Introduction
Control Charts are the basic tool for quality control which was developed in the 1920s when the dominant type of production was mass production. Increased quality awareness and technological progress are driving companies to introduce and modify existing solutions and methods to monitor and control production processes. In addition, intense global competition and the need to meet the needs of the customer who increasingly focus their attention on high quality at low prices are the main reasons for changing the type of production. Increasingly, mass production is moving away from series production, piece production or make-to-order production. Consequently, it leads to differentiation of production. These types of actions also cause the processes to become more and more complex, so it turns out that some of the assumptions from the 20s are not met by processes. This results in the fact that some of the classic SPC tools cannot be properly used in practice. Many scientists, such as Reynolds, Zimmer, Costa, Calvin, and Chan, have adapted the classic idea of Control Charts to the modern conditions of production. The aim of the paper is a literature review of the modification of classic Control Charts and special Control Charts developed to enable them to be used for monitoring and controlling production processes when the normality and autocorrelation of process measurement assumptions is not fulfilled.

A brief review of literature
The main purpose of a manufacturing process is to produce a product with the support of, among others, quality control whose main task is to extract and reject non-conforming units which do not meet certain criteria (requirements). To make the identification of these units profitable a preventive strategy should be undertaken that disables the production of useless products, and consequently protects the company against unnecessary financial as well as temporal losses. For this purpose, among all Control Charts an essential tool in Statistical Process Control (SPC) are used and are based on graphical and statistical analysis. According to Greber (1999) the idea of Control Charts is monitoring and controlling the process in real time (i.e. on-line control), which allows for systematic observation of the controlled process. Yen, Hong & Ha (2013) write that they enable, in a relatively easy way to distinguish common causes from special causes. Then, the person supervising the manufacturing process may, on the basis of the controlled product characteristics, track its progress and evaluate whether the variations of the statistical measure (chose on the basis of the type of production)
conducted Control Chart e.g. average, standard deviation) of the controlled features are so significant that they indicate deregulation of the process.

The efficacy of the use of this tool is mainly based on the proper selection of a chart and its adjustment to the characteristics and course of the processes (also taking into account the economic conditions), from the most common ones (e.g. specific for mass production) to processes which are non-standard (e.g. unit or multi-series production). Scientific research carried out in enterprises, as well as the author's own experience show that the misuse of Control Charts leads to serious errors in their conduct. According to the research conducted by Kowalczyk (2012), the first primary problem results from the use of specifications to determine the limits of intervention in the manufacturing process, which will only contribute to process control without the possibility of its improvement. In this situation, Control Charts are treated as a kind of "lifebelt," which will be used in case of reclamations. Analysis of key characteristics of the use of Control Charts only in the case of "emergency" situations as documentation of the correct process. Kowalczyk (2012) also stated that the next mistake is trivializing the role of the manufacturing employee, whose task is to conduct Control Charts without any substantive preparation (an employee receives specific guidelines which he must follow, without the possibility to make any decisions, e.g. on stopping the process or signaling the need to introduce corrective actions). In these types of situations, SPC comes down to a rigid indication of relevant statistics and creating documentation, which eventually turns out to be useless.

Classic Control Charts were introduced in the 1920s, when the dominant model was mass and multi-series production. Constantly progressive economic and social transformations, globalization and the unification of the market, as well as technological development, in a natural manner changed the type of production in enterprises. As a result, it appears that traditional SPC tools (including Shewhart's Charts), due to certain assumptions cannot be practically used in an appropriate manner.

Increasingly, a trend can be observed of companies undertaking production of small batches and in short production runs (which is particularly evident in micro and small enterprises). Multi-assortment production and short production runs are very often associated with frequent retooling of machines within one manufacturing process. This in turn leads to a situation where there is no possibility (also due to lack of a sufficient amount of time) of obtaining a sufficiently large sample to determine the stability of the manufacturing process. Kujawińska & Więcek-Janka (2010) emphasize that a large amount of various types and configurations of the manufactured products lead to the establishment of an "infinite" number of control charts each time there is a change in the assortment. In addition, studies of real production processes carried out by Kujawińska & Więcek-Janka (2010) and Boypati, Nasiru & Lakshmi (2015) indicate that the assumption of a normal distribution of the measurement data is not always respected. Kujawińska & Więcek-Janka (2010) proved that the use of Shewhart's Charts in this type of situations can lead to, among others, the appearance of false alarms indicating process deregulation, failure to detect special causes or deterioration of the course of the process.

Due to the situations mentioned above, a number of theses have appeared related to the new Control Charts for example Boypati, Nasiru & Lakshmi (2015), Ali, Pievatolo & Göb (2016), Mohammed, Panesar, Laney & Wilson (2013), which have been adjusted to specific situations which occur in the manufacturing process. Therefore, there is a real need to elaborate their classification. The aim of this article is to update the division of the selected Control Charts and prepare their concise description, which takes into account the most recent scientific findings and market trends.

**Classic control charts of Shewhart**

Dahlgård, Kristensen & Kanji (2000) indicate that the first Control Charts were developed in 1924 by W. A. Shewhart, in order to determine the boundaries in which a manufacturing process should be held (i.e. variation control). As is well known, no production process proceeds in a perfectly stable manner, due to the existing, previously mentioned, common and special cause, whose definitions, in accordance with ISO 3534-2 (2010) standard, are as follows:

- **common cause** - "factors typically existing in large numbers, where each of them is of relatively little importance, leading to variability, which must necessarily be identified",
- **special cause** – "factors (usually systematical), which can be detected and identified as those causing qualitative property changes or changes in the level of the process".
Hamrol (2009) underlines that, in case of using Shewhart’s Control Charts, it is important to preserve the assumption of the normal distribution of the measurement data or being as close to normal distribution as possible, which means that the process is statistically regulated. Failure of meeting this assumption determines the need to apply a different type of Control Chart, due to the emerging risks which will be described in the next chapter.

To verify whether the distribution of the measured data is normal or close to normal, a so-called pilot sample should be carried for at least 100 observations (these data are usually read from a Check Sheet). Then, based on a histogram or an appropriate statistical test, a verification of the assumption of normal distribution occurs. Next, an assessment of the process’s capability is carried out, which, depending on the branch should be maintained at the level of \( c_p \geq 1.33 \) (\( c_p \geq 1.66 \)).

If the above assumptions are met, an appropriate Control Chart should be chosen, taking into account the kind of studied feature/product characteristic (measurable or unmeasurable), as well as the size of the taken samples which are usually determined by economic reasons (Fig. 1).

The above division determines two methods of implementation and design of Control Charts - design and stabilization. Kowalczyk (2012) writes that the first of them concerns the charts with pre-defined normative values, thanks to which it is possible to check whether the tested feature is significantly different from the specified normative values, with values greater than expected (it is assumed that the production process is affected by a special cause). On the other hand, according to Kowalczyk (2012), the stabilization method is based on the determination whether the studied measurements differ between each other by a value greater than that which should only be attributed only to random disturbance.
When conducting Control Charts, the abilities to read the stability of the process and interpret graphs are equally important. In general, when monitoring the process with the use of Control Charts, it is expected that subsequent points on the graphs will be arranged symmetrically around the center line. In addition, the ISO 8258+AC1 standard (1996) describes 8 situations that may indicate process deregulation, they are the so-called process configuration tests:

- one point outside zone A,
- fifteen points in zone C above or below the center line,
- nine subsequent points in zone C or beyond it on the same side of the center line,
- six consecutive points constantly increasing or decreasing,
- fourteen points subsequently alternately increasing and decreasing,
- two of three consecutive points in zone A or outside it,
- four out of five consecutive points in zone B or beyond it,
- eight subsequent points on both sides of the center line, but none in zone C.

Olszewska (2008) emphasizes that the above-mentioned configurations do not determine a one hundred percent deregulation of the process. They only constitute information about any worrying symptoms of deregulation.

Modern Control Charts

The author presents a suggestion for the division of Control Charts, meeting the needs of the twenty-first century, and defines them as Modern Control Charts (Fig. 2). Two main categories of Modern Control Charts have been distinguished: Shewhart’s classic ones (this type of chart persists to be used in the industry) and the new generation (Olszewska (2008) defines it as an alternative to Shewhart’s Control Charts in the case where no assumption listed in the previous section is met, as well as one identifying even small results of special interferences much faster). In turn, the charts of the new
generation are grouped into four subcategories: Sequential, Adaptive, Standardized and Special (the distribution of Shewhart's Charts is in accordance with Fig. 1).

According to Bartkowiak (2011), Sequential Charts prove greater sensitivity to the variability of the process in comparison to Shewhart’s Control Charts and are used to detect emerging trends and small shifts in the average value of the production process. Montgomery (2009) notes that Shewhart’s Control Charts use information about the process originating from the last observation of a sample and ignores all the information provided by a whole sequence of points, which, in turn, causes them to become less sensitive to small changes, e.g. technological ones. Among sequential charts, the following can be distinguished: Cumulative Sum Control Chart (CUSUM), Move Average (MA) and Exponentially Weighted Moving Average (EWMA). Their descriptions and application examples have been described, for example, by Sałaciński (2009).

Olszewska (2008) indicates that Adaptive Charts constitute an alternative to Sequential Control Charts, as they are also very sensitive to small changes in the process. Generally, the design and operation of Control Charts requires the determination of three parameters: sample frequency, sample size, coefficient for control limits (it determines the distance of the lower and upper tolerance limit from the Center Line respectively and is expressed in the number of standard deviations). According to Psarakis (2015), a Control Chart is considered to be adaptive if at least one of the parameters can be changed in real time depending on the position of the observation of the previous samples with respect to Control Limits. Psarakis (2015) notes that Adaptive Control Charts are more efficient than Shewhart's Charts, as they use archived data to determine the future scheme of the process. Psarakis (2015) described the rules for process control with the use of Adaptive Control Charts, according to which if the current measurement is too far from the Center Line, there is a suspicion of displacement of the process. Otherwise, it can be concluded that the process runs properly. Therefore, if the measurement is within the Control Limits and at the same time close to them, it is reasonable to increase the sample size while at the same time reducing the sampling frequency. Whereas, in a situation in which the measurement is close to the Center Line, it is possible to reduce the size of the sample while increasing the sampling frequency. The principle of extracting Control Limits both for a normal distribution (e.g. Variable Sample Size chart - VSS, Variable Sampling Interval chart - VSI, Variable Parameters chart - VP) as well as for other than normal (e.g. symmetric and asymmetric Burr's Charts) has been described, e.g. by Olszewska (2008).

Kowalczyk (2012) indicates that the Standardized Charts have use in the case of production characterized by short series. They are versatile in application and do not require practically any prior assumptions. Exemplary Standardized Charts are the Z and Z* Chart (both are most often conducted with a moving range of mR), u* and p*. Oakland (2004) suggests using a Z or Z* Chart in a situation in which the numerical values of tolerance significantly differ from product to product. Kowalczyk (2012) indicates that this type of charts is perfect for the analysis of products with different parameters on a single chart.

In turn, Special Charts were divided into: Short Series, Multivariate, for monitoring the Time Between Events, distributions other than normal and for autocorrelated data. Boyapati, Nasiru & Lakshmi (2015) note in the case of short production runs, data for determining Control Limits is usually lacking, because the process is completed before they are estimated, leading to a situation in which stability assessment occurs afterwards. Boyapati, Nasiru & Lakshmi (2015) also indicate that in cases when it is possible to collect the appropriate amount of data, it is followed by conversion of machines and changing assortment, which is connected to the establishment of a new chart. In these types of situations, charts like Deviations from Nominal (DNOM-mR), Mean and Range Short Run Control Chart (X-R short run), Qusenberry (Q chart) or Hiller are well suited. A way of determining Control Limits has been described by Qusenberry (1991) and Hiller (1967, 1969) respectively. It turns out, however, that these charts are by far the least frequently used in manufacturing enterprises, though they are constructed on the basis of a few preliminary measurements. Kujawińska & Więcek-Janka (2010) indicate that the DNOM Chart is used for a situation when the process variability with respect to specific series is identical (which is subject to additional verification). The way of determining Control Limits for these type of control charts has been described, for example, by Montgomery (2009).
In their studies, Ali, Pievatolo & Göb (2016) indicate that in order to control high-quality manufacturing processes, which require a very low level of defectiveness (expressed mostly in pieces per million produced) characteristic to automatic production (i.e. arms systems, integrated circuits) the so-called Between Time-Events Charts (TBE Charts) are to be used. Instead of controlling the number of events occurring in a specific sample interval, TBE graphs monitor the time between the occurrences of events. According to Yen, & Chong Ha (2013) the term "event" refers to the appearance of incompatible components in the manufacturing process, e.g. failures in reliability analysis, accidents, arrival of client, etc. whereas, the "time" refers to other variables (both discrete and continuous) monitoring the number of observations between subsequent events. These are the so-called Synthetic-Type Control Charts. Examples of their use have been described, e.g. by Yen, Vhong, Ha (2013) or Ali, Pievatolo, Göb (2016).

There are many situations in which simultaneous monitoring and control of two or more associated qualitative features/characteristics is necessary, and their independent control may prove to be misleading. According to Montgomery (2009), this is caused by the fact that both the error of the I type (recognizing that the process is dysregulated in the case of its stability) as well as the probability of the occurrence of an observation in Control Limits are not the same as in the case of a one-factor chart. The answer to this type of need is constituted by Multivariate Control Charts i.e. Generalized Variance Control Chart (GV Control Chart), T2 Hotelling Control Chart, Cumulative Cum for Individual Observations (MCUSUM) and Mean Values (MEWMA). Their description can be found e.g. in the work of Montogomery (2009).

The most commonly occurring distributions of measurement data, apart from normal distribution, are skew distributions. For inclined populations, Karagöz and Hamurkaroglu (2012), indicate the risk of the occurrence of a false alarm increases along with the value of the k₃ asymmetry index, the reason is the discrepancy in the variation of the normal and asymmetric distribution. In literature, a number of heuristic methods can be found used to indicate the Control Limits in the case of distributions other than normal (including skewed), with the use, for the example, of skewed distribution percentiles, the Skewness Correction Method (SC Method), the Weighted Variance Method (WV Method) or the Weighted Standard Deviations Method (WSD Method). The idea of determining the Control Limits for this type of charts has been described by for example Karagöz and Hamurkaroglu (2012) as well as Czabak-Górska (2016).

Magaji, Yahaya, & Asiribo (2015) point to the fact that in the case of continuous processes, the assumption of measurement data independence is not always assured, in particular when subsequent units are similar to each other. They also point out that along with the increased dependence of data, the probability of the occurrence of false signals on the Control Chart increases. Karaoglan & Bayhan (2011) suggest three possible approaches to the control of correlated data:

- modification of data using the Autoregressive Integrated Moving Average model (ARIMA) and classic Shewhart's Charts,
- the adjustment of standard control limits in conventional Control Charts to account for autocorrelations resulting from the observation of the process,
- eliminating autocorrelation from the data with the use of Engineering Controllers.

Additionally, Keller (2011) suggests the use of dedicated charts i.e. Regression Control Chart, EWMA Chart with Moving Center Line, Batch Means Charts.

**Conclusion**

An accurate selection of Control Charts for a particular type of production and economic conditions constitutes an important element of monitoring and improving production processes. Ignoring the assumptions which constitute an integral whole with which a particular type of Control Chart may result in, inter alia, a situation where the stability assessment process is inadequate, which may in the end even result in its deregulation. A Control Chart which is improperly adjusted to the process may indicate false signals suggesting the appearance of special causes or in extreme cases even "mask" them, which may also lead to a shift in the process setup.

In the recent years, Control Charts have been booming again. Many scientists have undertaken the adaptation of the classic idea of conducting Control Charts to the modern production conditions, i.e. Ali, Pievatolo, Göb, Yen Chong Ha. Thanks to this, it is possible to avoid committing basic errors
implying the formation of the above-mentioned situations. Modern Control Charts, i.e. Sequential, Adaptive, Standardized or those defined by the author as Special Charts can be much more effective than traditional Shewhart’s Charts, but require a very good diagnosis of the process nature, i.e. whether the distribution of the measured data is of a normal distribution character or other than a normal type of production, etc.

Changing the type of production of modern manufacturing enterprises (for meeting the expectations of customers) from mass production to small-series production leads to a lack of possibilities to take a sufficient sample (often multi-element) in order to conduct a pilot test which ultimately leads to the abandonment of the idea of process control using Control Charts. In such cases, assessment of stability usually occurs afterward, and the employees and management do not have the possibility to undertake appropriate steps at the right time, to prevent and eliminate the formation of errors. In turn, the inability to monitor processes using one Control Chart in the case of for example multi-assortment production causes great confusion and leads to the formation of useless documentation as well as entails huge costs and is completely unprofitable.

AN ANALYSIS OF OCCURRENCE OF THE HIDDEN FACTORY PHENOMENON IN PRODUCTION – BASED ON THE SELECTED YIELDS – CASE STUDY

Izabela Dagmara Czabak-Górska,¹ Marcin Lorenc²

Abstract: This article describes a procedure for identifying the phenomenon of ‘hidden factory’ based on classic and Six Sigma yields, a term attributed to wastefulness during production. The paper presents a study that aims to establish a method for improving the efficiency of production by eliminating this wastefulness. The first part of this article presents a synthesized review of the current literature regarding the negative influence of the ‘hidden factory’ on production efficiency. The theoretical considerations involve a case study with quantitative data collected from a metal foundry of Zawiercie in Poland, which specializes in producing iron castings, including connectors for water, gas, and vapor installations, as well as minor machine castings. The results indicate a hidden factory within this company’s production line. The analyzed example underlines the efficiency of the applied method for detecting the undesired phenomenon of the ‘hidden factory.’

Introduction
Growing competition as a result of globalization is causing production companies to search for new ways of improving their financial gains. In many areas, the fiercely strong rivalry between competitors makes it impossible to raise the product prices that would quickly and directly lead to financial success. Porter (1979) stresses that except for the intensity of competition in a given branch, four other factors can influence profitability in varying degrees, though managers, especially production managers, have little influence on these factors. Nevertheless, there are other areas, as defined by Gryffin (2010), where their efforts can achieve smooth and efficient operations in managing production. This article focuses on one such area, the problem of the ‘hidden factory,’ which directly influences the efficiency of manufacturing and consequently, the final financial outcome of a company.

Literary Review
The Phenomenon of the ‘Hidden Factory’
Harry and Schroeder (2005) defined the ‘hidden factory’ as all processes, activities, and systems aimed at correcting errors arising in the various stages of production. Miller (2001) stated that the ‘hidden factory’ does not lower the fulfillment of client’s expectations (most frequently expressed in a nominal value and tolerance limit). To the contrary, to a large degree, it increases the company’s requirements for fulfilling client’s expectations. Miller (2001) also underlined that it generates problems connected with costs, which usually increase due to the lack of awareness of such a phenomenon. According to the research of Kosiny (2013), the savings resulting from the reduction of the costs connected with the ‘hidden factory’ are directly proportional to the savings from Six Sigma projects. Also, spending to improve the quality is nonrecurring and results in long-lasting profits.

Furthermore, Dobrzyński and Waszczura (2012) stressed that, in the end, maintaining a ‘hidden factory’ considerably overrates the quality of production (‘sigma’ level). Therefore, it is imperative that companies become aware of this phenomenon. Figure 1 depicts the operation of a ‘hidden factory.’

The product is processed in the order in stages from 1, 2, 3, 4 to 5 (Figure 1). Figure 1 shows flaws detected at stage 3 with the product being returned from stage 5. This is usually performed without the knowledge and consent of management where the detected flaw is eliminated, and then the product is moved to position 6 where the final operations are carried out, and the control of the finished product is run. Such activities negatively influence production, and the company incurs additional costs because the time of production has been lengthened, while management is unaware of the disturbances occurring in the process. Nawrocki (n.d.) underlines that the ‘hidden factory’ does not improve production. Moreover, long-term, it becomes an integral part and is unnoticed by management, and

¹ Faculty of Production and Logistics Engineering, i.czabak-gorska@po.opole.pl
² Faculty of Production and Logistics Engineering, m.lorence@po.opole.pl
thus, in turn, leads to wastefulness by the company. Identification of the ‘hidden factory’ phenomenon is relatively straightforward and is based on a comparison of classic and Six-Sigma derived yields. Thompson et al. Nieckula (2005) revealed the weak aspects of classic yields, which usually appear after the occurrence of the ‘hidden factory.’ They are critical of the first-time yield, which does not include the number of flaws per selection unit nor the entire set of processes necessary to manufacture a product. Thompson et al. (2005) identified the superiority of yields from the Six Sigma method compared to that of the classic. The advantage is due to the former’s selection method, i.e., counting flaws as well as faulty units. Also, Miller (2011) believed that the difference between rolled throughput yield and final yield should alert companies to the true efficiency of their operations, which is relatively low, and that their ‘hidden factory’ exaggerates the fulfilling of clients’ expectations. Interpretation and functional dependencies of yield from both classic and the Six Sigma approach are described in Czabak-Górska and Lorenc (2015).

Data and Methodology

‘Hidden Factory’ Phenomenon – Case Study

The identification of the ‘hidden factory’ was carried out for a casting production line at Odlewnia Żeliwa S.A. in Zawiercie (Poland). This metal foundry specializes in producing iron castings, including connectors for water, gas and vapor installations, as well as minor machine castings. Production at the foundry consists of various stages (Figure 2). The production line operates on technology with mechanical extra-operational transport.

The results of the quality control documentation shown in Figure 2 formed the basis of the analysis. At each production stage there was a possibility of the following casting flaws that were listed as critical for quality: a fold or teeming arrest, dent, or burst (quality controls 1–3); precipitation, cold lap, or transposition (quality controls 1–3); and exterior bubble, ignition, or hot cracking (quality control 1).

Throughput yield denoted the probability of manufacturing all elements of a product in compliance with requirements. The normalized yield was the average of throughput yield expected at any stage of production. The yield (Y) denoted the probability of manufacturing all elements without a flaw.

Results and Discussion

Figure 3 compares incompatible products and other incompatibilities at every investigated stage. It also shows the yields, for throughput and rolled throughput. The remaining results are compared in Table 1.

At the beginning of manufacturing, the process planned to produce 2 365 units of castings (Figure 3). After manufacturing, the molds, pouring, and castings shake-out stage had 15 rejected pieces as waste products (i.e., defects unfit for further processing and subject to re-melting). At this stage, there were 395 pieces of castings that needed repair with a total 450 units detected with defects. Continuing operations, i.e., the finishing of castings and mechanical treatment of castings, involved 2 350 pieces. Quality Control 2 showed 10 units of castings needed repair and 30 had casting defects, without demonstrating the need to recognize any nonconforming unit. Then, after mechanical treatment of castings, none of the castings had defects, and there was no need for repair (Figure 3).
The first-time yield (FTY₁) indicated that stage 1, preparing the matrix, potting, and striking castings, was the least efficient, from the perspective of fulfilling clients’ expectations (Table 1). The probability that a product will pass a quality control in this first stage was 82.7%, which is 16.9% lower than that for the finishing stage. The results indicate 100% efficiency of the mechanical processing. The final yield showed that 17.1% of castings would not pass the quality control the first time. The number of flaws per million possibilities was 11 276 (Table 1), which is an extremely high value. In the three-sigma approach the ‘perfection threshold’ for defects per million opportunities (DPMO) is 0.002 and in Six Sigma method, 3.4.

The probability that a flaw would not appear in the product as a result of the process (Y) was 81.5%, which is a value close to the probability compatible with the requirements of manufacturing all elements of the product (81.6%). As well, it corresponds to a probability that the product, having passed through the entire process, will be without flaws (81.6%). The ‘sigma’ level was 2.33, which is an exceedingly poor result that leads to the conclusion that the process needs improving.

Comparing final yield (FY) with the rolled throughput yield (YᵣT) showed a 1.3% difference, which infers a ‘hidden factory’ in the process. Furthermore, the higher value of the normalized yield (Y₉A) of 93.5% compared to yield (Y) and throughput yield (Yᵣ) means that correction activities can be undertaken. This conclusion results directly from the definition of the indicators, which denote respectively: average expected as throughput yield at any stage of production (Y₉A), probability that processing would proceed without a flaw (Y) and probability of manufacturing all elements of a product in compliance with requirements (Yᵣ). Additionally, another concern is the activity of the ‘hidden factory’ with the relatively low ‘sigma’ level. In addition, the coexistence of the ‘hidden factory’ phenomenon with a relatively low ‘sigma’ level can cause that the efficiency of the production to be significantly inflated. As a consequence, the elimination of the “hidden factory” phenomenon without implementation of suitable strategies for improvement may result in a high percentage of defective product.

**Conclusion**

The problem of the ‘hidden factory’ in production facilities often ensues completely unnoticed by the management of the company. As the low to medium level managers, and particularly employees working directly on production lines, believe that flaws in production are a natural consequence of the whole process, such a phenomenon ‘must’ appear with regular frequency. At the same time, this personnel does not undertake appropriate activities aimed at improving the efficiency of the whole process. This study focused on identifying the phenomenon of a ‘hidden factory’ based on classic yields and those used in Six Sigma. The suggested yields were used to analyze production at a metal foundry in Zawiercie (Poland). The obtained results show the presence of a ‘hidden factory’ in the manufacturing of this company. As a way to improve the company’s competitiveness, and at the same
time, its financial gains, it is recommended the board of the company undertakes activities for maximum constraint of the ‘hidden factory.’ In particular, a situation where the running of production is characterized by excessive defects (high DPMO yield) and low efficiency (low ‘sigma’ level) indicates a borderline between an uncompetitive and competitive middle-class enterprise.

ACCOUNTING AS A 21ST CENTURY BUSINESS VALUE DRIVER
Marius Costin Daraban

Abstract: Companies have focused for decades on maximizing the value creation process of direct productive business activities. The information revolution has left its mark and has started an irreversible transformation of classical business processes and activities. In the new 21st century information and data driven society, commodity is value and knowledge, making Porters value chain concept an important key factor for successful and innovative businesses. Business value creation was during the industrial revolution a topic strictly liked to direct productive activities. The increased and transformed business environment required innovative and sustainable competitive advantages for business organizations. The indirect productive business activities, and the business support services have been considered business value consuming and having no contribution towards the company value chain. 21st century accounting has evolved from the role of record keeper to a business value driver that assures and contributes to the company value chain by using its internal knowledge pool. The existing scientific publications are approaching accounting from different perspectives and support the main conclusion of the paper: accounting, in the 21st century is not a “bean counter” anymore, accounting is a certain and consistent business value driver.

Introduction
The activities within any company are direct productive and indirect productive, or business services directly linked to the outcome of the company and business support services that support and enable the smooth and plane business operation.
The 21-st century, also known as the information revolution century, where the information revolution has made its mark on the classic approach of doing business. Information and information management has become one of the key “commodities” of the modern, profitable and efficient company. Information management has become the defining element of the modern, efficient and sustainable business.

Any activity with a company must have a productive, useful, and efficient outcome regardless of the direct or indirect relation to the business output and core activity.
The purpose of this paper is to show that indirect productive business activities, also known as business support services, are 21st century business value drivers that need to be handled with care, properly managed, and measured.
Accounting is a “classical” example of indirect productive business activity that will be used to demonstrate the research hypotheses of this paper. The research hypotheses of the current paper are:

- Accounting activities as knowledge based organization
- Accounting activities as a business value generator
- EVA of accounting activities

Genesis of accounting
Concerns of numeration and counting can be traced back to the early development stages of human society. The development and establishment of states and authorities that have as a basis a form of taxation as a public income have necessitated besides the knowledge of numbers also the knowledge of calculation and counting. The need of recollection of numerical topics can be considered as a very early form of keeping accounts and records. This need of keeping records of numerical facts has laid the foundation of the science of accounting.

In 1495 Luca Pacioli published in Venice his book “Summa de arithmetica, geometria, proportioni et proportionalita” (Summary of arithmetic, geometry, proportions and proportionality)” that was a comprehensive summary of Renaissance mathematics, including practical arithmetic, basic algebra, basic geometry and accounting, written in Italian for use as a textbook. (Wikipedia, 2017). In one of the sections of his book about business, the section Particularis de computis et scripturis (Details of calculation and recording) describes the accounting system used by the Renaissance Venetian

1 Lucian Blaga University of Sibiu, marius.daraban@ulbsibiu.ro
merchants and this is one of the first documented sources about the today's double entry accounting system.

Since Pacioli was a Franciscan friar, he might be referred to simply as Friar Luca. While Friar Luca is often called the "Father of Accounting," he did not invent the system. Instead, he simply described a method used by merchants in Venice during the Italian Renaissance period. His system included most of the accounting cycle as we know it today. For example, he described the use of journals and ledgers, and he warned that a person should not go to sleep at night until the debits equaled the credits! His ledger included assets (including receivables and inventories), liabilities, capital, income, and expense accounts. Friar Luca demonstrated year-end closing entries and proposed that a trial balance be used to prove a balanced ledger. (Smith, 2013, p. 2).

**Role and fields of accounting in business organizations**

Accounting is also known as the “language of a business” because it communicates the information that owners, investors, managers and government use to evaluate the business performance towards the ultimate business goal to create value for its stakeholders and shareholders. The generic role of accounting can be defined as a sum of three key activities: record, report, and interpret financial data that are used for business decision making.

The key basic activities of accounting can be challenging, especially in the dynamic changing, globalized markets. The recording and reporting of financial data is made easy by the 21st century modern accounting software packages, that enable a more standardized and uniform approach to accounting rules and standards. The recording and reporting of financial transactions, also known as financial accounting, is governed by standardized rules and regulations defined by fiscal and tax authorities and accounting organizations. Governments define the fiscal and tax rules and regulations for their economic environments, that every business organization must follow.

Independent worldwide recognized organizations like FASB (Financial Accounting Standards Board) that have issued GAAP (General Accepted Accounting Principles) that are widely used, with local variations, in the Anglo-Saxon countries. Due to internationalization and globalization of business and financial worlds the IASB (International Accounting Standards Board) have issued the IFRS (International Financial Reporting Standards) that are widely accepted and used by European companies and non-US-based companies.

Due to an ever-increasing business complexity that implies a more and more globalized approach and because of the fully internationalized capital and financial markets companies worldwide are starting to adopt IFRS as an accounting standard.

Because of the needed standardization of accounting principles, the development of modern accounting software has made the recording and reporting of the financial statements, also known as financial accounting, more simplistic, standardized and streamlined. The recording and reporting of financial data has become today a “commodity,” a standardized process that will evolve and develop into a world-wide standardized process that allows easy comparability and understanding.

The interpretation, communication and management of financial data, also known as management accounting, is the more demanding and complex of the accounting activities because it is more flexible, it is not regulated so much by 3rd parties, and requires and particularized approach.

**Accounting as an internal knowledge based organization**

The key defining concepts of the 21st century are information and knowledge that have had a major impact on business organizations all over the world. Business organizations must redefine their strategies and their values to assure their competitive advantage in the increasingly fast moving global market place. (Daraban, 2016, p. 1).

A knowledge based organization is an organization where workers use processes and infrastructure to produce, change, manage, use, and share knowledge based products and services to achieve the organizational goal. (Daraban, 2016, p. 4)

The generic role of an accounting department is to record, report, and to read the financial data of business organization. Therefore, it can be concluded that accounting is meeting all the main characteristics of the 21st century knowledge based organization.
The accounting organization uses defined and established processes and infrastructure in the collection, recording, and reporting of financial data. The collection, recording, and reporting of financial data is strictly regulated by financial and fiscal authorities and is the main activity of financial accounting. The regulations need to be understood and implemented by the accountants for each specific business case or business model. The created records and reports are shared with internal stakeholders, that use the received information for the business and management decision process, and external stakeholders (like government, suppliers, clients, investors, etc.) that use the information for the business performance evaluation. Financial accounting is the form of reporting business performance, and value creation, in a form imposed by governments, that has transferred the business value creation through accounting to business entities for a price, taxes and fees. Financial accounting is a mandatory activity for all business activities, worldwide, having as stakeholders the business organization and the local fiscal authorities and regulatory state organizations. Because of its implications, possible penalties and legal responsibility, financial accounting can make or break a business if taken lightly. Non-compliance with fiscal regulations can lead to insolvency and bankruptcy. Therefore, financial accounting is a radical business value creator or destroyer through the knowledge and understanding of accounting rules and regulations.

Management accounting is using and “translating” the financial accounting information and received knowledge, in form of financial statements, into data that is used by and in the management and business decisions process. The “translated” financial accounting data, received in form of the financial statements, are reinterpreted by management accountants for the business value optimization process; one major objective being cost reduction, legal minimization of tax obligations. Both accounting fields, that are quite different but serve a common goal, strive towards the achievement of the ultimate business goal of value creation by recording, reporting, and reading financial data. Financial accounting is more retrospective by analyzing and reporting on past business actions, whereas management accounting is using the past analyzed events and is trying to find the best options and alternatives to improve and increase the efficiency and value of the business.

One of the knowledge generators of the 21st century modern, knowledge and information driven, business organization is the accounting organization that records, handles, and disseminates information based business internal and external rules and regulations like an independent, external knowledge based organization.

**Accounting as a business value driver**

Value creation is the most important goal of any business activity. By assuring the continuous business value creation through stable, efficient and innovative processes the company safeguards its future and assures its competitive sustainable advantage.

Therefore, in an ever-increasing business complexity, globalization and internationalization of business processes and transactions business organizations must tap and assure that all available and available resources are used at their maximum efficiency and effectiveness.

To be able to survive companies must develop mid and long term strategies that give them the sustainable competitive advantage by efficient and profitable set up of all involved business processes.

“Competitive advantage cannot be understood by looking at a firm as a whole. It stems from the many discrete activities a firm performs in designing, producing, marketing, delivering, and supporting its product”. (Porter, 1985, p. 33)

In his book, Competitive Advantage, Michael Porter is defining primary and support activities as being contributors to the “margin,” and profitability of the business. In the defined value chain, under Firm Infrastructure he mentions the business support services as being the services that support and sustain the rest of the business. The contribution of business support services towards the creation of business value has been recognized and determined by Porter in his book, Competitive Advantage, 1985 where he introduced the value chain concept. In the value chain concept, the support services, which also include accounting, are listed under support activities that contribute to the margin of the business.

Triggered by the information revolution and by the huge developments and changes in information management and IT systems and infrastructure the classical concepts have been undergoing an irreversible change and development process.
At the time when Porter introduced the value chain concept as being the sum of all discreet business activities, in 1985 the impact of the information revolution and information technology was in the early stages, at that time the business activities have been seen in their classical view.

The support services, including accounting, have been understood in the “classical role.” Accounting has been seen and defined as a record keeper and nowhere close to the value driver role of the 21st century. Since 1985 accounting has been going through major changes in concepts, understanding of business transactions and use of accounting tools.

Accounting has been undergoing major transformations determined by the internationalization and globalization of businesses and of the increasing complexity of business transactions. Today’s financial accounting is characterized by the following aspects that reflect Porter’s value chain and is contributing to business value creation and margin increase:

- Financial accounting is following besides the local statutory fiscal and financial legislation, IFRS principles that allow a standardization and comparability of financial statements almost worldwide determined by globalization and increasing internationalization and complexity of business transactions
- Today’s financial accounting systems enable a higher standardization and commoditization of transactions recording by elimination of points of failure and increase of transparency
- Most of the today’s modern financial accounting systems are real time systems, most transactions are visible and show their business impact
- Statutory reporting is automated and is supported by the integrated ERP’s
- The understanding and interpretation of the financial data and financial accounting records can be enabled by usage of business intelligence software tools that allow an automated transformation of data and financial records for decision making and business analysis

Because of the transformations that the support services have been going through the classical approach of support services has suffered a dramatic change. Accounting has developed from the classical role of record keeper to a real business value driver. The business value driver role is conditioned by the development and adoption of:

- Modern information and management systems that enable and support rapid and accurate recording, dissemination and interpretation of the financial data used for management and business decisions
- Value based management that implies a consistent change in the view of classical concepts of business and management, the business activities (primary and secondary activities) need to contribute to the growth, profitability, and efficiency of the company

A value driver is an activity or capability that adds worth to a product, service or brand. More specifically, a value driver refers to those activities or capabilities that add profitability, reduce risk, and promote growth in accordance with strategic goals. (Rouse, 2016)

The considerations and developments of the 21st century has put accounting into a new position that added to the classical role of accounting features that enabled the transformation of the classical view. The modern accounting meets has benefited from the information revolution; data recording and dissemination has increased in speed and accuracy that enabled value creation by information availability in due time for the business and management decision process.

**Valuation of accounting services**

Value is not easy to determine, especially if we are talking about intangibles. For tangibles, fixed assets, one way of determining the value is by evaluating its intrinsic value. For the intangibles, immaterial assets it is not that easy to have an objective value.

IAS 38, issued by the International Accounting Standards Board, defines the characteristics of intangibles assets.

**Intangible asset:** an identifiable non-monetary asset without physical substance. An asset is a resource that is controlled by the entity as a result of past events (for example, purchase or self-creation) and from which future economic benefits (inflows of cash or other assets) are expected. [IAS 38.8] Thus, the three critical attributes of an intangible asset are:
• identifiability
• control (power to obtain benefits from the asset)
• future economic benefits (such as revenues or reduced future costs)

**Identifiability:** an intangible asset is identifiable when it: [IAS 38.12]

- is separable (capable of being separated and sold, transferred, licensed, rented, or exchanged, either individually or together with a related contract) or
- arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.

(Deloitte Global Services Limited, 2017)

Based on the definition of intangibles, accounting activities, are meeting most requirements. Accounting activities are only indirect identifiable through the human resources, specifically the finance professionals that are performing the activities. As an employee of the company or as an outsourced activity the accounting activities are under the full control of the firm. The future economic benefits are very clear, without accounting activities the firm would not be able to operate legally nor would it have needed financial information about business operations, if we consider the different accounting fields, financial accounting and management accounting.

Under the IAS 38 definition we could assume that the involved human resources in accounting activities are the assets that the firm has bought and invested.

An invested capital, in this case in accounting staff and systems, is expected to have a contribution towards the value creation of the firm. Common indicators to measure the return of invested capital and the value addition of the invested capital are ROIC (return on invested capital) and EVA (economic value added).

ROIC is defined as the ratio that shows how profitable the invested capital is turned into profits whereas EVA is defined as a measure of surplus value on the investment.

ROIC and EVA can be determined per the formulas from below:

\[
ROIC = \frac{NOPAT}{IC} \Rightarrow NOPAT = ROIC \times IC \\
EVA = NOPAT - CC = NOPAT - (WACC \times IC) = (ROIC \times IC) - (WACC \times IC) = IC \times (ROIC - WACC)
\]

Where

- ROIC = return on capital employed
- NOPAT = net operating profit after tax
- IC = invested capital
- WACC = weighted average cost of capital
- EVA = IC \times (ROIC - WACC)

The valuation of the contribution of accounting services cannot directly be determined, the services being indirect productive and not having direct impact on the sales of the firm. Therefore, it can only determine when EVA is positive, when value is created and accounting is contributing to the value chain of the firm.

\[
ROIC - WACC > 0 \Rightarrow EVA > 0 \text{ the company is creating value through its growth and assures that the expectations of investors are met.} \\
ROIC - WACC < 0 \Rightarrow EVA < 0 \text{ the company destroys value and needs an immediate adjustment of operations} \\
WACC \text{ is the minimal level of return on invested capital where no EVA is generated by business development and growth.}
\]

For accounting services, it can be considered that the invested capital is the total amount paid as salaries for the accounting team as a way of procuring the needed and mandatory resources, knowledge in the case of accounting activities. Financial accounting is mandatory for most of the world markets being imposed by financial and fiscal local authorities; it can be considered as being the cost of doing business in a specific market, cost that is being paid to the market regulator and supervisor.
To have a legal running business that is based on sound economics and profitability, the minimal return on invested capital would be at least at the level of WACC, where EVA neutrality (EVA = 0) would be assured.

**Conclusions**

Value creation has become a central problem concerning enterprises. It is invoked mainly by shareholders, but also by managers and financial analysts, as it represents an imperative for the company, but also a key factor for justifying major decisions (for example, activity cessions, disinvestments operations, staff cutbacks, etc.). Value creation for the shareholders should be constant. (Petrescu & Apostol, 2009, p. 1)

The financial theory emphasizes the importance of maximizing shareholder wealth as the ultimate goal of business firms. At present the business environment is faced with numerous challenges that can have a major impact on the performance of firms. (Vasilescu & Popa, 2011, p. 1)

Companies are facing a major hurdle, to survive globalized and the complex business environment. Nowadays companies must excel in all their functional and organizational areas by creating a steady and sustainable flow of value. In their quest for value creation companies must reinvent themselves and innovate the classical way of doing business. Therefore, a detailed and very systematic analysis must be performed on all business processes and activities to assure that no growth and value creation potential remains untapped.

For decades’ companies, during the industrial revolution, have focused mostly on the direct productive activities and their extensive development to assure growth and profitability. The impact and challenges of the information revolution, combined with the complexity, internationalization and globalization of business environments have led companies to focus and to maximize the value potential also from business support activities.

A company value stream cannot be considered only coming from direct activities, the economic value stream of a company is the sum of all value streams generated by all business activities direct and indirect.

Modern accounting, with its two major fields financial accounting and management accounting, have left their mark in the development of the company business. The transformation of the classical view of accounting as record keeper has started and is not reversible. During the information dominated markets and societies the accounting is providing business information post- and ante-fact that can and will be used by managers in the business decision process.

Accounting activities, financial accounting and management accounting, have a gain momentum in the business data and information delivery. The provided data and information about past and future business actions have a certain and business value. Management accounting is providing data and information, with help of modern IT tools, that are the basis of modern business intelligence.

Value is subjective and particularized especially for immaterial, intangible services from within business organizations. Economic Value Added (EVA) can be used as a tool for the determination and illustration of the value created by indirect business activities.

The output of accounting activities can be assimilated to the current definition of company intangibles due to increasing complexity and influence and impact of the modern IT systems and tools that make business information more and more available.

ENHANCEMENT OF ASSESSMENT OF THE INTANGIBLE ASSETS OF THE COMPANIES BY MEANS OF SUBTLE SETS
Andrei Diamandescu,¹ Ion Ioniță²

Abstract: The reason for approaching this topic in our article starts from the fact that the value of goodwill (GW), which is an indicator that expresses the intangible value of the company, that is a factor with essential contribution to the company’s market value, is determined through a method which we consider to be imprecise – respectively as difference between the price of sale of the asset and the value estimated by the evaluator. Or, the result obtained by this method is not accurate, and it does not answer the knowledge and information needs of the manager. In this article, we refer to the fact that managers also want to know, besides the GW, the factors that contributed to its achievement and factors that contributed to its achievement and in what percentage. The need appears more important in cases of the sale of companies when both the buyer and the seller are interested in establishing a fair price, based on the market value of the company in question. Starting from this practical requirement, the authors plan to elaborate econometric models based fuzzy set, by which they would determine the right level of the goodwill and to provide information in connection with the generating factors.

JEL Classification Number: G32; DOI: http://dx.doi.org/10.12955/cbup.v5.910

Key words: goodwill, fuzzy sets theory; subtle sets theory; movable assets; tangible assets

Motivation
The property that in economics takes the form of capital is subject to some specific processes such as privatization, sale, division, merger, liquidation, etc., processes that create a market of the companies. The accomplishment of any of these processes requires a complex assessment study of evaluation by which to determine an estimated value that will stay at the basis of establishing the asset’s alienation price.

The evaluation represents the activity of estimation of the value of an asset, concretized in an evaluation report, performed in accordance with the standards specific to this activity and with the professional deontology, by a certified assessment evaluator. Concretely, by the evaluation of an asset, its market value is established, that is obtained by adding to the value of the tangible assets (tangibles), expressed by the net corrected asset (ANC), the value of intangible assets expressed by the goodwill. (Ioniță et al., 2004)

Stock-in-trade is made up of the aggregate movables and immovable assets, tangible and intangible, used by a trader for developing its activity. They are tangible assets (furniture, stocks, etc.) and intangible assets (company’s trademark, goodwill, etc.). Thus, the goodwill in its aggregate is deemed an intangible asset of commercial nature that is however made up of the tangible assets and intangible assets. The intangible assets of the stock-in-trade are divided into groups:
- The assets that are accounted and may be evaluated distinctly. They are recorded individually in the balance sheet and are classified depending on their nature;
- Assets that are not individualized, but are reunited in an aggregate of assets referred to as goodwill, accounting notion that is recorded in the balance sheet and of which calculation represents the topic of our article.

The goodwill, according to the accounting provisions from Romania, represents the part of the goodwill that is not recorded within the other patrimony assets, but which competes in maintaining or developing the company’s potential. The goodwill represents, in fact, the company’s reputation in a certain area, reputation given by the management quality; by the fabrication mark, trade and services; by the company’s customers, and by the commercial connections which it maintains in a certain geographic area, etc. The goodwill is an important factor in the processes of procurement or combination of some companies, as it influences favorably or unfavorably the company’s purchase price and depending on the accuracy that it was established with. (Ioniță & Stoica, 2009)

If the accounting practice makes a difference between the stock-in-trade and the goodwill, the same is proceeded also in the process of assessment of the goods. The intangible assets are part of the company’s patrimony of assets and must be included in the final value established by the evaluator. In

---

² Bucharest University of Economic Studies, Bucharest, Romania, ion_ionita@yahoo.com
the methodology used currently by evaluators, intangible assets of the goodwill are not subject to an evaluation and nor of a separate recording in the balance sheet, however, they contribute in maintaining and development the potential of the company’s activities. In this context, we appreciate that a fair assessment of a company is only the one including in the final value established by the evaluator and surplus of value or of the goodwill which the goodwill generates and that is calculated with a high degree of accuracy. Also, in the evaluation, it must be taken into account the effect of the synergy of the goodwill, in the meaning that its value is bigger than the sum of the values of its assets taken separately.

As the intangible assets bring additional profit in relation with other companies from the same category, but that don’t benefit of the mentioned items and that, as we showed before, determines the goodwill, value of the company \( (V_0) \) should be established by adding GW to the value established for tangible assets, respectively ANC, according to the ratio (Ioniță, 2008)

\[
V_0 = ANC + GW
\]

The calculation of the company’s value by this ration presents however a series of deficiencies deriving, as mentioned, from the modality of determining GW of which its dimension is established in the current methodology of assessment as the difference between the purchase price (or the value of contribution of the stock-in-trade) and the updated value of the asset items. The resulted difference is included in the value of the goods that make the purpose of the sale purchase agreement or that is recorded in the account of goodwill, without knowing the factors that determined it and the weight of participating of each of them. Or, such information is essential for the purchaser’s information that always aims a clear image over the future profitability of the company. In our appraisal, this objective can be achieved by means of the econometric models based on fuzzy and subtle sets.

**Specifications concerning the role of subtle sets and of the fuzzy sets in the company’s assessment**

In connection with the subtlety concept, we mention that it was treated even since the 16th century by the mathematician Gerolamo Cardano in his work “About subtlety” (Cardano, 1554) published in Latin. In the substantiation of the concept, the author specially emphasized the diagnostic and forecasting analysis, items that made such conception be presented also on the current medical practice.

The fuzzy sets although they were studied before by Lukasievicz and by Moisil, were only defined in 1965 by Zadeh, so that further on they can be developed by many more authors (Zadeh, 1965). Although there are separated from the concept treated by Cardano, it may be asserted that by the conception treated in his book, Zadeh anticipates the concept of subtle space, putting the basis of a new way of thinking in the activities developed currently in the vital fields of the economic and social life. Thus, by their means, many applications were made in economics, in psychology, and in sociology. In our country, the model fuzzy sets are applied to the evaluation of the companies (Ioniță et al., 2004). In the economic field, in the case of our evaluation, a big interest for the application of the fuzzy sets is represented by the evaluation of the intangible assets. Although they hold an important weight, in the final value of the company, their evaluation is not made by a rigorous methodology, based on mathematic calculations that would assure us that the result is correct. On the contrary, the evaluation process, as it is developed presently, introduces a series of imprecision items that might be corrected by means of fuzzy sets. In order to clarify the role of fuzzy sets in determining with an acceptable accuracy the value of the intangible assets (generating goodwill), we will analyze the possibility of their application to the evaluation of one of the main factors participating in obtaining the goodwill value in a company. We, however, mention that the method proposed by us may be applied with good results also for modelling some activities from other fields of economics, especially those of management. (Mordeson & Davender, 2014)

**Methods of evaluation of the inventive – innovative potential of the companies based on fuzzy sets**

In accordance with national and international legislation from the field of industrial protection, innovations represents solutions that are applicable to an asset, process, etc. that lead to their perfection, while an invention signifies an original technical solution. The innovation expresses therefore only an improvement with the character of novelty applied to some original technical
solutions. From a legal point of view, the difference consists in rating the term of legal protection as it follows: 10 years for innovations and 20 years for inventions.

The main actions related to the evaluation of the inventive – innovative potential of the companies may classify as follows (Stoica et al., 2006):
- Actions that may be generated by the entire mass of employees of the company;
- Actions that are generated by the company’s specialized services (research-development, designing, trials of prototypes, workshops, etc.);
- Actions generated by specialized institutions and experts from outside the company (consulting companies, universities, research-designing institutes, licensors, individuals, etc.), from the country and abroad.

These actions are followed by a series of technical and economic indicators of goodwill that will be evaluated in a positive way and others of bad will that will be negatively valuated. The indicators represent potential results of effective results. Obviously, for potential results, smaller degrees of trust will be granted than the effective ones (obtained as a result of determinations from the real economic system and not from the simulated system).

Further on, we disclose the method of evaluation of these results for various stages and compartments.

**Evaluation of the innovating potential**

An elementary indicator that must be evaluated is the total number of innovators NTv, of which: Nv1 represents the number of innovators with a single innovation approved; Nv2 - number of innovators with two innovations approved, etc. It is awarded a score for the number of innovators with a single innovation approved Piv1, a score Piv2 for the number of innovators with two innovations approves and so on. The total score PTv, for the number of innovators is:

\[
PT_v = N_{v1} \times P_{iv1} + N_{v2} \times P_{iv2} + \ldots + N_{vn} \times P_{ivn}
\]  
(2)

For the proposals of innovations endorsed NivAF it is awarded a number of points PivAF, and the total number of points is obtained with the following ratio:

\[
PT_{iv}^{AF} = N_{iv}^{AF} \times P_{iv}^{AF}
\]  
(3)

Some of the innovations endorsed affirmatively may enter among those applied immediately NivAl, and others enter in experimenting NivAex. It results that the restriction (4) must be satisfied as a part of the innovations cannot be experimented due to the impossibility of bearing of the experimenting cost by the company:

\[
N_{iv}^{Al} + N_{iv}^{Aex} \leq N_{iv}^{AF},
\]  
(4)

Further on, the innovations accepted after experimenting, noted by NivAp, will be applied in the production process, and the others, that prove unfeasible in technical terms or inefficient in economic terms, will be rejected (NivAex). Therefore, the relations expressed in the following ratios will be observed:

\[
N_{iv}^{Aex} \leq N_{iv}^{Aex} \quad \text{and} \quad N_{iv}^{Aex} = N_{iv}^{Aex} - N_{iv}^{Ap}
\]  
(5)

Of course, the scores increase as the innovations reach a stage closer to the current production. If we note with PivAl the score awarded to innovations that may be applied immediately in production with PivAex the score awarded to innovations that needs to be experimented and with PivAp the score awarded to innovations that were experimented with success and are applied already to production, then we will have the following restrictions:

\[
P_{iv}^{Aex} \leq P_{iv}^{Al} \quad \text{and} \quad P_{iv}^{Aex} \leq P_{iv}^{Ap}
\]  
(6)

And the total score for experimenting and production will be determined with the ratio:

\[
PT_{exp} = N_{iv}^{Al} \times P_{iv}^{Al} + N_{iv}^{Aex} \times P_{iv}^{Aex} + N_{iv}^{Ap} \times P_{iv}^{Ap}
\]  
(7)

There may be also introduced bad-will items for rejected innovations, like:
\[ PT_{BW} = -(N_{iv} Aexr \times P_{iv} Aexr + N_{ivrp} Aex \times P_{ivrp} Aex) \]  

In which:

\[ N_{iv} Aexr \] – number of innovations rejected following the experimenting;

\[ P_{iv} Aexr \] – number of points of penalization for the innovation rejection after experimenting;

\[ N_{ivrp} Aex \] – number of innovations accepted as feasible after experimenting, but that proved to be inefficient on the basis of the results effectively obtained after application in production;

\[ P_{ivrp} Aex \] – number of penalizing points for the innovation rejected after application in production;

\[ PT_{BW} \] – total number of penalizing points for rejected innovations.

Obviously, the restriction will be made up:

\[ P_{ivrp} Aex >> P_{iv} Aexr \]  

Finally, the score for innovations, totaling each stage carried out from the scheme and diminished with the badwill is:

\[ PT = PT_{iv} + PT_{inv AF} + PT_{exp} - PT_{BW} \]  

These scores are added with the technical and economic results obtained following the effective application. A global result might be the profit increase obtained by the company following the application of all these innovations. Be it \( \Delta P \) of this profit. Then it may be calculated of form- profit indicator obtained on point awarded for innovations, as it follows:

\[ \Pi_1 = \frac{\Delta P}{PT} \]  

For \( \Pi_1 \) it is awarded a score \( P_{iii1} \), where: \( P_{iii1} > P_{iv} Aiv \)

To the effective profit \( \Delta P \), it is granted a degree of trust bigger than the total PT score. It might however, raise the issue of also considering other criteria than the profit, such as for example, ecological, ergonomic, psychological criteria, etc.

Consequently, it might be likely to be calculated a global utility of innovations \( U_i \), by an interdisciplinary team of economists, technicians, psychologists, sociologists, physicians, biologists, etc. In the end, an efficiency indicator \( u_i \) can be calculated that would express the utility of the awarded point, like:

\[ u_i = \frac{U_i}{PT} \]  

**Evaluation of the potential for investments**

In an analogical way with those presented for innovations, the total number of inventors among the employees will be established \( NT_{inv} \) where:

\[ N_{inv}^1 \] - number of inventors with a single patented invention;

\[ N_{inv}^2 \] - number of inventors with two patented inventions, etc.

A score \( P_{inv}^1 \) is awarded for inventors with a single patent, a score \( P_{inv}^2 \) for inventors with two inventions, etc. The total number of points for inventions made by the employees may be determined with the ratio:

\[ PT_{inv}^A = N_{inv}^1 \times P_{inv}^1 + N_{inv}^2 \times P_{inv}^2 + ... \]  

Further on, it is considered the number of proposals of inventions endorsed affirmatively \( N_{inv} AAF \) as well as the score awarded for an invention endorsed affirmatively \( P_{inv} AAF \), which allows establishing the total score for this category of inventions, as follows:

\[ PT_{inv} AAF = N_{inv} AAF \times P_{inv} AAF \]  

A part of the inventions endorsed affirmatively may be directly applied (without experimentations) in production; obviously, at the beginning, with an experimental character and then in definitive terms.

We will note this category of inventions with \( N_{inv} Aexr \). Another part, which we note by \( N_{inv} Aexr \), require
experiments for which the company has funds for bearing the costs of prototypes, trials, etc. It still remains a part, noted with $N_{INV}^{anex}$ of inventions that must be experimented, but for which the company does not have the funds necessary to execute prototypes, trials etc. They will be returned to the authors for finding a financing source or, with their consent, a stock $S_{INV}^{anex}$ of the uncompleted inventions is made up. Therefore, the following restriction must be checked:

$$N_{INV}^{AI} + N_{INV}^{anex} + N_{INV}^{anex} = N_{INV}^{AF}$$  \((15)\)

The total score $PT_{INV}$ awarded for these inventions is:

$$PT_{INV} = N_{INV}^{AI} \times P_{INV}^{AI} + N_{INV}^{anex} \times P_{INV}^{anex} + N_{INV}^{anex} \times P_{INV}^{anex}$$  \(16\)

where: $P_{INV}^{AI}$, $P_{INV}^{anex}$, $P_{INV}^{anex}$ represents the score awarded for inventions from the appropriate category.

It may be considered $P_{INV}^{anex} \approx 0$, taking into account that these inventions were already scored in the ratio that expresses the total number of points awarded to employees, and if the authors will find funds for experimenting and of they will prove as efficient, they will be scored in the ratio that expresses the total number of points awarded for the endorsed inventions.

On the basis of the inventions presented by the employees and experimented by means of the company's research and designing service, $N_{INV}^{anex}$, a number of prototypes $N_{PE}^{1}$, are made, that can be calculated by the ratio:

$$N_{PE}^{1} = c_1 \times N_{INV}^{anex}$$  \(17\)

where: $c_1$ = average number of prototypes necessary to experiment an invention of the employees.

In an analogical way, $N_{PE}^{2}$ is determined, which represents the number of prototypes necessary for experimenting the inventions proposed by the company's research and designing service, by using the ratio:

$$N_{PE}^{2} = c_2 \times N_{CP}^{INV}$$  \(18\)

In which: $c_2$ = average number of prototypes necessary to experiment an invention made by the company's research and designing service.

After the endorsement and technical and economic analysis of the results of the experimenting, it is obtained a number of prototypes with positive results $N_{inv}^{FAV}$ and another number $N_{inv}^{AF}$ with unfavourable results. For inventions with favourable results $N_{INV}^{FAV}$, respectively $N_{INV}^{FAV}$ (of the employees and those of the company’s research and designing service) patenting files are drawn out, that are submitted to the competent authorities spending the taxes $T_{1,1}$, respectively $T_{1,2}$. In parallel with patenting, experimental implementation may be started. A technical and economic analysis of the results of the experimental implementation is made and if the results are not favourable, redesigning occurs, and if it is then favourable, final implementation is started.

On the basis of the financial accounting situations, the profit effectively obtained due to the implementation of the inventions $P_{inv}^{EF}$ of the employees may be assessed, respectively of the company’s research and designing service. The total score of made prototypes $PT_{PROT}$ can be calculated by means of the ratio:

$$PT_{PROT} = N_{PE}^{1} \times P_{PROT}^{1} + N_{PE}^{2} \times P_{PROT}^{2} + (N_{PE}^{1} \times P_{n}^{1} + N_{PE}^{2} \times P_{n}^{2}),$$  \(19\)

where: $P_{PROT}^{1}$, $P_{PROT}^{2}$ – the score attached to the experimented prototypes made by employees, respectively by the company’s research and designing service;

$N_{PE}^{1}$, $N_{PE}^{2}$ – number off prototypes that require certain corrections;

$P_{n}^{1}$, $P_{n}^{2}$ – negative score awarded to prototypes that require certain corrections.
The score awarded for successful development of the experimental production of the prototypes $PT_{PEX}^{INV}$ will be determined by the ratio:

$$PT_{PEX}^{INV} = N_{FAV}^{INV} \times P_1^{INV} + N_{FAV}^{INV} \times P_2^{INV},$$

(20)

where: $N_{FAV}^{INV1}, N_{FAV}^{INV2}$ – number of prototypes that behave positively (of the employees, respectively of the company’s research and designing service);

$P_1^{INV}, P_2^{INV}$ - the score awarded to abovementioned prototypes.

Also, a score $P_{PREM}$ is awarded for each of the $N_{PREM}^{INV}$ inventions that were prized. Finally, the total score generated by inventions $PT_{G}^{INV}$ is:

$$PT_{G}^{INV} = PT_{A}^{INV} + PT_{AE}^{INV} + PT_{INV}^{INV} + PT_{PF}^{STUD} + PT_{PEX}^{INV} + (N_{INV}^{P} \times P_{PREM} + S_{INV}^{INEX} \times P_{S}),$$

(21)

where: $P_{S}$ the score for the stock of unused inventions (very close to zero).

Another number of points is awarded for the studies drawn out with own forces, of which a part endorsed affirmatively and for the studies paid to consulting companies (only if they are endorsed affirmatively). This score is noted by $P_{STUD}$ and is given by the ratio:

$$P_{STUD} = N_{FP}^{STUD} \times P_{STUD}^{FP} + N_{AF}^{STUD} \times P_{STUD}^{AF} + N_{CONS}^{STUD} \times P_{STUD}^{CONS},$$

(22)

where:

$N_{FP}^{STUD} =$ number of studies made by own forces;

$P_{STUD}^{FP} =$ the score for the studies made inside the company;

$N_{AF}^{STUD} =$ number of studies endorsed affirmatively;

$P_{STUD}^{AF} =$ the score awarded to studies endorsed affirmatively;

$N_{CONS}^{STUD} =$ number of studies achieved by consulting (paid only if they are endorsed affirmatively);

$N_{FP}^{STUD} =$ the score awarded to studies achieved by consulting.

For the technical and material basis of the technology transfer, the score $PB_{TM}$, is awarded, that is calculated by the ratio:

$$PB_{TM} = NLC \times PLC + NP \times PP + NPP \times PPP + NAIPA \times PAIPA$$

(23)

where: NLC - number of research laboratories;

NP - number of the staff occupied in research-design activities;

NPP - number of prototype projects;

NAIPA - number of prototype trial laboratories.

The patents will be scored as follows:

- For the patents of the inventors among employees (NB), that were supported by the company with the payment of taxes $T_{s1}$, the score (PB) is awarded;

- For the patents of the inventors among employees $NB^S$ that undertook the tax $T_{s1}$, the score $PB^S$ is granted;

- For the patents obtained on behalf of the company, $NB_F$ and for which it paid the tax $T_{s2}$, the score PB$_F$ is awarded. The total score for patents $PT_B$ is calculated with the ratio:

$$PT_{B} = NB_A \times PB_A + NB_A^S \times PB_A^S + NB_F \times PB_F$$

(24)

For licenses, a score $PT_L$ is awarded, given by the ratio:

$$PT_{L} = N_{Lj}^A \times P_{Lj}^A + N_{Lj}^S \times P_{Lj}^S + N_{Ln}^A \times P_{Ln}^A + N_{Ln}^S \times P_{Ln}^S$$

(25)
where: \( N_{lf}^A \) = number of autochthon licenses used in the production process;

\[ P_{lf}^A = \text{the score associated to these licenses;} \]

\[ N_{lf}^S = \text{number of foreign licenses used in production;} \]

\[ P_{lf}^S = \text{the score associated to these licenses;} \]

\[ N_{ln}^A = \text{number of unused autochthon licenses;} \]

\[ P_{ln}^A = \text{the score associated to these licenses (} P_{ln}^A \rightarrow 0 \text{ or even} P_{ln}^A < 0 \text{).} \]

\[ N_{ln}^S = \text{number of foreign unused licenses;} \]

\[ P_{ln}^S = \text{the score associated to these licenses (usually} P_{ln}^S < 0 \text{).} \]

The total score total for preparing the workforce \( PTP_{FM} \) is given by the ratio:

\[ PTP_{FM} = NPS_L \times PS_L + NPS_{FP} \times PS_{FP} + hc \times P_{es} - hg \times P_g, \]  
(26)

where: \( NPS_L \) – number of persons specialized by the licensor;

\( PS_L \) - the score awarded for a person specialized by the licensor;

\( NPS_{FP} \) - number of persons specialized by own forces;

\( PS_{FP} \) - the score awarded for a person specialized by their own forces.

\( hc \) - number of hours for conferences achieved by the organization for convincing employees that the technology transfer will be a benefit for employees;

\( P_{es} \) - the score awarded for the conferences organized for convincing employees about the advantages of the technology transfer;

\( hg \) - number of strike hours organized by workers as a protest against the technology transfer;

\( P_g \) - the negative score for the strikes of protest against the technology transfer.

The profit is forecasted according to the feasibility studies for certain technology transfer projects, that promote inventions or that use purchased licenses. Be it \( P_p \) such a profit. The follow-up stage is started during which the effective achieved profit \( P_e \) is established. If \( P_{T_e} \) represents the total number of points awarded for the technology transfer achieved by the considered feasibility study, then the forecasted profit is calculated on points awarded with the ratio:

\[ \Pi_p = \frac{P_p}{P_{T_e}} \]  
(27)

Or the profit achieved on awarded points:

\[ \Pi_r = \frac{P_r}{P_{T_e}} \]  
(28)

If: \[ |\Pi_p - \Pi_r| \leq \varepsilon \] (where \( \varepsilon \) = maximum accepted limit as lag between the forecasted level and the one effectively achieved), then for the general score of know-how, a number of points \( TP_r \) is added. If, on the contrary, such limit is exceeded, a number of \( TP_{PN} \) points awarded as penalty for non-fulfilment of the provisions from the feasibility study are deducted. The number of these points is established by specialists.

Totalizing all mentioned points gives us a number that estimates the vastness of know-how and with which the patrimonial value of the company will be corrected.

**Conclusions**

In the current practice, establishing the value of an asset is achieved by using evaluation methods based on tangible and intangible assets. The first one leads to the determination of ANC, and the last ones to the determining the super profit or of the goodwill. The price proposed by the seller is made up by adding to the value of ANC the goodwill value. If the determination of ANC, for which the necessary information is collected from accounting, does not raise special problems, when the accounting is well drawn out, determination of GW complicates the evaluation process, as the
necessary information are not found in the accounting. Such information originates from the subjective assessment of some intangible assets such as the management quality, the good custom, clients’ fidelity, etc.

The profit surplus, expressed by the term “goodwill,” is, therefore, the result of an additional profitability in relation with the other agents from the field, of which will benefit the owner of the company. As a result, the final value of a company, established by the evaluator, must include the correctly calculated dimension of the goodwill.

In the development of some market economic specific processes, such as the privatization, sale, division, merger, etc. their partners are interested in also knowing the items that generate goodwill, including the weight that they participate. That is why, the analysis of the possibilities of calculation of the goodwill and establishing the factors which they determine, remain a large interest research topic for specialists in the field. There may be use for econometric models based on the theory of subtle sets and of fuzzy sets, as presented in the article. By the application of these models, the main deficiency of the current methods may be eliminated, which on the one hand, does not provide information related to the goodwill generating factors, but on the other hand provides very useful information both for the company’s buyer and for its seller.

THE POWER OF PRIVATE BRANDS
Savica Dimitrieska,1 Ljiljana Koneska,2 Kostadinka Gavazova Kozareva,3 Jasna Teofilovska4

Abstract: National brands are well-known and popular brands of manufacturers, such as Coca Cola, McDonald's, Milka, Maggi, Colgate, Toblerone, Evian, Knorr, etc. These brands usually are well accepted and favorites of consumers. They associate with high quality, availability, feelings, experiences, promotions, and events. However, their popularity is increasingly threatened by private brands. Private brands are brands of retailers and distributors, that starting from the 14th century, and especially today, have conquered lots of consumers. Initially, private brands appeared among consumer goods (food products) and were without name, style, design, with relatively low quality and with much lower prices than national brands.

Economic crises, low living standard, poverty that existed in several countries in the middle of the XIX-th century caused the consumers to become more sensitive to prices, and they began to show interest in private brands. The greater demand for these products the richer became the retailers. Retailers had a great advantage: they knew the needs and wants of consumers. With time, retailers have invested more in quality, taste, packaging, design, style, and colors of their brands that have attracted more customers. Today, private brands represent a severe competitive threat to national brands. Some recent research shows that private brands are more popular and more required than national brands. This paper aims to reveal the future of national and private brands with the help of empirical research.

JEL Classification Numbers: D40, M31, L81; DOI: http://dx.doi.org/10.12955/cbup.v5.911

Keywords: national brand, private brand, retailers, competition

Introduction
By the 1960's of the last century, the market was dominated by national (producer) brands. They were brands of companies-manufacturers. According to Business Dictionary, the word “brand” means unique name, design, sign, symbol, shape or a combination of these, employed in creating an image that identifies a product and differentiates it from its competitors. (http://businessdictionary.com) These manufacturer brands have been favorites to consumers, recognized for their quality, functionality, performance, as well as their emotional connection, feelings, experience, events, and memories. During this period, the role of trade was insignificant and pure logistics. Trade served as a mediator between production and consumption. Its main task was to distribute the products of manufacturers to consumers in the required quantities, assortment, places, and deadlines.

But in the 1960s significant structural changes occurred. Trade received an increasingly important role in the exchange. These changes were due to the high concentration of trade, cooperation, and integration on a horizontal and vertical level, trade internationalization, strengthening the marketing orientation of trade, technological progress, and competition in innovations. Retailers began to invest their capital surplus in the development of their own brands. Initially, retailers were not aware what “boom” this will make to the market. Private (store brands, retailer brands, own brands) labels were brands of retailers and distributors that were mostly offered in the retail chains.

According to Blazeska (2013), the main reasons for the occurrence of these brands were:

- A need to create low cost products and services,
- A need for creating loyal customers,
- Taking the opportunity to make greater profits,
- The continuous change of shopping habits of consumers,
- Fulfilling the unsatisfied needs of consumers.

Retailers slyly noted their comparative advantage in the market and they started to offer their own products which were, at first, “no name,” generic, affordable as well as cheaper than national brands. Having in mind the economic crisis, poverty and declining living standards, consumers showed an interest in these products, and over time they became loyal customers.

3 Bayer Macedonia, Kostadinka.Kozareva@bayer.com
4 Faculty of Economics, State Univerzitety-Tetovo, Teofilovskajasna@yahoo.com
Retailers began to make large profits by selling their own (private) brands that had much larger margins than the profits made off selling other brands. Larger profits were primarily result of the fact that retailers cared for the design, production, promotion, distribution of products by themselves. They were specialized in promotion and distribution that helped them to reduce the costs and sell the products at a lower, more competitive price than national brands. With time, retailers started to invest in product quality, design, style, packaging that attracted consumers even more. As a result, the dominance of national brands has declined.

By investing in quality and value, private brands have become a serious competitive threat to national brands. Private-label success was strongest in commodity-driven, high-purchase products and those where consumers perceive little differentiation.

As stated in the Nielsen Report of 2014 (http://nielsen.com/pk/en.html), private brands are mostly developed in Western Europe. Switzerland has the highest private-label share at 45%, followed closely by the U.K. and Spain at 41% each. Private label is less developed in Eastern and Central Europe, where the share varies greatly from as high as 24% in Poland to as low as 5% in Ukraine. The percentage of participation of private labels in Canada, USA, and Africa is 18% each. The weighted global average reaches 16.5% dollar share of private brands in 2013. Some marketing experts believe that this percentage will increase in the future and private brands will dominate the global market.

**Literature review**

Private brands are generally perceived by consumers as low quality-products. Private label brands are defined as products produced by one manufacturer and sold under the name of a different company. As Mbayé (2009), Burton, Lichtenstein, Netemeyer and Garretson (1998) state, private labels are those sold under the retailer’s brand instead of the manufacturer’s. A private label product is manufactured by a contract or third-party manufacturer and sold under a retailer’s brand name. Private brands, also known as “store brands”, “retailer brands”, “own brands”, “own labels”, and “generics” are owned by distribution channel actors (retailers, wholesalers, distributors, etc…) and are sold only, under a particular brand name, in their stores (De Wulf et al., 2005).

There are five fundamental drivers of renewed growth and market penetration of private brands: (http://bridgestrategy.com)

- **The Recession.** Consumers' increased focus on value, price and affordability, a result of an economic crisis, is one obvious explanation for the rise in private label sales. Consumers have shown their willingness to purchase lower-priced alternatives.

- **Retail Landscape Consolidation.** Private label penetration has proven to be highly correlated with the level of retail concentration. Higher levels of trade concentration not only give retailers greater negotiation power against brand manufacturers but also create the critical mass required for making investments in the development of more sophisticated private label brands.

- **Improved Product Quality.** Private label quality has improved dramatically since the days of generic products. Several consumer studies have claimed that the quality gap between national brands and private label products has been reduced or eliminated. Accordingly, consumer perception has improved substantially creating a highly positive attitude towards private label.

- **Enhanced Retailer Capabilities.** Over the past several years, many retailers have been improving the skills and capabilities required to develop and manage increasingly sophisticated private label brands. They have hired brand and category managers, invested in marketing analytics and innovation and branding capabilities. As a result, retailers have developed a deeper understanding of consumer needs and wants, as well as segmentation and targeting techniques.

- **Renewed Strategic Approach.** The traditional approach to developing low-cost, generic alternatives to national brands, targeting price-sensitive, brand-agnostic shoppers, is giving way to a much more strategic role for private label, as part of more thoughtful shopper segmentation, category management, and assortment planning strategies.

There are four main stages in the evolution of private brands: (Blazeska, 2013)

- **The first stage** was represented by private brands that had low quality and low price. They had the same name as a retailer or retail chain. They did not have any elements of brand identity as design, packaging, color, slogan, logo, jingle, etc…
In the second stage, private brands gained some elements of brand identity like their own name, symbol, color, design and sometimes slogan. Products in this stage had a certain level of quality and still low competitive price...

The third stage is characterized by private brands with improved quality and reasonable price that still is lower than the one of the national brands. The price continues to be the main reason that attracts and retains customers.

The last stage of evolution, the one that still is unclear, will be presented with the leadership of private brands in some product categories or close cooperation between national and private brands. Although initially private brands were limited to commodity-based products (tea, sugar, fresh fruits, vegetables) and were perceived as low quality and unbranded alternatives to national brands, by time their products’ range extended in almost every product category, such as: (uhra.herts.ac.uk)

- Personal care,
- Beverages,
- Cosmetics,
- Paper products,
- Household cleaners,
- Condiments and salad dressings,
- Dairy items and
- Frozen foods (or more than 90% of consumer packed goods).

Even though private labels have a low market share, retailers continue to keep private brands in stock because of the profit margins they represent, being higher than national brands. Also, there is a large sector of consumers who take these private brands as a second-rate alternative, considering them as inferior in quality when compared to national brands (Raju et al., 1995; Beldona & Wysong, 2007; Gonzalez Mieres et al., 2006). However, despite the tendency of private brands to be considered as lower quality products than national brands, in the last decade they significantly have improved their quality. With the investments in their quality and value, they are above national brands in the same product category. (Apelbaum et al., 2003; Gomez-Arias & Bello-Acebon, 2008). Private brands are generic products that compete with national brands through price and later through value.

However, national brands still dominate the market for products with very high quality, prestigious and rare products, specific and complex products. These products include jewelry, clothing, household appliances, computers and computer equipment, cars, furniture, etc… Private brands penetrate in those product categories where retailers have power and strength to offer better products than national brands in the market. Private label brands become less popular in those product categories in which the difference in quality between national and private label brands is higher (Gonzalez et al., 2006). Private labels tend to do better in categories where price sensitivity is higher to a consumer (Raju et al. 1995; Hoch & Basenji, 1993).

Private brands have substantial benefits for both retailers and consumers. Some of their biggest advantages for retailers include: lower costs, higher profit margins, higher chain profitability, increased differentiation and product turnover, control over shelf space, control over production, control over pricing, adaptability, generating store loyalty, control over branding, and strong visual identity. (Ashley, 1998; Bonfrer and Chintagunta, 2004, Ailawadi et al., 2008)

Advantages of private brands for consumers can be summed up as follows: lower price, improved quality, improved accessibility, variety of alternatives, etc. According to Cunningham et al. (1982), private brands can offer substantially lower prices (15%-40%) than national brands. Market share has doubled after the 1990s and private brands have higher market share than national brands in about 30% of product categories (Quelch and Harding, 1996).

Data and Methodology

For the purpose of this paper, secondary and primary sources of data were used. Secondary data refers to the use of professional literature in the field of marketing and consumer behavior.

The primary source of data that was used refers to the questionnaire that was constructed and conducted among consumers in the capital of Macedonia, Skopje. The questionnaire included socio-economic data (data about sex, educational level, age and household income) and questions (open-
ended and multi-choice) about consumers’ attitude toward private and national brands. The research was conducted in the period of 15th of January to 15th of February 2017, and 80 respondents were approached. Keeping in mind that only 61 (76%) out of 80 respondents purchased and were interested in private brands, only these respondents were analyzed.

**Results and Discussion**

In Macedonia, there are many supermarkets that sell their own private brands. At the beginning of 2000s, many markets promoted their own brands. However, for the purpose of this paper, two markets were analyzed that sell national brands and private brands: Tinex and Zito. The selection of these two markets is made on the basis of their long-term experience, image and extensive coverage with stores across the country. Tinex sells its private brands under the name “Extra,” and Zito under the name “5-ka”. These retailers closely collaborate with a network of different manufacturers that produce the products for them.

Mainly, their private brands occurred in the following product categories: food products, dairy products, canned vegetables, cereals, dietary food and beverages, confectionery, sanitation items, personal hygiene products, pastry and bread, frozen foods, and fish. The distribution of the products is only within the retail chain.

The above table (Figure 2.) shows that the prices of private brands are lower than those of national brands, in some product categories even lower than 40%.

As already mentioned, out of total 80 respondents that were approached, only 61 responded affirmatively that they buy private brands, even if in only just one product category. 13 of the respondents were male (21%) and 48 female (79%). According to the education level, 8 respondents
(13%) had basic (elementary) education, 30 respondents (79%) had secondary education and 23 respondents (38%) were with higher education. In terms of age, 4 respondents (7%) were below 20 years, 18 (30%) were aged between 20-40 years and 39 respondents (63%) were over 40 years. Regarding household income, 48 respondents (79%) had a monthly income of 10,000 Macedonian Denars, 10 respondents (16%) had between 10,000 to 20,000 Macedonian Denars and 3 respondents (5%) had an income over 20,000 Denars.

According to these data, the average consumer profile that purchase private labels is a middle-aged woman (over 40), with secondary education, with low or average monthly income (socio-economic status).

On the question of what kind of private brands consumers buy frequently, they provided the following responses:

**Figure 3: Mostly purchased private brands**

According to respondents, the price is the main criteria for buying private brands. On the question what are the most important characteristics of private brands they ranged them as follows:

- Price,
- Quality,
- Availability,
- Design and
- Packaging

The answers show that consumers buy private brands because of their reasonable and still lower price than national brands, their improved quality and availability. To them packaging is not so important.

The biggest disadvantages of the private brands were illustrated by the following statements (open questions were used):

- There is a need of greater availability of private brands in more markets,
- There is a need of greater investment in the quality of private brands,
- Markets should offer more promotional activities for private brands,
- Private brands should be included in other product categories, such as cheap jewelry, cosmetics, clothing, shoes, etc.
- There is a high risk and uncertainty related to the quality of products.

The consumers also buy national brands, especially when they need high quality-products and are willing to pay higher prices.

On the question of how they see the private brands in future, the respondents answered that they expected more private brands in different product categories in more markets. They believe that over time they will dominate the market with higher quality and reasonable prices.

**Conclusion**

There is no clear realistic scenario about the future of private brands. However, in recent years, private brands showed great achievement in particular product categories. Many experts believe that their growth will accelerate in the upcoming years. Private brands are expected to increase their market
share and become more pervasive in most product categories. They are becoming a greater competitive threat to national brands. Brand manufacturers can no longer ignore private brands. They need to change their strategies and offer the appropriate responses to private brands.

In some product categories, brand manufacturers can take opportunities to explore together with retail partners. Namely, the market situation is as follows: manufacturers of national brands are under pressure to cut prices, and retailers (producers of private brands) to raise the quality and intensely to invest in promotion, which will inevitably lead to an increase in their prices. This market situation will impose a need for cooperation between producers and traders. Each party should do what is doing the best way on the market, meaning that retailers have to focus on carrying out sales activities, and manufacturers on high quality and functionality of products. Only in this way, customer will get the best from the market.

INNOVATIVENESS OF BELARUSIAN ECONOMY THROUGH THE PRISM OF ITS COMPETITIVE POSITION IN INTERNATIONAL TRADE

Krzysztof Falkowski

Abstract: The main purpose of this study is to answer the question of how innovative Belarusian economy is. Its innovativeness has been assessed through an in-depth analysis of Belarus’ position in international trade, especially in high- and medium-high-technology goods, on the back of the assumption that any competitive advantages possessed in them testify to the economy’s high innovativeness. The analysis of the dynamics of long-term revealed comparative advantages in Belarusian foreign trade by using Balassa’s RCA methodology and covering the years 2000-2014, has shown that the country was generally characterized by low innovativeness, as evidenced by the possession of such advantages only in trade in goods of relatively low technological intensity (medium-low technology). Meanwhile, in hi-tech goods (high and medium-high technology), Belarus did not have any (or only had relatively small) long-term revealed comparative advantages. Moreover, Belarus’ competitiveness in international trade deteriorated over that period, not only regarding high and medium-high technology goods but also in foreign trade overall. This seems to be, amongst others, the consequence of low efficiency of the country’s current innovation policy.

Keywords: innovativeness, competitiveness, comparative advantages, international trade, Belarus

Introduction

In the contemporary time, amidst the advancement of globalization and internationalization of business activities on a global scale, it is becoming increasingly difficult to meet the growing competition in the international markets for goods and factors of production, which is one of the important reasons for the strong diversification of economic growth and development of individual countries in the twenty-first century (Hämäläinen, 2003). Experiences of many countries around the world, being a kind of empirical exemplification of a number of different theoretical concepts, indicate that today the most important factors of international competitiveness, as well as of the aforementioned economic growth, are – apart from wider institutional factors – human capital and essential innovations/innovativeness of the economy (Aghion & Howitt, 1992; Arrow, 1962; Atkinson & Ezell, 2012; Drucker, 1992; Lucas, 1988; Lundval, 1992; Romer, 1989).

For these reasons, it seems worthwhile to take a closer look at the competitiveness of Belarusian economy, being a consequence of its level of innovativeness, to answer the question how this largest European country without access to the sea, strongly associated with Russia and the post-Soviet economic area, manages to cope in an era of ever-fiercer international competition increasingly based on knowledge, modern technologies, and innovations. Another important reason for analyzing this issue is a striking shortage of research papers concerning Belarus and its economy in international economic literature, including also those covering research on the innovativeness and competitiveness of Belarusian economy.

In this article, an attempt has been made to assess the innovativeness of Belarus through the prism of the competitiveness of its economy in international trade, especially in technologically advanced goods. It is based on the core assumption that the possession of any long-term comparative advantages in international trade in the field of hi-tech goods (i.e. the goods of high and medium-high technology) directly testifies to the high innovativeness of the whole economy. Moreover, the strengthening of the existing comparative advantages or acquiring new ones with respect to these hi-tech goods, over time, is by definition evidence of effective innovation policy pursued by the country. To assess the level of Belarusian economy’s competitiveness, the method of analyzing revealed comparative advantages developed by B. Balassa is applied.

Based on the results of the analysis above, this study puts forth the thesis according to which, in the case of Belarus, the absence of any (or only relatively small) long-term competitive advantages in international trade in hi-tech goods demonstrates the low innovativeness of this country’s economy. Also, the low effectiveness of its innovation policy can be considered, which is particularly disadvantageous for its further economic growth and development.

Literature review

The state of research on the innovation of Belarusian economy and its competitiveness in the contemporary international trade, published in English and available to all those interested in this issue around the world, still leaves a lot to be desired. Regrettably, an almost complete lack of this kind of research papers and publications can be observed, even though both the country itself, as well as this issue, not only from an economic point of view, seem to be very relevant and exciting. A significant barrier to such research, especially the one survey-based one, is undoubtedly the availability and reliability of the necessary data. Also for this reason, amongst others, Belarus is not included in the most widely-known and popular publication concerning competitiveness, The Global Competitiveness Report, prepared annually by the World Economic Forum (Schwab, 2016).

About the competitiveness of Belarus, which is no doubt a direct consequence of its innovativeness, Dobrinsky et al. (2016) state that the two categories of goods in which Belarusian industry is most competitive globally are agricultural and food products, and chemicals. They go on to observe that although under the Eurasian Economic Union (EAEU) framework protectionist measures have been imposed and state interventions have been undertaken to support high value added sectors, the competitiveness of the relatively more advanced sectors has been in decline over the last decade. Thus, Belarus can serve as a counter-argument to the 'infant industry' argument, also as it is part of the EAEU which comprises countries facing similar development problems stemming from the insufficient modernization of their industries, as well as from weak infrastructure and institutions.

What's more, Freinkman, Bakanova, and Sidarenka (2010) also note that Belarus' comparative advantages have steadily weakened over the last several years. Based on the estimates of revealed comparative advantages (RCA), they observe that the country’s comparative advantages have changed from labour- and capital-intensive goods to natural resources and petroleum, which puts limits on creating jobs and improving productivity. Moreover, what has hardly changed is the so-called “export sophistication,” a feature of more developed countries which can export a wide variety of higher value goods. This would indicate, amongst others, that the shift has been towards goods with lower technological content. Alarminglly, Belarus also seems to be losing its share in markets with higher export sophistication (such as Russia). Similar conclusions were also reached by Falkowski (2013, 2016). Also, as noted by Dabrowski (2016), Belarusian enterprises are increasingly losing their competitiveness on the traditionally significant markets of Russia and other CIS countries. This, in turn, largely explains the gradually deteriorating overall competitive position of Belarus on international commodity markets (Havlík, Astrová, & Pindyuk, 2012).

The major challenges facing Belarusian economy, also in the context of the actual relatively low international competitiveness being a consequence of its relatively low innovativeness, are described by i.a. Bikar and Kmet’ko (2015), Egorov (2014), Shirow, Sabchishina and Potapenko (2016).

Research methodology and data

In the literature, a multitude of different methods for assessing the international competitiveness of economies is in use, both from their capacities as well as their innovation position. One of the methods of assessing innovativeness in an economy is to analyze the structure of its foreign trade, especially in goods of high technological intensity. It is also one of the methods applied to assess the innovativeness of economies in “Innovation Union Scoreboard” reports, commissioned by the European Commission. Among indicators used by authors of these reports are the shares of high-technology and medium-technology goods as well as of knowledge-based services in the export of the country (The European Union, 2014). A similar methodology of measuring innovativeness is also applied by creators of Global Innovation Index reports (Dutta, Lanvin, & Wunsch-Vincent, 2015).

In this study, however, to conduct an in-depth analysis of the innovativeness of Belarusian economy, the method of analyzing revealed comparative advantages (RCA) in international trade developed by Balassa (1965, 1989) has been applied; specifically, the study uses Balassa’s original logarithmic formula of:

\[ RCA_i = \ln \left( \frac{x_{ij}}{x_j} \times \frac{x_i}{X} \right) \]

where:
RCA$_i$ – the revealed comparative advantages index of the given country in the $i$ goods category

$X_{ij}$ – exports of the $i$ goods category from the given country to the $j$ country or category of $j$ countries

$X_j$ – total exports from the given country to the $j$ country or category of $j$ countries

$X_i$ – global total exports of the $i$ goods category

$X$ – global total exports

The logarithmic form of the formula ensures the symmetry of both positive and negative values of the RCA$_i$ index in the region around 0, which facilitates their interpretation (Vollrath, 1991). If RCA$_i$ > 0, then the country enjoys a revealed comparative advantage in trading goods from the given category and the value of the index indicates the degree of such an advantage. On the contrary, if RCA$_i$ < 0, then no such revealed comparative advantage, to a higher or lower degree, exists.

In order to identify potential long-term comparative advantages in foreign trade of Belarus, especially in the field of hi-tech goods (i.e. the goods of high and medium-high technology), as it is their occurrence and intensity which should be regarded as a kind of acid test for innovativeness of the economy, the entire commodity structure of foreign trade of Belarus in the years 2000-2014 is analysed herein below. Also, the analyzed goods have been broken down into four basic categories according to the OECD classification based on their technology intensity, namely into the goods of high, medium-high, medium-low and low technology (Hatzichronoglou, 1997; Organization for Economic Co-operation and Development, 2011). Such methodological approach makes it possible to formulate certain conclusions about the innovativeness of Belarusian economy in the contemporary global economy. All data used for the analysis are derived from the United Nations Commodity Trade Statistics Database.

**Empirical research results**

When analyzing the development of long-term revealed comparative advantages (RCA) in the foreign trade of Belarus in the years 2000-2014, taking into account the aforementioned OECD classification of goods based on their technological intensity, it must first be very clearly emphasized that throughout the analyzed period the country had the greatest comparative advantages in trade in the medium-low technology category (see Figure 1). However, what can be noted is that starting from 2009 on these benefits began to diminish. On the other hand, in the case of the low- and medium-high-technology categories, Belarus had certain, admittedly relatively low, but still present, comparative advantages throughout the entire analyzed period. However, in the last two years covered by the analysis, that is 2013-2014, a gradual deterioration became noticeable about the medium-high-technology category, leading to the loss of these advantages.

*Figure 1: Dynamics of Revealed Comparative Advantages (RCA) in international trade of Belarus in the years 2000-2014 according to the OECD classification of manufacturing industries based on their technology intensity*

On the other hand, concerning the hi-tech goods, especially significant from innovativeness of any economy, as they come from industries intensively using common factors of production and characterized by a high level of innovation, the situation in Belarus has for years been dramatic. Not only did Belarus not have any comparative advantages in the period 2000-2014 years in this category, but the competitiveness of Belarusian goods from this category in total has deteriorated.

Secondly, because, as indicated above, particular attention in the context of innovation of Belarusian economy should be paid to its competitiveness regarding two categories, i.e., the high- and medium-high-technology categories. Figure 2 shows the dynamics of RCA indices for Belarus in these two categories in the years 2000-2014.

According to the OECD classification, the category of high-technology goods includes the following five subcategories of goods: aircraft and spacecraft; medical, precision and optical instruments; office, accounting, and computing machinery; pharmaceuticals; radio, TV, and communications equipment.

The analysis of the data presented in Figure 2, concerning the competitiveness of Belarusian economy in the international trade and individual subcategories of goods within the high-technology category according to the OECD classification, in the years 2000-2014, has revealed that Belarus did not have any comparative advantage (RCA values < 0) in any of them. By far the most uncompetitive in the international arena was Belarus traditionally in the aircraft and spacecraft subcategory (the lowest values of RCA recorded throughout the entire analyzed period, with a negative trend).

Among all subcategories of goods within the high-technology category, regarding its international competitiveness, as measured by the RCA index, Belarus fares relatively the best in the medical, precision and optical instruments subcategory. However, even for this subcategory overall, the RCA is negative, which indicates that Belarusian economy does not have any comparative advantages in international trade in this subcategory either. Nevertheless, the relatively best situation in respect of the remaining subcategories is the consequence of the fact that if we look deeper into the structure of Belarusian goods trade at the level of individual, specific categories of goods, and specific values of the RCA index, it turns out that it is in this very subcategory, i.e., medical, precision and optical instruments, that Belarus has the highest comparative advantages out of all hi-tech goods (Table 1). It is, therefore, a kind of Belarusian export specialization.

The second category of goods, which from the point of view of the innovativeness of Belarusian economy should be assessed, is the category of medium-high-technology goods, according to the OECD classification which includes the following five subcategories: chemicals excluding...
pharmaceuticals; electrical machinery and apparatus, n.e.c.; machinery and equipment, n.e.c.; motor vehicles, trailers and semi-trailers; railroad equipment and transport equipment, n.e.c.

Source: Author

International competitiveness of Belarus in the subcategories mentioned above within the category of medium-high-technology goods is very differentiated (Figure 3). Belarus has by far the strongest comparative advantages in this category with respect to chemicals excluding pharmaceuticals. What’s more, also in the subcategory of machinery and equipment, n.e.c. Belarus showed a certain level of international competitiveness, although over the years 2000-2014 the RCA index for this subcategory of goods was getting lower year by year, and in the years 2011-2012 and in 2014 was even negative. This, sadly, demonstrates the worsening competitive position of Belarusian economy in this area.

Figure 3: Dynamics of Revealed Comparative Advantages (RCA) in international trade of Belarus with respect to goods from the medium-high-technology category in the years 2000-2014

Source: Author

On the other end of the scale, the lowest competitiveness in international trade (the lowest value of the RCA indices) characterizes Belarus in the subcategories: electrical machinery and apparatus, n.e.c. and railroad equipment and transport equipment, n.e.c. In the case of the latter subcategory, a dramatic decline in the competitiveness of Belarusian economy occurred in the years 2002-2010. Even though in 2011-2013 some improvement was observed in this area, Belarus still did not record any comparative advantages, which proves that Belarusian railroad and transport equipment was not competitive in the international trade over the entire period.
Table 2 below, in turn, presents the most internationally competitive Belarusian goods from the medium-high-technology category (with the highest values of the RCA index). It turns out that 6 out of 10 most competitive Belarusian goods from this category are from the subcategory of chemicals excluding pharmaceuticals.

Therefore, it is no surprise that it is in this subcategory that Belarus has traditionally been most competitive. Among the goods with the highest values of the RCA index in 2014 were also, amongst others, threshing machinery and milling machines, knee-type n.e.c. for removing metal from the machinery and equipment, n.e.c. subcategory.

Conclusions

The subject-matter of this study was an in-depth analysis of the international competitiveness of Belarus, with respect to the categories of goods of high and medium-high technology, conducted to assess the country’s innovativeness and the effectiveness of its innovation policy.

The snapshot analysis, based on the assumption that the gauge of the innovativeness of Belarusian economy is its competitive position in international trade, has revealed that in the analyzed period of 2000-2014 Belarus was characterized by low innovativeness, as evidenced by a general lack of comparative advantages in the high-technology category overall. The situation was better in the case of goods from the medium-high technology category overall as Belarus did periodically possess some, although not high, comparative advantages in this regard. Of course, this does not mean that Belarus is not competitive in international trade concerning some goods from the high-technology or medium-high-technology category (according to the OECD classification), although such cases in the Belarusian foreign trade are sporadic. However, Belarus can compete internationally in respect of relatively low-tech (medium-low technology), low value-added, capital-intensive goods, coming basically from industries employing semi-skilled workers.

On the other hand, if we look at the results of the studies dynamically, i.e. analyzing the development of the RCA indices in the category of high- and medium-high-technology goods throughout the whole period of 2000-2014, as well as looking at the entire structure of Belarusian foreign trade (according to the OECD classification of goods based on their technological intensity), it turns out that generally Belarus’ competitiveness deteriorated over that entire period. What are the reasons? Firstly, it is down to the low effectiveness of the innovation policy current pursued by Belarus, which is a direct consequence of, amongst others, the country’s highly dysfunctional National Innovation System, its inability to use its relatively well-educated human resources in a pro-innovative way, low innovation awareness of Belarusian enterprises and the actual lack of policies supporting private innovation projects and start-ups. It is also the result of some serious structural weaknesses of the country’s economic and socio-political system, which adversely affects its international investment attractiveness, and thus the possibility of improving the relatively low endogenous innovation capacity of Belarusian economy through know-how coming with foreign direct investments, as well as the efficiency of the entire economy. Secondly, the declining competitiveness of Belarus in international...
trade in goods of high technological intensity identified in this article is, to a large extent, also the effect of the increasing importance attributed to knowledge, technology, innovation, and consequently innovativeness in a growing number of countries of the contemporary globalized and dynamically changing world, in which high- and medium-high-technology goods are becoming more and more important. Thus, without implementing a feasible and consistent innovation policy, in the long run, Belarus will not be able to keep even these comparative advantages which it currently holds.

Based on the results of the analysis of Belarusian economy’s competitiveness in international trade as evidenced by the presence of comparative advantages in the most innovative categories of goods, i.e. high-technology and medium-high-technology, the following general recommendations for Belarus can be formulated: 1) the country’s pro-innovation potential should be used more pragmatically, especially in order to maintain the existing competitive advantages in the category of medium-low-technology goods, as well as to achieve sustainable advantages in international trade in medium-high-technology and low-technology goods; 2) institutional conditions for doing business should be improved in order to effectively attract high-tech foreign investment creating spillover effects and increasing the innovativeness of Belarusian economy, which could translate into obtaining some competitive advantages in hi-tech goods; 3) workable innovation policy should be consistently implemented aimed to foster effective cooperation of state institutions, research centres and enterprises for the creation and commercialization of technologically advanced solutions. What’s more, it seems that the effective execution of these recommendations will not be possible without the greater openness of Belarusian economy onto the world and without implementing structural economic reforms aimed to build a knowledge-based market economy. Undoubtedly, this will be a major challenge for Belarusian authorities; however, rising to it seems necessary in the rapidly growing, increasingly globalized world economy.

ONLINE RECOMMENDATION SYSTEMS’ USAGE BY COMPANIES IN BALTIC COUNTRIES

Elina Gaitniece

Abstract: Global retailers are using sophisticated online recommendation systems (ORS) which enhance customers' loyalty towards the specific site. Online markets in Baltic countries are growing fast, but Baltic e-commerce sites are not using a wide enough range of eWOM tools. The aim of this paper is – to evaluate how eWOM through ORS is perceived and used by digital marketing specialists and e-commerce players in the Baltics. Research methods used were: literature analysis on ORS's influence on consumer purchase decisions, and an expert survey and monitoring study. The research results revealed major barriers for advanced ORS usage in the Baltics, as they discovered a gap between experts' opinion and the current reality in the Baltics. The article provides recommendations to online retailers in the Baltics on improvements that are needed.

JEL Classification Numbers: M31, M39; DOI: http://dx.doi.org/10.12955/cbup.v5.913
UDC Classification: 658.8
Keywords: recommendation system, eWOM, Baltic countries

Introduction

The fast development of digital media during the last decades provides consumers a wide choice of opinions originating from many diverse sources. Today consumers are not only consumers, they are also producers of new information online (Flanagin & Metzger, 2013). Word of mouth communication, in general, has been recognized as an important influencer for consumers' purchasing decisions, and is thought to influence 20-50% of all purchasing decisions (Berger, 2013) (Strauss & Frost, 2014). Recent research shows that the influence of eWOM is growing hand in hand with the growth of a range of different communication channels and tools (Oestreich-Singer & Sundararajan, 2012). From the range of eWOM tools, one type are online recommendation systems (ORS), whose systems can be very basic or highly advanced. Pine (1995) states that ORS are a critical factor increasing consumer’s loyalty towards the specific e-retail site. And it is also known that one of the main sources of eWOM communication is online reviews which have become an important tool of marketing communication due to the fact that many consumers search online reviews before making their purchase (Park & Lee, 2009) (Chatterjee, 2001). But online retailers in the Baltics are only utilising the potential of ORS in very small extent. This is because of the prevailing opinion that consumers in the Baltics only tend to leave negative reviews.

But, the specifics of the online market is that borders are open, global players are stepping in and competing along with local retailers. All while, effectively working ORS systems which help a consumer to make the right decision, might become a competitive disadvantage for online shops which are not yet using them.

Due to this, the aim of this paper was – to evaluate how eWOM through ORS is perceived and used by digital marketing specialists and e-commerce players in the Baltics. To reach the aim, some tasks were defined: 1) to check previous studies on ORS influence to purchase journey; 2) to interview digital marketing experts and e-commerce players; 3) to prepare recommendations for ORS usage in the Baltics.

Literature review

As defined by Burrow (2012) WOM is sharing of information between consumers through different communication tools, frequently also called “storytelling”. In the past, oral communication was almost the only way how to transfer information, but after the invention of writing and other communication tools, WOM processes have become more advanced, and hence it is not anymore linked so much with the “mouth” part of equitation (Burrow & Fowler, 2012).

The power of WOM has already been recognized long ago in the marketing world. As Berger stated WOM is the primary factor in 20-50% of all purchase decisions (Berger, 2013) and is already a multi-billion dollar industry by itself. But today's consumers are sharing their opinions with more than just

---

1 Faculty of Business, University of Latvia, elina.gaitniece@gmail.com
their friends and family; consumers can learn from complete strangers who shared their opinion in the digital environment. This is frequently referred as eWOM.

When a consumer wants to get an info about some product – he can “Google it”, post a question on a social network site, read online customer reviews or do other online activities which will provide a wide range of “consumer experiences” in the form of eWOM (Kaufman & Horton, 2015). eWOM encompasses a wide range of different forms and technologies (e.g., blogs, tweets, and shopping bots) of which online reviews are the most accessible and most frequently used (Thurau et al., 2004).

Online customer reviews are an important source of product information, and consumers rely on these reviews to infer product quality and to make purchase decisions. The influence of online customer reviews compels online retailers to use review systems that allow purchasers of the product to share their experiences with others by posting product reviews on the website (Pang & Qiu, 2016). Online ratings are a quantitative summary of experiences, attitudes, and opinions usually expressed as stars or points whereas, reviews are open-ended, user-generated text messages about a product or service. The two forms can occur separately or in combination. The most prominent example of online ratings and online reviews is that by online retailer Amazon.com. (Floh et al., 2013). Gathering knowledge about online consumers is becoming a critical success factor for businesses and online recommendation systems are one of a large range of tools to do so (Liao & Chang, 2016).

An experiment done by Senecal and Nantel showed that ORS have a strong influence not only on loyalty but also on consumers’ purchasing decisions. Results showed that subjects who viewed product recommendations selected recommended products twice as often as subjects who did not consult recommendations. The experiment also showed that an online recommendation source in the form of a “recommender system” was more influential than traditional recommendation sources even when perceived as possessing less expertise than human experts and as being less trustworthy than other consumers (Senecal & Nantel, 2004).

Schafer et al. (1999) worked out a classification system for ORS, which divided ORS into four major groups – non-personalized; attribute based; item-to-item correlation based, and people-to-people correlation based. Systems are measured and compared by two dimensions level of automation and the level of persistence in the recommendations as visible in Figure 1.

Figure 1: Recommendation Taxonomy

![Recommendation Taxonomy Diagram](image)

Source: Author

The most simple form is non-personalized ORS – this just takes into account feedback received from other customers, and where everybody gets the same offer. The next level, – attribute based ORS makes choices based on attributes searched by a particular customer and analyses syntactic properties of products to offer. The next level of ORS (item-to-item correlation ORS) takes into account customer’s behavior during his previous visits. And the most sophisticated level is people-to-people correlation ORS which seeks correlation between habits of different customers (Schafer, Konstan, & Riedl, 1999). According to Oestreicher et al., (2012) people-to-people correlation ORS is very effective and triples purchases of complimentary products. Also, Senecal and Nantel (2004) proved with an experiment that ORS influences a lot of consumers purchasing intentions – consumers who
were reading recommendations purchased recommended products twice as often as those who did not read recommendations. It also showed that ORS systems were more influential than human advisors.

**Data and methodology**

A survey of 53 digital marketing specialists in the Baltics was carried out during February and May 2016, and further on followed up by a monitoring study. The author used a purposive nonprobability sampling method and selected digital marketing specialists by using a range of professional contacts. The group included e-commerce owners and digital marketing specialists. Twenty-seven e-commerce owners representing all three Baltic countries got an invite to participate in the survey, sixteen of them provided answers. The group of digital marketing specialists was smaller, twenty-six specialists from the Baltics were invited to participate and thirteen provided their opinion. Latvia was represented by fifteen responses, Lithuania – by ten and Estonia – by only four. Due to the small number of responses gathered on country by country level – all conclusions were done only on a Baltic level and hence there was no possibility to compare responses between countries. Further on, 15 e-commerce retailers in the Baltics were monitored and their usage of ORS was evaluated using Schafer’s classification.

**Results and Discussion**

Survey results revealed that specialists in the Baltics recognize the impact of ORS – highest scores were given to the basic level of ORS “consumer reviews and ratings” – sixty-six percent of specialists rated them as “high” or “very high” influencers of consumers’ decision making about the purchase.

As Figure 2 shows ORS “frequently bought together” was evaluated as high or very high influencer by 45% of surveyed specialists. The most sophisticated ORS has the highest influence on consumer decision if compared with another advanced ORS “consumers who bought this item also bought…” was recognized as important influencer only by forty-one percent of specialists.

Source: Author

An important barrier to starting using sophisticated ORS was the recognized value of needed investments and also the availability of good and qualified specialists. As Figure 3 shows other
obstacles got much lower scores. Additionally, it was mentioned by respondents that management attitude plays an important role in decision to go for advanced ORS in an e-shop. The previous assumption of the restrictive factor that the perception about consumers leaving mostly negative reviews was not proven, as only twenty-four percent of specialists mentioned this as an obstacle. It is also worth to mention that the majority of specialists recognize that competitors – mostly global online players are already using quite sophisticated ORS. Additionally, monitoring studies covering both pure player and “brick&click” channel e-commerce players revealed that there exist even retailers who do not use any ORS, whereas the majority uses only one type of ORS (usually the basic one) and there is no online retailer who would use more than 2 types of online recommendation systems. The most popular system was the attribute based online recommendations system as it was used by 47% of online shops monitored. The author also recognized that this study might produce different results if some specific product group would be selected and that the results might also change over the time. Still, it was recognized that online recommendation system usage level in the Baltics seriously lacks behind from the level reached by global e-commerce players.

**Conclusion**

The study revealed that previous research in the field confirms that eWOM through different online recommendation systems is an important influencer to the consumer during his decision journey – particularly on the alternative evaluation phase – which brand and product to choose from several options, and also on the purchase phase – widening range of considered alternatives and possibly enlarging purchase basket. The survey results also confirm that online marketing specialists in the Baltics recognize the importance of ORS, it did not confirmed the previous assumption that ORS in the Baltics are not used due to expected negative reviews from consumers. Instead there were several other factors mentioned as barriers to using advanced ORS in e-commerce sites in the Baltics. Most relevant barriers – value of needed investment and availability of qualified specialists. Because of this, the usage of ORS in local online shops is very limited. Therefore, the author suggests to online retailers who are competing in the Baltic market, side by side with global players, to start using the most advanced ORS to keep their customer loyalty and not to lose momentum when first time users make their first purchases and get used to certain helping tools which guide them through their purchase decision journey. This study will be continued by a wide consumer survey which will identify factors which consumers find relevant in influencing them in online recommendation systems.

TECHNIQUES AND ANALYSIS OF MANAGEMENT AUDITS

Peter Gallo,1 Romana Pichová,2 Anna Šenková,3 Daniela Matušíková,4 Jana Mitriková5

Abstract: The proper management of an enterprise involves a set of complex activities that, in the current rapidly changing world, require adoption of modern market requirements. This paper describes a study concerning management audits. The study aims to identify and evaluate the specific techniques that are useful for obtaining information for audits in evaluating management, and examines modifications and applications of the model by McKinsey, ‘model 7S’, with an ‘IFE Matrix’. As practice shows, until now, the ‘model 7S’ approach is the most frequently used tool to assess the current state of management executives in business. The proposed models in the paper’s conclusion can be used individually or by combining two separate models to create a ‘two-staged adaptive model 7S’.

JEL Classification Numbers: M42; DOI: http://dx.doi.org/10.12955/cbup.v5.914

Keyword: management audit, model 7S, Adaptation model 7S, effectiveness, efficiency

Introduction

The main goal of most enterprises is continued improvement of their management system, which requires, in particular, an understanding of the current state regarding its strengths, and weaknesses, and a proposal to improve or overhaul the system where needed. The management of the company must first approve the audit of the management system in their company as a prime activity.

Many authors have defined the requirements of a management audit. For example, Law (2009) defines a management audit as an independent review of corporate governance, which is executed by professional management consultants, specializing solely in this type of review.

According to the authors, Wheelen and Hunger (2012), a management audit can be described as an analysis of business management with the audit compiling a list of questions from various areas of management and areas that affect management with the aim of receiving objective and honest responses.

The simplest definition of a management audit is given by David (2011), who characterized management audit as a gathering and evaluation of information about management activities within the company.

As the above characteristics indicate, a management audit is a special type of business management support, not a supervisory authority that only searches for errors and weaknesses. A management audit serves managers or management leaders as an administration tool since it has to provide impartial information about management systems used in the enterprise (Spencer, 2011).

All activities implemented in the management audit are performed by specialized personnel, who must not only know the theory and principles of corporate planning, organization, and management, but also business practices (Kotler, 2013).

According to Trunečka (2004), a management audit aims to identify and assess the current state of corporate governance, i.e. to identify and characterize problems in the company that prevent effective management.

Other management techniques, such as controlling, benchmarking, and internal analysis methods, are also used to assess the current stage of management. Examples given by Gallo (2013) include a Balanced Scorecard; a Space Analysis; the Strengths, Weaknesses, Opportunities, and Threats (SWOT)6 analysis; Internal Factor Evaluation (IFE) matrix of business processes; and an analysis of the key factors based on the model 7S proposed by McKinsey (Schawel, Billig, 2012). This paper

---

7 Efficiency signifies a level of performance that describes a process that uses the lowest amount of inputs to create the greatest amount of outputs.

8 The degree to which something is successful in producing a desired result; success.
An important characteristic of a management audit is that, it does not have fixed or mandatory procedures or standards. While these are controls that an auditor could use, a management audit has a creative form (Kumar & Sharma, 2015).

The function of a management audit in the company itself does not need to be established but can be secured from external sources by outsourcing the management audit. Managers or the company management leaders must assess and choose the form of management audit needed (Montana & Charny, 2008).

Data and Methodology

The 7S Model was modified based on responses from structured interviews with experts in the field of auditing with a specific focus on issues of management audits and of managers who personally processed management auditing in their companies. The research was conducted in the Czech Republic, 2015 – 2016, and was centered on small- and medium-sized enterprises (employing 11–250 employees). From the possible internal analyses of management audits, the 7S Model, IFE matrix, and SWOT analysis were the most convenient and most preferred methods of the respondents and hence considered the best methods to assess the current state of corporate governance.

The 7S Model was selected as a basis for a new evaluation model (Adaptation of 7S Model) of the present state of management from the above methods. The reason for choosing this approach was that it not only is used as the main tool for internal analysis of the company, but it simultaneously analyzes the influence of elements of greatest importance in business management.

The overall assessment of the current state of business management was based on point. The scale in the evaluation parameters of the individual evaluation factors was chosen according to the choice of Likert five-point scale.

Results and Discussion

The application of an ‘Adaptation of 7S Model’ involved separate factors (Table 1), emphasizing consistency and harmony. Among such factors in the ‘Adaptation of 7S Model’ were structure, systems, style, group skills, strategy, and shared values, that were contained in the original model. Furthermore, certain factors involved evaluation indicators as well as a set evaluation parameter.

Evaluation indicators were assigned based on the results of respondent surveys. The requirement of respondents was to assign a maximum of four evaluation indicators for each factor. The evaluation questions were prepared, based on the results of interviews with managers within the companies.

The evaluation parameters were chosen for efficiency and effectiveness, based on the work of the renowned management consultant, Drucker (1974), who considered any management activity to be viewed from these perspectives with effectiveness meaning performing requirements successful and efficiently means performing requirements successfully, in a way to avoid waste.

Evaluation questions were drawn for each factor to correspond to the evaluation indicator of each. The number of selected and assigned questions for every factor was five, and hence, five was the maximum score for each. The compiled questions are shown in Table 2.

The principle of the current state of governance evaluation based on the above model in Table 1 consisted of assessing replies to the set questions in Table 2 in terms of efficiency and effectiveness. Questions were constructed so that the answer was either yes or no. This evaluation system is shown in Figure 1.

<table>
<thead>

</tbody>
</table>

The principle of assessing the current state of management, corresponding to Figure 1, is as follows:

The system for evaluating the answers to the questions in Table 2 in terms of efficiency and effectiveness. The answer could be yes or no.
1. Setting of evaluation questions for each factor listed in Table 2
2. Obtaining answers to these set questions, first in terms of effectiveness, where
   a. Zero is assigned to a negative answer regarding the effectiveness and also means a
      negative response to the question relating to efficiency, which thus scores a zero
      (when the activity in the enterprise is not provided, it is not able to be evaluated).
   b. One is assigned to a positive answer regarding effectiveness and means that the
      company carries out the activity and can further proceed to evaluate the response to
      the question in terms of efficiency.
3. Answers to these set questions for efficiency, where
   a. Zero is assigned to a negative answer regarding efficiency, where the company carries
      out the activity effectively, but inefficiently.
   b. One is assigned to a positive answer to the question from the perspective of efficiency
      and means that the company carries out the activity effectively and efficiently.
4. The total assessment is a simple sum of points with a maximum of 10 points for each
   evaluated factor. The ranges of evaluation points achieved are shown in Table 3.

For ease of quantitation, the evaluation questions were the same for effectiveness and efficiency.

Source: Authors

Table 3 shows evaluations scale. The final rating for evaluation ‘A’ represents the best possible score obtained, and the overall final rating for ‘E’ the worst. The ‘A’ evaluation with a score ranging from 70 to 63 is when the company is managed fittingly, and the chosen management system is sophisticated and at a high of proficiency. The ‘E’ evaluation with zero score points to inadequacy and a poorly chosen management system.

**Conclusion**

Every company seeking to be robust and stable, not only in financial aspects but also in corporate organization and management must constantly analyze its management system. For evaluating the current state of business management, it is possible to use many of the already known and used management methods, such as internal benchmarking, internal control, balanced scorecard, and space, SWOT, and process analyses. This paper describes an entirely new and more detailed model, the ‘Adaptation of 7S model’ for managers of businesses. This model serves to assess the current state of corporate governance and can be used without further modification or with adaptation according to specific needs and requests of the company.

MEASURABLE PERFORMANCE INDICATORS OF BUSINESS PROCESSES AND PERFORMANCE OF SLOVAK AND FOREIGN BUSINESSES

Katarina Gašová,¹ Martina Kováčiková,² Katarína Repková Štofková³

Abstract: Business activities (managerial, administrative, commercial, manufacturing, etc.), which are focused on production or the services provision should be managed as a whole, containing the activities liable to certain logistic in their arrangement and interconnection. The business activities’ transformation on processes and management (identification, modelling, mapping, analysis, measurement and improvement) through the process management can be understood as a type of methodology suitable for the analysis, evaluation and improvement of key processes in the business.

An aim of the application of business process management is to create a process model consisting of managerial, core, transparency supporting, measurable, and possible improvement processes. The principles of business process management application can lead to continuous improvement of business processes and to the position improvement of the business in a constantly evolving competitive environment. During the evaluation process, it is important to focus on one of the most important factors – the measurability of process performance.

JEL Classification Numbers: D00, D24, J24; DOI: http://dx.doi.org/10.12955/cbup.v5.915

UDC Classification: 658.6

Keywords: process, key performance indicators, critical success factors

Introduction

In the competitive business environment, the number of businesses applying principles of the business process management is currently increasing with an emphasis on the efficient management of processes to ensure the achievement of aims at the required quality and at a specified standard. An appropriate implementation of business process management also brings high productivity and profit. An effective process management requires the measurement of their performance. In the context of the business processes performance measurement – the efficiency of business processes – we mean the Key Performance Indicators (KPIs). KPIs quantify the performance of the monitored process in regard to the process output (added value of process).

Business processes

The process is characterized by the input, transformation, and output. At a closer look, it is possible to specify responsibility, owner, customer, sponsor, time parameters, boundaries, repeatability and the resources of process. Business processes can be classified by various criteria. The most common classification is to: management, core (main business, key) and support (service and section) processes. Internal and external processes can be specified in regard to the internal and external business environment i.e. to the orientation of process output on the internal or external customer (Soltés & Repkova Stořková, 2016).

The authors Dzubakova & Lichnerova (2012), Hromkova & Holociova (2005) cite Earl's classification of business processes:

- Core processes – relate directly to the external customer and are critical to functioning of the business.
- Support processes – are tasked to support core processes and create suitable conditions.
- Business network processes – transcend business boundaries and directly impact the competitiveness of the business. These processes focus on business partners, customers and suppliers.
- Management processes – impact the internal efficiency of the business. Represent the planning, organizing and managing resources.

Tucek & Zamecník (2007) cite the classification by Edwards and Peppard, who differentiate four types of business processes according to product and components of market oriented business strategy:

¹ Faculty of Operation and Economics, University of Žilina, Slovak Republic, katarina.gasova@fpedas.uniza.sk
² Faculty of Operation and Economics of Transport and Communications, University of Žilina, Univerzitná 1, 010 26, Žilina, Slovak Republic, martina.kovacicova@fpedas.uniza.sk
³ Faculty of Operation and Economics, University of Žilina, Slovak Republic, katarina.stofkova@fpedas.uniza.sk
Competitive processes – are focused on the competitors with the aim to improve the competitive position of the business. From an economic perspective, these processes ensure profit for the business.

Infrastructure processes – focus on human resources, processes and technology, i.e. they are crucial for the efficient future of the business.

Core processes – represents essential business processes important for remaining competitive. They are valued by process customers, i.e. customers, suppliers, employees and other stakeholders.

Support processes – are necessary to be carried out in a business however, are not appreciated by stakeholders.

Dzubakova & Lichnerova (2012) give a different view of the processes classification, which was brought by Kaplan and Norton (Kaplan & Norton, 1993). They categorize business processes to:

- Innovation processes – the main parts are research and development, which affect the competitive position of the business.
- Operations processes – run inside the business and are focused on production. These processes begin with the order and end with product delivery.
- Post-sales processes – services, following the sale, e.g. customer service.

In all mentioned classifications can be identified as major processes, which are crucial for the functioning of the process and also the processes, are used for the proper business functioning, and which support the performance of core processes.

**Business processes evaluation and measurement**

Each business performs process optimisation with regard to the Critical Success Factor (CSF) of business. Critical factors represent areas that businesses want to improve and by that increase their competitive advantage. Some authors claim that CSF are conditions which businesses must meet to be able to achieve their outlined strategic aims. CSF can be considered as business milestones. In compliance with the concept of CSF they represent the definition of the most important factors for business success. CSF are also referred to as key success factors so that these terms can be therefore be regarded as synonymous. The most common CSF which businesses seek to achieve are improvement on: customer satisfaction, quality, product delivery, employee satisfaction, productivity, financial performance, safety, environmental performance, social behaviour, price, the best suppliers, the best sellers etc. indicated by Zavadsky (2004) and Stofko et al (2016).

Changes in business process are carried out according to key success factors. However, it is necessary to obtain accurate and objective information about the progress of processes and sub-processes to be able to evaluate the made changes. This information is obtained by the process performance measurement. A term of the process measurement includes activities, which provide accurate and objective information about the process flow. This information is used mainly by process owners in operation management. According to this available information, process owners are able to meet all the requirements of the process (Triad, 2015).

It is necessary to secure the completeness, sufficient level of detail, and validity of the measurement to obtain the relevant results of the process performance measurement (input, flow, output). In the context of the measurement it is necessary to set the frequency and accuracy of the measurement and also to identify deviations from the different requirements in different locations of the process or to accept the seasonality of specific phenomena. The realisation of processes’ performance measurement requires the definition of the indicator, based on which it will be possible to quantify the business performance. The most commonly used quantification units are units of: time, percentages, currency or quantity (piece, volume, weight and length measures). The measurement results should be presented in an intelligible, clear and univocal manner, i.e. the key performance indicator have to be defined unambiguously.

The relationship between Critical Success Factors (CSF) and key performance indicators (KPI) is also defined in a set of ITIL book publications (ITIL, 2015) (Figure 1).
According to ITIL (set of book publications, containing a collection of the best practices from the discipline of management and information technology services and is owned by the British company AXELOS, Ltd.), each business should define appropriate CSF derived from the process purpose. A further level represents the determination of key performance indicator derived from the defined CSF. The determination and acceptance of KPI should be carefully considered, whether the KPI actually results from the CSF and corresponds to the level of business. Businesses should constantly monitor the determined KPI because it can signal a deterioration of process performance as well as identify opportunities for process improvement (OMNICOM, 2016).

**Key performance indicators**

KPI are defined as indicators or performance metrics associated with the process, the product, the service, and the whole business or part of it. KPI are tasked to quantify the performance of business as a whole, in regard to a determined top aim of the business i.e. the critical success factor. However, the business performance is a result of the performance of the individual parts and business processes. Therefore, it is necessary to correctly select the appropriate KPI, but also to choose a suitable activity to be linked with the KPI as equally indicated by Dzubakova & Lichnerova (2012) and others (Management Mania, 2016). KPI should be quantifiable and should enable business to determine measurable aims, monitor, identify and predict trends. In some cases, KPI should provide preventive, remedial, and improving measures. Top management of the business should establish KPI as a basis for strategic and tactical decisions. KPIs should be suitably selected and assigned to the relevant functions and levels of the business, depending on the processes structure and should thus support the monitoring of the achievement level of top aims (Martisovic, 2016).

A substantial part of process performance measurement is the process of determining the specific process performance indicator. The key is to correctly identify and define the process. Thereafter the predetermined team provide a substantial analysis of possible indicators, which result in the specification of the most appropriate indicators of inputs for the process performance measurement (Klbko, 2016).

**Types of measurable indicators**

Measurable performance indicators can be divided into several categories according to business focus and the nature of business products. In this regard, it is possible to specify universal performance indicators, production processes performances indicators, and performance indicators of non-production processes (Repa, 2006).

**Universal performance indicators** represent indicators which can be used to measure various processes and are not tied to a particular or specific process. There exist many universal indicators, but the most used are:

- Effective use of process time – it is a ratio of processing time to process continuous period.
- Ongoing process time – represents the time which elapses from the time of acceptance of the process input to final output of the process.
- Total process costs – are composed of the conformity and non-conformity costs.
- Effective use of costs – is a ratio of the conformity costs to the overall costs of the process.
- Mismatches ratio of process – is the ratio of the mismatches identified during the process to volume of matched output of the process.
- Number of registered deviations in the process (Loucanova et al., 2015).

**Production processes performances indicators** are mainly used for operational management of production. The most common and the well known performance indicators include: the value of production-in-progress, the percentage of downtime on the available machine capacity, worker productivity, machine productivity, capital productivity, overall efficiency of the device, the
proportion of defective products to total output, number of worked hours, elasticity in response to a change in production, the number of suggestions for improvement and many others (Klbko, 2016).

Non-production process represents each process, except production, which flow in businesses during the course of product realization. Non-production processes can take place before the start of production (development, marketing, etc.), during the course of production (repairs, maintenance, etc.) or after production (import, service, etc.). The best known and most widely used performance indicators of non-production processes are: the evaluation of suppliers, the reaction rate to mismatches notified by customers, the share of scheduled orders to realised contracts, the cost to retrieve suitable suppliers, the time of placing a new product on the market, the return on investment for design and development, the share of maintenance costs of the total costs, the share of new requirements for service to all the unmet needs etc. mentioned by Free ITIL training (ITIL, 2011).

In regard to other measurement elements is the process-oriented standard: STN EN ISO 9001 which complements the aforementioned key performance indicators of production, non-production and universal processes of performance measurement by variations (delays of supplied material and information input, defects of tools and equipment, unprepared or incompetent staff etc.) and by the index performance measurement (data recorded for evaluation: time of measurement, names of used indicators, weight of indicators etc.) referred to in ISO 9001 (ISO, 2011).

Another categorization of process performance measurement indicators can be focused on specific attributes or the characteristics of processes. In this regard, it is possible to specify the orientation to animate and inanimate attributes of a particular process.

Data and methodology

Authors used professional literature published in the field of process management during the literature review. Information from the statistical offices’ web pages were used during the research. This information represents secondary data sources. Authors focused mainly on the analysis of options for process improvement in context of process management i.e., the analysis of the process evaluation and performance measurement. The most attention was devoted to the comparison of the European Union countries based on the labor productivity per hour. The labor productivity per hour is an indicator considered as a coefficient of performance relating to operative processes in general, in regard to the comparison of countries.

Various methods were used during the research. Methods of professional literature selection, induction and deduction were used during the literature review. Authors carried out the analysis and synthesis necessary for the determination of mutual influence between the established facts. A method of comparison was used to compare the findings of the European Union member countries to the established performance indicator. The methods of induction and deduction were used during the whole contribution. Authors used MS Excel and PowerPoint as a basis for the graphic and image processing.

Comparison of the Slovak and foreign businesses performance

Labour productivity can be used for the comparison of the performance of businesses in different countries as described below. The contribution of Horvathova & Suhanyiova (2012) claims that there is a significant difference between the performance of Slovak and foreign businesses. However, this difference does not consist of differences in employees’ education or technology disparities of business equipment, because Slovak businesses are at the same or very similar level in these areas as businesses abroad. The difference consists mainly of the processes arrangement and their effective management and flow. This situation is a result of the fact that foreign businesses are currently dealing with issues of process management more than Slovak businesses. Foreign companies pay more attention to processes and the elimination of barriers for the most efficient process flow within the business. It is necessary to verify and prove that businesses abroad, particularly in developed countries, actually perform better than businesses in Slovakia. On the assumption that inputs, education and technological equipment are comparable in different countries and that conditions for businesses are approximately at the same level, then it is possible to compare the performance of businesses in different countries with the use of labor productivity per employee or labor productivity per hour worked. Labour productivity per hour worked provides objective information about
productivity because the assessment of labor productivity per employee does not take into account the types of employment contract and real worked time.

According to EUROSTAT (2016), the labor productivity per hour worked in Slovakia was 13.2 € in 2013. In France, Belgium, Sweden, Ireland and the Netherlands had a level of labor productivity per hour worked at the level from 45 € to 48 €. The highest labor productivity per hour worked reached Denmark. Lower productivity compared to Slovakia reached Bulgaria, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, and Romania. The lowest labor productivity among the surveyed countries in 2013 was recorded in Bulgaria at the level of 4.9 €. We processed the statistical pages of PORDATA (2017) to give a different perspective on monitored issue. The following figure expresses a graphically processed comparison of the monitored indicator in 1995 and 2015 (“-“ represents unavailable information) (Figure 2).

Figure 2: Labour productivity per hour in euro

In the context of the trend formation, the statistical pages suggest that according to the measurable performance indicator – labor productivity per hour worked – that Ireland will be the leader in the future.
Conclusions

Processes are very important part of every business. The setting and types of processes in the business affects its functioning, but particularly its performance. However, not all businesses realize the importance of processes. They do not have processes explored and mapped and thus do not see opportunities for improvement. Business process improvement is currently considered as a prerequisite for a successful business. It should run continuously, with the acceptance of measurable indicators, setting KPI and CSF, to bring a change, which will have a positive impact on the business.

Prosperity, productivity, business flexibility is reflected in the prosperity of the country and also in the citizens’ standard of living. We used labor productivity per hour worked expressed in Euros as an indicator of the countries performance in the contribution. The growing trend of monitored labor productivity per hour worked was generally observed. Nevertheless, the Nordic countries still occupy leading positions in regard to the measure of labor productivity per hour, while Luxembourg dominates from all of the Western Europe countries. From the V4 member countries we see Slovakia and the Czech Republic to be almost equal.

Based on the findings we can partially confirm the above statement, that foreign businesses operating in the developed countries perform better than businesses operating in Slovakia. Therefore, it is possible to assume that the management oriented on business processes have a key importance.

COMPETITIVENESS ANALYSIS OF KAZAKHSTAN CONFECTIONARY SECTOR USING FINANCIAL DISCRIMINANT MODELS

Petr Hájek,1 Gulnar Zhunissova,2 Tatjana Čábelová,3 Adilya Baidildina4

Abstract: Measuring competitiveness offers hundreds of analytical options. We have chosen to analyze and compare companies of confectionery sector in Kazakhstan. We opted to use bankruptcy and creditworthiness models and compare competitiveness through the financial situation of main competitors on that market. Companies analyzed comprise of two Ukrainian companies (Konti and Roshen), Russian companies (Nestlé Russian branch serving also Central Asian markets and KDV - Yaskino) and three local corporations Rakhat, Bayan Sulu and Konfety Karagandy. Models used for analysis are Altman z-score model, Taffler z-score model, IN099, IN01, IN05, and creditworthiness model. The IN models were created in the Czech Republic based on companies' data from the 1990s which was the period of higher inflation, small currency an big banking crisis, massive imports, developing competition and infrequent political turmoil. These models have comparably much greater benefits for analyzing companies in Kazakhstan because they are based on hundreds of companies in contrast to tens of companies on which Altman or Taffler based their famous and highly predictive models. We present an analysis of models in 2007 – 2016 period based on publicly accessible data. We show the IN models have valuable benefits for comparison compared with other older models and that they can disclose certain events or corporate situations in a clearer way than other Altman or Taffler z-score models and should be used in Kazakhstan and improved to suit better the local market environment.

JEL Classification Numbers: G32, G33; DOI: http://dx.doi.org/10.12955/cbup.v5.916

Keywords: bankruptcy, valuation, sweets, creditworthiness, IN models, Altman, competitiveness, Taffler, z-score model.

Introduction

Kazakhstan is a large country, very rich in many resources and home to 138 nationalities. What all these nationalities love are sweets. Confectionery business in Kazakhstan is famous and produces great quality products. Unfortunately, in last ten years had to adapt to many changes, including cocoa prices significant changes multiplied by the depreciation of tenge, and growth and recession periods of the Kazakhstan's economy. Regardless, citizens never stopped buying the sweets.

The financial analysis offers many models to analyze the likelihood of bankruptcy or solvency conditions that usually serve only to company financial director or investment companies for their decision-making about buying or selling shares. Analyses comparing companies from almost any whole sector in Kazakhstan are nonexistent.

We have decided to change this situation and analyze companies that cover a significant portion of confectionery business in Kazakhstan altogether (see data chapter for individual companies analyzed). That includes companies from Kazakhstan, Russian Federation, and Ukraine.

To proceed with such an analysis, we have selected models used in the EU and USA, but also frequently used models in the Czech Republic, which were developed using data from thousands of companies compared to tens of the Altman or Taffler models.

The objective of this research paper is to compare and comment results of various financial analysis models using publicly accessible accounting data since 2007, recommend changes to some models while analyzing usefulness (positives and negatives) of such models under Kazakhstan economy conditions.

Economic environment

Ten years ago, in 2007, started a subprime banking crisis in the USA. It sparked global recession and crises on various asset markets around the world during next 2-3 years including Kazakhstan. The banking sector in Kazakhstan was hit and credit market froze. That resulted in a Government intervention. During the great recession the price of the main export product of Kazakhstan, the oil, plummeted. Its price has a significant influence on the exchange rate of tenge to USD.

Since then it is hard and expensive to get any credit. Banks are very risk-averse, and interest expenses of companies are high when compared to the EU countries, or countries in the Eastern Europe. Table 1 shows the situation: inflation is increasing with the depreciation of tenge. To limit the inflation, the
The central bank decided to increase target interest rate, which led to skyrocketing interest expenses of all indebted companies. Consumer expenditures (where spending on sweets belongs) show slow growth in last two years as GDP growth does. Therefore, we can expect citizens to be buying relatively smaller amounts of sweets and thus production and sales of the confectionery industry cannot be expected to rise significantly.

Main import commodity and unreplaceable production input for confectionery industry is cocoa. See Figure 1 for price fluctuations in KZT and USD on world markets. We can see that cocoa prices started to significantly increase during fall of 2014 to reach multiples of prices that were common between 2007 and 2013. The same chart also shows a significant increase of USDKZT exchange rate affecting negatively (concerning costs) other imported commodities for whole industry as well. Besides mentioned expenses on cocoa, the sector also faces other import tariffs and price fluctuations for sugar, nuts and other ingredients not produced in Kazakhstan, or in the countries of the Customs Union.

Table 1: Selected indicators of Kazakhstan economy

|------------------------------------------|------|------|------|------|------|------|------|------|------|------|---------- \\
| CPI [% YoY change]                       | 10.8 | 17.2 | 7.3  | 7.1  | 8.3  | 5.1  | 5.8  | 6.7  | 6.6  | 14.5 | WB       \\
| CPI (2010=100)                           | 74.3 | 87.0 | 93.4 | 100.0| 108.3| 113.9| 120.5| 128.6| 133.2| 157.1| IFS      \\
| Central Bank Policy Rate [% p.a.]        | 11.0 | 10.5 | 7.0  | 7.0  | 7.5  | 5.5  | 5.5  | 5.5  | 16.0 | 12.0 | IFS      \\
| USDKZT [Period Average]                  | 122.6| 120.3| 147.5| 147.4| 146.6| 149.1| 152.1| 179.2| 221.7| 342.2| IFS      \\
| GDP growth [% p.a.]                      | 8.9  | 3.3  | 1.2  | 7.3  | 7.4  | 4.8  | 6.0  | 4.2  | 1.2  | 1.0  | WB       \\
| Household final consumption, [% YoY change, constant KZT] | 10.8 | 6.9  | 0.7  | 11.2 | 11.9 | 10.3 | 10.4 | 1.5  | 1.8  | n/a  | WB, Authors \\

Figure 1: Cocoa prices in USD and KZT

According to (Euromonitor, 2016) the import duty on the cocoa product has been reduced by Eurasian Economic Commission at the start of 2017 from 3-5% to 0% of the customs value. The 0% will apply to non-defatted cocoa paste, cocoa butter, and cocoa fat. The new tariff will not affect Rakhat, Bayan Sulu and Konfety Karagandy (further referred as KK) because they have their own cocoa beans
processing mostly Helva and other cheap products. However, other local companies, such as Hamle (bought in 2017 by Ulker Biskuvi Sanayi for 3 mil. USD) and Almatinskiy Produkt (producing mostly Helva and other cheap products that are less popular), do not have the equipment for roasting and processing cocoa beans.

**Data and Market Description**

We have decided to analyze companies covering a significant portion of the market for confectionery products in Kazakhstan. Selected companies originate from three countries: Kazakhstan (Rakhat, Bayan Sulu, Konfety Karagandy), Russian Federation (Nestle Russia, KDV - Yaskino) and Ukraine (Roshen, Konti). Analysed data were downloaded from publicly available sites: for Rakhat from (Rakhat reporting, 2017), for Bayan Sulu from (Bayan Sulu reporting, 2017), for Konfety Karagandy from (Konfety Karagandy reporting, 2017), for KDV Yaskino from (KDV - Yaskino reporting, 2017), for Roshen from (Roshen reporting, 2017), for Konti from (Konti reporting, 2017), and for Nestle Russia from (Nestle reporting, 2017). Due to data availability and for easier comparison we have limited data used for ten years between years 2007 and 2016.

Source: (Rakhat, 2017)

According to (Rakhat, 2017) the market for sweets is close to saturation. The trend of sweets consumption growth rate is decreasing in last few years. Because of the significant weakening of the national currency, a reduction in income and a decrease in the purchasing power of the population led to the concentration of sales moving to a cheaper segment of the market: consumers turned from more expensive chocolate to cheaper confectionery products as cookies, waffles, and caramels. The market has the capacity of 227 000 tons with domestic companies producing 183 000 tons of which 68 800 tons is exported, and another 112 800 tons imported (mostly Russia and Ukraine as seen from Table 2).

**Results and Discussion**

To analyze financial trends of individual companies, we have selected (considering the availability of indicators) the following bankruptcy and creditworthiness models: Altman z-score model, Taffler z-score model, IN99, IN01, IN05, and Creditworthiness index.

Certain peculiarity making hard any such analysis in Kazakhstan is sometimes unclear accounting terminology resulting in problematic “translation” of certain indicators used in various models in other countries. It would be impossible to do such an analysis without consultations with local accounting experts knowing the specific terminology of indicators in each Czech, English and Kazakh environment. Our experience is that research based on a plain translation of indicators from local websites would be unusable. For the purpose to clear doubt for anybody, who would like to replicate our analysis, we present a three-language terminology table of indicators used (see Annex).

These models belong to the group of indicator systems, which are supposed to assess the financial situation of the company. Since the values of these indicators are very important for banking institutions, when deciding about granting or rejecting a credit. Their purpose is to eliminate limitations and potentially missing information discovered by the ratios. (Kislingerová, 2008)

Creditworthiness models examine the financial health of a company based on macroeconomic and microeconomic principles and also on an experience and knowledge of the financial analyst. Creditworthiness models assess the financial health of the company in comparison with other companies, or they use a point system, in which the companies are classified according to their financial situation. (Grünwald, 2007)

As (Kislingerová, 2008) points out: the purpose of the bankruptcy models is to predict a threat to the financial health of the analyzed company and the likelihood of bankruptcy. The term financial distress
represents a state of the company in which it is not capable of settling its debts, or the value of its debts exceeds the value of its assets. In other words when a company becomes illiquid or insolvent.

Altman Z-score

According to (Vochozka, 2011) the Altman Z-score belongs to the group of bankruptcy models. This model is named after Prof. Edward Altman who on the grounds of several ratios and statistical analysis managed to evaluate the bankruptcy likelihood of the company or the probability of decline two years in advance and with up to 70% success rate five years in advance. According to (CRF, 2017), the z-score is known to be about 90% accurate in forecasting business failure one year into the future and about 80% accurate in forecasting it two years into the future.

Prof. Altman constructed it by using discriminant analysis with five ratios used in the equation, according to which is possible to identify a bankrupting company. (Vochozka, 2011)

\[
Z = 1.2 \times X(1) + 1.4 \times X(2) + 3.3 \times X(3) + 0.6 \times X(4) + 1.0 \times X(5)
\]

Where:
- \( X(1) = \frac{(\text{working capital} \times \text{current assets} - \text{short-term liabilities})}{\text{total assets}} \)
- \( X(2) = \frac{\text{retained earnings}}{\text{total assets}} \)
- \( X(3) = \frac{\text{EBIT}}{\text{total assets}} \)
- \( X(4) = \frac{\text{market value of equity} }{\text{book value of debt}} \)
- \( X(5) = \frac{\text{sales}}{\text{total assets}} \)

We can see Konfety Karagandy faced several important events in 2014. First 24 Jan 2014 the main shareholder of the Apex's way (Kazakhstan) sold 90% of shares (all they owned) to Centis International Ltd. (British Virgin Islands). Apex way owned the shares only since December 2013 when they bought them from British UIG Ltd. According to the decision of the Novosibirsk region, Arbitration court the KK owed 221,045,487 RUB past due to trading company Armatele LLC. The debt has to be paid by the end of the year 2017 (Konfety Karagandy, 2015). Then on February 11, tenge devalued by 20% against US dollar, which significantly increased the dollar value of KK foreign debt. After the change of ownership, the KK went through a restructuring in 2014, changed management, and with decreasing sales since then through early summer of 2016 they decided to shut the production completely down to buy new equipment. (NovoeTV, 2016). Date of production reopening is unknown.

We can see several companies struggled to survive during the Great Recession and frozen credit market. Nestlé managed to survive with support from the holding company in Switzerland. Bayan Sula struggled through the whole recession because of a significant increase in the volume of receivables. Also, the company received new credit and sold owned shares to increase its financial situation. Roshen faced a similar environment in Ukraine and got out from it with a significant increase in liabilities and bank credit in 2008, and 2009 respectively. Bank credits increased until 2011 and in 2012 started to decrease. In 2007 Nestlé had almost ten-fold volume of Short-term financial investments (probably shares to improve financial stability) compared to other years. KDV-Yaskino took in 2015 lots of bank credit to survive the long-term liabilities that skyrocketed in 2014.

In 2010 Roshen started to invest into the construction of a new factory in Lipetsk region of Central Russia which finished in 2013 and cost 250 mil. USD. (Focus, 2010). In 2013 Roshen after the approval of the annual accounts for the 2011-2012 revealed the fact of overstating net costs and understating the profit for 2011 and 2012. The identified error led to the increase in taxable profits in 2011 and 2012, and the additional payment of 1,307,789.79 RUB profit tax. (Roshen, 2014). The factory in Lipetsk was
closed in March 2014 due to problems that emerged during the Russian annexation of Crimea which happened 20 Feb 2014 – 19 Mar 2014. (BBC, 2014)

Taffler’s model (Růčková modification)

It is a bankruptcy model that indicates the probability of bankruptcy of the company. The model was published in 1977. (Atlantis, 2017) Taffler’s z-score model discrimination function has the form of modification of (Růčková, 2011) with four ratios.

\[
TZ = 0.53 * R1 + 0.13 * R2 + 0.18 * R3 + 0.16 * R4
\]

Where:  
- \( R1 = \frac{\text{Earnings before taxes}}{\text{short-term liabilities}} \)  
- \( R2 = \frac{\text{current assets}}{\text{liabilities}} \)  
- \( R3 = \frac{\text{short-term liabilities}}{\text{total assets}} \)  
- \( R4 = \frac{\text{sales}}{\text{total assets}} \)

TZ> 0.3  low probability of bankruptcy of the company
0.2 <TZ <0.3  gray zone of unmatched results
TZ <0.2  increased probability of bankruptcy of the company

The original version of Taffler’s model uses the share of financial assets net of current liabilities to operating costs instead of sales to total assets and does not use gray zone. When evaluating the original Taffler’s Model, the gray zone is not used. Enterprises are classified according to the index outcome only on bankruptcy and credibility: zero is the critical value for the determining the category. A positive index corresponds with credit business and vice versa. (Vochozka, 2011)

Růčková (2011) used the same breakdown of enterprises according to the established value of the Taffler’s Model. Rather than evaluating enterprises as creditworthy, she states that the company has a small probability of bankruptcy and instead of bankruptcy enterprises says that the company has a high probability of bankruptcy.

The [Taffler] model is shown to have the clear predictive ability over time period [of 25 years] and dominates more naïve prediction approaches. [This] study also illustrates the economic value to a bank of using such methodologies for default risk assessment purposes. (Agarwal & Taffler, 2007)

Source: Authors

We have already described the KK situation. The Roshen company became a victim of war in Ukraine and shut down newly built Russian factory. The loss of rich Donbas to pro-Russian separatists caused a significant loss in 2015 for many Ukrainian firms, causing an increase in debt and interest expenses.

**IN Models - Credibility indexes**

According to (Neumaier & Neumaierová, 2002) the IN models belong to the group of bankruptcy models and were created for the conditions of the restructuring Czech market during the 1990s. The authors using discriminant analysis, ratios and weighted mean values created a function for identification of bankrupting companies. IN models have gone through several phases of evolution, the first being the IN95 index, which focused on the company from the creditor’s point of view and included Past due liabilities, an indicator not being published by companies in Kazakhstan (so we cannot use it in our analysis). Then the IN99 index followed, which assessed the company from the perspective of the owner. These two resulted in bankruptcy index IN01, which connects both of the previous indexes and also includes the economic added value. The last version emerged in 2005 when IN01 was updated into the bankruptcy index IN05 (Neumaierová & Neumaier, 2005).

**IN99 Index**

\[
IN99 = -0.017 * A + 4.573 * C + 0.481 * D + 0.015 * E
\]
The IN index may be an appropriate indicator of value creation, especially if it is not possible to work with market prices for a company’s shares due to their low ability to provide information or if no equity cost can be determined. With the success rate of 86.4%, the index proves the value creation and with an even higher rate of success 98.9% has been able to identify that there is no value creation. (Atlantis, 2017)

According to (Atlantis, 2017) the construction was based on a discriminatory analysis and was based on the data of 1915 enterprises from the Czech Republic that were divided into three groups: 583 were in the group of enterprises creating value, 503 enterprises in bankruptcy or just before bankruptcy, and 829 other enterprises.

Source: Authors

IN99 focuses on the company through lenses of the owner. The greener the fields, the happier the owner. We can see that almost all companies had to experience very tough times in last decade. Besides already commented situation of KK, Rakhat shows relative ability to get out of surpess or depression faster than its competitors. Konti results are a surprise as in the environment of recession, frozen credit markets, depreciation of UAH and war in Ukraine remains in relatively much healthier conditions compared to the competition. In 2010 and 2011 the profit and stocks increased as well as bank credits. Total liabilities increased in 2010 by 64 % from 2 568 139 to 4 227 610 UAH. Konti also did something the KK did not: converted all their debts in EUR and USD to UAH on September 9, 2009, so they evaded later depreciation of UAH that would hit them hard when the war with Russia-supported separatists started after the annexation of Crimea in 2014. Konti faced high Ukrainian interest rates between 2010 and 2011 (after the conversion of all debt to UAH the rates started to fall from around 26 % to 17 %). (Audit reports for 2009 and 2011 from Konti reporting, 2017) In our opinion, the IN99 describes the conditions of analyzed companies in the given environment in a more vivid way than Altman’s z-score, which also shows very useful and interesting results.

IN01 Index

The IN01 merges creditworthiness and bankruptcy models.

\[
IN01 = 0.13 \times A + 0.04 \times B + 3.92 \times C + 0.21 \times D + 0.09 \times E
\]

Where:

- \( A = \text{assets} / \text{liabilities} \)
- \( B = \text{EBIT} / \text{interest expenses} \)
- \( C = \text{EBIT} / \text{total assets} \)
- \( D = \text{sales} / \text{total assets} \)
- \( E = \text{current assets} / \text{short-term liabilities} \)

\( \text{IN01} > 1.77 \) Enterprise creates a value

\( 0.75 \leq \text{IN01} < 1.77 \) Creditworthy business not creating value

\( \text{IN01} < 0.75 \) Enterprise is on the way to bankruptcy

Together with IN05, the IN01 uses interest expenses which show especially in case of Konfety Karagandy serious problems with credit repayment. KK as mentioned went through a restructuring in 2014, in early summer of 2016 shut the production to buy new equipment. Date of production reopening is unknown. To be able to run analysis on KK, we had to limit the ceiling of the ratio EBIT / Interest expenses to 9 if the result was to be higher (in absolute value as well) to limit distortion of the z-score result. In fact (Neumaier & Neumaierová, 2002) note that in similar cases (when the ratio would skyrocket up to infinity – including cases of zero interest expenses) the 9 is maximum value to be used.
This ceiling we implemented affected results of IN01 and IN05 for Rakhat, KK, Nestle, Roshen, and KDV – Yaskino.

Source: Authors

IN05, on the other hand, shows more distressed periods of analyzed companies. KDV – Yaskino red field is caused by the significant increase in liabilities in 2014. Similarly, as KDV – Yaskino, Bayan Sulu, and Roshen red fields, just below the threshold, show period of depreciation and severe crisis in Ukraine (Roshen, compared with much more stable Konti). Bayan Sulu increased common capital in 2009 16-fold. Credits also increased significantly in 2009 while cash from operating activities was nearly non-existent.

**Creditworthiness index**

The creditworthiness index, also referred to as the creditworthiness indicator, is based on a multivariate discriminatory analysis based on a simplified method. It is mainly used in German-speaking countries. (Atlantis, 2017) The credit index (index) is calculated according to the formula:

\[ CI = 1.5 \times x1 + 0.08 \times x2 + 10 \times x3 + 5 \times x4 + 0.3 \times x5 + 0.1 \times x6 \]

We used the following ratios:

- \( x1 = \text{cash flow} / \text{liabilities} \)
- \( x2 = \text{total assets} / \text{liabilities} \)
- \( x3 = \text{earnings before taxes} / \text{total assets} \)
- \( x4 = \text{earnings before taxes} / \text{sales} \)
- \( x5 = \text{stocks} / \text{sales} \)
- \( x6 = \text{sales} / \text{total assets} \)

Evaluation:

- \( x1 < 0 \times <CI < 2 \) extremely bad
- \( x2 < 0 \times <CI < 1 \) very bad
- \( x3 < 0 \times <CI < 0 \) bad
- \( x4 < 0 \times <CI < 1 \) certain problems
- \( x5 > 0 \times <CI < 2 \) good
- \( x6 > 0 \times <CI < 3 \) very good
- \( x6 > 0 \times <CI < 3 \) extremely good
Table: Results of the Creditworthiness index

Source: Authors

Per model rules, we would normally use seven colors between dark green and dark red, but since KK showed statistics worse than -3, which is outside statistics of the model, we marked the outside values with black color and white text. Otherwise, the model shows only Rakhat is truly creditworthy company while Konti, Nestle and recently also Bayan Sulu can also have relatively easy access to credit.

**Conclusion**

The IN models showed us certain “hand” intervention into the models is necessary because the market is very specific and offering one would say changing and significant permanent challenges. It is certainly not for beginners to operate in such a market. Another specific of the whole market is high interest rates causing fluctuating and hardly predictable interest expenses of all indebted companies. We see foreign exchange risk can cause even clinical death as in case of Konfety Karagandy. Depreciation linked to oil prices that plummeted during the Great Recession is a permanent threat because given current oil supply and demand trends it is unlikely the RUB and KZT currencies will strengthen in the near few years. Oil prices may even decrease a bit with next recession in the region, or with global problems that will sooner or later come, and companies will face distress conditions again. Such an environment cannot be called standard and regarding financial analysis methods and models certainly would appreciate similar approach as in the Czech Republic. In Prague, the Ministry of Industry and Trade through cooperation with the University of Economics in Prague operates a web portal where every company can enter their data and receive model results.

It is called Benchmarking Diagnostic System of INFA Financial Indicators. (MPO, 2007) This system serves businesses to verify their financial health and compare their results with the industry’s best businesses to verify their financial health and compare their results with the industry’s best practices. Using bankruptcy and creditworthy models. Retrieved from http://www.finanalysis.cz/pouzite-bankrotni-modely.html

IDENTIFICATION OF RELEVANT STAKEHOLDERS WITHIN A RESILIENT CITY IN THE SLOVAK REPUBLIC

Ján Havko,¹ Michal Titko,² Jana Kováčová³

Abstract: Apparently, there is a significant increase in the occurrence of disasters and their negative consequences. It is believed that the main reason for this problem is related to climate change. In recent years, several approaches and efforts related to the topic of climate changes have been researched and in some cases also implemented. One of them is the resilient city concept as a tool dedicated for enhancing resilience and decreasing the vulnerability of a city and its citizens in case of a disaster. In this article, the concept of the resilient city is briefly described. The very important role within the resilient city represents the stakeholders. The understanding of the stakeholders’ possible participation in city resilience building is important for city security. For that purpose, the relevant stakeholders’ identification is necessary. Our research was conducted with regard to the data from the Step Up project and takes into consideration recommendations from the resilient city concept.

Keywords: disasters, resilient city, stakeholders

Introduction

In this article, we deal with the issue of resilience and the resilient city concept. Implementation of any project or concept requires cooperation between the wider community of actors who are more or less interested in the project objectives and also have different expectations of the project outcomes. Moreover, actors’ engagement offers cities several benefits as a broader knowledge base for the decision making process, improvement of the quality and effectiveness of projects, further opportunities for joint projects, long-term support for strategies and actions in the city, and more robust and transparent decision making (Step Up Project, 2015). Therefore, the focus is placed mainly on the identification of interested parties (actors) – “stakeholders”, who participate in building the resilient city. The term “stakeholder” refers to the person or group that has an interest in the success or performance of the system (subject, entity, project, concept, etc.), or can influence its success or performance (Grasseová, 2010). We can also identify stakeholders as interested groups. By consideration of the possible interest of actors in taking part in resilient city building it is possible to identify relevant stakeholders within the society and this is our intention to do so within this article.

Literature review

Based on the statistics and literature review (Groenemeijer et al., 2016; Bouwer, 2011; Guba-Sapir, Hargitt & Hoyois, 2004; Luskova, Dvorak & Leitner, 2015) it can be argued that there is an increasing trend of disasters occurrence. At the same time due to the higher intensity of disasters, more severe impacts can be observed. As a trigger of such events were identified mainly climate change aspects (Groenemeijer et al., 2016; Bouwer 2011; Guba-Sapir, Hargitt & Hoyois, 2004). In order to address the development of current disasters, several guidelines (directives) and measures have been adopted by the organizations of international crisis management. The topic of climate change was addressed in the Paris climate Agreement (2016) and in frameworks Sendai (2015), Hyogo (2005) and Yokohama (1994). These documents are focused mainly on the issues of society’s resilience as a concept of civil protection. Implementation of the resilient city concept also has specific areas which as well as having issues of risk management and crisis management, also do not provide direct and immediate outcomes for the actors in terms of profit (monetary or otherwise). Priorities and related outcomes within the resilient city concept are set as follows: (1) the understanding of disaster risks, (2) enhancing of risk governance in order to manage these risks, (3) investing in measures leading to disaster risk reduction in relation to resilience, (4) enhancing disaster preparedness and disaster response and recovery "Build Back Better" (UNISDR, 2015). Therefore, it is necessary to analyze the behavior (motivation, opportunities, interest, and responsibility) of stakeholders within society (system) in achieving these priorities and outcomes.

Behaviour, Interests and Responsibility of the Subjects within the Society

Every system’s subject (actor) has an interest to satisfy their needs within that system. Such a satisfaction can be reach at the expense of other system’s subjects. By decomposition of the system into components (interest areas) with several active subjects, there can be often recognized a contradiction between individual interests of every subject. As an example, a business environment can be assumed to be an inseparable part of each city, but our focus is a similar environment – the resilient city.

On the one hand, the primary interest of all business subjects is to maximize their profit. This effort is understandable and justified but makes us think about the way how that profit is achieved. On the other hand, the primary interest of the resilient city concept is not the economic profit of the subject (it can be seen as a secondary interest because prevention can save resources in the future), but it is a community-based interest. As it was stated, the profit or any interest are mainly achieved at the expense of the other subject in the system. This is one of the main reasons why it is necessary to consider certain restrictions on the personal interests of a subject within a system. The possible restrictions can be provided and explain by two concepts: (1) the social contract and (2) ethics of responsibility.

Enlightenment thinkers (e.g., Thomas Hobbes, John Locke and Jean-Jacques Rousseau) have introduced the concept of the social contract. Acceptation of that concept would release individuals (and subjects) out of the constant whole-society fight for wealth, and they voluntarily gave up part of their rights, freedoms, and profits. They would achieve a legal state that would guarantee the same rights and duties of all members of a system (society). The concept of the social contract is present in today’s society, and its justification is the basis of the current legal as well as social system.

Ethics of responsibility obliges the actors (subjects) to take a stand and be responsible for the (foreseeable) consequences of their actions (Machalová, 2008). Karl-Otto Apel (1922) as one of the founders of this approach to ethical issues, considered three levels within the responsibility structure. The first one is the subject of responsibility (the holder). It is the responsibility of a particular person (in our case it can be seen as representative of a social group or a stakeholder) who is able to correctly define his objectives given the current interests of the community to which it belongs and considering the direct and indirect consequences of their actions. The second level is formed by the object of an action - for what is the holder responsible. The last third level of responsibility creates the responsible action (behavior) itself, to whom we are actually responsible. Formulating of the responsible behavior and the definition of its scope is a collective issue because human responsible behavior is meaningful only in the context of collective choice (Machalová, 2008).

The idea of a subject’s responsibility to a worldwide population is a theoretical possibility whose practical use is almost unfeasible. In contrary, a feasible project is the responsibility of the local community and its individual subjects – stakeholders. Just the ethics of responsibility gives the community stakeholders a tutorial on how to act and enhance the living standards and resilience of community. Obviously, each stakeholder can be interested in the community through various ways. Therefore, it is important to identify and treat the stakeholders individually.

Resilient City’s Stakeholders Identification

There is no binding definition or strict interpretation of stakeholders within a city (neither in a resilient city). In order to identify relevant stakeholders within a resilient city we have conducted the basic literature study and we have also examined several reports mainly about implementation of the resilient city concept and about familiar concepts as well (e.g. the smart city concept). Within the mentioned sources, there have been identified mainly stakeholders as groups not stakeholders as individuals. These groups include academia, local and regional administrations, industry and commerce, finance, energy suppliers, ICT partners, communication companies, innovation bodies, international companies and citizens (Ielite et al., 2015; Rotterdam Resilience Strategy, 2016; Resilient San Francisco, 2016). Identification of specific stakeholders within the resilient city is missing or is performed only partially.

For the purpose of the further resilient city research and in particular for its more stable implementation, we have conducted the identification of specific relevant stakeholders. The first step was a selection of the relevant stakeholders who (Step Up Project, 2015):

- have interests and activities relating to the issue in question (resilience),
- can provide information, expertise and resources required for effective policy making.
are key players in ensuring successful implementation of disaster resilient city

We have been also considering two main aspects:

- the city aspect (stakeholder groups within each city by which every city’s resilience is built) - we assume three stakeholders groups:
  - the application of the resilient concept and the solution to strategic tasks is the responsibility of the city (or municipality), the city government and public administration, will be the first and main stakeholder group,
  - the resilient city concept is citizen-oriented and therefore, the citizens and societies (communities in the cities) will definitely one of the main stakeholders in the city as well,
  - a complementary position between communities and public administration (and government) is formed by the private sector (organizations, companies, institutions, agencies, etc.) which represent the third stakeholders group.

- the resilient city concept particularities aspect - the resilient city concept has defined seven basic components (UNISDR, 2012) of the city which should be addressed in order for successful implementation.

As an additional aspect for the identification of relevant stakeholders we used the Slovak Republic conditions where some stakeholders could differ due to specific differences in municipality and governance structure.

These aspects represent our starting point for stakeholders’ identification and they are illustrated in Figure 1. This figure also illustrates a close relationship between the mentioned aspects. These aspects and related components can be found in every city (municipality). However, in some cases we may encounter some specifics which are not taken into consideration. Each city can vary based on their size, population number, social structure, spatial structure, level of development, governance, etc. From that reason they can also differ in the structure of city stakeholders – some of the stakeholders could be missing within the city (e.g. city does not have an university) or new ones could occur. Every particularities could be included in further identification and analysis if needed.

![](attachment:Figure 1.png)

Based on the above mentioned aspects and components of the resilience city, the relevant stakeholders were identified as follows (Table 1). We assume that each of the stakeholder will be represented by a responsible representative (delegate) or by a group of representatives if needed. The leading position should be taken by representatives of city government and they should take part in all others interest areas as well. This is dictated by practical consideration because achieving a resilient city status is primarily the main task of the city leaders. City representatives, in some cases, may lack sufficient knowledge and experience in dealing with issues of crisis management, vulnerability reduction, disaster
preparedness enhancing, or resilience enhancing, we assume a close cooperation with rescue services, risk managers as well as experienced subject-matter experts.

**Conclusion**

The resilient city is a concept by which a city adopts adequate measures to be able to minimize direct and indirect consequences of a disaster. It is also capable of a prompt and quick restoration of basic services, social, institutional and economic activities in the city after a disaster. We argue that the provided stakeholders’ identification method can serve as a basis for further research and for the implementation of the resilient city concept. Identification of the relevant stakeholders should also serve for their further analysis and this is our intention to do so. By understanding the stakeholders’ behaviour, interest, expectations, and responsibility within the process of building a resilient city it is possible to involve them and help them move towards a resilient city status. For explanation of these features the social contract concept and concept of ethics of responsibility can be used. On the one hand, we assume that there will be considerable similarities within the implementation of the resilient city concept and engagement of stakeholders into that process, but on the other hand, the particularities of each city (and stakeholders) should lead to an individual approach for each city and in particular to each stakeholder. Our intention is the analysis of relevant stakeholders of the practical example within the city Žilina in the Slovak Republic.

A LOCAL BRAND AND “FMOT” OR FIRST MOMENT OF TRUTH
Aivars Helde1

Abstract: This study examines the nature of an advertisement with the focus on social discourse and First Moment of Truth (FMOT) in the context of this research. This paper aims at analyzing different commercial advertisements (product/non-product ads) to investigate the intentions and techniques of consumer product companies in reaching more consumers and selling more products. First Moment of Truth (FMOT) represents the “a-ha” moment when a consumer is confronted with a product and related alternatives, assumed to take place in everyday life. This is considered to be the point when a consumer decides to buy a specific brand or product. Although commonly the First Moment of Truth as a technique, is used as online or in-store selling, this technique has a crucial role in the perception of print advertising too. “Any time a customer comes into contact with a business, however remote, they have an opportunity to form an impression,” said Jan Carlzon, president of Scandinavian Airlines, defining the Moment of Truth in business. It has now crossed over into sales and marketing as others have embraced the term to describe different customer and consumer behavior (Shep Hyken). As soon as people in Latvia are going to trust to the national brand more, it is very important to focus on the visual manifestation of a local brand. The Norman Fairclough’s 3-D model, Kress Van Leeuwen’s grammar of visual design, and the French semiotician Roland Barthes (1977) suggested theoretical and semiotic tools for analyzing and understanding advertisements are used to analyzing the data. All materials are taken from the Latvian media.

Keywords: advertising, the photographic message, local brand

As the elements of a marketing program come together to create a complete offering, marketers must also consider how the marketing program will be used to create effective branding and positioning. While the concept of a brand may seem relatively simple to understand, branding strategy can be quite complex. From a technical point of view, a brand is a combination of name, symbol, term, or design that identifies a specific product. Brands have two aspects: the brand name and the brand mark (Ferrell & Hartline, 2014). The brand name is the part of a brand that can be spoken, including words, letters, and numbers.

The brand mark—which includes symbols, figures, or a design is the part of a brand that cannot be spoken (Nike’s swoosh). Jenni Romaniuk, a professor from The Ehrenberg-Bass Institute, says that distinctive assets are the elements that uniquely identify the brand across the clear majority of category buyers, such as the Nike swoosh or red and yellow M&Ms. The opportunity and challenge of distinctive assets is that potential assets can come from a wide source of possibilities, from colors, fonts, advertising style, celebrities, characters or logos, just to name of few. While these technical aspects of branding are important, branding strategy involves much more than developing a clever brand name or unique brand mark. Good brands are those that immediately come to mind when a customer has a problem to solve or a need to fulfill. So, branding strategy is “the battle for your mind” (Ries & Trout, 2001). However, for most people advertising is something to encourage or persuade them to buy a specific product. Advertisements not only serve this purpose, they “also amuse, inform, misinform, worry, though it may be argued that these functions are all in the service of the main function” (Cook 1992). By the other hand there are non-product advertisements as well that, without promoting any products, only advocate a change in behavior. Such non-product ads are used in different campaigns, and they show the effects of not adopting the advocated behavior. “Ads may not always be obliged to refer to a product, but they are still obliged to refer, however obliquely, to a change of behavior.” (Cook 1992). Today it is very common to use a third possibility—to combine these techniques and promote a product using different cultural and behavioral stereotypes. The aim of this type of advertisements is not to change habits of behavior but on the contrary—to maintain or strengthen these habits. Cook (1992) remarks that “Advertising is not a remote and specialized discourse, but a prominent discourse type in contemporary society.” In order to understand and study the images, one must be aware that they are created with social power and influenced by ideology. The term "ideology" in this case is an understood belief system, which exists in all cultures. Tuen van Dijk, founder of critical discourse, in terms of the concept of "ideology" gives us several of these important aspects. First, the ideology as a kind of "idea system" refers to the processes of cognition. Second, the ideology is social and is often associated with a group of interests, conflicts, and battles. Ideologies

1 RISEBA University, Riga, Latvia, awhelds1@inbox.lv
can be used to legitimize or, conversely, removing power and domination, often it symbolizes social problems or inconsistencies. Third, the ideology associated with the use of language or discourse, to indicate how it is expressed or reproduced in society. "If we want to know what are ideologies, how they work and how they are created, modified and reproduced, we need to carefully analyze the discursive manifestation" (Van Dijk, 1998). Sturken and Cartwright believe that ideology is an extensive and irreplaceable set of common values and views, one in which individuals survive their difficult relations with the large range of social structures (2001). Pictures are a major tool by which ideology is produced and to which ideology is projected. Visual culture is essential for power and ideological relations. Discourse is described by Gee (1989, 2005) as “language” (oral or written) in use with more socio-politically oriented meaning” Fairclough (1989, 1995) goes further and defines it as ‘just a particular form of social practice”. In other words, discourse constitutes social practice and is at that some time constituted by it. (Wodak, 1997). Inter-textuality has been described as text (which) is recognized in terms of their dependence on other relevant text. Essentially, it amounts to the relationship between text and the various languages or signifying practices of that culture. Therefore, one reason for the success of an advertisement or commercial may well be the underlying relationship between its presentation and a literary association familiar to the target audience. “Standard and messaging and conventional creative executions and placement are rapidly becoming outdated. To win a consumer’s attention and trust, marketers must think less about what advertising says to its target and more about what it does for them” (Rayport, 2013). In respect of connotative mechanisms it would be good to use Roland Barthes “Rhetoric of Image and the photographic Message”, his essays gets us tools for semiotic understanding of advertisements. In “Rhetoric of image” he separates one ad into three messages: the “linguistic message” that includes all the textual information, the ‘symbolic message’ -the connoted image and the 'literal message’ that refers to non-coded meanings that derive from the denoted image, all non-verbal elements in the image that do not have any cultural code. For Barthes, ‘the common domain of the signifies of connotation is that of ideology, which cannot be single for a given society and history, no matter what signifiers of connotation it may use (1977) Through a semiotic analysis, we can argue that these ideological representations in advertisements are assigned meanings to products or services.

In this case, Moment marketing or FMOT (pronounced EFF-mot), is a technique that can help marketers realize their idea about design communication. FMOT is the 3-7 seconds after a shopper first encounters a product on a store shelf or outdoor ad. It is these precious few seconds that advertisers have the best chance of converting buyers mind or create new understanding for a product by appealing to their senses, values, and emotions. Communication design focused around these life-changing messages can alter the whole perception towards the communication design field, from being a decorative aesthetically driven expenditure to becoming a significant investment that makes lives possible, easier and better.

"The public good must be the most important objective of design activity, and it should be sought with the best resources, being understood as an investment with high returns affecting hidden dimensions of the economy." (Frascara, 2002, p.35). Visual culture, of course, does not depend on pictures only, but visualization of different situations and meanings play very important role in our society. Researcher Mirzoeff (1998) believes that visual culture is a kind of crisis information and that everyday life is filled with visualization. He believes that post-modernity in which we live is the ocular centrist. This happens because we are becoming more and more operate and interact with fully constructed visual manifestations. Mirzoeff stresses that the first step towards the visual culture is the understanding that the visual image is not stable, but varies depending on relations with the external reality of modernity in certain moments (1999). Rogoff (1995) believes that visual culture as a transdisciplinary and between methodological approaches to development provides an opportunity to reflect on the culture’s most complex problems in another aspect. This approach allows you to look at some of the problems that are updated visual culture, such as the presence and the absence, shortage, invisibility, stereotyping, wishes, reflection, and objectification (Zitmane, 2015).

Talking about advertising the situation for the local brand is more favorable. Local manufacturers know their consumer behavior much better because they themselves are part of this behavioral model implementers. However, in the reality faced there are situations where a vendor claims to be socially responsible, even though actually it is only a marketing trick.
Ideological meanings are often idealistic, mythical significations assigned through connotative verbal and non-verbal elements of the advertisements. So, the nature of the experience is what needs to be considered – what does the consumer require when making this purchase decision? In his book – “Paid attention” Faris Yakob wrote: “Consumers need different brands to do different things. The clear majority of purchases do not adhere to a purchase funnel at all- they are made impulsively. Since there is, or there is perceived to be, functional parity among the primary competitors, we need to have only a very slight preference for a brand to aid the decision. Other purchases have different contextual needs that brands help to fulfills. There are always is combinations of rational and emotional needs that brands satisfy. The needs of consumers and the drivers of their behavior are variable. By looking at some of the veiled aspects of attention and cognition, we can begin to understand better people and brands, and how they interact. (Faris, 2015).

Statement of the problem and Purpose

The nature and importance of brand identity and brand image has been highlighted by many leading scientists on brand management and strategy. This has typically been done in the context of products, services or product and non-product advertising. Many studies of advertising, separate out components of ads, concentrating on one or a few and ignoring the others. There are some theories that are traditionally used, such as Fairclough’s 3D model or Kress and Van Leeuwen's visual grammar or Roland Barthes semiotics and rhetoric of advertising for consumers. Before dealing with ads analysis, it is worthwhile to explain what is meant by successful ads. These are described in their three basic parameters: strategy, creativity, and fabrication. The strategy constitutes a specific target selection, the target audience’s choice, the report creation, and media planning. Describing advertising as discourse is both more complex and more difficult than any of these approaches. It must be taken into consideration then that there is a danger of dilution in the analysis which attempts to tackle too much. Professionals advise marketers to approach this medium as a landscape composed of four domains: the public sphere, where we move from one place or activity to another, the social sphere, where we interact with and relate to one another, the tribal sphere, where we affiliate with groups to define or express our identity, and the psychological sphere, where we connect language with specific thoughts and feelings (Rayport & Jarowski, 2004). The dominant approach in cultural studies for analyzing ads has without doubt been semiotics. Many key arguments about the way ads perpetuate and feed dominant ideologies, about the way they construct audiences as consumers, and about the impact they have on culture more generally, are grounded in semiotic analysis. The problem is that the theoretical basis for those analyses has been chipped away at (e.g., Corner, 1983, Pateman, 1990), and if we are to rescue a strong critical, textually informed approach to ads, we need to supplement semiotics with theories of the social. “Semiotic analysis – in stark contrast to discourse analysis – begins by theoretically separating out of the realm of the symbolic, including language, and other sign systems such as the meaning of images, from the realm of social. The kind of analysis has worked well with ads partly because they appear pure semiosis with few traces of actual social and communicative activity. Ads often have no obvious senders. They are designed for a large audience to make sense of rather than a specific group, providing positions for us to locate ourselves within consumer culture. They are also divorced from their co-text: an ad on a bus has nothing to do with the bus, and thus require consumers to invoke the semiotic system needed to interpret them by themselves.” (Matheson, 2005) "Media discourses”

This study will focus on Latvian ads with effect of social discourse as a principle of a brand communication with the customer and FMOT based on customer cultural habits and expectations.

Scope and research Questions

This study employs quantitative and qualitative analyses, based on a content analysis and Kress and Van Luween’s visual grammars interpretation of advertisements. Taking into consideration that advertisements targeting local consumers are associated with national affiliations, the current study aims to answer the following questions:

(1) Which categories that conceptualized national identity are evident and significantly present in the advertisements of a local brands of Latvia

(2) What cultural meanings are assigned to the national affiliation categories in respect of verbal and non-verbal components in the visual corpus?
(3) Do FMOT induce a brand mark or a brand name to the national affiliation categories in the visual corpus?

“If human experience is a medium for advertising, how can marketers engage consumers there in a way they will welcome?” (Rayport, 2013). Rather than focusing first on a communication strategy and marketing mix, they should begin by considering how consumers live their lives and under what circumstances they will prove receptive to messages in this domain. For analyzing different advertisements, product ads and non-product ads have been selected. The answers of researched questions are not possible if we do not pull back the “ideological curtain” to see the power and ideology behind images, the chosen ads are predominantly visual. In other words, they communicate through images and pictures.

**Methodology and corpus**

The advertisements are from Latvian media and include brand promotion through social discourse. The dimensions of discourse and discourse analysis can be described as follows:

1. Text description; representing, relating, identifying positions for text analysis;
2. Discursive practices (analysis/interpretation: position for processing);
3. Social practices-social analysis/explanation

So, we can call, the first dimension is text analysis or description, the second dimension is processing analysis or interpretation, and the third dimension, social analysis or explanation. All dimensions are interdependent, and therefore it does not matter which kind of analysis one starts with. The series variables common to similar investigations were selected to provide a coding scheme. More specifically, seven categories identifying nationhood in advertisements were defined in the coding frame, as follow:

1. Geographic references/locations: distinctive landscape and landmarks
2. Leisure practices: popular activities
3. Cultural heritage; historical and cultural icon figures
4. Social relationships and social values: family, friendship
5. Objects: distinctive objects
6. Food/ drinks
7. National symbols (Hogan 1999; Edensor 2002)

In addition to the semiotic approach, verbal and non-verbal signs were identified using Barthes’ theoretical model of depicting linguistic messages, coded and non-coded iconic messages of advertisements (1977). Denotation and connotation combine to construct ideology and, based on Barthes arguments, denotation refers to the first order of signification and reflects literal meaning. Connotation refers to the second order of signification and reflects cultural, ‘constructed’ values which are attached to a sign.

**Materials**

Four different advertisements -product ads and non-product ads have been selected for analysis. The chosen advertisements communicate through images and pictures. The chosen advertisements communicate through images and pictures.

![Figure 1: The advertisement “Help Bring Your Baby into the World”](image-url)
Results and semiotic analysis of advertisements

The study was relevant to seven chosen cultural meanings, the dimensions of discourse and discourse analysis.

The “Elvi” (Supermarket Chain) Campaign - “Help Bring Your Baby into the World” This is the picture of a happy smiling baby, (see Figure 1). The company “Elvis” the producer of this ad, (It...
seems that there is the text “Help! To make dreams come true, donate by calling or in the” Elvi” store at point of purchase.”

The colors in this advertisement are light; the accent is not on the baby but the first text phrase with ‘help’ written in green color. The viewer is almost too intimate with the baby who is next to the text. This ad is considered to be for charity. It is trying to solve a problem. Thus the result, the viewer has the power to be involved or not. There is no power above to force her/him. From the point of cultural meanings, this advertisement shows us “Our” proposes the idea of Collectiveness by suggesting an imaginary community, that shares and adopts the concept of mutuality. In the current example “we take care of “our” families.

The “Aldaris” (Beverage Manufacturer) The advertisement “Beer duel.”

We see a complex picture. In the first plan, we see two beer bottles, labels indicate that to the right is the “haze” but to the left the "ancient." Deliberately the bottles are presented from such point of view, so after "haze" - "ancient" followed by "ancient" - "haze". Visible in the background of two men in the face, both Latvian recognizable people. In addition, one of them with dark hair, while the other is bald headed. At the advertisement top we see inscription- “Aldaris,” below this is text- “Men vote for our own folks” and the texts, which are located in circles, and, as can be understood to say the men in the picture. On the right side is the wrestler Zelonijs, he says-haze because it looks like more interesting taste, as will to eat some fish or cheese, luge rider Prūsis, he says- certainly “ancient” bee, it tastes much better. The colors used in this ad are brown and beige. These two men faces attract the viewer’s attention and encourage her/him to read the ad. This ad gives the viewer a sense of rivalry. The eye-level angle shows that the power balance is on the side of the viewer and he is the real judge. Thus, the viewer feel inclined to obey the advertisement, preferring his idol. From the point of cultural meaning, we can observe that historic authenticity is another ideal that use local brands. Food/drink were found to have a significant effect on the representation of nationhood. More specifically, when beer is used, there was some evenly distributed preferences for traditional products.

The “Mama daba” (On the one hand, the task of “Latvijas valsts mezi” is plain and simple – to manage the forests belonging to the state of Latvia. On the other hand, we would like to contribute by bringing people closer to nature. Hence, “Mammadaba” – Mother Nature - a structural unit of “Latvijas valsts mezi”, which aims at acquainting local resident and foreign guests with the richness of nature here and helping everyone become one with its primeval beauty). The advertisement “Rush”

This is a non-product ad. about how to regain strength and emotion of our hectic everyday life (See figure 3). As a result, its discourse is social responsibility in highlighting a social problem. The colors in this advertisement are autumn, and soothing. In the background, it is dominated by saturated green tones. The picture is rich with the forest animals. At the top of the advertisement we see the logo by “Mammadaba” and slogan “Active leisure in LATVIAN State Forests” but at the right corner, we see an inscription which complements the center of the display where we see the word “Rush” successfully left Behind in Latvian State Forests. This ad aims to draw attention to a problem. As a result, the viewer feels inclined to obey the advertisement. From the point of cultural meaning we can observe wild nature, signifying an essence of ecology, that we, collectively, in Latvia love our clean and wild forests, the environment for our guests.

The sweets Manufacturer “Laima”

Here we have picture of a baby on a pale-pink cloud (see Figure 4). The colors used in this ad are blue, white, and pale pink. The color blue gives the viewer peace, the color white offers contrast, and color pale pink in middle of the picture of the baby attracts the viewer’s attention and invites her/him to buy the biscuits that lie below the picture of the baby. Above this picture the following is written in white:”

For a Real Childhood, Selga”. Below the biscuits is explanatory text: “Buying any biscuits “Selga” help 5 Latvian hospitals present special apparatus that controls the unborn baby’s heartbeats”. The company “Laima” is producer of this product (biscuit) ad, which aims to present the company as a socially responsible one that cares about children. The discourse of this “Laima” product could be considered as charity. Therefore, the viewer has the power to choose the biscuit or not. There is no force. From the point of cultural meaning-the pronoun “our”, what mean a responsibility and collectiveness. Specifically, in the current example, 'we are taking care of ‘our’ baby, which provides the moral center of this narrative.
From the point of the first moment of truth

Figure 5: Scheme of the FMOT

Text and picture make coherent sense by the ways they instantiate structures of meaning. “Though these may seem like fine distinctions, they are crucial. They suggest that we may be able to talk about what happened in the images and texts in a specifically textual way, without having recourse to hypotheses about what their sender may have intended them to mean, or without having to guess about their effects on a single given receiver. In short, the separation of addresser from sender and addresser from receiver is what lets us do semiotics rather than psychology (Thwaites, Lloyd, Warwick, 2002).

In addition, from the point of FMOT - it is important to mention that these findings show us how FMOT may work for print ads. For example, in the first and fourth situation “Help Bring Your Baby into the World”, “For a real childhood” - Our attention is attracted by the call to help (in the first case it is found in the second to understand the unconscious level that we have to protect, care for children), along with the child’s picture, acting as a stimulus, followed by empathy and understanding of the nature of the (internal reaction force of human empathy, moral maturity, option) and the social experience. Incentive and experience are equally important moments in a determined man’s further action. The second example, the ad of the “Beer duel” - advertising legend and the image stops us even confuses us, while incentive arises in addressing the question of a visual puzzle on already incurred emotion-smile. The advertisement “Rush” works in otherwise, there is an incentive for even more specifics, it is connected with the desire to examine, explore.

Conclusions

“All living human beings communicate through sounds, speech, movements, gestures, and language. Communication involves many human activities, speaking, listening, reading, writing, viewing, and creating images. How people communicate is based on cultural conventions that are adhered to in interacting with other people, in producing and sending messages and interpreting messages” (de Mooji, 2014).

A content analysis of local brand advertisements has revealed that, in respect of nationhood. The purpose of this study was to analyze advertisements, product ads, and non-product ads, in order to see when the producers use their power to imply something to the viewer, while at the same time paying attention to the process called the First moment of truth. The analyses showed us that in modern days it is very common to use the focus on social discourse for commercial ads. This technique allows producers to cultivate better relations between the viewers (consumers) and the company. In this case, we should use power in discourse as a form of social practices which are themselves shaped and constituted by power relations. In analyzing these advertisements and defining the position of the viewers, the followings conclusions were made. The producers try to show that the viewer has the power to choose or not to choose something. All meanings were explored in respect of the Latvian sociopolitical context and portrayed through visual communication. These cultural meanings are very much related to the social characteristics of the people and their daily practices of every day. As Rogoff wrote in “Visual methodologies”: 

165
Visual imagery is never innocent; it is always constructed through various practices, technologies, and knowledge.

The meaning of an image or set of images are made at the three sites: the site of production, the image itself, and its audience.

There are three modalities to reach of sites: technological, compositional, and social.

Theoretical debates about how to interpret images can be understood as debates over which of these sites and modalities is most important for understanding an image.

A local brand has a great advantage because they are able to reach their potential audience, based on national identity. This is very important especially in times when there is increasing competition in the market, and in the local market too. The current research would provide additional and useful results about image identity from the viewers’ perspective in local brand advertisements.

SURVIVING THE BUSINESS IN THE LONG RUN: A STUDY OF FAMILY ORIENTED SMEs IN DEVELOPING ECONOMIES

Ravindra Hewa Kuruppuge,¹ Aleš Gregar²

Abstract: Whilst the majority of family oriented SMEs are suffering from survival problems in the long term, some businesses perform successfully over generations. This article explores the emerging themes which are related to the business longevity of family oriented SMEs in Sri Lanka. Addressing a lack of knowledge in the area, our strategy of enquiry used a qualitative approach coupled with semi-structured interviews; 17 owner-managers of family-oriented SMEs were interviewed and the results were subsequently transcribed for the analyses. The results indicated that the founders’ tacit knowledge of producing goods or services, consequently transferred to heirs in family oriented SMEs, drive the survival of businesses for longer periods in Sri Lanka.

Keywords: Business longevity SMEs, tacit knowledge, family business

Introduction

Sri Lanka is a South Asian country whose indigenous management and business practices have been developing in a rich cultural heritage for the past 2500 years, and also have been influenced by the teachings of Buddhism (Ranasinghe, 2011). As a result, teamwork and a long tradition of strong family ties in business have been common for Sri Lankan businesses, especially in the case of Small and Medium-sized Enterprises (SMEs). In Sri Lanka, a family business is ideally limited to members of a single, extended, multi-generational family. Consequently, these businesses are relatively small in terms of capital and number of employees. Sharing of social, psychological, economic and security values among family members is a typically observed facet of Sri Lankan family culture (Jayawardena, 2000). Most SMEs in Sri Lanka are rooted in a family firm context, and owners of these businesses expect family involvement in business activities, as well as sharing economic values with family members. In these small businesses, the managerial positions are largely reserved for family members, with each individual’s behavior influenced by having family. Due to this, in the Sri Lankan business culture, the enterprises are family-based and small in scale.

From the literature which concerns family businesses, it seems that all over the world these businesses outperform non-family businesses in the short term. The same literature proposes that these businesses rarely continue to the second generation from the founder. However, contrasting, there are some studies which conclude that some family businesses are progressing effectively over generations and overcoming burdens which are unique to SMEs (De Alwis, 2015). In literature, there is only a limited amount of studies which address how some of these family firms are progressing effectively, and as a result, any emerging themes and concepts of the long-term survival of family owned SMEs in Sri Lanka are unknown. This present study focuses on understanding the emerging themes behind the longevity of family businesses, and it explores the current business strategies of owner-managers of family oriented SMEs in Sri Lanka. It seems that to understand the success of family-owned SMEs, more emphasis should be given to intangible resources, like the tacit knowledge which is handed down through the generations. Accordingly, utilizing the resource-based view model as the theoretical lens for the study, the main goal of this study is to understand the themes behind survival of family firms in the long-term. Following the introduction of the study, the remainder of the article is structured into four sections, namely theoretical and literature review, the methodology of the study, results & discussion, and finally the conclusion.

Theoretical and Literature Review

The literature review in this article is comprised of two parts. The first part discusses the theoretical lens (Resource-based View) of this study. The second part discusses family-oriented SMEs and business longevity.

² Faculty of Management and Economics, Tomas Bata University in Zlin, Czech Republic, gregar@fame.utb.cz
Resource-based View (RBV) of the business

The RBV of a business suggests that a business’s internal resources, which are accumulated through a period of time, are viewed as tangible and intangible drives in the sustainability and continuity of the business. The knowledge, skills and methods specific to any industry play a huge role in the survival of a business (Barney, 1991). However, the RBV is based on two specific assumptions. Firstly, this theory presupposes that an individual business possesses unique resources, which cannot be imitated or copied. This indicates the uniqueness of the individual business in the case of its resources (Barney, 1991). Secondly, RBV assumes that there is a difficulty in resource mobility due to higher cost of transacting. Such resources cannot be separated from the business and could not be bought in the market (Barney, 1991).

Family-oriented SMEs and business longevity

Throughout the world, in previous studies family businesses have been defined in a multitude of varying ways. This study treats family businesses as unique, inseparable, synergistic resources with capabilities arising from the family involvement and their interactions (Kellelarmms et al, 2012). At the current time The Ministry of Industry and Commerce of Sri Lanka (2014) recognizes SMEs as enterprises or business entities with less than 300 employees, coupled with an annual turnover of less than Rs. 750 million. According to this definition, almost all micro-scale businesses are also identified as SMEs. Moreover, most SMEs in Sri Lanka are family-orientated. The business longevity of SMEs has been addressed by many researchers earlier.

Studies regarding Entrepreneurship have extensively discussed the longevity of SMEs. De Clercq and Voronov (2011) highlighted the importance of legitimacy and profitability in sustaining SMEs, as well as the entrepreneurial abilities of SMEs. They recommended balancing business profit and sustainable growth. Analyzing SME performance grounded in RBV, Terziovski (2010) found intangible resources to be a main factor for business sustainability in the 21st Century. This was in addition to identifying business culture and innovations as determinants in the performance of SMEs. Rangone et al. (1999) argued that RBV was a foundation to identify the potentials of SMEs in case of survival, and their study found out long-term competitiveness was a function of resources of the business. Knowledge has been identified as the prime resource for making innovations, which gives a business competitive advantage over similar businesses in the present economy of global knowledge. At the same time, all other physical resources, like land, labor and capital, have been gradually replaced by intangible resources such as human capital. In the global competition, even a very small business located in a rural area has been highly challenged by other businesses. Irrespective of the size of the business or the industry, almost all businesses in the global market have a high chance of continuing and surviving. In a study of 600 family businesses, Diaz Morlán studied succession in family businesses and concluded that the intergenerational knowledge transfer is a determinant of longevity. Researchers in this field have studied the positive and negative factors of business longevity and, in general, business longevity has been adequately examined by previous studies. However, there are only a few studies regarding family-oriented SMEs.

Methodology

This study was conducted by implementing a qualitative approach. Purposive sampling was used to select both cases and respondents. 10 family-oriented SMEs from Sri Lanka were selected as cases for this research, and 17 owner-managers were selected as respondents. The interviews were privately held and successfully conducted. The respondents and cases were chosen with regard to the history of the business and the business experience of the respondents. Data was collected mainly via semi-structured, in-depth interviews. Data collection consisted of 17 interviews and 10 business cases. Before the data analysis, coding and categorization of respondents’ views from interviews helped to identify common patterns and themes from both within-case and across-case analysis. Content analysis, the analytical tool selection and the analysis were carried out through the lens of RBV.

Results and discussion

The main goal of this analysis was to understand the concepts behind the survival of family-oriented SMEs over several generations in Sri Lanka. The coding of transcriptions of interviews ended up with three main categories, namely family involvement, intangible assets and tangible assets. When the detailed content of each category was analysed, some interesting themes emerged.
In the analysis, it was clear that family contribution to the development and survival of the business takes place through the tangible and intangible resources of SMEs. One of the key findings of this analysis was that the degree of contribution by each person depends on the business type and its family objectives. Both business and family objectives are prioritized in family businesses. In terms of development and survival, this analysis indicated that intangible resources are more powerful than tangible resources in family-oriented SMEs. Family members involved in the business have passed their business secrets and experiences as tacit knowledge to their successors or trustworthy business associates. Often, no one else can copy or imitate such knowledge, and it is only transferred among specific family members. This happens in the businesses over generations. Respective members of SMEs have preserved intangible resources like tacit knowledge more than other assets of the businesses. Interestingly, this may not be the case in non-family business where there is no family involvement and accordingly, intangible resources are identified as the main resource of family oriented SMEs in Sri Lanka. Another finding is that when a family business is sustained through successive generations, the founder’s legacy and culture has an important role to play. Most of the positive work manners, attitudes and practices have been created in the business and have become a part of its history. Such positive concepts in a business have been clearly supported by the legacy of the business founder in family-oriented SMEs in Sri Lanka. Following direct quotations from respondents of interviews provide enough evidence about this founder legacy and tacit knowledge sharing.

Case 04, Res: 02 “Our business is a result of founders’ effort. My fathers’ father has started this business and handed over to my father before his death. He has given all required knowledge including all business secrets to my father. My father did the same for us”

Case 08, Res: 01 “Nobody else, other than me, in this world knows how to mix all these ingredients together to make this a solid production. All the time, I do the process alone and manually. I do not need to make others to know about this mixture”

Case 09, Res: 02 “Business continues based on our handful experience. Once the knowledge goes to unwanted people, it is the end of the business”

Case 02, Res: 01 “I will give my all business secrets and experiences once a person, one of my sons, is ready to take the business. My experiences are more precious for them than the business assets”

Case 01, Res: 01 “my mother said, business is nothing. It is all about personal relationship with people”

In most cases, family involvement in SMEs is natural in developing countries. Accordingly, family involvement is one of the most common areas of analysis. In this study one interesting theme amongst all others stood out. In surviving businesses, it is the legacy of the founder which emerged as a strong concept in family-oriented SMEs. When the current management of family-oriented SMEs implement the concepts and practices introduced by the founder, those practices make the current management hard working, confident, trustworthy and committed to the business. In addition, the tacit knowledge of producing goods or business processes as an intangible resource contributes to the business surviving in the long term. Commonly, this tacit knowledge is transferred by owners to successors or very trustworthy business associates as business secrets. With this practice, family-oriented SMEs keep their products and services unique when compared to other similar businesses. This study is limited by neglecting the need for business innovations to be competitive and survive in the long term. Almost all of the previous studies into organizational learning, organizational development, entrepreneurship and family businesses have highlighted this factor.

**Conclusion**

The findings of this study indicated how family oriented SMEs survived over generations through their intangible resources. On the one hand, findings of this study give answers to the everlasting problem family-oriented SMEs, business survival in the long term. On the other hand, this analysis shows the benefits of family involvement which can result in longevity and sustainability of SMEs. This stresses the need of handling family matters in businesses effectively, so as to sustain the business for a longer period. At this stage, practitioners and policy makers in this field are well
facilitated by this finding. Further, the emerging theme of intangible resources has proved that intangible resources are more powerful than tangible resources in a family-oriented SMEs in terms of development and survival. The tacit knowledge of producing goods or business processes is identified as the strongest intangible resource which contributes to business continuation. Accordingly, the tacit knowledge of operating business activities, transferred among close family members, is called business secrets. This kind of business secrets are identified as the main intangible resource of family-oriented SMEs. These findings direct the owners of family-oriented SMEs to understand the potential of family orientation in their businesses.

CUSTOMER ENGAGEMENT WITH A BRAND IN THE CONTEXT OF SOCIAL MEDIA

Magdalena Hofman-Kohlmeyer

Abstract: Nowadays, a strong brand is one of the most valuable assets of a company. In order to obtain this asset, the growing ranks of enterprises decide to include social media in their marketing strategy. Social media gives the possibility to have customers highly engaged with a brand. The present article is aimed to give an outlook on the process of building customer engagement in a brand throughout social media. The presented approach is based on a literature review.

INTRODUCTION: The meaning of social media in engaging customers is widely acknowledged. In order to building a strong brand and make current customers loyal, the growing ranks of managers decide to include social media in their marketing strategy.

OBJECTIVES: The present article is aimed to give a theoretical outlook on engaging a customer with a brand throughout social media.

METHODS: To achieve the assumed goals the author presents a literature review.

RESULTS: The literature review offers some directives on how to make customer engage with a brand, information on how this process should proceed and information about the profits which can the brand obtain.

CONCLUSION: Social media gives an opportunity to make customers highly engaged in a brand. The building of customer engagement throughout social media takes place through the following process: connection, interaction, satisfaction, retention, commitment, advocacy and customer engagement. Social media is also treated as a source of mass communication. One-to-one communication between stakeholders and firm-to-firm communication exert a positive impact on brand trust. In terms of customer-to-customer communication, there are some doubts. The authors also indicated the vital role of content quality and the occurrence of negative conversations on the fan page.

Introduction

Since the emergence of the commercial internet, spending on online advertising campaigns have been continuously growing. The internet has quickly become a strong competitor of other communication channels. Online advertisement makes users involved, enhance them to interact and increase their interest in a product or service (Dudzik-Lewicka & Hofman-Kohlmeyer, 2015). On the internet, the line between entertainment and advertising become blurred (An, Stern, 2011). Within the last couple of years, online promotion has undergone many changes. One of the developed means of communication is contextual advertisement. It allows to reach consumers at the exact time while they watch the contents substantially related to the product or service promoted (Dudzik-Lewicka & Hofman-Kohlmeyer, 2015). There is recognition of increase in use of social media among corporations. According to the University of Massachussets Dartmouth, in 2012, 73% of companies among Fortune 500 had an official profile on Twitter, and 66% had a page on Facebook. Furthermore, social media goes to mobile, mitigating the traditional time-location restrictions (Okazaki & Taylor, 2013). In a relatively short period of time, managers have included social media for a variety of marketing purposes, e. g. branding, research, customer relationship management, service, sales promotions. The most important purpose is using social media for branding, as an integrated component in marketing communications channel (Ashley & Tuten, 2015). The interactivity of social media enables users to establish conversations with individuals and firms in communities of sellers and customers. Customers are involved in the content generation, and value creation and practitioners have the possibility to serve customers better and meet their needs.

The evolution of the internet was timed to coincide with the increasing interest in customer engagement (Sashi, 2012). Some authors defined engagement in the context of a psychological state, while others focus on its behavioral manifestations toward a brand or a company (Cabiddu et al., 2014). There is an approach to customer engagement that assumes that engagement is a tendency to maintain a relationship with a partner, even when the delivered value does not meet expectations, and there is the small prospect of any change in the future (Mitrega, 2005). New ways to engage both firms and customers with each other in social media is a brand community with a large number of users (Gummerus et al., 2012). Although the importance of social media for customer engagement is acknowledged, a better

1 University of Economics in Katowice, Faculty of Informatics and Communication, magda-hofman@o2.pl
understanding of this phenomenon can help find the unique features of social media (Cabiddu et al., 2014).

This article is organized as follows. At first, the role of the brand is presented. The next part constitutes the characterization of customer engagement in a brand through the social media based on a literature review. In the final part, there are some suggestions for future research and the conclusion.

**The role of the brand**

Contemporary organizations develop a variety of methods to build a strong brand as part of their business strategy. The brand is often evaluated as a company’s most valuable asset (Wallström et al. 2008). A customer which is loyal to the brand may be willing to pay more for the product with the brand’s logotype because they perceive some unique value. The uniqueness may be caused by grater trust in the reliability of a brand (Chaudhuri & Holbrook, 2001).

Brand building activities are positively correlated with brand equity and lead to acquiring and retaining customers and increasing the value for a company. Brand equity is important in building long lasting relationships with customers (Samu et al., 2012). Brand equity is a set of brand assets and liabilities linked to a brand, its name and symbol that add or subtract from the value provided by a product or service to a firm and/or to that firm’s customer.

The brand effect and brand trust are positively related to brand commitment (Chaudhuri & Holbrook, 2001). Commitment is defined as the customer’s confidence that the functional and affective benefits from maintaining a relationship with the companies are greater than the benefits from ending them. Commitment is described as a core feature of customer relationship management and an inevitable factor in achieving a company’s goals. Customer committed to a brand is motivated by company to actively cooperate with customers and not to choose competitors’ offer (Hur et al., 2011).

The popularity of social media enabled companies to build close relationships between their customers and themselves (Cabiddu et al., 2014). Branded social campaigns can be utilized to increase brand awareness and brand liking, enhance customer engagement and loyalty, and evoke consumer word-of-mouth communication about the brand (Ashley & Tuten, 201). Nowadays, a vast number of Polish firms treat building the relationship with customers as the most important part of the marketing strategy (Mitrega, 2006).

**Customer engagement with a brand and social media**

In recent years, the emergence of new digital technologies and tools can be observed, especially social media like blogs, micro blogging sites like Twitter, video sites like YouTube, virtual worlds like Second Life and social networking sites like Facebook, MySpace or LinkedIn (Sashi, 2012). Cabiddu et al. (2014) reminded that social media are defined as a group of Internet based applications which build on the ideological and technological foundations of Web 2.0 and which allow the creation and exchange of user-generated content. Social media contain applications that allow users to create, edit and access content and communicate with other individuals (Cabiddu et al., 2014). The growing popularity of social media led to the necessity of better understanding these technologies and tools especially as an opportunity for creating customer engagement. Customer engagement focuses on satisfying customers by providing better value than competitors in order to gain customers’ trust and commitment in long-term relationships. The interactivity of social media enhances the process of creating relationships between sellers and buyers (Sashi, 2012).

Sashi (2012) examined customer engagement from the point of view of the practitioners. He formulated a customer engagement cycle with the following stages: connection, interaction, satisfaction, retention, commitment, advocacy and engagement. The cycle is presented in Figure 1.

Connection is the first step to establish emotional bonds between sellers and buyers. To connect with the buyers, a company can use simultaneously traditional offline methods (e.g. a salesperson) as well as new digital online methods (e.g. social networking). Social media expedites the establishment of connection with a large number and wide variety of individuals and firms.

Interaction is the second stage in the cycle. The growth of the internet mitigated the restrictions in communication like space and time
Worldwide interactions among people at real time have become possible through social networking, virtual worlds or instant messaging. Interactions between companies and their customers can improve the understanding of customer needs and help upgrade existing products or develop new products to better meet these needs. The Internet allows marketers to maintain a dialogue with customers. This dialogue can support research and development activities, involve customers in new product development and in market testing stages, and allow for the companies to understand customers’ needs. Customers can collaborate with marketers and participate in the value adding process.

Satisfaction is necessary to maintain connection between a company and its customer and to make progress towards engagement. Satisfaction is an intermediate step to achieve the goals of an organization. It is an inevitable but not sufficient condition for customer engagement. Satisfaction can be defined as an overall evaluation based on the total purchase and consumption experience of goods or services over time. Satisfaction is achieved at a high level when the company exceeds the customer's expectation and the customer's emotions are highly positive.

Customer retention is an expected result from satisfaction and positive emotions. Retention leads to repurchases and implies a long-term relationship between customers and a brand.

Commitment in a relationship can be considered in two dimensions: effective commitment and calculative commitment.

Calculative commitment is rather rational and often is caused by a lack of another choice or switching costs. Affective commitment is rather emotional and is the effect of the trust and reciprocity in a relationship. Affective commitment can build a higher level of emotional bond between the customer and seller.

Advocacy occurs when satisfied customers spread the word about their positive experiences with a product, brand or company using their Internet social networks. Customers offer some recommendations to another using word-of-mouth communication. Affective commitment is positively related to advocacy, and calculative commitment is not. Companies can play advocacy roles as well as customers by acting in the customers' best interest. Companies expect that they will look after each other with and the customers and the values will be exchanged.

Engagement can happen when customers are loyal and delighted, share their experiences with other's in their social networks and become advocates for a product, brand or company. To achieve customer engagement, a company need to create strong emotional bonds with customers. Customer engagement includes customers in the creation of value, enhances their satisfaction and turns customers into fans.

The customer in each stage of the cycle can be arrayed in a customer engagement matrix (Figure 2). Transactional customers are distinguished by low emotional bonds and low relational exchange. They are price sensitive and switching sellers from transaction to transaction. These customers are the source of customers for the other cells in the array. A company can potentially turn these customers into loyal, delighted customers or fans.

We have delighted customers when the relational exchange is low and emotional bonds are high.

---

**Figure 1: Customer engagement process**

![Customer Engagement Process Diagram](image-url)

Source: Sashi (2012)
Delight does not cause long-term relationship. The company needs to enhance relational exchange.

![Customer engagement matrix](image)

Source: Sashi (2012)

Loyal customers are characterized by high relational exchange and low emotional bonds. Customers are loyal only for rational reasons. There is lack of emotional connections between the customers and the brand. According to future intentions, there is a need for developing effective commitment and turn loyal customers into fans.

When customers are fans, we have customer engagement. Relational exchange and emotional bonds are high. Fans trust companies and advocate for them. They connect with other fans and interact with them. Companies want to have many customers who are fans and also delighted, loyal and transactional customers who can be future fans. This process can be improved by using social media, especially when it comes to establishing connections, interactions, and the increasing likelihood of satisfaction. Social media enhance deriving of transactional customers, creating delighted and loyal customers and turning them into fans (Sashi, 2012).

Vohra & Bhardwaj (2016) carried out a research study in the field of social media and customer engagement in a brand. They focused on Twitter and Facebook because these two platforms were on the top of the list of social media channels being used by marketers for engagement. A questionnaire with open-ended questions was sent by e-mail to digital media managers of 25 firms in India. The survey reveals how firms view engagement in the context of social media.

According to the study, social media channels offer a wide range of features which the brands can use to engage with their customers. Managers indicate the potential of social media as a source of mass communication, one-to-one communication between stakeholders and also firm-to-firm and customer-to-customer communication. Marketers focus on behavioral dimensions of engagement, like some customers’ activities, for example sharing the company’s content and posts with the others participating in the conversations. Many customers are not active users, but they are engaged in brand passively. Customers may use information shared on social media in an active and frequently way, without taking part in any conversations. Customers must be attracted to a brand’s social media by the content. The content should invite customers to conversations and attract the passive customer. Content can take the form of a simple text, videos, audio clips, or images. Social media can be used as a social recommendation system (like and share buttons). Managers should take into consideration that conversations can be positive but can be negative too. Many customers use social media profiles to express their negative feelings towards the brand. These negative conversations can lead to negative engagement. It is important to marketers to manage positive as well as negative conversations that take place on social media (Vohra & Bhardwaj, 2016).

Habibi et al. (2014) investigated the process of building brand trust in social media, especially in brand communities. They conducted a survey of members of the brand community. Participants filled out a questionnaire. The findings provide information on how brand community and engagement in social media impact building brand trust.

The brand community relationship such as customer-brand, customer-product and customer-company positively influence brand trust. Surprisingly, the customer-other customer relationship exerts a negative
influence on brand trust. Perhaps some members have doubts about the credibility of the received informations from social media. Another explanation assumed that consumers’ connectivity and interactions increase customers’ expectations toward the brand. We can suspect that the brands have limited control of social media. On the top of that, the literature review offers mixed results in this issue. The research conducted by Habibi et al. also support the statement that community engagement matters in social media. Engaging consumers in brand communities creates a stronger relationship with the brand, the product, other consumers and the company. Conversely, consumers who trust the brand, more willingly participate in the brand community and building of the brand relationship (Habibi et al., 2014).

Although the importance of social media for customer engagement in a brand is acknowledged, there are some suggestions for further research in the literature review. In future research Laroche et al. (2013) recommended to utilize a brand type, culture, characteristics and facilities of the community on social media to examine how these variables affect customer relationships with brand elements (Laroche et al., 2013). Kim & Ko (2012) indicated that a future study should develop effective tools to measure appropriately the effect of social media marketing (Kim & Ko, 2012).

**Conclusion**

In recent years, the use of social media among corporations has significantly increased. Managers include social media for marketing purposes like research, customer relationship management, service, sales promotions and especially for branding. Companies have the opportunity to engage customers and maintain the relationship. The building of customer engagement throughout social media takes place according to the previously mentioned cycle. This process begins with the establishment of connection. Next there is interaction, then satisfaction, retention, commitment, advocacy and the final part constitutes customer engagement. This cycle delivers transactional customers, creating delighted and loyal customers and turning them into fans.

Managers indicate the potential of social media as a source of mass communication, one-to-one communication between stakeholders and also firm-to-firm and customer-to-customer communication. These relationships have a positive impact on brand trust, except the customer-to-customer communication. There are various different results present in the studied literature and because of this, additional research might be necessary.

The authors also indicated the vital role of content quality. The content should invite customers to conversations and attract the passive customer. Managers should also take into consideration the negative conversations on fan pages and mitigate the effects of these conversations.

Despite the progress made, there is still a need for further research in this field. A better understanding of the importance of social media for customer engagement can help identify unique features and create better tools to make customers loyal to the brand.

INNOVATIVE APPROACHES AND THEIR APPLICATION IN MEASURING BUSINESS PERFORMANCE

Jarmila Horváthová,1 Martina Mokrišová2

Abstract: In the area of business performance evaluation, we should pay attention to innovative approaches to performance measurement. They include the application of a matrix model. This concept was initially used for addressing the efficiency of input and output transformations. However, the terms ‘efficiency’ and ‘performance’ are closely linked. Some authors even assign them the same meaning. Based on the above-mentioned, a linear programming model for addressing the problems of input and output transformations can also be applied for business performance measurement. The benefit of this paper is the measurement of business performance applying a matrix model. One of the significant outcomes of such matrix model is the formation of new indicators, which can be beneficial in business performance measurement. Another positive aspect of this approach is the creation of a network of indicators assessing business efficiency, effectiveness and performance. There are strong links between indicators in a network, which can be mathematically described. Based on the knowledge, the management of a business can focus on those functional areas, which are preconditioned for business performance and efficiency improvement.

Keywords: business, efficiency, indicator, input, matrix, model, output, performance

Introduction

The measurement of business performance is nowadays a very actual problem. Recently there is a decrease in use of conventional profitability indicators as synthetic measures of business performance. Nowadays, due to the changes in the economic environment, new tendencies arise. These tendencies originate in the areas with the most developed capital markets and are linked to the shift of top indicators of performance measurement towards maximization of shareholder value. The result of this is the use of so-called value criteria for business performance measurement.

Literature review

Conventional financial indicators have a low predictive value in looking for ways to improve business performance, especially in the long-term. This is due to the fact that these indicators measure and evaluate special area of business financial health. “It is important to supplement conventional financial indicators with other more dynamic and more prospective indicators, which are adjusted to specific competitive conditions” (Gallo, 2013). The aim in performance measurement is to monitor and compare the implementation of performance results with the planned level of performance, to monitor strategy implementation, to identify accompanying fundamental problems and to perform measures to eliminate deviations (Dudoková, 2004).

From this point of view, it is necessary to implement modern indicators of performance measurement which are based on market principles, not on accounting, and proceed from the theory of value management and the acceptance of the internal and external risks and are applicable in business valuation (Mařík, Maříková, 2005; Suhányiová, Suhányi, 2011). “Therefore, basic financial fields of evaluation and measurement of business performance can be supplemented by more recent and modern indicators and methods” (Kislingerová et al., 2011). “Evaluation using modern methods with the application of market characteristics such as the EVA indicator (the EVA model has been known since 1980. Its authors are representatives of Stewart & Co., Americans Joel M. Stern and G. Bennett Stewart III.), INEVA, MVA, RONA, WACC or indicators based on FCF, CVA and others” (Stern, 2015).

In addition to measuring performance with the use of financial indicators, we focus on business performance measurement applying a set of non-financial indicators which are based on experiments from the early 80s, when Peters and Waterman (1982) proposed eight factors that lead to business success and Rockart (1981) and Chung (1987) suggested critical success factors. As the comprehensive approach to business performance measurement, the concept of a Balanced Scorecard (Kaplan, Norton, 2000) developed in the 1990s followed. Another business performance evaluation method which uses non-financial indicators is the method of Harry Pollak (2004). “Methods of

1 Faculty of Management, University of Prešov in Prešov, jarmila.horvathova@unipo.sk
2 Faculty of Management, University of Prešov in Prešov, martina.mokrisova@unipo.sk
performance evaluation based on non-financial indicators also include techniques of determining measures for business management - for example CMM (Capability Maturity Matrices), performance pyramid, EP²M (Effective Progress and Performance Measurement) and the management of performance processes” (Sink and Tuttle, 1989). “Modern techniques of performance management and measurement also include Total Quality Management, Six Sigma, Benchmarking, Kaizen, Business Processes Reengineering and others” (Horváthová et al., 2014). These approaches represent a multi-criteria evaluation of performance with the use of financial and non-financial performance indicators applicable in all areas of value added (Suhányi, Suhányiová, 2014).

An important benefit in the issue of performance measurement is the application of a matrix model processed in the contributions of Grell, Hyránek (2012, 2014). According to these authors conventional indicators are a very good basis for further examination of performance applying mathematical methods. They also criticize one-way orientation of performance measurement on output measures and point out the necessity of incorporating intensity indicators to performance measurement models. Based on above-mentioned, business performance can be examined by a matrix model, in which various combinations of inputs and outputs are applied. One of the important results of the matrix model is the definition of new indicators, which may be beneficial for business performance measurement and evaluation. In addition to the mentioned authors, efficiency of production systems with the use of a matrix model is also addressed by Cibulka (2007a); Cibulka (2007b); Kliešťik (2009), Huai et al. (2011). The positive aspect of this approach is that indicators measuring business efficiency, effectiveness and performance create a network with strong relations between them (Štefko, Gallo, 2015), which results in the synergic effect of indicators’ impact on business performance.

**Data and methodology**

The research problem of this paper was focused on the analysis of business performance. The EVA indicator and linear programming aimed at addressing the problem of input and output transformations were used to calculate business performance.

The formulation of the research problem: Is the EVA indicator a synthetic indicator of business performance measurement, the value of which reflects the impact of functional areas of business? Is business efficiency precondition for its performance? Is the matrix model suitable input for performance measurement? Is performance measurement based on the matrix model an adequate alternative to measuring performance by EVA?

The research objective was to calculate and analyze business performance with the use of the EVA indicator and the matrix model addressed as a linear programming model applying the simplex method.

In accordance with the research objective, we proposed the hypothesis:

H: We suppose that the results of the performance measured by the EVA indicator are identical with the results of efficiency measured with the use of model of input and output transformations.

The research was realized on a sample of 30 businesses operating in the Slovak heat industry. For this research sample, we processed a matrix model, which was an input for efficiency and performance analysis.

For the creation of the matrix model, which we used for the evaluation of efficiency and performance of businesses operating in Slovak heat industry, we selected these data: as inputs, we chose A – Assets, FA – Fixed Assets, MC – Material costs, E – Equity, C – Costs; as outputs, we chose R – Revenues, S – Sales, VA – Value added, EBIT - Earnings before interest and taxes and EAT – Earnings after taxes. With the use of mentioned inputs and outputs we created a matrix of input and of output transformations, which consists of a number of important indicators of business performance – Quadrant A in above-mentioned matrix model is formed by indicators of efficiency and effectiveness. Quadrant B consists of indicators of assets and capital structure. Quadrant C is formed by indicators designed as input/output. This group includes indicators of intensity. Quadrant D consists of indicators of output/output. This quadrant includes indicators of structure, but also indicators of output profitability. From the structure of this matrix, it is obvious, that performance was evaluated by a group of indicators from all areas determining it. The matrix consists of indicators of efficiency,
effectiveness, and intensity and in terms of financial indicators, there are indicators of profitability, activity, and capital structure.

Results and discussion

To evaluate the performance of businesses, we calculated the average value of the indicators EVA Equity and EVA Entity. From the 30 analyzed businesses, 14 businesses showed a positive value of the EVA indicator and 16 businesses had a negative value of this indicator. Based on these results we can say that the analyzed sample of businesses has difficulties in achieving optimum values of performance. Further analyses show that these problems are due to low liquidity and low profitability of the analyzed sample of businesses. Average values of EVA indicator are shown in Figure 1.

For the comparison of performance calculated by EVA indicator, we formulated a problem of linear programming (Table 2). The linear programming model consisted of 8 selected indicators - 4 indicators of intensity and 4 indicators of effectiveness.

180
Based on the results of the problem of linear programming we can say that from the 30 analyzed businesses only 2 businesses reached a maximum value of efficiency at the level of 1 therefore, their performance is high. An efficiency less than 0.1 was achieved by 4 analyzed businesses.
Based on the detailed analyses and calculations, we found out that businesses which achieve low efficiency, also reach a negative value of the EVA indicator, so their performance is low. We also found out that from the border efficiency of 0.3 downwards, the performance of businesses is low and from the value 1 to the border efficiency of 0.5, the performance of businesses is high. In the efficiency range from 0.3 to 0.5, there is a gray area where we cannot definitely say whether performance of businesses is low or high. In this range, businesses achieved positive or negative values of the EVA indicator. Business HT27, which achieved the highest value of the EVA indicator at the level of 1 million, had an efficiency of 0.83. We can also mention business HT18, which reached the second place in the value of the EVA indicator as well as in the efficiency calculation.

**Conclusion**

Based on the research, we can conclude that business performance can be exactly measured by efficiency indicators. These measures are appropriate because they connect inputs and outputs. We proved that the results of performance measured by the EVA indicator are identical with the results of efficiency measured with the use of the model of input and output transformations. The hypothesis was confirmed. Based on the above-mentioned we can conclude that the EVA indicator is a synthetic indicator of business performance measurement. A synthetic measure is also the calculation of business performance applying the linear programming model because with its use we obtained one aggregate number which expresses business performance and takes into account all indicators of business performance evaluation.

TRANSPORT OF DANGEROUS GOODS AS PART OF A FUNCTIONAL MODERN SOCIETY

Petya Vaskova Hristova1

Abstract: The European economy is dependent on transport. Electronics, fertilizer, medical items, metal paint, plastic, rubber and different modes of machinery are classified as dangerous goods when transported, as are pesticides and different products for agriculture and cosmetics. Within the transport context, dangerous goods are considered to be those goods which may cause harm to people, the environment or property. They are transported mainly by specialized companies, using special equipment. It is vitally important for the economy that dangerous goods are transported in a well-synchronized logistic chain that is both functioning and efficient. The transport often requires the use of different transport modes, intermediate storing or crossing of national borders. In order to ensure that the complex chain is efficiently functioning, the following article aims to summarize the harmonization and bridge the differences between the nation's legislations and those governing the various modes of transport. Innovative technical tools, methods, and systems are analyzed in cooperation with operators and infrastructure managers. The article describes how the economy is highly influenced by safety regulations and anti-terror actions.

UDC Classification number: 338.2; DOI: http://dx.doi.org/10.12955/cbup.v5.922
JEL Classification: L92
Keywords: dangerous, goods, environment, economy, safety, efficient

Introduction
The European transport policy is obligatory for all European countries and regulates important issues such as traffic jams, safety issues, security, prevention measures and environmental protection. Within that European transport policy, a strict finance framework for infrastructure projects has been developed. One of the most important ones is for transport.

In the past ten years, the European Union has witnessed a dramatic growth in the importance of advanced industrial societies, namely regulation and risk assessment, as well as innovations. The use of law to regulate economic activities has become a defining characteristic of the modern society. Managing the entire logistic chain well and efficiently is crucial for the transport of dangerous goods.

Transport of dangerous goods as a part of a modern society
Dangerous goods are considered as dangerous because during their transport they may cause harm to people, the environment or property through being explosive, flammable, radioactive, toxic, oxidative, corrosive or some other chemical property. The legislation in force has been extended, and currently, it covers the whole transport chain from sender to hauler till the receiver. They are prohibited to be transported but because we can’t live without products that are considered dangerous goods they are transported under strict regulations. Those regulations are precisely written into the Directive 2008/68/EO and its annexes as they are amended.

The dangerous goods are shipped as freight goods accompanied with strict safety and security regulations. In relation to that transport policy, the serious accidents on roads have been reduced by more than 50% in the last few years. The intelligent transport systems of dangerous goods and the usage of special equipment that allows following the goods during the whole transport time is an outcome of the modern society solutions.

The dangerous goods by themselves rarely cause accidents but, as a coincidence of an accident, they can cause extensive damage. Last year, on 10th December 2016 in the village of Hitrino, Bulgaria, a train of a private railway operator derailed and caused enormous damage to the infrastructure and the environment. 8 inhabitants of the village died, 29 were seriously injured and more than a 100 injured. All of the citizens of Hitrino were evacuated for 10 days due to the heavy air pollution as a result of the accident and the spill of the dangerous goods.

Crucial characteristics for the transport of dangerous goods as a part of the functional modern society is the mobility, petrol dependency, infrastructure, business competency and environmental protection.

According to the Finnish strategy for transport of dangerous goods (2005), the assessment of the transport of dangerous goods as a part of the modern society involves:

---

1Faculty of Transport and Energy, University of National and World Economy, Sofia, Bulgaria, pettivass@aol.com
1. impact assessment which aims to promote the functionality of logistic chains;
2. safety of transport, the traffic, and environmental protection;
3. assurance that all national specific conditions are duly taken into account at the European and international level;
4. to improve the competitiveness and effectiveness of the field.

The administrative support shall process, plan and monitor the transport of dangerous goods. All personnel involved in such transport should promote safety, among the economic and profitable operators across the entire TDG sector.

One important issue which has been a practice in the last several years within Western European countries is a relevant working time for the people involved in the transport of dangerous goods. The time that the personnel involved in the loading, transport or unloading of dangerous goods, as well as all other related to the transport activities, should have a shortage of the working hours.

As stated into the Directive 2008/68/EO (2008), to improve the wellbeing and working ability of personnel, the expertise in the sector shall be guaranteed in a long term and the personnel to be accordingly trained.

Another example is the transport of medicines, petrol products, plastic, etc.; such products which the modern society can’t survive without. That is why from an economic point of view, in the transportation of dangerous goods it is vital that the entire transport chain to be designed in a way that these goods reach their destination on time, safely and profitably.

All regulations are amended in such a way to meet the needs of the industry and at the same time those of the private consumers. Due to social changes nowadays in the EU and the constant increase of the competitive transport market, the stock of kept materials for production has been minimized as much as possible. The success of the companies and operators depends on ensured logistic chains, which are functioning efficiently and safely.

The transport of dangerous goods (TDG) takes place on all roads within Europe and all over the world. Its transport often is international and even with different modes of transport; the TDG rules and regulations have been harmonized and synchronized. For example, the requirements for the road and rail transport and waterways for EU have been issued in one single directive: Directive 2008/68/EO. The Annexes ADR, RID and ADN contain all the important rules for those three modes of transport.

GO GREEN is another important transport policy which is old but at the same time still in its beginning. Go GREEN is an initiative which started several years ago stating that the current transport system comes along with a wide range of problems - such as global warming, environmental degradation, health implications and the emission of gases. It is considered that the transport sector can be attributed for 23% of the world’s gas emissions resulting from the burning of fossil fuels. To reduce the air pollution significantly, an efficient model of optimization for the transport of dangerous goods is required.

All participants in the transport of dangerous goods aim to reach a safe, secure and functional system.

Figure 1 represents a model for a safe and functional transport system within the modern European society.

Guidelines for safe, secure and modern transport of dangerous goods

According to Tzvetkova (2010), the functionality of the transport of dangerous goods shall be managed by the results. In order to increase the clients’ satisfaction from the transport and at the same time to meet the high levels of safety and security, the following guidelines may be summarized:

1. Reduce the quantity and unnecessary volume of paper; transport documentation shall be accurate and clear. The legal requirement and obligations for the participants shall be known and comprehended by all operators and authorities engaged in the surveillance or supervision. The legislation should be clear for everyone, effective and understandable.
2. Advance training and strengthening of the level of knowledge for the transport of dangerous goods. All TDG sector operators should be trained to the level of their responsibilities. This will improve the knowledge and the general safety attitude and improve the safety within the entire transport chain.

185
3. Accessible sources of information, free of charge for the consumers and interested parties.
4. Safe and profitable transport through cooperation. In order to achieve the above mentioned goals, the cooperation and open communication between various authorities, administrations, infrastructure managers and operators is a crucial sector indicator. The cooperation should be promoted during the daily work of everyone.
5. Appropriate surveillance and supervision duties.
6. Removal of the level crossings especially on the routes with dangerous goods. TDG routes shall be functional and safe.

**Conclusion**
The transport of dangerous goods takes place on roads, railways, by water, and by air. The entire logistic chain is often international. The transport often requires the use of multiple transport modes and the crossing of national borders and well developed logistic chains. In order to ensure that the complex logistic chain is functional, it is believed that, where possible, legislation should be simplified and harmonized. The harmonization of the legislation applies to solve practical issues. Technology and telematics applications are increasingly utilized in TDG. The development and maintenance of the infrastructure and transport routes are ensured and particular attention has been put into the regulations and legislation norms.

The article summarizes the current transport of dangerous goods where the safety is priority number one. Cooperation between the different administrative authorities, the operators and consumers as well as all other relevant participants is essential for promoting safety and environmental protection, but at the same time ensuring an economic efficiency.

THE IMPACT OF ADVERTISEMENT ON CONSUMER’S PERCEPTION

Martin Hudák,¹ Radovan Madleňák,² Veronika Brezániová³

Abstract: Marketing can be described as a tool for companies to influence the consumer’s perception to the desired direction. The current market situation is characterized by dynamism, growing consumer power, and intense competition. The consumer perception and behavior are changing and therefore need to be constantly monitored and measured. The aim of this article is to scan and measure consumer’s perception while watching a video advertisement. During this experiment, an eye-tracking technology was used, which allows capturing a consumer’s gaze. The central part of the research is to measure the brain activity of a consumer based on the EEG (Electroencephalography). EMOTIV EpoC+ is a 14-channel wireless EEG, designed for contextualized research and advanced brain computer interface applications. An advertising campaign from four different mobile operators was used for this purpose. In the conclusion of this article, consumer’s perception of different advertising campaigns are compared and evaluated.

Introduction

Neuroscience is a branch of life sciences, which examines the workings of the nervous system of animals and humans, its development during life, and examines individual neurons, parts of the nervous system, their interconnections, methods of creating neural networks, their cooperation and their relationships to the surrounding (Hudak & Madlenak, 2016). The field of neuroscience also includes cognitive neuroscience, which examines the procedures in the human brain during cognitive processes. These processes include for example perception, thinking, remembering, recalling from memory, learning, etc.

Determining how a person processes various sensations is also a valuable knowledge for the field of marketing. It is of great benefit if entrepreneurs who are trying to offer their products to potential customers know how these customers will react to advertising stimuli and other marketing tools. The use of knowledge and methods of neurology in the field of marketing gave birth to a new discipline – neuromarketing.

Analysis of the problem

There are several definitions of marketing, and it can be characterized from various perspectives: it can be a system of activities of an entrepreneur, or it can be defined as a complex of elements of business activities, which are mutually interconnected, or a business philosophy (Corejova & Rostasova, 2015).

However, what all of these definitions have in common is the customer and satisfying his or her needs. Therefore, it is preferentially focused on the demand side and customers’ needs (Jankalova, 2014). This emphasis results in the mission of marketing in the business environment – it has a particular function, specifically to reconcile opportunities in the market and enterprise resources (Madlenakova et al., 2016). Certain tools are required in marketing so that its role in the business is fulfilled. The marketing theory speaks of four essential tools, so called 4P, which are product, price, place, and promotion.

Marketing communication is a permanent part of the marketing mix. It is defined as a targeted delivery of content and necessary information to potential customers/recipient (Kolarovszki et al., 2016). It is often understood in a very narrow view only as “advertising,” which is caused primarily by the fact that advertising is the most common tool used in marketing campaigns. Marketing communication can be understood as a marketing tool that comprises all means that serve to inform and convince customers and directly or indirectly points out the products they sell.

³ The Faculty of Operation and Economics of Transport and Communications, University of Zilina, veronika.b007@gmail.com
Advertising is one of the forms of marketing communication. With advertising, it is possible to efficiently share the necessary content to the target groups en masse. It can inform, convince, and remind the brand or increase the product awareness.

The goal of advertising is to influence the purchase decision making of the consumer. Psychology, which examines human behavior, emotions, and motivation to act, plays a significant role in advertising.

When designing advertising, regarding psychology, one needs to look at the environment, in which the product is promoted (for example the role of media) on the one hand, and the content of advertising itself on the other. How do the media affect the impact of advertising? By creating an environment, in which the product is offered – for example, a source, which is perceived as untrustworthy has the same impact on the information it provides, and in the end, the information also appears untrustworthy. In addition to its credibility, the attractiveness of the source, etc. are also important (Chynal et al. 2016).

It is also possible to encounter several types of advertising and advertising media (Madlenak & Hudak, 2016). The most visible and probably most popular medium is the TV. TV as a medium for advertising is especially suitable for an introducing of a product; it allows using picture, sound, music, and movement (Madudova & Kolarovszki, 2016). Thus, the marketing message can be made very emotional and impressive by means of TV. A TV spot can portray essentially any creative idea.

**Objectives and Methodology**

The goal of this article is to identify, measure, and compare the impact of visual advertising on potential customers. The research object was the advertisement of mobile network operators active in Slovakia. Currently, there are four mobile network operators in the Slovak market offering various service packages. These operators have their own frequencies assigned, and they are building their own networks. In addition to providing services under their own name, the operators are offering mobile services, which give the impression that there are other operators. These services, so called “children” of big operators, are Funfón of the Orange Corporation and Juro of the Telekom Corporation. In addition to these, there is also Tesco mobile – a virtual operator, who does not own a mobile network, but it has signed an agreement with a registered provider of services. Tesco mobile has a signed agreement with O2 – it uses its network, but offers services under its own name.

For research needs, advertising sets were selected, which were used by the four mobile operators for the Christmas season in 2016. The Orange Slovakia Corporation introduced a campaign, which should point out, jokingly, that older generations are not familiar with the modern technologies and also to introduce products the corporation is offering. This advertising presents a multi-generational family
and a situation, in which the grandson explains to his grandmother everything the corporation is offering. The campaign of the Telekom Corporation is in a futuristic style, and the main topic is “Christmas at Sagan’s in 2061.” Similarly as with Orange, it uses the presence of well-known celebrities in advertising – Peter Sagan and his wife. During the Christmas of 2016, O2 introduced a campaign to the audience, in which the main advertising message is “with us, you can choose yourself.” All of the spots have the same element – a family member buys a present he/she likes and puts it inconspicuously under the family tree. Advertising of the Swan Corporation (the mobile operator 4ka) are quite atypical for the Christmas period. The TV spots are shorter and do not have a story; they have only a central idea, e.g. product offer at half the price.

10 respondents participated in the test; 3 women and 7 men. The respondents were presented with the videos (advertising campaigns of individual operators) consecutively. While they were watching these spots, the respondents had an EEG neuro headset on their heads – a device with electrodes that captures their brain activity (Plochl et al., 2012). We have also tracked their eye movement using an eye camera (Soussou et al., 2012). EEG measurements were supplemented with the testing of the respondents using the eye camera to help us identify more easily, what the respondents were focused on (Figure 1).

The EEG neuro headset was the EMOTIV - Brainwear® - wireless devices, which hold electrodes measuring brain activity. Data collected from each electrode were transformed into cumulative characteristics using software – these are depicted with curves of various colors, whereby each color represents a certain emotion linked to current perception:

- Excitement (entertainment/fun) is divided into immediate and long-term. Short-term excitement (depicted by the orange curve) captures surprised reactions or reactions to specific events, ideas or proposals.
- Long-term excitement (black curve) measures the overall mood, as it accumulates over time.
- Engagement/boredom (red curve) measures the level of focus and immersion in the activity.
- Frustration (blue curve) measures negative emotions linked to the performed activity.
- Meditation/relaxation depicts the measure of how good (calm) the person feels, and it is depicted by the green curve.

Results and Discussion

In addition to the EEG measurements, we have also conducted a measurement using the ETG eye camera during the text, through which we were able to analyze where the tested respondent is looking at the moment, and what elements interested him or her in the spot. By combining the ETG measurements for individual campaigns into general statements, we can state, that the audience (respondents) are focusing mainly on persons, found on the screen, and especially on their face. If there is a significant element suddenly in the spot, then this element will get the most attention, although sometimes only for a short while. For very dynamic spots and with a great number of significant elements at the same time, watching the spot is slightly chaotic; as if the audience does not know where to look first. With a traditional setting the audience is accustomed to (like the environment in the Orange and O2 spot), this setting is almost ignored and the attention is focused on the story, the plot or an object, found in the foreground, and vice-versa, with an unconventional concept (Telekom) the environment itself captures the audience.

Elements, which had the greatest impact on respondents or entertained them or interested them the most have been identified in the EEG research. When all tested campaigns are evaluated, it can be said that the respondents were interested primarily in spots or elements, which are humorous, and which they have not seen before – i.e. they are optimal. However, at the same time it is necessary to be aware that these ideas need to be within certain bounds, and ultimately they have to “meet the taste” of their target customers.

The respondents appreciated verbal humor the most, which in the tested spots was found in the Orange Corporation spot. If the word play is accompanied by an interesting story (in this case the differences between the generations), it evokes an even better impression in the audience (potential customers). Futuristic elements in the campaign of the Telekom Corporation attracted most of the respondents, but not all of them were intrigued in a positive way.
Another element used in the campaigns was the presence of well-known celebrities in the spot – as already mentioned in the previous sections, in this case, the customer’s sympathies with given person play a major role here, but the author of the spot cannot influence them (Figure 2). A risk with the celebrities can also be the fact that oftentimes they do not act very naturally in the spots and interviews or scenes look unnatural and forced.

The plot of the advertisement, which should inspire the main idea, i.e. the operator’s offer, took attention away from it instead of drawing attention to the offer. In this case, a better linking of the story and the advertised information, or placing this information not at the very end, but in the middle of the advertising spot could be proposed. It would also be suitable if the offer would be presented or at least hinted several times during the spot – so that it would not be too distracting, but also to create an interest in offered products.

Conclusion
The analysis of the mobile network operator market covered four mobile operators operating in the Slovak market. Each of the operators introduced a Christmas advertising campaign in 2016, which had a particular theme and presented its current offer. Except for the Swan Corporation, all operators bet on traditional Christmas motifs, although each one interpreted them differently. The paper also states how the neuromarketing options were used in the world. Research carried out using EEG and supplemented by eye tracking using the ETG technology discovered that respondents had different impressions from the spots – they depended on the presented spots, but also on their current mood or taste. Elements were identified, which affected several respondents the same way (humor, faces, and story). A big negative of the presented TV spots was the fact that the respondents almost did not perceive the advertising information given operator shared using the campaign. Therefore, advertising
information should be shared in a more creative way, so that the story and elements of the spot would have a clear connection to the offer.

THE DILEMMA OF KNOWLEDGE MANAGEMENT IN AN ORGANIZATION

Agnieszka Bieńkowska¹, Beata Ignacek-Kuźnicka²

Abstract: In scientific discourse, opinions exist about the passing of knowledge management. These voices are incompatible with an argument that, in the era of knowledge-based economies, organizations need to be moving towards this concept of knowledge management. Such divergence requires examination. Hence, this paper presents the findings of a thorough literature review aiming to examine how widespread knowledge management solutions have been adopted in organizations as well as to identify the traits that define a knowledge worker. Also, the paper identifies the relationship between knowledge management and human resource management in the context of supporting knowledge workers. A critical analysis of literature together with theoretical conclusions are the main research methods used. The article is the basis for further empirical verification of the problem. The results indicate that the implementation of knowledge management can be a trend without formal acknowledgment. Thus, without obvious intention, the organization implements a management method that fulfills the premises of knowledge management. This paper presents an interpretation of knowledge management that invalidates the passing of this knowledge field.

Keywords: knowledge management (KM), knowledge workers (KW), human resource management (HRM)

Introduction

Knowledge workers benefit organizations because they directly participate in the research, creation, practical use, and extension of strategic resources of that organization, or in other words, knowledge. The extraordinary role played by knowledge workers (referred to as KW in this paper) implies a need for their special treatment so they can develop and use their competencies unhindered. It seems a natural progression to support the development of solutions that benefit KW by a system of knowledge management (referred to as KM in this paper). However, there are several dilemmas regarding this area. First, it is unknown how widespread KM solutions have been adopted by organizations since, although KW are identifiable, it is not possible to exclude situations in which KM solutions remain unimplemented. Second, the form of the specific KM solution dedicated to KW remains a dilemma. Third, one needs to fully study the relationship between KM and human resource management (HRM), especially in the context of support for the KW, who seem to lead the KM of the organization. In literature, theses have evaluated the assumptions of both concepts. It is clear that implementing the human resource function for KW needs to be specific (from recruitment to motivation).

The three problems mentioned above can be specified by the following research questions: Is KM common in an organization? Can the implementation of KM in an organization occur unconsciously? Are statements concerning the passing of issues related to KM definite? Is the traditional concept of a ‘brain-worker’ the same as the modern concept of the knowledge worker? What are the relationships between KM and other management concepts, notably those of HRM? How should an organization create KM and HRM solutions to support KW?

This study aims to answer these research questions by way of a thorough literature review to detail the categories relating to KM. Also, the considerations include whether the traditional concept of brain-worker is the same as the modern concept of KW.

Conscious and Unconscious Knowledge Management in an Organization

The origins of issues relating to knowledge management date back to the nineteen-fifties. However, today, in scientific discussions, voices are proclaiming their imminent passing. This opinion is controversial, especially when one considers that in the era of a knowledge-based economy organizations are needing to move towards the concept of KM. Possibly a reason for these controversial statements about the passing of KM is that when an organization adopts this concept, the process may seem semi-intentional. Specifically, this can relate to a situation where management supports the premise but fails to implement KM directly. This case raises the question of what constitutes the distinguishing features in such an organization.

¹ Wroclaw University of Technology, ziro@pwr.edu.pl
² A solicitor, bignacek@gmail.com
Regarding whether KM is a common phenomenon or not, one should first refer to Tabaszewska (2011, p. 64), who concluded that all organizations have managed knowledge in the past and will continue to manage such today. At the same time, Tabaszewska advocated diversity of professionalism regarding formal and, consequently, theoretical preparation and implementation. Tabaszewska used gradation to develop different categories of KM. Morawski (2011, p. 13) stated that the first category, ‘focus on knowledge’, can be defined as the continuous movement of knowledge within an organization. This claim is rational, since the focus on knowledge, according to Drucker (2011, p. 166), is the goal toward which the organization aims; it reorganizes the present to develop a better future. The continuous movement of an organization towards knowledge and reorganization (resulting from the need to seek knowledge), as discussed by Drucker, is maintained by perpetually stimulating the exchange of knowledge (Jashapara, 2014, p. 365). This case is implied among people within the organization as the constant transformation of explicit knowledge, combining innovation and ideas (Morawski, 2011, p. 15), that dynamically provide the organization with unique authority. A focus on knowledge is therefore somewhat intentional KM. Hence, regarding the original question of whether KM can be implemented unknowingly, the answer seems to be affirmative. This is concluded because the tendency for knowledge to circulate occurs, though purely from the rational management of the organization while there is a lack of awareness in the matter and lack of professionalism.

Stimulating knowledge exchange with its notorious transformation and constant updating to dynamically provide the organization with unique knowledge becomes routine with an advanced focus on its awareness in an organization. This outcome leads to the next category relating to the concept of KM, knowledge creation. The author of this category, Oleksyn (2014, pp. 559-560), claimed that organizations that use and also generate knowledge need to be defined as organizations created by knowledge. Oleksyn (2014, p. 126) also drew attention to another phenomenon: the absorption of knowledge management in the administration of professional development. In this phenomenon, an organization does not need to identify KM, as such tasks are implemented within the framework of professional development. Furthermore, Tabaszewska (2011) considered that KM had always existed and Drucker (2011, pp. 98–99, 119, 165–166, & 221–222) reiterated that the management of a brain-worker is a conscious projection of a habit to supersede the present. Hence, it would appear that KM does not require many commands or specific control, but only an entrenched habit to make it effective. The phenomenon of absorbing KM by other modes of managing an organization is evidenced by the multitude of categories relating to it. Tabaszewska (2011) indicated that the phenomenon gives rise to various forms of knowledge management systems and the following is a translated quotation about such forms: Some emphasize the use of information technology, which often focuses on information management rather than knowledge. The following are translated statements of Tabaszewska (2011, p. 60): Others establish the dominant role of sharing knowledge or building a system of continuous education; only a few organizations can create a knowledge management system that integrates all activities. The passing of issues related to KM does not occur, although terminology changes that result from the evolution of KM indeed take place. Thus, there is, no justification for the pessimistic visions concerning this field.

**Identifying the Knowledge Workers in an Organization**

When KM advances to the concept of strategic management of an organization, the importance of KW shifts into the foreground and thus, interpreting this concept becomes paramount. From a narrow traditional perspective, Kowalski (2011, pp. 315–316) developed a closed catalog of traits of KW, which are formal education, taxonomically listed professions, active participation in acquiring knowledge, autonomy, and performing under pain of bearing the consequences. According to Wellin (2013, p. 123), KW are experts in their field (law, accounting, and architecture) who share their knowledge with clients. Drucker (2011, p. 132) provided other examples: doctors, teachers, and preachers, along with lawyers, in the class termed ‘traditional professions’. Jashapara (2014, p. 300) gave a similar set of examples of KW, but at the same time reduced these to a common denominator, the culture of individuality. This culture consists of an individual’s autonomy with simultaneous collective cooperation, which provides the opportunity for fulfilling an individual’s passions. More precisely, this culture of individuality needed to be incorporated into the knowledge worker’s skills. The narrow definition presented above includes one additional major premise, namely, the professional ethos. This premise is found in Kowalski (2011) in the discussion about performance
under pain of bearing consequences. Thus, in this respect, a professional is a brain-worker combined with the ethos of their profession. It should be noted that a professional in the narrow sense of the word, is not necessarily a brain-worker, not according to the literal interpretation.

The traditional understanding of KW was ultimately evaluated by Drucker (2011, pp. 132-133) who wrote: “Knowledge workers today is used productively by an organization” and “business and state administration.” A skilled brain-worker in this structure holds highly specialized knowledge and tends to play an active and autonomous role in decisions while communicating with workers according to the logic of the situation rather than the formal structure of competence. At present, the professional ethos has been replaced by an individual system of values, prestige, and ethical codes. The popularity of the latter increased dramatically after the bankruptcy of the Lehman Brothers in 2008. In summary, based on the literature (Drucker 2011; Jashapara 2014; Kowalski, 2011; Wellin, 2013) the traditional understanding of the notion of KW is characterized by the following premises:

1. Erudition – which has formal education; expert in the given field;
2. Professionalism – taxonomically listed professions
3. Autonomous participation in knowledge processes – given examples are types of freelance;

It is necessary to create a contemporary catalog of the knowledge worker’s predispositions in a broad sense, taking into account the considerations mentioned above. Also, Drucker’s position and the view of Bogdziwicz (Juchnowicz, 2009, p. 144) consider the future of professionalism and the current trait of knowledge workers, as generally and commonly having a greater presence in the attitude of future generations of employees experiencing the development of the knowledge-based economy. Based on this in-depth literature study, specific traits of the knowledge worker were defined according to constitutive and descriptive values (Table 1). These descriptive characteristics were taken from detailed descriptions of scientists that help develop, define, and complete the image of the established KW.

Knowledge Management and Human Resource Management

Knowledge management is a comprehensive approach that applies to every area of an organization. In this context, relating KM with other management concepts is unavoidable. The most frequently discussed relationships are between KM and total quality management (TQM; Zhao & Bryar 2001; Ručevičius, 2006), CRM (Stefanou, 2003; Porębska-Miąc, 2005; Liew, 2008), KM and enterprise resource planning (ERP; Chan et al., 2009; Metaxiotis, 2009), and KM and balanced scorecard (BSC; Wen & Lin, 2002; Darvish et al., 2012). Contemporary KM is increasingly becoming integrated with other management concepts given that many areas are common to each. The issue of co-occurrence of KM with other management methods has been partially discussed, e.g., by Biękowska, Walecka-Jankowska, and Zgryzwa-Ziemak (2013).

One concept that seems to coexist with KM naturally is HRM. This is supported by the following translated quotation: One can even speak about the tendency to use KM techniques to support staffing and retention efforts in an organization, as well as the acquisition and dissemination of knowledge hidden within the organization (Roberts-Witt, 2003 cited Staniewski, 2008, p. 358).

The interaction between KM and HRM is evident (see Armstrong, 2009, pp. 219 & 225). However, it has not been thoroughly recognized in the literature, especially in the context of developing solutions dedicated to knowledge workers. Wheelan and Carcary (2011) have rigorously analyzed the relationship between these methods and have emphasized that effective KM depends on successful management of those people of the organization who have key knowledge. On the one hand, management by competence should set the objectives for KM in areas relating to key competence, from both the perspective of the whole enterprise and that of its individual workers (who hold certain positions). On the other hand, KM should provide the necessary information for HRM, by using state metrics. Both methods should also provide motivation for workers.
Contemporary features that define KW have a direct impact on the formation of specific solutions for KM and HRM, which are dedicated to these entities. Solutions for knowledge workers are required, and they include those specific approaches that integrate system-wide solutions and specific HRM guidelines. The results of a study conducted by researchers from the Warsaw School of Economics (Staniewski, 2008, p. 31-32) imply that when implementing system-based KM, Polish managers expect a beneficial movement of the organization around knowledge, as shown in Figure 1.

Figure 1: The circulation of knowledge in an organization after implementing a knowledge management (KM) system

The benefits of implementing a KM system that the managers expect, are consolidated with their specific anticipations in the field of HRM, namely, as Fryczyńska (Fryczyńska, 2004, cited Staniewski, 2008, p. 31-32) lists in hierarchical order: “fuller satisfaction of the clients’ needs, growth of work efficiency, growth of workers’ motivation and satisfaction, gaining qualified workers”.

Integration of a KM system with specific HRM guidelines leads to the rational use of working time, which avoids time wasted on the chaotic circulation of knowledge. In contrast, regulated exchange of knowledge would minimize the time needed for decisions, as in when responding to market needs, since such a system could appropriately structure and then effortlessly deliver information about customers and competition. This approach directly affects the development of the workers’ competence. Ultimately, all such efforts result in a significant increase in the efficiency of the organization (Tomczak, 2007, p. 5).

Conclusion
The results of this study exclude the risks of absorption of KM in organizations. The scientific notions defining this issue are relevant in light of imminent economic transformations given the imperative progress of technology and information. Therefore, postponing this type of management is not recommended. However, the pace of knowledge evolution remains an open issue. One should expect the systematic expansion of KM, as well as its rapid progression, and eventual revolutionary transformations into knowledge-based organizations. In the premises of KM, the importance of the knowledge worker has shifted to the foreground. Therefore, studying and interpreting this notion thoroughly in line with the ultimate purpose of this article, of initiating exploration leading towards ways of motivating KW, is necessary.

Abstract: This article examines the environmental conditions forming the origin and development of clusters in the Slovak Republic. It focuses on the current information and financial support for clusters, the preferred legal form of these associations in the Slovak Republic, and the possible forms of cross-border cooperation. The aim of this article is to analyze the structure of clusters in the Slovak Republic. The paper features an overview of the possible number and focus of clusters, including the procedure for identifying clusters needed to create this list. Despite its stated limitations, this indicative list provides a basis for further research in this area.

UDC Classification: 338.1

Keywords: cluster, small and medium-sized enterprises, risks

Introduction

According to Porter (1998), a cluster is a geographically close group of mutually interconnected companies, suppliers, and institutions in a particular branch. It is usual for companies as well as educational institutions, research centers, regional self-government, and agencies supporting the business development and the region itself to form clusters (Duman, Balog, Rehák, Zaušková & Loučanová, 2009). The value of clusters for companies entails increased productivity and competitiveness, both on the national and international level. For educational institutions, clusters allow the opportunity for dual education for practical needs as well as the applied research and transfer of technologies into practice. Their formation primarily benefits the economy but also helps in supporting infrastructure development for the regions or the regional self-governments.

Support of Clusters in the Slovak Republic

The emergence of the first Slovak Republic clusters was mainly an initiative of Slovak companies in a certain line of business or region. The legal form of such companies’ association depended especially on valid legislation of the particular country. The clusters in the Slovak Republic are mainly established as ‘interest associations of the legal entities’ and ‘citizens’ associations.’ These two preferred legal forms appear to be the most suitable since no legal basis exists for their founding. The official means of the government support for the clusters were provided for the first time in 2012 by the Ministry of Education, Research, and Sport of the Slovak Republic through subsidies aimed at scientific and technical services (Kaliňák, 2012). Further, the Ministry of Economy intend covering the support of clusters through the Scheme for Support of Industrial Cluster Organisations, from 2018. In 2016, seven applicants obtained subsidies to support industrial clusters while three were rejected (Zoznam, 2016). Only clusters with the legal form of ‘interest associations of the legal entities’ can obtain such subsidies (Schéma, 2014). However, a cluster with the legal form ‘citizens’ association’ can apply for a subsidy through the Ministry of Economy, based on legislation about providing subsidies (Law No. 71/2013 Coll.) issued by the Ministry of Economy. Based on this law, the purpose of a subsidy for clusters can be to support small and medium enterprises, research, development, and innovations, or development of the industrial production and services (Law No. 71/2013, Coll.). Regardless of the legal form of the tourism clusters, the subsidies are issued by the Ministry of Transport, Construction and Regional Development, according to the law concerning support of tourism (law No. 91/2010, Coll.). The regional budgets, university budgets, or European Union (EU) structural funds can be introduced as other possibilities of financing from public resources. Financing from the public resources is important, especially during the initial phases of the cluster life cycles. The financing of the clusters by the private sector is utilized to a smaller extent. The financial contributions of the cluster’s member companies through membership fees or sponsorships by persons other than cluster members belong here. Financing from the private resources is utilized during the later phases of the cluster life cycle; the membership fees are critical (Pavelková et al., 2009).

2 University of Žilina, stanislava.strelcova@fbi.uniza.sk
The Slovak Innovation and Energy Agency (SIEA) provides support in the form of information to the clusters. The Slovak Innovation and Energy Agency published an analytical study, Clusters for Support of Innovations in 2009 and is considered the first publication mapping the situation with clusters in the Slovak Republic (Duman et al., 2009). Another analytical study was published in 2015, Cluster Policy in the Conditions of Slovakia (Balog, 2015). The list of clusters operating in the Slovak Republic on the website of the agency SIEA was last updated in 2009, and that in the Cluster Policy in the Conditions of Slovakia in 2010. Nonetheless, the organization, European Cluster Observatory (ECO), provides a more up-to-date list of cluster and cluster policy analyses in Europe. The statistical data about clusters that are available is current to 2011. The Cluster Union of Slovakia deals with the activities for supporting the cluster policy development in the Slovak Republic as well as other activities. This union was established in 2010. Currently, there are 11 members (the clusters of different orientations) with the union participating in various international projects. The union currently cooperates in the framework of the project V4 Clusters Go International, which is aimed at building international cluster capacities and orientation in new markets (Únia, 2016).

Forms of Cross-Border Cooperation in Cluster Area

A cluster offers a space for establishing an internationally competitive business, and thus, needs to provide information about the international markets, trends, and innovations. Therefore, a necessary task faced by the cluster organization, and the companies involved, is to achieve international cooperation. The international cooperation from the perspective of clusters can be classified by the following groups:

- the international cluster initiative,
- the domestic cluster with foreign participation,
- the cross-border cluster, and
- the cross-border cooperation of clusters.

The cluster initiative is understood as an organized activity aimed at improving the level and competitiveness of the cluster organizations (Duman et al., 2009). The group of the international cooperation can involve establishing various supporting policies, strategies, projects, and institutions at the EU level, e.g., the European Cluster Alliance or European Cluster Policy Group.

A domestic cluster with foreign participation represents cooperation based on membership or collaboration with a foreign company as well as an educational or research institution. This group can be divided, according to the involvement of the foreign participant in the domestic cluster, into these sub-groups:

- a foreign subject is a member of the domestic cluster,
- a foreign subject is the founder member of the domestic cluster, and
- the collaboration of the domestic cluster with a foreign company.

The domestic cluster with foreign participation arises under a certain legal form. In the Slovak Republic, the legal forms are predominantly, 1) an interest association of legal entities and 2) citizens’ association. The domestic cluster with foreign participation is financed predominantly by the subsidies of the domestic country and membership fees.

A cross-border cluster arises based on requests of various programs aimed at cross-border cooperation. It is established where a project involves domestic and foreign participants delivering on common goals. Participants in the framework of a cross-border cluster cooperate to achieve the goals of the project, including building and strengthening foreign relations. An example of a cross-border cluster is the Hunting and Forestry Cluster of Economic Cooperation and Nature Protection in the border area of Hungary and the Slovak Republic. Another is the Czech-Slovak-Polish Cluster aimed at common projects in the area of the road, railway, and building construction, and another, the Czech and Slovak Industrial Cluster of Collaboration of East Moravia and West Slovakia. European Union funds, governmental co-financing, and, to a smaller extent, co-financing of involved participants and partners, help finance projects of the cross-border clusters, as compared to a domestic cluster with foreign participation, financed through subsidies and membership fees.

The cross-border cooperation of the clusters develops with the same orientation across particular economic activities of several countries. An example is the cooperation of the Automotive Cluster of
the Slovak Republic and Moravia-Silesian Automotive Cluster. Another involves the cooperation between the Slovak Plastic Cluster, Czech Plastic Cluster, and the Industrial Cluster Bydgoski. Hence, several examples exist of such a cluster collaboration between countries.

The activities aimed at improving the level of the cluster organizations by the government and the participants of both the public and private sector should be oriented towards creating particular measures according to the structure of the clusters in the Slovak Republic. The mapping activities of the clusters’ orientation in the Slovak Republic play a major role in such. The analytical study Cluster Policy in the Conditions of Slovakia (Balog, 2015) identifies a list of 16 clusters that have been active in the Slovak Republic up until 2010. This study aims to identify the current number of Slovak Republic clusters and their orientation.

**Data and Methodology**

The study examined a group of clusters active in the Slovak Republic. A list of these clusters was created to investigate their number and orientation and to analyze their structure. The exact name and orientation of individual clusters are excluded from publication. Particulars for the list were obtained from the registers of ‘the interest associations of the legal entities’ and ‘citizens’ associations,’ published by the Ministry of Interior of the Slovak Republic (Registre, 2016). For extraction, the keyword ‘cluster’ was entered into the search field of the registers (for each name). Then, the list was expanded by adding organizations other than those found under the keyword ‘cluster.’ First, these were the organizations, Biterap, IT Valley, Z@ict, and Celim Slovakia, which were shown on the websites of SIEA and ECO as clusters. Next, the interested associations that applied for subsidies to support industrial clusters and which had been approved by the Ministry of Economy of the Slovak Republic were added to the list. These applicants included the Association for Development of the Region Horná Nitra and the Slovak Centre of Productivity. Further, the list of clusters was completed by identifying the interest associations that contained the words ‘development of the region’ in their names, as in the case of the cluster Association for Development of the Region Horná Nitra (an applicant for subsidies for a cluster). Overall, 70 clusters were identified, out of which 23 had the legal form ‘citizens’ association.’

Each clusters was assigned as having a particular orientation using the orientations given in the abovementioned registers of the Ministry of Interior of the Slovak Republic. The representation of the identified clusters was compared to that of the companies by ranking the companies according to the more general classification based on the results of Malé (2016, p. 71).

In creating the list, the study had these main limitations. Firstly, it was not possible to identify all cluster organizations operating in the Slovak Republic using the above methods. Secondly, having a record in the register of interested or citizens’ associations did not guarantee that the cluster was active. Thirdly, the cluster organization could have had another legal form that inevitably introduces a word other than ‘cluster’ in its name. Finally, it was not possible to identify an exact definition, or a border when it meant designating a given association of the companies or other cooperating participants without a closer specification or as a cluster. Nonetheless, it was considered that the list provided a general survey of clusters within the Slovak Republic and thus, a theoretical basis for deriving possibilities for developing a cluster initiative and policy in the area of the Slovak Republic.

**Results and Discussion**

Of the 70 clusters identified, approximately 19% were aimed at ‘tourism,’ 30% belonged to the classification ‘regional development’, and 51% were oriented towards a particular industry activity (Figure 1). The clusters classified under industry involved 10 areas (Figure 1). The scientific research and the development of various specializations were the major industrial area. This was followed by clusters of the engineering industry; energetics industry; information and communication technologies; electrical engineering and technics; agriculture and food industry; transport; and waste disposal and environmental protection. In contrast, the collaboration in the building industry and processing of plastic materials was not that common, with only one cluster in each.

The majority of clusters in the Slovak Republic arose during 2014. Of the 70 clusters included in the research, 12 were registered in that given year; a number that was three times that of the previous two years. These 2014 registrations were mainly clusters in tourism as well as associations that were not
previously present in the Slovak Republic at that time, e.g., transport (railway and air transport) and an agricultural and food cluster.

![Proportional distribution of clusters in the Slovak Republic by area of activity](image)

**Figure 1:** Proportional distribution of clusters in the Slovak Republic by area of activity

The abovementioned analytical studies (Duman et al., 2009; Balog, 2015) grouped cluster organizations into two classifications: technology and tourism. This study used three classifications: tourism, industry, and region development (Figure 1). The tourism clusters in the Slovak Republic involved participants in tourism from a certain region or in a popular tourist area. The second group, the regional development, comprised clusters with participants in various lines of business in the same region. Their aim was to increase the competitiveness of the region through activities oriented toward improving the economic activity, erudition, reducing unemployment, protecting the environment, and supporting tourism. The industrial clusters involved participants situated in another region, but with the same orientation in economic activity, i.e., in the same line of business.

The cluster initiative can be oriented toward either supporting the existing clusters or creating suitable conditions for building new cluster organizations. The support of the existing clusters could be oriented toward improving the cluster promotion and their advantages. This research found several cluster organizations had no website, which meant it was difficult to gather information about them. In this respect, the clusters could be losing potential members. A solution would be to create a common internet portal to record clusters and their basic information. Thus, the companies and other potential members would have an overview of the active clusters in their territory or with the same or similar orientation. A cluster initiative aimed at supporting the rise of new clusters needs to be concentrating especially on increasing areas that are currently lacking in the Slovak Republic and which will presumably attract interest from members of the public and private sector. These clusters especially correspond to those lines of business in which a large number of companies operate.

Figure 2 compares the percentage represented by each identified cluster with that of the companies operating in the Slovak territory. The economic activities of agriculture and food industry, scientific research and development, and information and communications technology in the clusters closely matched that represented by companies in the Slovak Republic (Figure 2). The building industry had the biggest discrepancy in the framework of comparing the cluster and company orientation (Figure 2). There were many companies in the building industry, but the cluster representation of such (only one) was minimal (Figure 2). In contrast, regarding the percent share, there were more clusters aimed at electrical engineering and technics than companies operating in this area (Figure 2).

The building industry had the largest representation of companies that were manufacturing enterprises (Figure 2). A comparison of the structure of the clusters and companies aimed at production showed a lack of clusters involved with wood and metal processing (Figure 2). There were few companies...
producing plastic (rubber) products, or in engineering or electrical engineering and technics (Figure 2). However, the clusters that associate with this specialization were identified.

**Figure 2: Clusters and companies according to their orientation toward economic activities**

![Figure 2: Clusters and companies according to their orientation toward economic activities](image)

*Source: Authors*

Figure 3 depicts the lines of business of the major active enterprises outside of a cluster. These enterprises especially include economic activities oriented towards services. The majority of legal entities in the Slovak Republic operate in the wholesale and retail business. The next largest is the sector of legal, accounting and consultancy activities, followed by administrative and support services, and then activities in the area of estates (Figure 3).

**Figure 3: Lines of business for clusters and companies (outside of a cluster)**

![Figure 3: Lines of business for clusters and companies (outside of a cluster)](image)

*Source: Authors*

It is noted that the companies operating in the lines of business shown in Figure 3 could overlap in cluster organizations, e.g., the companies aimed at accommodation and catering services could be members of a tourism cluster. As tourism is not an interdepartmental line of business, the tourism clusters can also be associated with companies of another orientation. The companies operating in these lines of business could be members in those clusters ranked in the group ‘region development’. These clusters are associated with companies of various lines of business that operate in a particular region.
Conclusion

A cluster initiative represents a set of activities aimed at improving the level and competitiveness of clusters. These activities are oriented especially towards financial support and providing information for the clusters. The type of state subsidy for financing a cluster depends on the legal form and orientation of the cluster. The Slovak Innovation and Energy Agency provides international support by way of information for the clusters or other institutions. This current analysis found that an updated list of clusters is needed for the cluster initiative of the Slovak Republic. An analysis of the cluster structure was based on a list of 70 clusters (exact names and orientations are not published). The information for creating a list of clusters operating in the Slovak Republic was obtained from records about ‘the interest associations of the legal entities’ and ‘citizens’ associations. This article compares the percentage of companies represented in a line of business with those of clusters identified in the study. Despite limitations in the compilation, the list provides a general overview of the clusters in the Slovak Republic and therefore, creates a basis for further research in this area.

THE GUIDELINES FOR STRENGTHENING AGRICULTURAL COOPERATIVES IN THE ASEAN REGION

Narongsak Jukrkorn1

Abstract: The majority of the populations in the Association of Southeast Asian Nations (ASEAN), are small and consists of poverty farmers. The governments of almost all countries in the region employ agricultural cooperatives as a tool to tackle poverty and the problems of farmers. However, many cooperatives in this region have similar problems of how to manage their business in response to members’ needs and environmental changes. Data and insightful information were drawn from a series of training courses and workshops during 2013-2015. The main objective of this paper is to present the guidelines for enhancing cooperatives organizational capability. The series of learning intervention programs, study visits in both Thailand and Germany, strategic planning, business plan formulation, plan implementation, monitoring and supporting as well lesson learned summarization, have been integrated for building up organizational capability. The outcomes are emerging of new business and services of four pilot cooperatives in Vietnam. The model for strengthening Vietnam’s cooperatives can be applied to other countries in the ASEAN region.

JEL Classification Numbers: H25, M89, I01; DOI: http://dx.doi.org/10.12955/cbup.v5.926

UDC Classification: 334

Keywords: Agricultural Cooperatives, Strengthening Model, ASEAN.

Introduction

Countries in the ASEAN region are located in the same tropical climate zone, a majority of the population are small and consists of farmers (except for Singapore and Brunei). Farmers in each country often have similar problems, i.e., high production costs, low yield per rai (hectare), fluctuation of crop prices and being exploited by market forces. Moreover, they also face climate variability. The governments of almost all countries in the region employs agricultural cooperatives as a tool to tackle poverty and the problems of farmers mentioned above. Support is rendered to encourage farmers to unite in establishing agricultural cooperatives. The governments then support agricultural cooperatives to act as a coordinator with different agencies, to promote the development of production capacities of farmers by means of provision of loans, production factors and other agricultural services, as well as to act as an intermediary in the collection of member products for processing and distribution in order to help raise crop prices and prevent them from being exploited by the middlemen. Agricultural cooperatives are therefore an agricultural institution that plays a key role in the economic development and livelihood improvement of farmers.

For Thailand, His Majesty the King presented the concept of sufficiency economy as a guideline for the country’s economic development, which is consistent with the principles and values of cooperatives. In this context, cooperatives could be called the practical part of the sufficiency economy. They focus on promoting the carrying out of occupation and livelihood on the principle of self-reliance on the middle path, practicing reasonableness and moderation, being based on knowledge and capacities that are in line with existing economic and social conditions, and attaching importance on equitable allocation of resources and surpluses. The royal development projects are located all over the country, and all use cooperatives as a tool for development.

However, whether and how well cooperatives are able to serve the mentioned functions depends on their capacities in the management of businesses. Hence, capacity development of cooperatives to enhance business potential and competitiveness is an important action to be taken by cooperatives in every country on grounds of driving forces including change of circumstances, chance of survival of cooperatives themselves, as well as allocation of benefits to members based on each cooperative identity.

Research methodology

This paper is summarized lessons learned from the project “Strengthening Cooperatives in Central Vietnam” under the Vietnamese-Thai-German Trilateral Cooperation and the research project on the “Collaboration for Agricultural Cooperative Development in ASEAN Countries.” Data and insightful information were drawn from series of training courses and workshops, and captured through participatory learning and observation in 2013-2015. Case study research has been applied to as a research methodology. The 12 cooperatives in 4 provinces have become pilot models on strategic planning and management for further outreach. 4 cooperatives have successfully carried out new activities following strategic plan, their visions and missions. These model cooperatives are Hoa Thang 2 (in Phu Yen), Binh Thanh Dong Agricultural Cooperative (in Quangngai), Phu Dong Agricultural Cooperative (in Quangnam) and Phu Ho Cooperative (in Thua Thien Hue).

The conceptual framework for strengthening Cooperatives

Marquardt (1996) argued that organizations of all kinds in the world, are continuously facing changes due to rapidly changing economic, social and cultural circumstances, as well as advancement of science and technology. Cooperatives mostly are small and medium enterprise (SMEs), related to business operations, being part of the world’s economy. They need to adapt themselves for higher efficiency and effectiveness, as well as develop capabilities to learn and adapt in order to be competitive and survive under continuously changing circumstances.

Mazzarol et al. (2012) proposed guidelines for capacity development of cooperatives and applied to studied business capacity development of producer cooperatives in Australia and France with respect to their competitiveness. It was found that network building between cooperatives could help enhance the potential of access to external resources, exchange of knowledge and useful information and efficiency of business operations of cooperatives.

To develop cooperatives in developing country, the governments’ role is a key success factor (Changjian et al., 2011). For example, the Cooperative Promotion Department (CPD) of Thailand has formulated a strategy to strengthen cooperatives in Thailand in terms of cooperative management, building of business networks and cultivating of cooperative principles and values for all concerned.

Key components to be considered when strengthening cooperatives include: (shown in Figure 1)

1. Antecedents refers to internal and external basic components of an organization that have an impact on the success of cooperatives, comprising:
   a. Organization features of cooperatives are resources that represent potentials of cooperatives, such as capabilities of the board, the strength of team work, networking etc. Each cooperative has different existing resources. Cooperatives with good quality of existing resources can be easily strengthened.
   b. Government policy and support are considered as major supporting factors that have an effect on the strength of cooperatives in each country. Any country which has a policy, system and mechanism to support cooperatives fully is likely to be able to advance cooperative development quickly.
   c. The external environment has an effect on the operations of cooperatives, such as integration of the ASEAN Economic Community and competition condition.

2. The process refers to the management process that has an effect on the success of cooperatives. How successful a cooperative will be, depends on its efficiency in process management that is suitable for it and in line with the cooperative’s resources. As mentioned earlier, important processes that have an effect on the success of cooperatives include:
   a. Strategic planning process
   b. Emotional bond and trust building process
   c. Business management process of cooperatives

3. Outcome is a result of the combination between existing resources and management process that will determine how far members and cooperatives will be benefited.
   a. Tangible results, such as benefits of members, profits, dividends, and incomes of members
   b. Intangible results, such as confidence and trust in cooperatives
However, in order to facilitate the design of activities to strengthen and develop various components, criteria for each component have been set to enable co-operators to design a set of activities that create quality of different components for strengthening capacities of cooperatives and work well together in systematically, hereafter referred to as the model for strengthening cooperatives.

The Model for strengthening cooperatives

The model for strengthening cooperatives is as “Organization Development” for cooperatives. It represents a continuous and dynamic cycle of learning and adaptation because strength of cooperatives is closely linked to steadily changing external factors. The ability to learn and adapt to the changing circumstances will enable cooperatives to survive and progress. Key components for project implementation are as follows:

Component 1: Project Design.

The project design involves the design of working group/staff structure, the allocation of budgets, the design of project activities, the design of coordination mechanism and system, as well as the design of regulatory mechanisms for the project management with a view to achieving the project objectives.

Component 2: Learning Intervention Programme consist of:

- Training and study visits on cooperative development in both Germany and Thailand
- Training on the environmentally-friendly green business concept
- Strategic planning workshop of pilot cooperatives
- Business planning workshop of pilot cooperatives

Component 3: Action Learning

Pilot cooperatives had the opportunity to use their knowledge and skills gained from the project learning processes to drive forward strategic and business plans of cooperatives, which led to a successful development or improvement of cooperatives to a certain extent.

Component 4: Monitoring, Support and Drawing of Lessons Learned

Activities to be carried out by the project working group consisting of Vietnamese, Thai and German sides involve monitoring, rendering of support and consultancy services, evaluation of project success and changes occurred to cooperatives, and summarizing of major lessons learned from the projects.
Information gained is used for the preparation of a manual on the guidelines for strengthening cooperatives. The model for strengthening cooperatives are shown in Figure 2.

**Organizing the learning processes for cooperatives and the development of cooperatives in Vietnam**

In strengthening cooperatives in Vietnam, importance should be attached to the organizing of learning processes, both in terms of theory and learning from direct experiences. This includes study visits, learning from case studies, strategic planning and business planning workshops, translation of the plans into action, as well as the drawing of lessons learned from the project. The organizing of learning processes can be divided into 2 modules as follows:

**Module 1: Study visits in Germany and Thailand**

The purpose of the study visits was to provide the working group and participating cooperatives the opportunity to learn from cooperative models of both countries on how they were developed and made progress, what the management processes are like, what businesses and services they offer and how problems are solved. The knowledge gained has been applied for setting goals and procedures for the development of cooperatives in Vietnam.

**Module 2: Learning about the concepts, procedures and major tools for strengthening the cooperatives**

The project has organized workshops to provide knowledge and skills related to the management concepts and procedures, as well as major tools for developing businesses/services of cooperatives. The learning processes are shown in Table 1.

**Change of 4 Pilot Cooperatives**

Cooperatives in 4 provinces have become pilot models on strategic planning and management for further outreach. 4 cooperatives have successfully carried out new activities following a strategic plan, their visions and missions. These model cooperatives are Hoa Thang 2 Agricultural Cooperative (in Phu Yen), Binh Thanh Dong Agricultural Cooperative (in Quangngai), Phu Dong Agricultural Cooperative (in Quangnam) and Phu Ho Cooperative (in Thua Thien Hue). The change of the 4 cooperatives are as follow:
Hoa Thang 2 Agricultural Cooperative

A majority of members of the Hoa Thang 2 Cooperative are engaged in growing rice and producing handicrafts in an irrigated area where rice can be grown throughout the year. The cooperative has expanded its business to collect paddy so that its members can sell paddy at a good price and not be exploited by the middlemen. It will expand its business to process paddy in the future. At the same time, the cooperative also aims to encourage members to grow organic rice in the area of 10 hectares (60 rai). These new cultivation techniques help increase the income of participating members by 10%, which is in line with the regional and international trend of growing organic rice and doing organic farming to avoid the intense competition in the general paddy market. The businesses operated by the cooperative can therefore be considered as well responding to the problems of the farmers. At the same time, these represent a good strategy of the cooperative for their market positioning based on their potentials. However, in order to operate the paddy collection business effectively, the cooperative will need to educate its personnel about paddy collection, paddy and rice markets.

| “Environment and Business” | 1) To create knowledge, understanding and awareness of environmental issues and their impacts on the members and the cooperatives  
2) To prompt the cooperatives to apply the knowledge gained for improving production of its members and improving businesses of the cooperatives that are environmentally-friendly | Training processes were designed to be a participatory learning, including brainstorming, sharing of experiences of the participants, provision of environmental concepts, practice of designing the guidelines for promoting the production of the members and business operations of the cooperatives that are environmentally-friendly. |
| “Strategic Planning and Management” | 1) To build a team of facilitators with skills at carrying out strategic planning of cooperatives in Vietnam  
2) To formulate strategic plans of pilot cooperatives | A participatory learning process is used to establish understanding about the concept and importance of strategic plans in cooperative management and to practice the actual process of strategic planning of each cooperative. |
| and business plans for Product/Service Marketing” | 1) To strengthen knowledge and skills of participants on business plan and marketing plan development in general  
2) To draft the product/service marketing plan and business plan using pilot cooperatives as case studies  
3) To enhance participants’ capacity in providing the consultancy service on business plan and marketing plan development for cooperatives | The training process is a participatory learning process with learning on principles and procedures and practice of business planning and of being a facilitator. The main content of the business planning process includes:  
1) Principle and procedure for business planning  
2) Practice of business planning for the four pilot cooperatives  
3) Principle and procedure for being a facilitator in the business planning |

Phu Ho Cooperative

The Phu Ho Cooperative has rice-growing members and rice mills. In the past, the cooperative collected paddy and sent it to private rice mills. After joining the project, the cooperative has developed its businesses to process and distribute rice under the brand “Phu Ho,” from which its members greatly benefit because this raises the price of paddy of the members and brings to the
consumers fairly-priced rice of the cooperative. At present, the first five tons of rice have been available for sales in the local market. In the future, the cooperative plans to produce 100 tons of Phu Ho rice per year, accounting for an income of 400 million VND. This demonstrates the effectiveness of creating brand identity of products, packaging design and efficient marketing planning. These factors will enable local products to be competitive in the upcoming ASEAN Economic Community.

Phu Dong Agricultural Cooperative

The Phu Dong Cooperative is located in a rural, semi-urban area where members are decreasingly employed in agriculture because they changed to another occupation. As a result, there is a shortage of agricultural labor. The cooperative has therefore developed businesses to offer agricultural services and supplementary occupations to its members, such as growing of Lingzhi mushroom etc. The cooperative also offers a new service in controlling the use of chemicals in rice fields, leading to a safe and cost-saving cultivation for the members. Within three months, the cooperative could generate an income of 8 million VND from this service while its members could reduce expenditure by 600,000 VND per hectare. Food safety and health is therefore a key factor for economic growth in agriculture in Vietnam and in this region.

Binh Thanh Dong Agricultural Cooperative

The Binh Thanh Dong Cooperative strives to increase the number of its members and its capital and has therefore organized a training program for its members on the cooperative principles and procedures. It has also developed agricultural services, such as preparing cultivated areas. From organizing the activity to develop cooperative membership system, the increase of the member base increased the amount of working capital for cooperative management. As a result, the cooperative's investment capital increased by 200 million VND. This is important in maintaining the cooperative values, as demonstrated in the examples of Thailand and Germany.

Although the four cooperative models aim at developing different businesses and services, the intention to strengthen their cooperatives is obvious. Activities towards this end include provision of knowledge and understanding about cooperatives to expand the member base and businesses and services of cooperatives with a view to better responding to the problems and needs of cooperative members and to concretely providing cooperative benefits to the members. This again builds confidence and trust and causes members to cooperate with their cooperatives. However, the cooperatives will need to develop the capacities of their personnel in the area of management of new businesses/services created by the cooperatives. In this way, they can be successful in the long term and thus be genuinely strengthened.

The four cooperative models are still in the initial stage of driving forward their business plans. Business success and tangible benefits for the cooperatives and members need to be further evaluated for another two to three years.

Conclusion

Strengthening cooperatives involves capacity building to learn, adapt and be competitive in order that cooperatives will be able to operate business in a way to respond to challenges and needs of the members.

Key components in strengthening cooperatives to be considered by co-operators are existing resources, design of the learning process and outcomes of the learning process. As regards the strengthening of cooperatives using the dynamic model, cooperatives will need to learn from the previous implementation and summarize lessons learned for use in the design of activities to continuously develop cooperatives.

Lessons learned and good practices could be drawn from the case studies of the "Strengthening Cooperatives and SMEs in Central Vietnam" project as follows:

1. The cooperative movement in central Vietnam, staff, and cooperative members benefit directly from the project while the partners from Thailand and Vietnam harness advantages in terms of cross-cultural knowledge and experience of developing cooperatives. For working across cultures, understanding the needs to be established about political, economic, social, cultural conditions and factors and belief of each country are important.
2. Working on the mentioned project involves an application of technical knowledge to develop cooperatives in practice. The project has generated knowledge in the development of cooperatives in the context of central Vietnam, which can be applied to other regions in the future. The project also attaches importance to the cycle of quality, based on which steps of analysis, development design, testing and evaluation of the change occurred to the target group in the short, medium, and long term take place.

3. The learning processes of the project are organized step-by-step. That is, the knowledge about sustainable and environmentally-friendly businesses is first provided, which is a major trend, followed by strategic planning, using the strategic plan for business planning, and extension of knowledge through study visits to cooperatives in Germany and Thailand in order to apply concepts and knowledge from abroad to cooperatives in Vietnam.

4. The process of developing knowledge and skills based on learning from hands-on practice (Action Learning) was in place so that knowledge gained can be applied in reality. For example, the process of strategic and business planning has provided the working teams of cooperatives in Vietnam with skills of a facilitator and a consultant for further outreach after completion of the project.

5. The four cooperative models, which focus on different development objects, are all based on the development of businesses and services that responds to the needs of their members. Other cooperatives may choose a development model that appropriately suits their context.

FORMATION OF A PETROCHEMICAL CLUSTER AND THE CREATION OF AN INTEGRATED PETROCHEMICAL COMPLEX IN KAZAKHSTAN

Assel Kadyrbergenova,1 Saule Yegemberdiyeva,2 Kulman Orazbayeva3

Abstract: The problems associated with the development of the petrochemical industry of the Republic of Kazakhstan are investigated by creating a petrochemical cluster in the western oil and gas region of the country. The issues of a forming petrochemical cluster in Kazakhstan and creating an integrated petrochemical complex in Atyrau region are considered. The essence of the cluster approach as the main factor for increasing the regional competitiveness of the Atyrau region is opened, the expediency and efficiency of the creation of the petrochemical cluster and an integrated petrochemical complex is substantiated. The stages of construction of an integrated petrochemical complex are described, depending on the sources of supply of the used raw materials. An integrated scheme of the petrochemical complex was created and investment petrochemical projects in the Atyrau region were considered. The main groups of factors substantiating the opportunities for the formation of a petrochemical cluster and the achievement of an economic effect in western Kazakhstan are defined.

Introduction

The globalization of production and capital in a modern economy will lead to an increase in the competitiveness of goods and services. The consequence of this is the emergence of a fundamentally new economic phenomenon that has been theoretically comprehended in the concept of the cluster, which is based on the combination of individual elements into a single whole for the performance of a certain function and the realization of a specific goal. Clustering in the economy is the main factor in increasing regional competitiveness (Kuandykova, 2009).

A cluster is a group of companies that belong to one sector and operate in close proximity to each other. An industrial cluster is a series of industries that interact as a buyer-supplier or supplier-buyer, as well as through common technologies, common procurement channels or distribution of general labor associations. Regional clusters are industrial clusters, in which the participating companies are territorially close to each other. Thanks to its huge reserves of hydrocarbon raw materials, the Republic of Kazakhstan has become, in the 21st century, one of the largest exporters of oil and gas. In the action program developed by the Government of the Republic of Kazakhstan for the coming years, providing for the accelerated development of all branches and spheres of the economy, it is centered on the diversification of processing industries, including the creation and development of a petrochemical cluster, an integrated petrochemical complex in Atyrau region (Orazbayeva 2009a).

Due to the introduction of innovative developments in the real sector of the economy through the formation of a petrochemical cluster, the development of resource and energy-saving technologies, it is planned to develop high-value-added industries, accompanying and adjacent production in the oil and gas sector, and a decrease in the energy intensity of domestic production. (Bopieva, 2007; Pervushina, 2015; Braginsky, 2009). Realization of these branches can save the economy of the country from raw dependence and to produce a strong multiplicative effect within the country. For the effective solutions to these important issues, it is necessary to conduct interdisciplinary research (economy, technology, ecology, etc.) and make a scientifically-based decision.

Purpose, statement of the problem.

The aim of the work is to research opportunities of developing petrochemical productions by creating and forming a petrochemical cluster, creating an integrated petrochemical complex in Western Kazakhstan. The main tasks are (Bopieva, 2007):

---

1 Eurasian National University, Asel-k-80@mail.ru
2 Eurasian National University, saule_8@mail.ru
3 Kazakh University of Economics, kulman_o@mail.ru
studying of the problems of creating an integrated petrochemical complex in the Atyrau region;
studying of the main indicators on resources and expected results that are available in Western Kazakhstan for the creation of a petrochemical cluster;
justification of the feasibility and effectiveness of the establishment of a petrochemical cluster and an integrated petrochemical complex in the Atyrau region;
studying of the stages of construction of an integrated petrochemical complex, depending on the sources of supply of the raw materials used;
Creation of an integrated scheme of a petrochemical complex and the study of investment petrochemical projects in Western Kazakhstan.

Research methods
Let’s consider the methods for solving topical tasks for the formation of a petrochemical cluster and the creation of an integrated petrochemical complex in the Atyrau area. Analysis of the effectiveness of clusters can be carried out in various directions: institutional organization of clusters; internal motivation initiation and maintenance of clusters; comparing the competitiveness of participants in a cluster; and the strategic potential of clusters. Thanks to being focused on its territory reserves of oil and gas, the Atyrau region is one of the perspectives and attractive regions of the Republic for the formation of a petrochemical cluster. Research and classification of characteristic features of clusters show their distinction in different countries, but in general, you can select the following main indicators resource and expected results that are available in the Atyrau area to create a petrochemical cluster:

- sufficient opportunities and resources researched for construction of structures in and out of the cluster and prospects for their development;
- opportunity for the development of labor-buildings and a workforce inside the enterprise’s cluster;
- the proximity of suppliers of hydrocarbons and other material resources;
- the presence of equity participants cluster; - the presence of associated structure opportunities ready for joint action;
- the presence of opportunities for the intensive formation of networks - high potential for innovation and training staff.

The main purpose of the creation of a petrochemical cluster should be the development of the competitiveness of petrochemical complex Kazakhstan and its products out on the world market, increase the efficiency of its contribution to the competitiveness of the National Economy. In the Atyrau region it is possible to form a petrochemical cluster on the basis of new petrochemical objects of two companies for the production of plastics, which 50% of shares were purchased by JSC Investigation – Production “KazMunaiGaz” on the basis of which will be created a single petrochemical complex. A cluster includes a processing company: “JSC Polypropylene,” “Aktau plant plastics, JSC” Atyrau Oil Refinery "and new oil, gas processing plant under construction on Karabotan, etc. (Sarmurzina, 2007).

The proposed petrochemical cluster, provides Kazakhstan raw material, having not only the internal market, but also external markets (Iran, China, Russia), has every reason to become a real subject of the cluster development in the future.

Due to the growth of oil production in Kazakhstan, the capacity of existing GPP (Gas Processing Plant) is not enough for the full processing of gas, because it is necessary to utilize processed gas, which contains an ethane fraction from 13% to 16% and above, being a basic component of petrochemicals. The receipt of ethylene from ethane technologically and economically cost-beneficially. In comparison it should be noted that the consumption of gasoline to get one ton of ethylene is 3 tons and more, while the consumption same propane for the of purpose is 1.8-2.0 tons. Further the received ethylene can be used for the production of a wide range of petrochemical products, but the most cost-benefit of Kazakhstan will release of polyethylene low and high-density, polypropylene different brands, styrene and polystyrene, ethylene glycol and benzene, methanol and the other products more than 20 items.
The formation of clusters accelerates the process in individual industries, leading to a splash in innovation and strengthens the ability to compete in the world market (Espaev and Kireyeva, 2013). Moreover, integration into a cluster based on vertical integration will not form a spontaneous concentration of various technological inventions, but a certain system of dissemination of new knowledge and technologies (Zhekeev et al., 2007). At the same time, the most important condition for effective transformation of inventions into innovation, and innovation in competitive advantages, is the formation of a network of sustainable links between all cluster participants.

Kazakhstan is located in the center of the Eurasian continent and has no direct access to the markets for petrochemical products. In this regard, the transport component in the cost of petrochemical ready products, taking into account the indicators for transportation of raw materials inside the Republic, will have tangible indicators for its increase. Taking into account these facts, as well as ensuring the breakthrough development of the petrochemical industry for the economic niche in the international market for petrochemical products, the Ministry of Energy and Mineral Resources of the Republic of Kazakhstan, in conjunction with JSC NC “KazMunaiGaz”, is implementing a set of measures to create favourable economic conditions through the formation of a special economic zone (SEZ) (Sarmurzina, 2007). The terms and status of the SEZ will ensure the release of enterprises that are part of investors and executors of the construction sites of petrochemical complexes of SEZ, from customs duties on imported licensed technologies, equipment and materials, exemption from payment of corporate tax, land tax, VAT and other mandatory payments in the budget.

Results and discussion

Based on the analysis of the prerequisites and conditions for the development of the economy of the western region of Kazakhstan, the petrochemical industry is defined as the main competitive industry, for development of which it is necessary to direct domestic and foreign scientific potential, which will allow to raise innovative entrepreneurship to a new level. The development strategy for the Atyrau region has defined the need for creating facilities for deep processing of oil and gas for obtaining a wide range of science-intensive products with 5-6 redistribution, restoration and development of the petrochemical industry (Orazbayeva, 2008). Currently, in this priority area with the involvement of petrochemical specialists, proposals have been developed on the composition and structure of the regional petrochemical cluster. Within the realization of this cluster, the implementation of modern technologies for deep processing of hydrocarbon raw materials produced in the region is being implemented with the acquisition of science-intensive petrochemical products. (Serikov and Orazbayeva, 2009; Orazbayeva et al., 2013; Orazbayev et al., 2013; Orazbayev et al., 2014).

Step-by-step construction of an integrated petrochemical complex will be carried out in the areas of Karabatan, Kulsary and Atyrau stations, depending on the sources of supply of the used raw material:

Step-by-step construction of an integrated petrochemical complex will be carried out in the area of Karabatan, Kulsary and Atyrau stations, depending on the sources of supply of the used raw material: Construction of the polypropylene Complex is the first step to create a petrochemical cluster in the region followed by obtaining high-basic products of the industry.

The Project provides to use worldwide high technology on deep processing of the propane (Phase 1) and ethane (Phase 2) to obtain the following types of commercial product: polypropylene - 500 000 tons per year.

As a result of the project it is expected to create 30 000 jobs and produces more than 3000 types of final outputs within Technopark located in the Special Economic Zone in West Kazakhstan, development of small and medium business, expansion of the tax base, and development of related industries.

At present, the concept of its formation and construction of an integrated petrochemical complex in the industrial zones Karabatan, Kulsary and in the Tengiz area (optimal points for the umbrella principle for fractionation and deep processing of raw materials) has been developed in the Atyrau region to create the SEZ “National Industrial Petrochemical Science and Technology Park.” (Orazbayeva, 2009b; Orazbayeva, 2009c).

The goal of the project is the creation in Kazakhstan of petrochemical industries for deep processing of domestic hydrocarbon raw materials (oil and gas) and the release of basic and high added value petrochemical products.
Most of the activities of the first stage of the Program have been completed, the number and list of petrochemical complexes that are economically profitable in Kazakhstan have been determined. Specific indicators on the parameters of petrochemical complexes, sources and volumes of the necessary hydrocarbon raw materials have been obtained to ensure their uninterrupted processing. Natural and associated gases will be used in which the fraction containing ethane is between 13% and 16% or more of the total volume of gas, which is the main economic and technological advantage for the production of ethylene, the basic petrochemical product. Further, the ethylene produced can be used to produce a wide range of petrochemical products, but the most economically profitable for the Republic will be the production of low and high-density polyethylene, polypropylene of various grades, styrene and polystyrene, ethylene glycol and benzene, methanol and other products of more than 20 titles.

To create various petrochemical industries in Kazakhstan, it is necessary to create a product for the production of basic petrochemical products - an integrated petrochemical complex (Figure 1).

The creation of a domestic base of raw materials for petrochemical industries based on the above-mentioned deposits is based on the implementation of investment projects presented in Table 1.

Thus, in Kazakhstan, when implementing investment projects, it is planned to create real sources of raw materials for the petrochemical industry, which, through a chain of added value, will produce a wide range of petrochemical products.

Source: Authors

The cost of production for complex processing of oil will be low, which will allow a fierce struggle in the market for the sale of petroleum products. The existing petrochemical enterprises in Kazakhstan cannot withstand competition. Therefore, it is necessary to create a scientific concept for reforming the petrochemical industry in Kazakhstan. It is necessary to focus on the world's advanced enterprises. (Braginsky, 2003; Qing, 2007; Alfaadala et al., 2009; Buzurtanova and Smirnova, 2010; World Intellectual Property Organization, WIP, 2011; Abu Dhabi UAE Petrochemical cluster, 2012; Dyrdonova, 2013; Melnik and Dyrdonova, 2014)

At present, there is no hydrogen production in Kazakhstan, and it is needed in large quantities for existing hydrotreatment processes, as well as future processes of hydrocracking, alkylation and others. Olefins (ethylene, propylene, butylene and isobutylene) can be used directly as a monomeric feedstock for petrochemistry. The absence of any of the above processes will lead to costs for the economy and ultimately will affect the cost of production. When processing oil according to the scheme of atmospheric distillation, existing in Kazakhstan, from each ton, the output is about $ 880. If all processing processes are implemented, all petrochemical syntheses that exist in the petrochemical complex, then about 2,2 thousand dollars of oil will be received from a ton of oil.

At the same time, fuel oil is mainly used as fuel at the CHP (combined heat and power) although it extracts the most expensive petroleum products, for example, lubricating oils, which are not produced in Kazakhstan. From this part of the oil, tar is obtained - raw materials for the production of bitumen, which is so much needed today for road construction, which is declared one of the government's priorities in the country. When burning fuel oil together with it, metals (vanadium, nickel, cobalt) contained in Kazakh oil and concentrated in heavy fractions are completely lost. If we add sulphur here, the content of which in fuel oil reaches 2%, and which is selected into the atmosphere in the form of sulphur dioxide, turning into acid rains, the advantages of burning fuel oil turn into negatives. In Kazakhstan, the entire gas part of oil and gas raw material is not processed. At best, the gas is supplied to the furnace, and in most cases, it is flared. At the same time, in addition to hydrocarbons, associated gas of oil production contains hydrogen sulphide and its incineration without purification is unacceptable.

It follows from the above that it is criminal negligence, which leads not only to the loss of additional cash receipts, but also creates unsolvable environmental problems to continue processing oil under a truncated scheme, without seeking the complex use of raw materials.

**Conclusion**

As a result of research into the formation of the petrochemical cluster in Kazakhstan, it is determined that there are numerous objective and subjective prerequisites for the accelerated creation and development of this cluster available in the Atyrau region. It is possible to single out the following...
groups of factors that justify the possibilities for forming a petrochemical cluster and achieving an economic effect.

The first group of factors is conditioned by the interconnection of potential resource and technological preconditions: for the petrochemical industry, Kazakhstan's heavy paraffin sulphurous oil is the best source of raw material; It is necessary to consider the technological interconnectedness of the petrochemical cluster; creation of new production facilities taking into account the existing infrastructure for the extraction and processing of hydrocarbon raw materials. All of the above will allow to help lay the foundation for the development of the petrochemical industry along the chain of subsequent complications of production to increase added value in the final product.

The second group of factors is predetermined by the reasons for the world demand for products and the need to provide an equivalent exchange in the international division of labor. Kazakhstan has large enterprises for the production of petrochemical products, which has a huge world demand. The demand for petrochemical products of the international market shows that the creation of basic petrochemical production facilities for the production of polyethylene, polypropylene, styrene and polystyrene, ethylene glycol and benzene will be very economically profitable for Kazakhstan.

The third group of factors is due to the possibility of activating the resumption of activities of petrochemical enterprises.

The fourth group of factors is predetermined by incentive motives to ensure high profitability of industries. The presence of an own hydrocarbon based requires the formation of a petrochemical complex that ensures deep processing of raw materials into final high-tech and science-intensive products to saturate the domestic market instead of imports and to expand the export potential of the final product.

The fifth group of factors is predetermined by the strategic platform for diversifying the country's economy in connection with the entry into the category of highly competitive countries. This dictates the expediency of forming a cycle of production of final products, which is the basis for creating a petrochemical cluster in the Republic of Kazakhstan. The development of an innovative cluster of petrochemicals can be a decisive factor in accelerating the diversification of the economy, promoting the activation of non-resource, high technology and high-tech industries.

The conclusion from the above is that the development of the production of petrochemical products in the Republic of Kazakhstan should become a priority not just as one of the fashionable strategies that will be forgotten immediately after the emergence, but as a plan for the development of one of the most important and strategic industries. Implementation of the cluster strategy and competitiveness of the economy can be facilitated by government policy aimed at solving the problem of transition from the import substitution stage to the stage of large-scale investments in the petrochemical industry and the creation of a petrochemical cluster. In the strategy for the development of the national economy of the Republic of Kazakhstan, it is necessary to add some changes, the basis of which should be based on the creation of a large petrochemical production, the source of raw materials should be oil, natural and associated gases extracted from the currently exploited deposits and concentrated on promising areas.

FORECAST OF USING NEURAL NETWORKS IN THE TOURISM SECTOR

Miroslav Karahuta,1 Peter Gallo,2 Daniela Matušíková,3 Anna Šenková,4 Kristína Šambronská5

Abstract: The paper addresses the issue of management decision-making using artificial neural networks and their application in hotel management. Today, the development of tourism is of great importance and plays a very important role in the development of national economy. Balanced ranking and prediction model using financial and non-financial indicators with the application of artificial intelligence, allows us to reach a high level of effectiveness and accuracy in evaluation of the financial and non-financial health of companies operating in this segment. This approach improves the manager’s ability to understand complex contexts and make better decisions for further development. It also brings new managerial and scientific point of view of an in-depth analysis of the performance of these facilities. It can help the development of tourism in terms of the application of modern management techniques built on scientific principles and thereby better integrate science and practice.

JEL Classification Numbers: C45, Z32; DOI: http://dx.doi.org/10.12955/cbup.v5.928

Keywords: Prediction models, financial health, neural networks, management, tourism.

Introduction

Tourism development has great importance and plays a significant role in the development of national economies (Šenková and Šambronská, 2014; Council, 2016). Therefore, the efforts of each country are heading to assist in the development of this industry effectively. Management, economics and application of modern methods of economics and management have very important role in this development and thus equally important is managerial decision making. The ability to decide optimally is one of the most crucial parts of hotel manager’s everyday job (O’Halloran, 2015). There are several methods that can be used in the field of managerial decision making. Many methods are based on an assessment of the performance of these businesses using the methods of financial analysis, prediction models, Economic Value Added or the methodology of the business performance analysis based on financial (Horváthová and Mokrišová, 2014) and non-financial indicators - Balanced Scorecard (Ivanickova et al., 2016). All these methods provide information to the optimal decision making by managers and to better controlling of these organizations. From modern economics models that can play a major role in the future, the management decision-making methods based on classification and prediction using artificial neural networks (ANN) are the most promising.

Artificial neural networks are one of the modern trends in assessment of the financial and non-financial health of the business. They are particularly suitable when part of the decision-making processes depends on coincidence and/or deterministic dependency. They are therefore suitable for modeling and exploration of complex, single, often irreversible strategic management decisions (Hanne, 1997).

During analytical phase of research, we have conducted many experiments with popular conventional models like Tafler model (Taffler and Tisshaw, 1977), Altman Z Score (Altman, 2013), Springate model (Springate et al, 1983) and many more (Beerman, 1976; Ohlson, 1980; Zmijewski, 1984; Kralicek and Spal, 1993; Hajdu and Virág, 2001; Neumaier and Neumaierová, 2005). Almost no commonly used model is optimal for tourism and specifically for hotel management.

Principal problems of conventional models were identified, such as their static nature and reliance on the principles of market behavior, which assumes a certain rational behavior of the consumer. Many models focus only on the financial side of the business, which is optimal for production type company, but not so for customer and service based businesses. Therefore, the presented model had to overcome these disadvantages and at the same time, be a convenient and efficient tool for managers.

Design of model
Designing of model based on the artificial neural network requires multiple steps and decisions to be made. The most important are input and output neurons and their number. Based on chosen topology, there are different types of hidden layers of neurons, their number and interconnections. Using appropriate configuration of ANN, activation functions and learning algorithm, we can create a network capable of analyzing and classifying health of companies in the accommodation sector in tourism.

However, technology is not enough. Deep analysis of accommodation sector was an essential part of this research. Without a deep understanding of the sector, there is a big probability of incorrect results - GIGO (Garbage In, Garbage Out). Learning system learns only from data provided.

The research samples
For this research, the basic research set of businesses operating in hotel services in Slovakia was created. Businesses were selected based on SK NACE, specifically Section I - Accommodation and food services, Division 55 - Accommodation and Group 551 - Hotels and similar accommodation. Time vector was 2009 – 2015. According to the portal “Index podnikateľa”, (www.indexpodnikateľa.sk) there were 1,652 businesses under the category SK-NACE 55.1. Subjects in this group consisted of business entities that are registered in the Commercial Register of the Slovak Republic and have submitted financial statements to the commercial register. This research group was separated into two groups. First one, labeled as ZS1, contained only healthy companies. The second group, marked as ZS2, contained companies in liquidation or companies which undergo the healing process. ZS1 group consisted of 1,514 companies, ZS2 group consisted of 138 companies. By using simple random sampling, the final research samples were created (S1 from ZS1 and S2 from ZS2). To optimize and maintain the objectivity of the results, companies that own more than one property were eliminated due to the unavailability of financial statements separately for each accommodation company.

For necessary verification of the functionality of the model, in addition to mechanisms that are part of the ANN, six companies were selected: two healthy companies of the group S1, two companies in bankruptcy/liquidation from the group S2 and two artificially created enterprises – one healthy and one problematic. Both artificially designed companies had been set up as real as possible to represent their category. These companies were not included in the data files intended for training, validation and testing ANN. It was applied only for final verification and comparison. An overview of all companies and their designations are shown in Table 1.

Data sources and input variables
Hotel and tourism business can be characterized as a business in an unstable environment with some level of risk and uncertainty. Changes in the market are swift and quite frequent. The common problem is also the rationality of customer behavior and changing trends. Therefore, the replacement of staff in this process is difficult, despite the intensive development of advanced technologies and management practices. The proposed model is designed to be a helpful tool for the manager, not his replacement. It helps managers to focus on the core of the business. To fix issues with traditional models mentioned in the introduction and to create a practical and precise model, we had focused on financial but also non-financial data and selected most valuable for hotel analysis and benchmarking.
We gathered information from multiple sources separated into two main groups:
Non-financial data: Association of Hotels and Restaurants of the Slovak Republic, Association of Tourism of the SR, Hotrec, Booking.com, TripAdvisor, STB, UNWTO, WTTC, Eurostat, European Travel Commission, Eurobarometer and the hotel websites.
After analyzing of every type of information gathered, the input variables were selected. They were divided into three groups: Financial (standard and reliable indicators of financial analysis and prediction models), Non-financial (relevant information specifying property) and Organizational (information specifying company). Input variables, their category, type and defined ID for clarity of research are shown in Table 2.

Model mechanics
Model mechanics can be simplified to the following basic steps: input of variables, variables processing, application of artificial neural networks and display output data. The main function of the proposed model is to classify health of the hotel. For this purpose, the MLP (Multi-Layer Perceptron) feedforward artificial neural network using backward propagation of errors training method was chosen. ANN model contains 21 input neurons. Each input neuron represents one variable. The model includes one hidden layer, and the output layer contains one neuron.

The model output
The output of proposed ANN is a real number in the range of <0;1> for each company per year. This one number provides immediate information about the state of business health. The 1 represents a healthy enterprise, 0 accounts for the troubled company. The turning point is in the middle - the value of 0.5.

The main output of the model is Hotel Report which processes and shows multiple financial and non-financial data in textual and multiple visual formats. The most important part is the result of ANN, its interpretation and multiple recommendations for the manager. Diagram of the model is shown in Figure 1.
Results

During experimental phase, we have analyzed multiple types and configuration of the artificial neural network. The final testing configurations consisted of 9-18 hidden neurons, 10%-20% of data separated for testing and 3 different training algorithms (Levenberg-Marquardt, Bayesian Regularization a Scaled conjugate gradient).

Final configuration consisted of 12 hidden neurons, 70% of data for training, 15% for validation and 15% for testing. Training algorithm was Levenberg-Marquardt. The progress of learning is shown in Figure 2. Deviations and regressions are listed in Table 3.

We had selected six companies for separate testing and validation of network. To avoid overfitting, these companies were not included in data set for ANN. This verification of an ANN model brought satisfactory results. Comparison of expected results and actual results of ANN are shown in Table 4.

Neural network wrongly classified SK2 company as healthy, although it was twice in liquidation. However, a closer analysis of the company showed that the reasons for liquidation are questionable and it did not have to be caused by bad state or financial results of the hotel. Because, after liquidation, the property was taken over by another company with a very similar name and ownership structure.

Conclusion

In conclusion, we would like to point out the indicators that are relevant and applicable in models for classification and prediction of the state of the organization. There are many indicators that may be applicable in models evaluating the condition of the property. Controlling in tourism offers a whole group of quality indicators, but for their calculation, the non-public information is often needed. The most important variables characterizing the property are the class, category, price, customer satisfaction, service quality, promotion and portals like Trip advisor and Booking.com. These portals have brought one of the most significant changes in the approach to the client, so it is important to take them into account when analyzing the state of the property.

Despite highlighting the importance of the analysis of non-financial factors, we do not expect their direct impact on the financial health of the company. Their importance and significance are increasing in combination with financial indicators and other non-financial indicators. Each category and class of accommodation property have an existing target group of customers. Problems of inappropriate choice of category, class or other nonfinancial variable arise from their improper combinations (for example, 5* hotel in unattractive and economically less developed areas).

The research has shown that the model built upon the artificial neural network using a complex business analysis in the context of the internal and external factors is more accurate than conventional models. To confirm this hypothesis, we have chosen randomly selected companies that were previously labeled as healthy or unhealthy. These data were not included in the data set intended for the Artificial Neural Network training. Then, we have calculated the classification of companies using conventional methods as well as the proposed model. Results were statistically compared with real estate. For this purpose, the Pearson χ² test was used. Summary of the results is shown in Table 5. Assumptions and hypothesis were confirmed. All conventional models were significantly different from the real situation. In the case of the proposed model, the statistical discrepancy was not confirmed. This does not prove that conventional models are wrong or unusable. They are supposed to be used in sectors they were created for (mostly manufacturing companies). Despite this, many authors used them as universal models.

Source: Authors
We can conclude that not only in the future but already today, artificial neural networks can play a significant role in modern methods of management of accommodation properties in tourism.

MODERN MANAGEMENT AND MARKETING OF THE FASHION INDUSTRY USING THE BRAND EXAMPLE OF YVES SAINT LAURENT.

Anastazja Magdalena Kasztalska¹

Abstract: The Brand Yves Saint Laurent is a company that represents a modern approach to management in the fashion industry. This article aims to answer the question of whether modern methods of marketing and management to generate profits for the company in the form of greater customer interest and increased sales. Research methods used in the article is a survey made with the cooperation with the buyers of luxury brand Yves Saint Laurent. Unquestionably, there is a strong link between marketing luxury brands and its results in sales. Further research can be focused on a bigger scale of this huge phenomenon.

Yves Saint Laurent Brand

The YSL (also known as Saint Laurent Paris) is a luxury fashion house founded by Yves Saint Laurent and his partner Pierre Bergé. The name founder of the brand, Yves Saint Laurent, died in 2008, while the fashion house produced its last line of haute couture in 2002.

The brand was founded in 1961 and is considered one of the most recognizable in the world. It known for its modern and very trendy designs, such as based on tuxedo jacket for women. Currently, YSL offers a wide range of models of clothes, leather goods, footwear and jewelry, while having large market shares in the cosmetic industry, amongst others, from the sale of perfumes. The current brand logo was designed in 1963 by A.M. Cassandre (Mouron, 1986).

In the 60s and 70s the firm popularized fashion trends such as a rebellious look, dress in safari style, very tight trousers for both women and men, adjacent and high boots (knee) and most famously its project tuxedo for women - Le Smoking Suit in 1966 (Drake, 2006). Some of the most memorable collections include inspiration from the Russian ballet, Pop Art, Picasso and the Far East among the muses and inspirations of Saint Laurent were Loulou de la Falaise (the daughter of a French marquis), Betty Catroux (English-Irish model), Talitha Pol Getty (the daughter of an American diplomat) and Catherine Deneuve - famous French actress. Brand ambassador in the 70s and early 80s was London millionaire Diane Vandelli (Née Princess Romanovsky), making the brand became increasingly popular among the European elite (Borrelli-Persson, 2017). The company YSL continues to grow with the introduction of a line of fragrances for men and women, that started a line in 1978. However, its share price began to fall after i. In 1993, Saint Laurent fashion house was sold to a pharmaceutical company Sanofi and Pierre Bergé appointed Hedi Slimane as an artistic director in 1997, who along with it resumed YSL Rive Gauche Homme. Hedi Slimane decided to leave the fashion house two years later and was the general manager of the sewing luxury men's suits - Ermenegildo Zegna (Porter, 2016).

In the 1999 Gucci bought the YSL brand and referred the proposal to Tom Ford who designed the casual collection, while Saint Laurent designed the haute couture collection. Saint Laurent did not hide his disapproval of Tom Ford during their collaboration, it is still criticized and publicly ridiculed. In 2002 Saint Laurent closed the production of haute couture fashion house YSL, due to his poor health, drug and alcohol addiction, severe depression and ever sharper criticism of his projects. The creator of the brand often said ‘‘Chanel liberated women, and I gave them the strength’’, he also claimed that he “created the contemporary woman's wardrobe” (Rawsthorn, 1996). Tom Ford left the fashion house in 2004, and was replaced by Stefano Pilati, whose designs were much more French than the emanating erotic visions of Ford. In 2009 after the death of Yves Saint Laurent and a few turbulent years of design by Stefano Pilati, some key boutiques of YSL were closed in San Francisco and New York. It was also announced that the design studio will have its headquarters in Los Angeles, California. In 2012 KERING Group announced that Hedi Slimane will replace Stefano Pilati as Creative Director. Slimane previously designed for Dior until 2007 (Cowles, 2012). Unfortunately, Hedi Slimane left YSL brand on 31st March 2016 his replacement is Anthony Vaccarello (Socha, 2016).

¹ Faculty of Management, University of Economics, Katowice, anastazja.kasztalska@gmail.com
Management and Marketing of the Yves Saint Laurent brand

The reinstatement of people who manage the company well and make the necessary innovation helped the brand very much. Hedi Slimane has worked previously for YSL, his return had raised a lot of controversy, especially after the announcement of the new collection and switch of brand names to “Saint Laurent” instead of the full Yves Saint Laurent or YSL. However, the name Yves Saint Laurent and the YSL initials still remain on accessories such as handbags and shoes, and cosmetics like perfumes (Winckel, 2013).

Figure 1: “Ain’t Laurent Without Yves” sweatshirt.

Source: Authors

The suspension of cooperation with a sales partner like Parisian boutique Colette, destroyed the image of the brand. Decisions by Hedi Slimane circulated worldwide and accounted for the largest newspaper headlines devoted to the fashion industry. These decisions became even more controversial when famous Parisian boutique Colette, started selling shirts with the inscription “Is not Laurent Without Yves”. The YSL company asked the store to stop selling the shirts, and when that did not work, on the October 2013 Colette received a letter accusing them of the sale of counterfeit goods, which however instead seriously damaged the reputation of the brand itself. Then Saint Laurent announced that it will not execute orders for the new Spring 2014 collection for the boutique Colette, despite the fact that the store has sold collections from YSL since 1998 (Sowray, 2013).

Figure 2: Saint Laurent store features a marble staircase encased by rods of nickel-plated brass.

The modern interior design shops improves the brand

Slimane designed the brand's flagship boutique in Paris which opened in 2013. The colors of deep red and gold, were replaced by a monochrome interior (mainly in shades of gray), created from various materials, including marble and nickel rods. This concept of interior design was also used in the boutique in Beverly Hills, the newly opened boutique in London and several new stores in the United States. Slimane officially plans to continue to develop a network of YSL boutiques in the United

225

**Choosing the right store locations**

Locations are the international points of sale and instill a strong brand in Europe as they are in key cities, such as Barcelona, Munich, Berlin, Warsaw, Kiev, Rome, Moscow and Cannes. Locations in the Middle East and in Africa are Casablanca, Abu Dhabi, Beirut and Jeddah. Asian YSL boutiques are Jakarta, Bangkok, Seoul, Macau and Hong Kong. The company strongly marked its presence in Japan by opening stores in Kyoto, Tokyo and Osaka, and many brand outlets located throughout the country. In China, individual boutiques are located in Wuhan, Shanghai and Beijing. Saint Laurent brand can also be found in many upscale stores worldwide (Official Yves Saint Laurent page, Retrieved: 27.02.2016).

**Methodology**

The survey is focused on selecting by interviewer, persons that represent interesting and tested qualities. The survey omits persons that do not have features which are being studied. An example is the study of the phenomenon of the luxury fashion industry, while respondents are the only owners of the items with label YSL or observers of the brand or the supporters of this company who have a certain opinion about this market. Individuals who for various reasons are not interested in luxury fashion industry, were excluded from the study because they do not have the relevant experience and a clear opinion about the exclusive fashion designers and luxury fashion brands (Lynn, 2014).

The survey was sent by email to people who are actively participating in the life of luxury fashion industry, as well as fans of the YSL brand. In the survey, 130 people participated. The survey was conducted in December 2016 and January 2017. Respondents had a very high degree of freedom of expression, because they could modify the questions and add their own observations and comments. Subjects were men and women, diverse in age, as the youngest tested person was 19 years old and the oldest 84. Age and gender had little significance as a major determinant. The main factor was the wealth of a person who can afford to be an owner of luxury clothes for example the items made by YSL brand.

<table>
<thead>
<tr>
<th>Table 1: Results of the survey and data analysis.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>What is the determinant impact of choosing YSL brand?</strong></td>
</tr>
<tr>
<td>Tradition and history of this brand.</td>

</tr>
</tbody>
</table>

Most respondents indicated the value and lifestyle represented by the brand YSL (25 %), this may be associated with the ideas that managers of the brand believe and many people can identify with. Another very large group is a group of people who decided to buy luxury clothes made by YSL because of the convenient localization and interior of the shops (23 %). Respondents indicated that a major determinant was when they travel and want to relax, they visit places that are suitable for their expectations of the interior of a shop. Another group almost as large as the previous two is a group of people who buy items made by YSL because of the prestige of this brand (22 %). It can be connected with the caring of the brand of its image, which is almost perfect. Some people were owners of the
luxury clothes made by YSL because they appreciate the tradition and the history of this company (17 %). It is affected by the long and very interesting history of this brand and also the tradition that started many years ago and is still alive and in practice. Few people decided that the most important factor for them was the unique design of clothes (7 %). It can be the result of the very classical style of the YSL, that has not changed a lot over the years. Customers buy products of this company not because of the influence of the fashion but for the company that is well known and very respected in the fashion industry. The smallest group were those who choose YSL because of its quality of products (6 %). These customers prefer the quality of the product rather than the history of the brand, that for them doesn’t have any significant influence during making the decision of a purchase.

Conclusion

With a doubt, marketing of luxury brands can significantly increase a company's revenue. Marketing of luxury brands significantly increases the demand for them. This is because for the customers the most important factor is the prestige of a luxury brand, which is created by the marketing of a company. Another factor is the value and lifestyle represented by the brand, which is also created by the appropriate marketing for a specific group of customers.

Managers through proper sales techniques can enhance the prestige of the brand, because for the respondents the most important features of the luxury brand are the features that company can create freely by the proper sales techniques. The need to express one's character by the purchase of luxury goods demonstrates the ability to customize brand products to the tastes and preferences of the target customers. Creating a person of the founder or the brand's chief designer significantly increases the prestige of the brand, because it makes the brand it in the eyes of customers more exclusive and luxurious. Managers can effectively create prestige luxury brands through the appropriate sales techniques based on emphasizing the nature of the purchaser by the company's products, the creation of the legend of the charismatic founder or designer and by controlling the image of the brand buyer in the eyes of themselves, and in the eyes of other people.

RISKS OF REGULATION IN NETWORK INDUSTRY – CASE OF THE SLOVAK REPUBLIC

Jozef Klučka¹

Abstract: Historically, the Slovak Republic infrastructure involved monopolies, with the State operating sectors of electricity, telecommunications, postal services, gas, and water supply through state enterprises. The electric energy sector has since become privatized in the Slovak Republic. Because of insufficient competition (oligopoly), a regulatory office formed with the role of price regulation. In this pricing area, the electricity supply sector suffered turmoil in the Slovak Republic. This paper addresses some practicalities of regulation and proposes measures to minimize risks relating to decisions of the regulating authority. The current issues reflect problems of price regulation of electricity in the Slovak Republic that have resulted in political disputes. This paper describes the regulatory framework of network industries in the Slovak Republic and general assumptions for transparent and efficient regulatory process. It includes an analysis of certain aspects of price regulation and the role and responsibilities of a chairman and other stakeholders in this process. Some measures are proposed to minimize the future risks of price regulation. These measures cover internal subjects and processes as well as the external environment involving stakeholders and their influence on negotiating prices.

JEL Classification Numbers: H25, K23; DOI: http://dx.doi.org/10.12955/cbup.v5.930

UDC Classification: 338.2

Keywords: regulation, electricity, price regulation

Introduction
Historically, sectors of infrastructure in the Slovak Republic were monopolies (electricity, telecommunications, postal services, gas, and water supply). The state was the operator of these areas through state enterprises. A trend of liberalization started the transformation of these corporations. Because of the imperfect market environment, however, these became subject to regulation. For this purpose, the Regulatory Office for Network Industries (URSO) was established to regulate prices. In regulating prices, electricity supply suffered turmoil in the Slovak Republic, and this was accompanied with political turbulence. As a result, the chairman of the regulatory office resigned.

Liberalization is a trend promoted by European Union (EU). It originates from the assumption that markets and competitions increase the competitive position of a country and, thereafter, market prices will decline. With monopolies transforming into entities in a market economy, competition becomes active. Moreover, monopolies that transform from state enterprises to private corporations operating in a market find the market restrictive (because of various reasons). The limited competition (oligopoly) results in a regulatory office forming with an objective of monitoring privatized corporations and their market behavior.

Current problems reflect issues within the price regulation of electricity in the Slovak Republic and which have resulted in political disputes. Hence, the objective of this paper is to address some practicalities of regulation and propose measures that could minimize risks in decisions of the regulating authority.

Methods
To identify the core problems and propose measures, the study analyzed the competencies and processes within the office responsible for the regulation of network industries, the URSO. It also identified stakeholders, their objectives, and potential problems that stem from their contradictory objectives.

The problem of price regulation (expanded to include heating prices) was assessed using a systematic approach to analyzing the following processes:

- appointment of an office chairman,
- chairman communication with other stakeholders,
- professional and ethical status of a chairman,

---

¹ Faculty of Security Engineering, University of Žilina, jozef.klucka@fbi.uniza.sk
▪ chairman’s responsibility taking into account:
  ▪ transparency of proposed or approved decisions,
  ▪ functions of regulatory council and fulfillment of control within the regulatory office.
▪ the requirement for explicit risk formulation related to the specific proposal of measures to minimize identified risks or the written expression to identified risks and their impacts on society and the customer segment.

Regulatory Framework – Case of the Slovak Republic
The theoretical background of regulation is straightforward: where there is no fully competitive market, there exists either an oligopoly or a monopoly. This market structure creates potential imbalances and economic and social disturbances. Therefore, regulation becomes necessary. The fundamental role of regulation (and an established regulatory body) is to build a regulatory framework. There are three theories (Shleifer, 2005) that explain economic regulation: public interest theory, contracting theory, and capture theory. Shleifer (2005, p. 446) identifies the key problem as being, “risk of public abuse of market participants by an official who is either pursuing his own political interests or is captured by a particular group, including the regulated industry itself.”

Tirole (2014) declares two problems of regulation:
▪ many markets are dominated by a few firms that together influence the process in volume and quality, and
▪ a regulatory authority’s lack of information about firm’s costs and the quality of goods and services it delivers.

The main objectives of regulation can be summarized as follows:
▪ to keep a balance between customers’ and investors’ interests,
▪ to safeguard return on investment into regulated enterprises,
▪ to add stimuli for the proper functioning of regulated enterprises, and
▪ support and format a fully competitive market environment.

The profound requirements of the effective regulatory body can be formulated as:
▪ independence – its solutions are based on a professional evaluation of data and based on communications with stakeholders when decisions are approved; independence is linked to nonpolitical activities in decision processes;
▪ professionalism/expertise – decisions are strictly based on documented data and empirical evidence; the framework is limited to the bill (Nr. 250/2012 Coll.);
▪ openness – activities of the regulatory body, where decisions are published and monitored by public control; and
▪ control/evaluation – decisions of the URSO can be verified by a court, and a regulating entity has the possibility to appeal against decisions.

Case of the Slovak Republic -- Price Decision on Electricity
In January 2017, the URSO approved a price decision (price of electricity) that changed the tariffs for various categories of customers. Incorporating the growth of fixed charges into the electricity price was the reason given for a dramatic increase. The price decision was sent to distributed companies that started to print and distribute invoices with new price declarations. For many households, communities, and enterprises, the new price policy increased electricity prices by 300% (Zákazníkom, 2017; Fico, 2017).

The regulator’s decision had these consequences:
▪ incorporating the Prime Minister into the agenda for charges relating to electricity (price decision of regulator);
▪ resigning of the chairman of the regulatory office following a request from representatives of the political coalition for him to resign; the government would propose to the President a new candidate for the position of chairman of the URSO;
▪ declaring the price decision to be invalid, and declaring a new one; the sum of advanced payments will depend on a new price decision.

The economic problem had grown into a political one. People challenged the 300% increase in charges, since unofficially the price for electricity was meant to have decreased by 10%.

229
A bill (Nr.250/2012 Coll.) controls the regulation of network industries in the Slovak Republic. As a member of the EU, the Slovak Republic also incorporates norms in regulating network industries within EU.

The scope of regulated activities covers several areas:

- generation, transmission, distribution, and supply of electricity;
- the performance of the short-term electricity market administrator’s activities;
- production, transport, storage, and supply of gas;
- production, distribution, and supply of heat;
- production, distribution, and supply of potable water;
- diversion and purification of the sewage system; and
- abstraction of surface water and energy water from water flows.

Transparency and non-discriminatory approaches of the regulatory body, URSO, are based on the law. Strategy and day-to-day activities are governed by a chairman and regulatory council. Regulatory Council approves strategic management of the office and concept of regulation in network industries. The head of the council is the chairman of the office. Employees are excluded from the membership in the council. Chairman of the office is appointed and recalled by the president - upon the proposal of the Government of the Slovak Republic (§5, sec.1 of the Act). The President recalls the chairman after fulfillment of conditions explicitly given in the Act (§5, sec.11 of the Act). Conditions for recall correspond to fundamental requirements of the objective and expert and independent activity of the chairman who governs the office and is representative of the regulatory office in the business and the nonbusiness environment.

The office also deals with operational activities. The strategic document determines the framework of regulation. The council approves the strategic policy that contains the performance of price regulation for a future period. The office is obligated by law to publish information related to its decisions on their website. This requirement guarantees openness and transparency of decisions and activities of the office.

**Problem of Price Regulation**

The price proceeding for the regulated activities (covering a broad spectrum including electricity distribution for citizens, communities, and enterprise subjects) commences upon the initiative of the office (§14, sec.2 of the Act). Price regulation of the office activities imply the following requirements:

- professional competency and independence of the office;
- system approach to price decision for individual customers’ segments;
- the openness of the office to professionals and the general public; and
- risk identification arising from the regulatory policy.

In all the above-mentioned, potential motives exist for a similar status to that of the past that lead to approval of a price decision with remarkable social-political problems. For this reason, future measures are recommended to minimize the risks of repeating such a price decision in the process.

**Appointment of an Office Chairman**

The current system is based on political nomination. The proposal is submitted by the government; each government is aware of the seriousness and complexity of the regulatory body decisions, and therefore, a nominee is appointed from political parties that create a governmental coalition. It would be useful for the appointment of such a chairman to be based on negotiations with political coalitions and professional organizations. In practice, the weight of high ranking professional authority has the same value as personal integrity. The fundamental condition of application is the willingness of political parties to cooperate and communicate with professionals and the general public.

**A Comprehensive System of Communication Between a Chairman and Stakeholders**

This process is officially fulfilled with all decisions (ex-post) published on the website of the office. The decision, however, requires communication during preparation and submission of a price. Each decision should follow the regulation strategy, and therefore regulatory council should be aware of such; Council in the case of identifying a discrepancy between strategy and price decision has the competency to disagree (to submit objection) towards price decision. Moreover, similar to a
consultation exercise, the price decision should be disseminated to representatives of customers, academics, and professionals to evaluate the proposal. The consultation exercise has to be formulated as an obligatory for specified organizations, whom the price decision (proposal) will be delivered. These institutions will be the regulatory council, departments of the regulatory office, customer’s, and non-profit, academic, and professional institutions.

Professional and Ethical Status of a Chairman

The scope and heterogeneity of problems place a high demand on the expertise of the chairman. It is essential to create experienced and professional staffing within the office. The prescribed standards of conduct for the chairman, high-level management, and the regulatory council need to be written as an internal norm of URSO. It is also proposed that a change in status occurs where the URSO chairman is also the chairman of the council so that the council is entirely independent of the URSO (i.e., with no personal relationships with representatives).

Chairman’s Responsibility

This component pertains to the transparency of proposed decisions and functions of the regulatory council and providing a control function in processes of the regulatory authority. Regarding price decisions, the chairman communicates with departments within the office (internal communications) as well as stakeholders (external communications). Therefore, the chairman may propose, at ad hoc, the structure or platform that fulfills the dissemination of information to prepare a price decision and the risks related to such. An application of control function stresses the need for openness towards stakeholders and an obligation to evaluate the price decision before approving the regulatory policy. Where any discrepancies are found, the proposal is to be modified and communicated in the next cycle.

Conclusion

The case in the Slovak Republic for a regulatory framework dealing with the price of electricity indicates the importance and complexity of regulation. This paper addressed key fundamental preconditions for effective regulation. Based on this case, proposed activities include modifications to the current framework to minimize potential future turmoil for society. The complexity of the subject also indicates the need for transparency, independence, and a professional regulatory institution headed by a chairman.

INFLATION SPIRALS AND SELF-REPLICATION OF INFLATION

Tatyana Kotcofana,1 Alexander Protasov,2 Polina Stazhikova St.3

Abstract: Inflation is a complex socio-economic phenomenon, whose formal sign is the depreciation of money. Most often it is expressed in the form of rising prices, although it also has other manifestations. The economic substance of this phenomenon lies in the area of public reproduction and the socio-economic relations about the distribution of public product and public wealth. In this article, the self-replicating nature of inflation is shown and genesis and evolution of inflationary process at all stages of public reproduction are analyzed. It is shown that each of the stages has the mechanisms capable of generating inflationary potential. The category of “inflationary spiral” is explained in more detail, because it cannot be presented only by a traditional “costs – prices” mechanism. Inflationary spirals can be observed at any stage of the reproduction process, making the task of managing inflation even more difficult. It causes the need for the complex accounting of all the variety of factors of the inflationary process and the inflation consequences in the formulation of an economic policy.

Keywords: inflation; reproduction process; price; cost; inflationary spirals; economic policy.

Introduction

Economic development of virtually every country takes place against the background of inflation with various causes that manifest differently, depending on the circumstances of time and place. Inflation is complex and heterogeneous in its causes, mechanisms and consequences. It is a socio-economic phenomenon. It creates difficulties for the study of the apparent surface-level characteristics of the inflation process as well as its inner structure and qualitative characteristics. The interpretation of inflation as a multifactorial phenomenon focuses on a comprehensive study in order to identify the roles of all the factors that are constantly changing interactions with each other and creating different inflation “pulses” and “pushes.” This approach prevents hypertrophy in evaluating some aspects and underestimation or total disregard of others. The methodology is based on the idea that there are no disconnected processes of inflation of prices governed by different unconnected determinants. Price increase may be caused by factors of money circulation or factors of the goods supply side. In the course of this single process parameters are tightly intertwined and one or the other parameter can become a priority in any given moment.

In our view, analysis of the genesis of the inflation process in a modern economy begins with accepting the depreciation of money and the associated rise in prices as only formal signs of inflation, while its economic content lies in the deeper areas related to the reproduction process and social relations over the product produced. Inflation can be interpreted as a monetary manifestation of imbalances already existed and/or deliberately supported within the national economy and which leads to an excess in the money supply. Purely monetary factors of inflation only frame or strengthen existing imbalances, but in any case, they are not the main cause of inflation. The approach is commonly referred to as reproductive, since it allows you to look at any economic phenomenon and its causes through the prism of all stages of the reproductive process, while stages are analyzed in their relationship and interaction. This approach is suitable for analysis of the inflation process with its interconnectedness and interdependence thus revealing their deepest nature and patterns of development. Economic policies based on this extended analysis of the causes of inflation and its impact on the economy is potentially more effective (Kotcofana, 2007).

Methodology: reproduction approach

The reproductive approach to the analysis of inflation is based on the fact that all stages of the reproductive process are interrelated, and each of them contains a certain inflation potential. It is important to bear in mind the following points:

1. Inflation is so complex it is not rare for causes and effects to switch places. Sometimes the same phenomenon acts simultaneously as the cause of inflation and its consequence. This

1 St. Petersburg State University, t.kotsofana@spbu.ru
2 St. Petersburg State University, a.protasov@spbu.ru
3 St. Petersburg State University, p.stazhikova@spbu.ru
characteristic of the process is reflected in the term “inflationary spiral” that is often used by economists (Tsatsulin et al., 2016). Examples of inflationary spirals are shown below. They are not limited to the traditional scheme of “wages-prices” (Xiang Baolin, & Xiao Xiaoyong, 2009; Pressman & Holt, 2008) or the broader one “costs-prices.”

2. Although the use of the reproductive approach does not reject quantitative methods of analysis, the emphasis is on identifying qualitative relationships and patterns of economic development. Quantitative, functional relations play a subordinate role. Under the reproductive approach mathematical calculations and illustrations are applied primarily to provide greater reasoning and clarity of logical conclusions.

Production stage
The analysis of inflationary processes at the production stage is related to factors affecting the value of the commodity (so called primary price-forming factors). Such factors include a real rise in cost of production due to increased prices on raw materials, equipment and tools, decrease in labour productivity and decreased efficiency of resource use, as well as degradation of technology. The effects of the inflationary spiral can be most clearly demonstrated in the sphere of production. Inflation leads to the rise in costs of production factors; it leads to increased costs of final products; it then leads to the next circle of inflation and increased costs of production factors. Thus, the crucial condition of expanded reproduction is the availability of credit, real interest rates for the non-financial sector and the volume of loans for the non-financial sector (Domashchenko, 2016). During inflation, the dynamics of bank interest is divorced from the dynamics of the profitability of the real sector; it leads to sharp fluctuations in interest rates and the levels of profitability. Random combinations of such fluctuations can completely eliminate or substantially reduce the profitability of production, but it may also increase profitability, regardless of technical and economic and organizational shifts in production. In order for the creditor to preserve money and get the interest, the nominal interest rate should exceed the rate of price growth. Usually it is calculated according to the formula: 

\[ R = r + \pi + r\pi, \]

where \( R \) is nominal interest rate, \( r \) – real interest rate, and \( \pi \) – inflation rate. The result of nominal interest rate growth is an artificial but real money shortage in the economy. It is harmful for production processes and hence production shrinks. During high tempo of inflation, the opposite phenomenon occurs: real interest rate plummets to negative levels:

\[ r = \frac{R - \pi}{1 + \pi} < 0, \text{если } \pi > R \]

It seems negative interest rate should contribute to the recovery of production, but in fact this does not happen, since such rate is not profitable for banks. Moreover, the credit period is reduced to one or two months due to increasing risks. It does not fit into the technological terms of turnover of funds at enterprises. It is important to consider that current money reserves under inflationary conditions are going down in value; it increases the demand for loans. There is a spiral: inflation leads to slowing down of business activity and a reduction in production, and this, in turn, is one of the factors of inflation.

Distribution stage
At the stage of distribution, our attention is focused primarily on secondary price-forming factors that deflect the price from value. This stage is of key importance for the analysis of inflation processes, because, in our opinion, the very nature of inflation is rooted in the social conflict over the distribution of the results of production between different social groups and the strata of society. More detailed can be found in Protasov (2011). Such conflicts are present in any society under any socio-economic system. However, the condition for its realization is unequal possibilities of various economic agents, social groups and countries in relation to the results of production due to prevailing economic and institutional structures. As soon as at least one actor gets enough of the economic power to make an attempt to redistribute wealth to one’s own advantage this conflict transforms from potential tendency into real actions generating inflationary impulses.

The distribution stage plays an important role in spreading inflationary impulses generated at the production stage and, consequently, in the further unwinding of inflationary spirals. For example, if we consider the process of price growth as a result of increase in production costs, then in accordance with the equation of the input–output model, this process has to be fading rather than self-replicating,
since the costs are only a part of any price and their growth should influence the chain of counter-parties of exchange less and less. The formula for a sequential change in the costs for inter-industry exchange, for example, due to monopolistic increase of prices in the 1st sector, will look as follows: \( P_i = \frac{P_i}{K_i} \times (K_i - 1) \), where \( i \) is the industry number (\( i = 1, ..., m \), and \( m \) is the number of the last of the entire set of industries under consideration). For example, raw materials are supplied from every \( i \)-th industry to \((i + 1)\)-th. \( K_i \) is the rate of price growth in the 1st industry; \( \alpha_{i,1} \) – the share of costs in the price of the \( i \)-th industry for the purchase of raw materials in the \( i \)-th industry; \( P_1 \) and \( P_i \) – the base price of goods in the 1st and current price in the \( i \)-th industries respectively. If we assume \( P_1 = 1 \), \( m = 10 \), \( \alpha_1 = \alpha_2 = ... = \alpha_{i,1} = 0.5 \), \( K_i = 2 \), then we have \( P_i = 1.002 \). That is, the final increase in price at the tenth stage of the exchange of goods for money was, in fact, zero. An example is taken from (Nusratullin, 2010)

Meanwhile, as has already been mentioned, spiral-like self-reproducing effects of price increases are observed in practice. These effects occur due to the fact that the value formation chains usually are not strictly linear. Both economic agents-initiators of price increases and a certain number of consumer subjects buy the same goods from the same suppliers in one link of the technological chain of inter-industry exchange. The example of economic agents-initiators of price increases is the monopolist, which raised the price of electricity supplied. However, they lose part of their “normal” value added, and in order to compensate losses they overestimate their own prices or request state subsidies and preferential loans, or get stuck in non-payments. Any of these actions, parallel to the actions of the initiating subject, gives rise to a new increase in their own prices, which again leads to the emergence and a new redistribution of costs growth for “parallel” consumers. It is launching the inflationary spiral.

**Exchange stage**

The exchange stage acts as a platform for the realization of the inflationary potential generated in the production and distribution of the social product. The exchange stage by itself can also generate and is generating a variety of inflationary impulses. The competition between manufacturers today is mainly based on the frequent changes in the range and quality of products, huge trade, and advertising costs. There is an increase in costs in general and distribution costs in particular. This is largely facilitated by the differentiation of the product in conditions of competitive adaptation of the producer to the needs of the consumer. The role of packaging, advertising, and marketing methods is growing, and it obviously entails increased costs. (Pashkus, 2016) If previously in economic theory costs were primarily associated with production and were interpreted as the “production costs” category in the past century it has transformed into the “production and marketing costs” category. The category of market transactions costs (or “marketing costs”) is one of the rapidly increasing components of production and marketing costs. According to American economists, the growth of these costs was the main reason for the rise in food prices. Already at the end of the twentieth century, they gave 90% of the total increase of final prices (Shershnev & Larionov, 1999), and we can assume that today this trend is not only preserved but is also becoming more prominent.

The development and strengthening of the market positions of intermediary structures plays an important role in the genesis of the inflationary process at the stage of exchange. Intensive distribution systems operate in a modern economy. Consumer properties of the goods include time, place, form and methods of delivery. Thus, the proportion of intermediary costs is increasing; it means that overall prices are rising.

The traditional price structure is as follows:

\[
PF = PC + M + B + ET + VAT + (CM + BM + VAT) + ... + (CM + BM + VAT) + CS + BS + VAT.
\]

Where PF is the final selling price (retail price of the product), PC – production costs, M – cost of marketing for the manufacturer, B – profit of the manufacturer, ET – excise tax, VAT is a value added tax paid by all participants in a supply chain, CM – costs of the intermediary (wholesale) organization, BM – profit of the intermediary organization, n is the number of intermediaries in the chain, CS – costs of the organization of retail trade, BS – profit of the retail organization.

Modern conditions drive up costs of the component M, as well as CM and BM, and VAT, paid by the intermediary link (in part due to increasing n). If the costs of the remaining components do not decrease, the price will increase. The inflationary spiral unwinds, because such a situation is observed
for the majority of products, including intermediates, the price of which is included in costs of other products.

It is important to understand that in itself the presence of inflation in the economy largely determines the propensity of economic entities to speculative and intermediary activities to the detriment of production, and this in turn leads to the further unwinding of the inflationary spiral.

Consumption stage

The role of the consumption stage in generating the inflation potential of the economy is more important than it may seem at first glance. First of all, let us trace the relationship between inflation and various forms of use of the produced social product. The following forms can be distinguished: personal consumption (C), industrial consumption (I), savings of the population and the accumulation of enterprises (S), exports (E), losses (L). It sums up as \[ GDP = C + I + S + E + L, \]

In the conditions of inflation, personal consumption becomes the main form of use of the created social product, since the productive use of it becomes much less profitable. The higher the inflation and the longer the production cycle are the fewer incentives entrepreneurs have for productive consumption. Devaluation of depreciation expenses leads to a reduction in opportunities to expand production and even maintain it at the same level. The nominal ratio of average propensities to save and to consume shifts in favor of consumption. If the nominal exchange rate remains at the same level, exports become less profitable, as domestic goods become more expensive relative to foreign-made goods. As a rule, losses increase during inflation. It can be caused both by objective reasons and by increased opportunities for dishonest statistical reports. As for Russia, the most important problem is the capital outflow from the country. According to Standard & Poor’s, capital outflow only in 2014 amounted to 152 billion dollars (Tuzova & Qayum, 2015). All of the above leads to a decrease in the productive capacity of the economy, and therefore, reduces the possibility of anti-inflation regulation.

It is also important to understand that consumption processes form the requirements for producers and the economy as a whole. If the country is characterized by a uniformly high rate of consumption, it will also stimulate production. By encouraging the development of effective demand, we stimulate industrial production, which means increase in employment, as well as in capacity utilization rate, etc., and the system begins to operate at full capacity. However, uneven consumption by different social groups can generate and is generating an inflationary potential. In Russia about 90% of the population uses only half of the consumer goods. The other half is consumed by a group with high income, it is accounting for only about 10% of the population. The basis of consumption is satisfaction of primary short-term needs; it allows drawing a conclusion about poor savings. The savings of high income group go mainly to the foreign market and do not exert demand pressure on the domestic market. Such a non-optimal structure of consumption reduces the production potential of the economy and increases inflationary pressures. In addition, an essential part of consumption is imported. This is a direct deduction from the income of domestic producers, as well as savings in cash, typical of the Russian population. Thus, producers do not receive the planned profit on produced products and as the result lack means of payment. This leads to a rise in the cost of credit, its inaccessibility and a reduction in the working capital of producers. It may result in the reduction of production and an increase of production costs.

So, at the stage of consumption, inflation manifests itself in sub-optimal proportions of forms of consumption, which, in turn, can contribute to the strengthening of the inflationary process, reducing the production potential of the economy.

Conclusion

Thus, the specificity of modern inflation lies in the fact that it is built into the reproduction process and cannot be considered outside the economic system as a whole. Therefore, a separate analysis of inflation, income generation and production is fundamentally insubstantial. All these three processes are not independent; they are only elements of a single reproduction mechanism. A thorough study of the real causes of inflation is necessary to improve the effectiveness of state policy, not only in preventing and containing the already inflated prices, but also in other aspects of economic policy. (Kirillovskaya, 2016) This requires a systematic approach to the analysis of inflation processes, taking into account that inflation in its inception and development covers all stages of the reproductive process. On the one hand, it exerts a certain influence on each of them, on the other hand it itself is
subjected to the reverse action from each stage of the reproductive process. Such an approach allows for the revealing of a variety of the factors generating inflation and influencing the character of its course. Many conflicting theories and concepts of inflation are brought into conformity. Within the framework of the approach, the most adequate mechanisms of anti-inflationary policy can be worked out, taking into account not only economic, but also social, and many other determinants.

PRACTICE OF PARALLEL IMPORTING: PROTECTION OF INTERNATIONAL COMPANIES' TRADEMARKS RIGHTS IN RUSSIAN FOREIGN TRADE

Victor Kovalev, 1 Oksana Falchenko, 2 Veronika Vyazovskaya, 3 Alexander Semin 4

Abstract: The paper is devoted to the problem of the exhaustion of international companies' trademarks and other intellectual property objects rights in the foreign trade practices of Russia and other countries of the Eurasian Economic Union (EEU). The paper focuses on the problems of trade integration through the intellectual property market, since any free movement of goods should always be correlated with respect for the interests of the trademark rights owners. The aim of this paper is to explore the process of parallel importing in the aspect of international companies trademarks intellectual property rights in the Russian Federation and EEU countries and the opportunities and challenges it provides for both manufacturers and importers. The problem of importing products labeled with trademarks through parallel import channels to Russia is being considered using the schemes for the importation of counterfeit goods into Russia through countries of the Eurasian Economic Union (EEU). The analysis shows that there are the problems with the application of the mechanisms of trademarks customs protection in practice. The main problem is the lack of unified legislation for intellectual property protection in EEU members.

Keywords: parallel imports, intellectual property, trademark, international company

Introduction

With the creation of the Customs Union, the Common Economic Space, and then the Eurasian Economic Union (EEU), the issues of intellectual property protection in the member countries are becoming more urgent, as the development of integration processes intensifies the consolidated movement of goods between business entities located on the territory of the EEU member states. Any free movement of goods must always be correlated with observance of the interests of the trademark rights owners. This problem did not bypass the trade of the EEU countries, in the first place this problem affected the interests of international producers in the food, automotive and pharmaceutical industries. The purpose of this paper is to explore the process of parallel importing in the aspect of international companies trademarks intellectual property rights in the Russian Federation and EEU countries and the opportunities and challenges it provides for both manufacturers and importers.

Parallel importing: literature review

This section offers a short summary of the literature on parallel imports. Parallel importing (or gray marketing) has been a widespread international practice, and one of concern to international manufacturers, distributors and retailers since the mid 1980s up to the present time (e.g. Baldo, 1985; Barlass, 1988; Mitchell, 1998). When gray marketing occurs across markets, such as in an international setting, the term used most commonly is ‘parallel importing’. According to Duhan and Sheffet (1998), "gray" may imply an “almost black market.” These points of view are very important for us because they can help to present in this article some possible schemes for the importation of counterfeit goods into Russia through the countries of the Eurasian Economic Union (creation of a new "gray" or an "almost black market" in EEU).

According to Maskus (2001), parallel importing means that the trade situation which involve genuine products that are produced under patent, copyright or a trademark protection, which are imported into another market (the destination market), without appropriate authorization of the intellectual property owner in the destination market. Parallel trade refers to the resale of goods between countries without the authorization of the intellectual property rights owner associated with those goods (Kyle, 2009). Parallel importing involves the selling of trademarked goods through channels of distribution that are not authorized by the trademark holders (Duhan & Sheffet, 1988). Mathur (1995) estimated the size of international parallel markets - from $US7 billion to $US10 billion. Parallel imports affect a wide range of industries, spreading from traditional luxury and brand name consumer products to industrial ones.

1 Ural State University of Economics, kovalev@usue.ru
2 Ural State University of Economics, falchenko@usue.ru
3 Ural State University of Economics, veronika.vyazovskaya@gmail.com
4 Global Economy Institute, Ural State Mountain University, aleks_ural_55@mail.ru
In the academic literature, we can find different points of view on parallel importing. The literature debates centre on whether parallel importing is a legitimate response to discriminatory pricing strategies or a market failure that occurs when business entities take advantage of being able to use a common resource, or collective good, without paying for it (see, e.g. Malueg & Schwartz, 1994; Kitchen et al., 2003).

In this paper, it is very important to use the opinions of foreign researchers about parallel importing issues. In Russia and the EEU this problem is quite new and the justification of our conclusions in this article will be quite weak without reference to the above authors.

Parallel trade deals with topics in three related fields: intellectual property law, international trade, and competition law (Kyle, 2009). The economics of parallel import can be viewed from the pricing and legislative perspectives. The first driving force for parallel imports is legislation. According to World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS Agreement) there are three forms of exhaustion of intellectual property rights (see also, Abbot, 2007; Semin et al., 2016):

1. national exhaustion principle (refers to exhaustion of the intellectual property owner’s rights on the first authorized sale in the specified national territory, while the patent owner may continue to enforce his rights in the region other than the defined national territory based on the legislation adopted by the other region);
2. regional exhaustion principle (refers to exhaustion of the intellectual property owner’s rights in a specific region, for instance the Eurasian Economic Union, etc., and its member states, while the intellectual property owner continues the right to distribution of the product anywhere outside the region);
3. international exhaustion principle (refers to exhaustion of the intellectual property owner’s rights to the product across all the geographies, irrespective of the territory of the first authorized sale).

According to WTO’s documents (see, e.g. The Doha Conference 2001 (WT/MIN(01)/DECW/2, 2001), paragraph 5(d)), the WTO members are free to choose the exhaustion regime without challenge, provided the clauses of MFN and National Treatment are complied with. The ability of the intellectual property owner to restrict such movement depends on the exhaustion regime followed by the destination country. Thus, in an increasingly integrated world, the annual growth rate of parallel imports has been estimated to be 22%, and this is expected to rise as new trade agreements, like GATT, TRIPS, etc., further lower trade barriers across nations (Skoko, 2014).

The second driving force for parallel imports is the price discrimination of the same product across different geographies when a firm sets a different price for the same product for different groups of customers based on the region, demographics, or any such segmentation, as defined in elementary economics (Hirschey, 2009). Skoko (2014) writes, that there are two reasons why parallel imports occur in international markets. Firstly, the parallel import exists because foreign manufacturers practice price discrimination among countries and gray market sellers arbitrage these price differences. Secondly, parallel importers are more efficient than authorized sellers because parallel imports compete with the goods of authorized sellers, in turn leading to lower prices that are beneficial to consumers.

**Parallel importing in the Eurasian Economic Union: contradictions and Russian experience**

In the EEU countries, there are different principles of exhaustion of exclusive rights to trademarks and other objects of intellectual property. So, in Russia, Belarus and Kyrgyzstan, there is a territorial (national) principle of exhaustion of rights to intellectual property objects, which means that the right to import original goods from other countries into the country belongs to either the right holder or his official distributor. It is very important, that there is an international principle of the exhaustion of rights in Kazakhstan and Armenia, which assumes that the exclusive right of the right holder is deemed to be exhausted with respect to a particular commodity at the time of its first introduction into commercial circulation in any EEU country. Thus, the commercial movement of goods between EEU countries is almost not limited.

There is a regional principle between the EEU countries – freedom movement between states, which does not violate the exclusive right to a trademark to use this trademark in respect of goods that have been lawfully introduced into civil circulation in the territory of the EEU directly by the right holder or other persons with his consent. In accordance with the Customs Code of the EEU, those intellectual
property objects that are entered by the right holder in the single EEU customs register of intellectual property objects (ETROIS) or the national (Russian, Kazakh, Belarusian, Armenian, Kyrgyz) customs registers of intellectual property objects (TROIS) are subject to protection. It should be emphasized that to date, the main problem has not been resolved - the harmonization of national legislations with regard to the protection of intellectual property. This illustrates the fact that currently there are no registered intellectual property objects in the ETROIS.

In parallel with the ETROIS, the customs authorities of the EEU member countries maintain national customs registers of intellectual property (TROIS). However, the filling of these registers varies: as of March-April 2016, there were 3864 objects (trademarks) registered in Russia, in Kazakhstan - 605, in Belarus - 293, in Armenia - 174, in Kirghizia - 148. For example, through the use of Russian TROIS, its interests are protected as foreign producers of food and beverages: Unilever NV (trademarks RAMA, BERTOLLI, etc.), Nestle Food LLC (trademarks MAGGI, NESQUIK, etc.), the company Ferrero SpA.” ("Ferrero SpA") (trademarks KINDER BUENO, Kinder Chocolate, Ferrero, Nutella, etc.), Kraft Foods Deutschland Holding GmbH (trademarks "Jacobs" et al ), Jack Daniel's Properties, Inc. (JACK DANIEL'S trademark), and others. At the same time, there is a problem that undermines the effectiveness of the national TROIS, consisting in the fact that, due to the difference in their filling, there is the possibility of unimpeded importation of goods containing intellectual property to the territory of one of the states in which they are not protected by rights holders, and taking into account the absence of internal customs borders for their further distribution in the territory of other EEU countries. We will consider the possible schemes for the import of counterfeit goods into the territory of Russia, which will be legal from the point of view of the legislation of the EEU (Table 1).

<table>
<thead>
<tr>
<th>The essence of the scheme</th>
<th>Schema content</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Scheme of import of &quot;gray&quot; goods to Russia, realized in connection with the difference in the principles of exhaustion of rights in the countries of the Eurasian Economic Union</td>
<td>There is the National (territorial) principle of exhaustion of rights in Russia, Belarus and Kyrgyzstan, while in Kazakhstan and Armenia it is international. According to this scheme, it is possible to import goods to Russia through the customs border of Kazakhstan or Armenia, where the exclusive right of the right holder is deemed to be exhausted after the introduction of a specific commodity into circulation in any country, and due to unimpeded movement within the EEU, the goods can be delivered to Russia. For Russia, these goods have the status of counterfeit (if they are not supplied by official distributors), but according to the legislation of the EEU, these are legal goods.</td>
</tr>
<tr>
<td>2) Scheme of the importation of illegal goods into Russia due to differences in the lists of controlled objects of intellectual property (TROIS) throughout the customs border</td>
<td>The scheme enables the import of counterfeit goods through the territory of the country where the objects of intellectual property are not subject to customs protection (the difference in the filling national TROIS): A) Import of goods into Russia through the territory of the Republic of Belarus or Kyrgyzstan (provided that the intellectual property object is not included in the TROIS of Belarus /Kyrgyzstan). In Belarus and Kyrgyzstan, the ex officio principle does not apply, customs authorities do not check goods not included in the TROIS; B) Import of goods into Russia through the territory of Kazakhstan, but one should take into account the possibility of applying the ex officio principle in force there, which allows customs authorities to detain counterfeit goods, even if they were not included in the national TROIS.</td>
</tr>
</tbody>
</table>

Most of the goods imported to Russia contain objects of intellectual property. This fact especially refers to the well-known international companies' goods imported to Russia and other EEU members from different countries. Analysing the Russian Federation customs bodies activity, we can see the number of intellectual property objects in the customs register (TROIS) increased by 24.4% in 2015 compared to 2013, from 3053 units up to 3860 units (Table 2). 304 units of intellectual property were included into the customs register in 2015. For the period 2013-2015 customs authorities prevented the damage of 10.3 billion rubles that could have been caused to the property right holders. In 2015 customs authorities identified 18.1 million units of counterfeit goods, and their share almost doubled in comparison with 2014, which may be partly due to the
problem of foreign trade sanctions. In 2015 customs authorities instituted 1121 proceedings in cases concerning administrative offenses. 96-97% of these proceedings - the article "illegal use of a trademark."

The analysis of judicial practice shows that the actors of parallel imports in certain cases are brought to:

1. administrative liability (for illegal use of a trademark). For example, the Arbitration Court of Sverdlovsk Region in its Judgment of 10 June 2014, upheld by the order of the Seventeenth Arbitration Appeal Court of 15 August 2014, brought the closed joint-stock company "Imcom" to administrative liability under article 14.10, part 1 of the Russian Administrative Code and sentenced it to administrative fine of 30,000 rubles and confiscation of the items containing illegal reproduction of a trademark "Barbie", seized with the protocol of seizure of 16 January 2014 in the Customs of Yekaterinburg;

2. civil liability (compensation to official distributors on the territory of Russia). The table below shows examples of compensation payments to official distributors on the territory of Russia (Table 3).

3. criminal liability (for the illegal use of a trademark repeatedly or by causing large-scale damage). For example, in the case of the illegal use of a trademark «Creative,» the guilty person was brought to criminal liability for entering into civil circulation of the original goods (Definition of a Sverdlovsk Regional Court of 25 November 2009 in the case №22-110966).
To date, the issues relating to the administrative liability and compensation to the trademarks rights holders in arbitration courts are most relevant. The analysis of Russian judicial practice permits to single out two approaches to parallel importing: when parallel imports are an independent illegal way of using a trademark and when parallel imports do not violate the exclusive rights of the right holder. In the first case, when parallel import is an independent illegal way of using a trademark, the import of both counterfeit original goods to Russia with the independent use of a trademark without the consent of the right holder is an illegal way of using a trademark, that is a violation of exclusive rights to the trademark. Thus, the Arbitration Court of Moscow in its Judgment of 02 June 2011 in the case № A40-12515/11, recognized illegal the Ltd. “ElitVoda Ru” import of goods (mineral water) labelled «PELLEGRINO» to the territory of Russia; ordered to seize and eliminate the goods labelled «PELLEGRINO.» In the second case, when parallel imports do not violate the exclusive rights of the right holder, the main purpose of a trademark is to provide a potential consumer the opportunity to distinguish goods produced by one person from similar goods produced by other persons. It is a customer loyalty issue and when some similar design of trade mark cannot mislead consumers to choose these similar goods but not the right holder’s goods, hence, there is no place for applying the trademark rights protection. This approach was used in a case with the claim of the company KAIABA KOGYO KABUSHIKI KAISHA to Ltd. «Avtologistiika» (Definition of the Ninth Russian Arbitration Court of Appeal of 28 September 2009 in the case № A40-2250/09-51-27).

Conclusion

In conclusion, it should be noted that the problem of protecting intellectual property rights for producers’ trademarks is quite acute in Russia, despite significant steps to improve the legislative base of the Russian Federation and the EEU. The problem of delimitation of the counterfeit original products importation is especially urgent. Specialists on the protection of the trademark from parallel imports distinguish three main ways of such protection: the information introduction in the customs registers of intellectual property objects in order to suspend the release of goods; appealing to the court, including with the claim of recognizing the parallel importer actions as unfair competition; and attracting a parallel importer to criminal liability.

THE IMPACT OF FISCAL DECENTRALIZATION ON PUBLIC ADMINISTRATION

Jozef Kubás,¹ Zuzana Štofková,² Ján Mišík³

Abstract: The allocating revenue to the individual budgets of self-governments in the Slovak Republic is a highly sophisticated process. Redistribution of resources using fiscal decentralization is an effective instrument through which the government attempts to eliminate subsidizing of municipalities and self-governing regions from the state budget and thus achieve higher stability of the economy. The function of municipalities and higher territorial units is secured by so-called special purpose tax revenues, which do not go into the state budget but directly into the budgets of self-governments. This research contribution focuses on the revenue side of budgets of public administration institutions for the period of the last five concluding budget years. The analysis demonstrates the meaning and importance of tax revenues for the mentioned institutions as well as the expenditure side of the state budget. In this contribution, a comparative study identified the changes that occurred in the individual years of the presented range and subsequently, evaluated fiscal decentralization and its influence on the revenue side of budgets of municipalities.

JEL Classification Numbers: H21, H23; DOI: http://dx.doi.org/10.12955/cbup.v5.933

Keywords: Fiscal decentralization, tax, finance, budget.

Introduction

The state budget provides the funding for public administration in the Slovak Republic, through which the primary functions of the state are financed for the relevant year. The National Council approves the budget through the Act on the State Budget on the Amount of Incomes and Expenditures. In the case of an imbalance between revenue and expenses, it also approves the amount of the deficit. The budget is compiled annually for three budget years, which correspond to calendar years, the first year of which is binding. The budget may also be amended during the year. It takes into consideration incomes that are domestic as well as income resources from the European Union (EU). Benjamin Franklin noted the importance and sovereignty of taxes in his historical sentence: “There are only two certainties in the world taxes and death”. It is taxes that are the pillars of revenues, and taxpayers request a functional socio-economic system and the provision of basic needs. A variety of systems and instruments of redistribution of public budgets have been tackled through fiscal decentralization. Fiscal decentralization means independence for authorities of regional administration when deciding on the use of their own revenues, responsibility for the use of public resources, justice when deciding on where to direct public resources and transparency when separating funds according to objective statistical indicators. In this approach, municipalities and self-governing regions can better fulfill their designated tasks and functions as well as meet the requirements of citizens. This research contribution focuses on revenues originating from the Slovak Republic, which comprise the predominant portion of income and a significant portion of tax revenues in the budget.

Methods

Used methods were analysis, synthesis, comparison, induction, deduction and logical thinking, the main source of information was drawn from the Public Administration Budget. This study focused on the allotment of revenue according to the economic classification in order to identify the importance of tax for revenue of the state budget and regional self-governments. This classification separated the individual revenues into main categories, subsequently, items and sub-items. The main revenues are categorized as follows:

- Tax revenues,
- Non-tax revenues, and
- Grants and transfers.

The Tax System in the Slovak Republic

The tax regime of the Slovak Republic involves two basic groups of tax revenues: direct and indirect. These taxes make up the major portion of revenue to the state budget. A direct tax is collected directly

¹ Faculty of Security Engineering, University of Žilina, Slovakia, Jozef.Kubas@fbi.uniza.sk
² Faculty of Operation and Economy of Transport and Communication, University of Žilina, Slovakia, Zuzana.Stofkova@fpedas.uniza.sk
³ Faculty of Security Engineering, University of Žilina, Slovakia, Jan.Misik@fbi.uniza.sk
from individual taxpayers and is not transferable to another (Bieliková, 2015). In the fiscal system of the Slovak Republic, income tax has a major position according to law (Act no.595/2003 Coll. on Income Taxes). Direct tax applies to the following:

- incomes of natural persons
- incomes of legal entities
- local taxes
- motor vehicle taxes

With indirect taxes, it is not possible to specifically determine the taxpayer to which the tax relates; such taxes apply to goods and services. The payers, in this case, are manufacturers (producers) while end-consumers are the ones who bear the cost. These taxes include value-added tax (VAT), which according to law (Act no.222/2004 Coll. on Value-Added Tax) is a universal indirect tax and is among the main sources of revenues for the state budget. This type of tax on consumption is characterized as a universal tax in that it all goods and services. The tax applies to all business subjects who have tax obligations (Štoňková, 2015). It is indirect in that the end-consumer bears the cost as it is part of the price of the goods or services received, but it is the producer or service provider who delivers the tax to the state budget. Since it is a consumption tax, all public and private spending, including that by a business operator is subject to the tax. Other indirect taxes include specific consumption taxes that are applied independently of VAT. A consumption tax, unlike other taxes, has a fixed amount per unit. Products covered by this tax are in accordance with those in other states of the EU (Kováčiková, 2015). This tax is placed on selected types of goods made domestically and also on imports, but goods brought in from the territory of a third state (outside the EU) in personal luggage, up to a certain value, are exempted. A consumption tax is added onto the sales price and so affects natural persons indirectly, upon the purchase of certain types of goods. As indicated in the Financial Report (2017), in the Slovak Republic, the following items are taxed in this way:

- Alcoholic beverages – spirits, wine, semi-products, and beer;
- Electricity, coal, and natural gas;
- Mineral oil, e.g., motor diesel, motor petrol, lubrication oil, heating oil, liquid petroleum gas (LPG), and others; and
- Tobacco products (cigarettes, cigars, cigarillos, and tobacco) and tobacco raw materials (tobacco leaf, tobacco residue, and tobacco papers).

While the classification of taxes into direct and indirect is important, it is also necessary to designate the territory for taxing and the organization that acts as the administrator of individual taxes. On the basis of this, tax revenues are allocated to the budget of the state, the budgets of higher territorial units (regional government), and the budgets of municipalities. Up until 2014, the tax on motor vehicles belonged to the revenue part of budgets of the higher territorial units. Since 2015, this tax has been revenue of the state budget. For the purpose of increasing revenue to higher territorial units, the state changed the distribution of income taxes from natural persons and thus, boosted the share of income proceeding to self-governing regions. Since 2016, the amended act on budget allocation of tax revenues pertaining to the revenues of a regional self-government has been in force. According to the law (Act no.564/2004 Coll.) tax revenue in the relevant year is divided so that 30.0% is contributed to the budgets of higher territorial units and 70.0% to municipalities. Among other revenue for municipalities are local taxes and fees for communal waste and small construction waste, which are defined by the law (Act no.582/2004 Coll. on Local Taxes). These taxes are fixed, modified, lowered, or exempted by municipalities under a generally binding regulation. These include property taxes, dog taxes, the tax on the use of public spaces, accommodation tax, tax from vending-machine sales and non-winning gaming machines, tax on the access and stay of a motor vehicle in the historical part of a town, and tax on core (nuclear) facilities.

**Share of Taxes in Incomes of the State Budget**

The state determines what comprises the revenue part of its budget. Fiscal decentralization determines which tax stream will be income and then which of these will be income of the state, higher territorial units, and municipalities. These revenues can be divided according to several criteria: economic classification, organizational classification, and sources of financing (Šoltés, 2016). Figure 1 shows a comparison of the amounts of total income tax revenues into the state budget for a period of five years.
Figure 1: The overall amount of total revenue compared to tax revenue in the state budget in 2012 - 2016

Source: Authors

Figure 1 shows the amount of income for the state budget from taxes. For the monitored period, the share of tax revenues was highest in 2016, making up 78.2% in the given year. The lowest share of tax revenues occurred in 2015 and comprised 64.9% of total revenue, even though the amount rose year-on-year by about €1,347 million. This share was influenced by the high proportion of income from EU sources.

Individual tax revenue for the state budget has the following tax sources:

- incomes and capital assets,
- goods and services,
- international trade and transactions, and
- sanctions imposed in tax proceedings and sanctions associated with payments for public services provided by Slovak television and Slovak radio.

Figure 2 shows the tax revenue for the individual years for the state budget.

Source: Authors

With the tax structure contributing to the state budget for the monitored periods (Figure 2), the highest share of total tax was from goods and services, which ranged from 72.7% to 78.7%. The share derived from income tax and tax on capital assets ranged from 20.8% to 27.4%. Sanctions imposed in tax proceedings and tax from international trade and transactions combined was less than 0.7%.

Regarding fiscal decentralization, taxes were allocated for self-governing regions and municipalities. Since 2015, this has involved the division of revenues from the income tax of natural persons. A
comparison of total income and tax revenue contributed to the budget of higher territorial units for the period 2012–2016 is shown in Figure 3, and that for the municipalities are shown in Figure 4.

Figure 3: Total revenue compared with the share from taxes contributed to the budget of higher territorial units

![Figure 3](image)

Source: Authors

Figure 3 shows an increasing trend of revenue transferring to the budget of self-governing regions. These revenues have grown in direct proportion to tax revenues.

Figure 4: Total revenue compared with the share from taxes contributed to the budget of municipalities

![Figure 4](image)

Source: Authors

Budget revenues of municipalities are gradually increasing as are revenues from taxes (Figure 4).

Discussion

This contribution identified the development of revenue of municipalities and self-governing regions after fiscal decentralization in the Slovak Republic. Tax revenues are used in the financing of the state and for financing municipalities and self-governing regions. In 2016, tax in the Slovak Republic comprised as much as 78.2% of state budget revenues. In 2014, this tax was the highest at 78.7% and was sourced from tax on goods and services. The remainder consisted of tax revenue and capital assets, which in 2013, at its highest, comprised 27.4% of total taxes.

It is these taxes that most affect residents and entrepreneurs in the Slovak Republic. When setting the tax burden for these subjects, it is important to proceed with great sensitivity because merely increasing the tax burden may not lead directly to proportionally increased budget yield. The opposite effect may occur, where with higher taxes, the budget revenue streams will trend downwards, as
entrepreneurs try to avoid paying these taxes in different ways, one of which is shifting the company to a tax haven, where the tax burden is minimal to non-existent. Another method is for people to make payments to one another, or payments directly without any records, and thus, avoid taxation. In countries with high taxes on goods and services, the preference for buying goods and using services of nearby foreign countries may arise.

**Conclusion**

Fiscal decentralization, which was preceded by a change of competencies for self-governments and a change of tax laws in the years, 2002 to 2004, has influenced the flow of tax revenue streams for the state budget. Since 2015, the motor vehicle tax has been revenue of the state budget; while in contrast, the total income tax from natural persons has been divided among the regional administrations. Decentralization has been strengthened by increasing tax revenue streams from natural persons. This endeavor has had a positive effect on the revenue of municipalities and regions, which receive increasing amounts with every year.

THE SET OF PERFORMANCE INDICATORS IN TRANSPORT AND FORWARDING SERVICES – CASE STUDY

Aneta Kucińska-Landwójtowicz,¹ Marcin Lorenc²

Abstract: This article applies to the set of performance indicators in companies operating in the transport and forwarding services. The authors described the importance of the process approach in the management of the organization, and its main requirements connected with the measurements and performance indicators. On this basis, the identification and analysis of the processes was carried out in small and medium-sized enterprises in the area of transport and forwarding. This is followed by a proposal to develop a performance measurement system dedicated to such companies. The system includes a comprehensive set of indicators to monitor the efficiency, effectiveness, timeliness and quality of the identified processes. The presented project is the original proposal of the authors, complementing the available literature knowledge. The paper depicts the research results which are based on a case study approach.

UDC Classification: 658.6; DOI: http://dx.doi.org/10.12955/cbup.v5.934

Keywords: performance indicators, performance measurement system, effectiveness, efficiency, quality, process management

Introduction

To meet the constantly changing and competitive environmental requirements, firms are searching for ways of enhancing their efficiency and effectiveness in their operations. It necessitates them to establish the ability to respond to the escalating demands of their clients as well as adjusting relevant business processes. However, these objectives alone will not be able to serve as a basic guide for controlling and optimizing their entire enterprise (Jochem et al., 2010). The concept that assumes both the identification and improvement of processes and concentration of a client–generate value is the business process management. The essential part of process management is measuring process performance (Harter et al., 2000). Companies have understood that for competing in continuously changing environments, it is necessary to monitor and understand firm performance (Taticchi et al., 2010). Measurement has been recognized as a crucial element to improve business performance (Sharma et al., 2005). A performance measurement system (PMS) is a balanced and dynamic system that enables support for the decision-making processes by gathering, elaborating and analyzing information (Neely et al., 2002). Studies on the evolution of performance measurement indicate their development of focus from the financial perspective to a non-financial one (Neely, 2005). The compilation of the Balance Score Card was a crucial point of this advancement and led to a dramatic shift in the approach towards non-financial indicators, significantly promoting their position (Kaplan and Norton, 1996). The literature investigating the PMS is extremely elaborate and enables to point out various types of Measurement Systems (Agami et al., 2012). However, the result of the literature review reveals a certain maturity of the literature related to large companies and a significant lack of PMS literature for small and medium enterprises (SMEs) (Taticchi et al., 2010).

The purpose of this article is, therefore, to provide proposals for performance measurement system indicators dedicated to small and medium companies, which address concerns of the indicated cognitive need. The research studies are confined to the forwarding and transportation industry, which constitutes a very important service sector dynamically expanding in the Polish market. The developed project on performance measurement system indicators handles the original value of the studies carried out by the authors. The collection of indicators connects the traditional approach towards performance assessment with target-oriented indicators of quality, effectiveness and efficiency. The investigation of the system was preceded by a literature review on process management and performance measurement systems.

Literature background

Due to the constant enhancement of operations, process management affects a company’s effectiveness and stemming from the indicated process-oriented need, it results in building a flat customer–oriented organizational structure. It is interpreted as the organizational effort required for

¹ Faculty of Production and Logistics Engineering, Opole University of Technology, a.kucinska@po.opole.pl
² Faculty of Production and Logistics Engineering, Opole University of Technology, m.lorencc@po.opole.pl
making business processes the platform for organizational structure and strategic planning (Reijers, 2006; Sabherwal et al., 2001). Empirical studies refer to a positive impact of process-oriented organizational design on a firm’s performance (Kohlbacher and Gruenwald, 2011) and point out that process management is widely exploited in a number of industries and application areas (Syamil et al., 2004).

As it has already been stated, one of the crucial elements of a concept is the process performance measurement. The key factors of the measurement include: effectiveness, efficiency, quality and timeliness, as well as performance and productivity depending on the assumed operation strategy of a company. The modern performance measurement system is defined as a collection of measurements applied to quantify the efficiency and effectiveness of a company’s operations (Najmi and Kehoe, 2001). Following the Balanced Score Card, we should take into account both financial and non-financial indicators. Kapug and Smith (2007) state that although non-financial measures are increasingly important in decision making and performance evaluation, copying non-financial measures that others use may not work. Instead, the companies should link the measures to the factors such as strategy, drivers value, organizational objectives, and competitive environment. Morgan (2004) considers the PMS a strategic tool with a wide variety of metrics used by the management to monitor and guide a company toward successful and desirable objectives and goals. It is also highlighted that small firms can achieve benefits, similar to those of large firms, by using non-financial measures to identify and monitor quality (Kettering, 2001). According to Zeglat et al. (2012) using the integrated performance measurement systems by practitioners is recently not enough, on contrast, researches and practitioners should consider and implement the newest and latest trends introduced in the generic PMS literature.

The literature has comprehended a diversity of indicators to measure general or specific performance of logistic service providers regarding transport activities (Van Donselaar et al. 1998), timeliness, and accuracy (Bromley, 2001), delivery performance (Stewart, 1995), personnel scheduling, and safety measures (Crum and Morrow, 2002). Logistics service providers can also be distinguished based on their characteristics of customer relationships (Knemeyer et al., 2003), loyalty, and satisfaction (Stank et al., 2003). An extensive review of literature (Krauth et al., 2005; Twaróg, 2005) provided a sustainable footing to generate a set of indicators in our case study.

**Methodology and procedure**

This paper depicts the research results which are based on a case study approach. For conducting these studies, a documentary analysis and a semi-structured interview were applied. A forwarding and transportation company was selected for the sake of the case study. It implemented a system of quality management and decided to launch a performance measurement system, which would enable it to analyze both financial and non-financial outcomes. According to Jochem et al. (2010), the first phase of the study shall be the analysis of the company strategy, quality policy, its principles, and business requirements. In this stage, the actual analysis and solution development for a short-term improvement had been conducted. Apart from that, identification of the implemented processes took place with the division into the management, basic, and auxiliary ones. The second phase of the experimental part aimed at the selection of appropriate indicators linking business requirements, company’s objectives, and key process factors. The analysis was carried out in three consecutive steps, for the three groups of processes respectively. In addition to the set of indicators which were previously used for assessing an operations effectiveness, the indicators displayed in the literature were also adopted. Their choice was further limited to the ones which allowed for the process evaluation according to the principle of avoiding a data avalanche due to the substantial number of indicators. The system of the project was analyzed together with the board of directors and the process owners. The final version of the system was accepted at the fourth meeting with the appointed representatives of the company. The results of the analyses are delivered in the following parts of the article.

**The case of study**

The analysis carried out in a forwarding and transportation company, where quality management system was implemented, enabled to develop a model of a processes’ map for this type of operation. In accordance with Bitkowska et al. (2011) approach, management processes, as well as basic and auxiliary ones, were identified.
Stage 1 Project of indicators for processes assessment system

On the grounds of the evolved processes map, the analysis of their impact on the fulfillment of the company goals was initiated. Consequently, a range of performance indicators was chosen. The established indicators constitute a complementary compilation entailing to provide an assessment of effectiveness, efficiency, timeliness and quality of the undertakings. They are means of pursuing quality and quantity assessment. The owners of the processes are responsible for gathering data utilized for the evaluation of respective indicators as well as for performing up-to-date analyses.

Step 1 Performance indicators of management processes

The first phase of the analysis concerned the management processes which aim at improving both the company’s financial efficiency and the effectiveness of its quality management system. For the measurement of the financial efficiency, classic indicators of cash flow and profitability were proposed: sell, assets and equities. The indicators of receivables turnover and cash flow were also taken into consideration. Within the effectiveness assessment of quality management, two aspects were highlighted: the internal and external evaluation. The analysis of the audit results was put forward, including the amount of identified non-compliances and the implementation degree concerning remediating and preventive actions. The outer effectiveness of the quality management system is consumers – and was evaluated. Their satisfaction degree corresponding to the received services and cooperation with a company is the key to the evaluation criteria. Thus, the result analysis concerning client satisfaction was proposed together with complaint indicators including: percentage and frequency of substantiated complaints of the executed orders as well as the costs of complaints against the sell value. Evaluation criteria and indicators of management processes assessment are displayed in Table 1.

Source: Authors

Step 2 Performance indicators of the basic processes

The second phase connected with collecting the indicators was based on the analysis of the basic processes impact (orders acquisition, forwarding and transportation service execution, client service after the sales disposal) on the effectiveness and performance quality of the whole company. The aim was to identify the key success factors for individual processes and consequently, to develop suitable performance indicators. Assessment criteria and the indicators for the basic processes are displayed in Table 2.

In the process of order acquisition, the key factors affecting its effectiveness is the growing number of orders and acquiring new clients. Therefore, performance indicators were assumed as: the amount of orders accepted for execution in relation to the number of sent inquiries, the amount of executed orders, sell value in relation to the number of employees winning the orders, and the amount of new clients in relation to all the clients. Such a collection of indicators enables us to monitor the
implementation goal of this process being the increase of both the number figure of acquired orders and new clients.

The process of executing forwarding and transportation services is of major importance for the company not only from the point of internal effectiveness and efficient operations but also quality and timeliness of the provided services. The criteria assumed for his evaluation are: operation effectiveness, the equities level, delivery quality, carrier documentation quality, and the driver’s performance quality as well as timeliness of the service provision. The effectiveness of the analyzed process means implementation of all the received orders in accordance with their specification and with optimal use of their means of transport and their load capacity are also taken into consideration. These are the major success factors affecting the effective application of resources possessed by the company.

Source: Authors

They are divided into the following indicators: the amount of executed orders in relation to the collected orders, the extent their means of transport are utilized and the extent of their load capacity utilization. During the evaluation of this process, the analysis of the equities level was taken into consideration, including transportation costs, the depreciation of the means of transport and people costs in relation to the sell value.

Quality assessment concerning service implementation shall involve the quality evaluation of: supply, carrier documentation, and a driver’s value in performing the shipment. The indicators offered for the assessment of the presented criteria include respectively: the amount of damages occurring during shipment, the number of faults in the carrier documentation, the costs of breakdowns and repairs depending on the drivers. The final criterion of the process assessment is the timeliness of the service provision. Its evaluation shall involve the following indicators: the number of timelydeliveries in
relation to the number of total deliveries, average delivery delay, average time span between an order placement and an order execution and timeliness of a vehicle provision.

It was suggested to apply the indicators enabling to evaluate the operations connected with timely handling of the possible complaints and the effectiveness by conducting a client satisfaction survey.

The responsibility for the assessment of the processes results is held by the designated owners of the processes.

Step 3 Performance indicators of auxiliary processes

The final stage of designing the performance measurement system was the analysis and selection of indicators for the auxiliary processes which include: marketing and market research, infrastructure management, purchase and management of suppliers, human resources management and work environment management.

Evaluation criteria and indicators of auxiliary processes performance are revealed in table 3.

The major aim of marketing operations of a company is gaining clients, maintaining constant relations with them, and creating their loyalty. Simultaneously, that process should be effective and efficient. For the sake of performance measurement, it was suggested to apply an indicator depicting the total marketing costs share in the sell value and an indicator related to the marketing cost per each new
client. Another assessment criterion is the effectiveness of marketing operations which, in this case, is evaluated by the share of acquired clients due to marketing within the group of total clients. Respectively, client loyalty may be measured with a regular client share in a group of all the clients.

Infrastructure management is understood by vehicles maintenance enabling effective exploitation and ensuring high quality of the provided services. For the sake of measurement of that process, it was suggested to apply the analysis of the number of breakdowns in the country and abroad and the share of executed repairs in relation to the schedule. An analysis of depreciation costs shall be carried out with the evaluation of repair costs, vehicle maintenance costs and vehicle breakdowns costs in relation to the sell value. The environmental aspect of the evaluation was also taken into consideration i.e. the analysis of exhausts emissions level.

The purpose of the purchasing and supplier management process is to ensure timely deliveries and the required quality of the stock, taking into account the appropriate price-quality ratio. Timeliness and quality measures have been proposed for the monitoring of the process, which concern the actions of their suppliers.

The crucial element of management of human resources as well as work environment consists of employee development care, their work satisfaction, and their safety. For the sake of monitoring the effectiveness of such a principle, it was suggested to apply the indicators which determine the percentage of employees entering trainings, improving their qualifications, and average spending on that type of operations. The level of employee work satisfaction may be indirectly assessed with the analysis of employee turnover and their absenteeism. A classical indicator of accident frequency during work and an indicator of the severity of these accidents, taking into account the employee absenteeism, shall be applied to measure work safety. This indicator illustrates the importance of company accidents and enables to differentiate between companies where accidents occur more frequently but with less consequences from the companies where accidents are less frequent but lead to longer convalescence of the injured. It is also worth it to take into account the specifics of the accidents during the work of the drivers and include this into such assessment.

Taking all the suggested indicators into consideration, the frequency of their measurement shall be defined. As far as the studied firm is concerned, the analysis of the basic processes indicators will be conducted once a year. However, the results of the basic and auxiliary processes shall be scrutinized once a month.

Conclusion

The performance measurement system presented hereby reflects the firm strategy and business objectives representing medium-sized enterprises operating in transport-forwarding service and it is keen to place emphasis on the need of aligning a substantial body of process-oriented measures with the demands of a specific group of companies. The applied process-oriented approach towards its design permitted simultaneously the association of these goals with the critical aims of the identified processes. This has provided a very compact and target-oriented PMS allowing for monitoring the efficiency, effectiveness, quality and timeliness of the identified processes. The delineated system constitutes an original proposal of the authors and particularizes the available literature knowledge. It should be noted, however that while designing it, a principle of eliminating superfluous information was adopted. That danger arises from too many selected indicators what usually impedes taking managerial decisions and dissuades from the application of such solutions. PMS shall become a tool for directing to adoption of improvement actions in accordance with the principle that measurement is the key to introducing alterations.

The limitation of the research lies in the fact that the results of the study are based on a single case study; therefore, caution is required before making generalizations on the basis of the data. Further research is required to gather analyses results within a larger number of enterprises, which would enable to certify the universal value of the designed system.

THE IMPACT OF VALUE ADDED TAX ON CASH FLOWS OF ROAD TRAFFIC COMPANIES IN THE SLOVAK REPUBLIC

Angelika Kútna,¹ Norbert Gyurián²

Abstract: Within the Member States of the European Union, value added tax (VAT) is the most harmonized form of tax from all types of direct and indirect taxes. It does not affect the costs or the revenues of the company, but it affects taxpayers on the other hand. The impact on the company's cash flows is most significantly affected. The basic principle of VAT taxation consists of the following idea. The Member State of final consumption of the goods or services is the state to whom the VAT finally belongs to. The free movement of goods and services between the Member States resulted in many new traffic companies being created. The measure of VAT influence on Cash Flows depends mainly on two impact factors. The first is the length of excessive deduction payment period to taxpayer bank account. The second impact factor is the amount of excessive deduction expressed through money. The objective of this study is an evaluation and quantification of the impact of value added tax on the road traffic companies’ cash flows. The financial burden of traffic companies had an upward trend only during the first and second year of the analyzed period. Since 2006, the financial burden had a downward trend. This decrease was more significant until 2009 (the end of the financial crisis in European countries). After this year, the declining rate had moderated. This development results not only from declining interest rates of the European Central Bank but also from economic growth and development in European countries.

JEL Classification Numbers: H25; DOI: http://dx.doi.org/10.12955/cbup.v5.935

Key words: value added tax, cash flow, excess deduction, Traffic Company, expense interest

Introduction

The objective of this study is an evaluation and quantification of the impact of value added tax on road traffic companies’ cash flows. This research also focuses on the comparison of this impact on three different sets of traffic companies. The criteria for creation these three sets were three basic value added tax (VAT) schemes. The first scheme is supply of goods and services at Slovak territory. The second one is the acquisition of goods in the territory of the country from another member state. The third schema is the importation of goods.

The time period of 2005-2015 is analyzed in this study. The impact of the value added tax is quantified by financial expense interests. These expenses depend on the period of time limits for the excess deduction and also on the excess deduction. The authors have chosen three basic indicators: indicator: “value of money I,” indicator: “value of money II” and financial burden (base index). The analysis presented in this study confirms the time period between the day of VAT tax return submission to the Financial Directorate by electronic means (this is the day of taxpayer’s entitlement to excessive deduction) and between the validity day (the day when the taxpayer receives payment to his bank account from the Financial directorate) as the cause of VAT financial burden. The study is organized as follows. First, the background of the VAT system in the Slovak Republic is presented, this is followed by the literature review, and finally by the theoretical background of the study and the hypothesis development section. Next, the methods and findings are presented. Last, discussion and implications of the study are presented.

Literature review

There have been two basic approaches to contributing to the debate on the importance of cash flows and the factors which influence them. One approach is to consider the relative usefulness of earnings, in particular, cash flows in predicting future cash flows. For example, a recent US study with this approach is by Barth, Cram, and Nelson (2001), who document the superiority of operating cash flow over earnings in predicting future operating cash flows. However, as pointed out by Subramanyam and Venkatachalam (2007) and Akbar, Shah, and Stark (2011), the prediction horizon in such tests tends to be relatively short. Furthermore, there are many other factors which influence cash flows (present and future) of enterprises. In this research we analyze and influence one of these factors, the influence of taxes. Different studies have examined firms’ cash flows risks and their effects on capital costs, values, and appropriate levels of the debt financing (Céspedes, Gonzáles and Molina (2010), D’Mello and Miranda (2010) and Lang, Ofek and Stulz,(1996), Ferenczi- Vaňová, et al.

¹ J. Selye University, Faculty of economics, Slovak Republic, E-mail: angelika.kutna@gmail.com
² J. Selye University, Faculty of economics, Slovak Republic, E-mail: ngyurian@gmail.com
(2015). However, these studies take place under the linearity assumption of the relationship between FCF risks and its influential factors. Bojňanský, Krajčírová, and Ferenczi-Vaňová (2013) and Bašťincová (2009) have argued that value added tax as a classic representative of indirect tax burdens and impacts the final result on the end-user. However, its impact is often hidden to the general public in the methodology of its functioning as an indirect tax – i.e., the taxpayer is not obliged to pay this tax personally at the appropriate revenue authority. This will be done by the respective VAT registered company instead, also claim Svátková, et al. (2007) and Hájek, et al. (2015). Hence this tax is becoming an important factor on cash flows of a company, so the traffic companies are not exempt.

According to Babone, Bird and Vazquez-Caro (2012), modern taxation systems impose a heavy burden on taxpayers, particularly on small business taxpayers. The level of economic integration in the European Union is relevant and in an initial stage requires measures in order to eliminate tax limits and to remove obstacles to the free movement of production factors in the economic era (Staciokas and Valanciene, 2002). As mentioned by Becker and Fuest (2010) European Union policy is closely connected with tax competition. This free movement of services and goods (main production factor) is closely connected with the development of traffic through the whole European Union.

The basic incentive

The EU’s common system of VAT in the European Union member states is based on Council Directive 2006/112/EC. This Directive is used to bring different national laws into line with each other. Implementation of the EU’s common system of VAT into the Slovak tax law was one of the conditions of the European Commission during the accession negotiations. The date of the Slovak Republic’s accession to the European Union was also the first day of the validity of the new Slovak VAT Law - Act No. 222/2004 Coll. on Value Added Tax, as amended. Taxable transactions include supplies of goods or services within a single EU country, intra-EU acquisitions of goods (goods supplied and dispatched or transported by a business entity in one EU country to a business entity in another one) and imports of goods into the EU from outside. As for the supply of services — the place of taxation is the place where the services are supplied. This depends not only on the nature of the service supplied but also on the status of the customer receiving the service. To ensure that the service is taxed at the place where it is actually consumed, there are some exceptions to these general rules, such as transport services. Since 2004, a large number of traffic road companies have been established in the Slovak Republic. Hence the main aim of this study is the evaluation and quantification of the impact of VAT on the cash flows of road traffic companies.

Model specification

We have used the statistical data after elaboration from the proposed sources:

- The intranet portal of the Slovak Financial Directorate SAP-ISFS SR,
- Data from VAT tax returns which are submitted by taxpayers,
- Data from VAT control statements which are submitted by taxpayers,
- The Statistical Office of the Slovak Republic.

The basic set of taxpayers who are analyzed in this study was selected from databases of the Financial Directorate of the Slovak Republic according to the strict rules:

- SET 1 Traffic companies I - taxpayers are registered at the Slovak Financial Directorate and the Slovak Companies Register. The supplies of transport services connected with imports or exports of goods into the EU from non-EU countries are more than 60% of total turnover,
- SET 2 Traffic companies II - taxpayers are registered at the Slovak Financial Directorate and the Slovak Companies Register. The supplies of transport services connected with Intra-EU acquisition of goods (goods are finally located after transport from another EU country) are more than 60% of total turnover,
- SET 3 Traffic companies III - taxpayers are registered at the Slovak Financial Directorate and the Slovak Companies Register. The supplies of transport services within a single EU country (the Slovak Republic) are more than 60% of total turnover.
As for timing, years 2005-2015 are analyzed in this study and standard mathematical and statistical methods were used for analyzing and comparing the partial indicators in the reporting period (arithmetic Average, base index).

Financial burden
The cause of this burden is the time period between the day of VAT tax return submission to the Financial Directorate by electronic means (this is the day of taxpayer’s entitlement to excessive deduction) and between the validity day (day, when the taxpayer receives payment to his bank account from the Financial Directorate).

Indicator “value of money I” = principal x interest rate of ECB x average loan term /365
Principal... average amount of excessive deduction of traffic companies
Average loan term... time period during which the traffic companies as lenders lend money to the state budget (state is the borrower in this case)
365... number of days in a year

Indicator “value of money II” = principal x average commercial interest rate x average loan term /365
Principal... average amount of excessive deduction of traffic companies
Average loan term... time period during which the traffic companies as lenders lend money to the state budget (state is the borrower in this case)
365... number of days in a year

A methodological approach was used in our research using the following criteria:

1. Definition of the criteria for set I, set II, set III of taxpayers (traffic companies),
2. Data were obtained from VAT tax returns. Tax period applicable to a taxpayer is a calendar month. Tax return shall be submitted within 25 days of the end of each tax period by each taxpayer,
3. 95% of taxpayers used to submit their tax return on the very last day or on the day before the last day of this obligation. Following this, taxpayers submit the tax return on 25th or 24th, after the end of the tax period,
4. The day when a taxpayer is entitled to an excess deduction and the day of its returning to the taxpayer’s bank account is a period of 80-85 days. The period of 83 days (hereinafter only "the period") is considered in the analysis,
5. The Period and Excess Deduction are the most significant factors which influence the extent of impact of VAT to taxpayers’ cash flows,
6. An important factor is also the interest rate of ECB.

Results and Discussion
The scope of VAT influence on Cash Flows depends mainly on two impact factors. The first one is the time limit for the excess deduction refund to the taxpayer bank account. The second impact factor is the amount of excessive deduction expressed through money. If the taxpayer cannot deduct excessive deduction from his own tax obligation in the following taxation period, the tax office shall return the non-deducted excessive deduction or its non-deducted part no later than 30 days after filing the tax return for the taxation period following the taxation period, in which the excessive deduction was created. In approximately 90% of submissions, tax returns are submitted within 23 - 25 days of the end of each tax period by each taxpayer. The period of 83 days can be considered to be the most frequent period and also the average period. The extension of excessive deduction is created as the difference between the right to deduct the tax on goods or service (§49 to §54 Act No. 222/2004 Coll. on Value Added Tax, as amended) and obligation to pay VAT from taxable transactions (tax liability for the supplied goods and services) (§8 to §9 Act No. 222/2004 Coll. on Value Added Tax as amended). Monetization of the time period between the days of VAT tax return submission to the Financial Directorate by electronic means and between the validity day is considered in this study as the indicator “value of money.” This indicator represents the percentage of money which the taxpayer will have in case that he has them immediately after he becomes entitled to an excess deduction, and he lends them to the bank, having an interest in this financial operation. In addition, the majority of companies borrow money from financial institutions and pay interest to them. From this point of view, we can consider the indicator “value of money” to be an indirect cost of the company. The evaluating of the results expressed by the indicators “value of money I” and “value of money II” should also take
into account the following facts. The average commercial bank interest rate in this study is the average interest rate of loans with validity not longer than one year which were provided by financial institutions to commercial companies (not to households and also not to other financial institutions).

</table>

The average amount of excessive deduction in the analyzed period in traffic companies was between € 1,500 and € 6,500. The highest level of excessive deduction was at traffic companies in which supplies of transport services connected with the intra-EU acquisition of goods (goods are finally located after transport from another EU country (hereinafter only “SET II companies”) was more than 60% of total turnover. There was the interval of excessive deduction from € 5,187 to € 6,411. As Figure 1 shows, in comparison with the traffic companies in which the supplies of transport services connected with imports of goods into the EU from non-EU countries (hereinafter only “SET I companies”) are more than 60% of total turnover, the amount of excessive deduction is higher than in traffic companies in which the supplies of transport services connected with imports of goods into the EU from non-EU countries the interval of excessive deduction was from € 3,569 to € 4,158. As Figure 2 shows, comparing with the year 2005 (base year and the first day of the analyzed period) the most significant changes of excess deductions were in SET III companies, which is most probably a result of constant changes in fuel prices. This price is the most important part of costs of traffic companies. The amount of excessive deduction had a downward trend until year 2009, which was closely related to the economic crisis in the whole Europe. After year 2010, it had an upward trend because of the upward trend in all economic areas (e.g. turnover of companies) after conclusion of the economic crisis in the European countries.
The financial burden of traffic companies had an upward trend only during the first and second year of the analyzed period, as we can see from the Figure 3. Since 2006, the financial burden had a downward trend. This decrease was more significant until 2009 (the end of the financial crisis in European countries). After this year, the declining rate had moderated. This development results not only from declining interest rates of the European Central Bank, but also from an increase in economic growth and development in European countries, as was mentioned previously. The average monthly financial burden was € 18.71 for one company (as a taxpayer) per month. The lowest VAT financial burden was for “SET III companies” of € 10.63 per month. The development of commercial interest rates is similar to the development of interest rates of the European Central Bank. For this reason, the development of “Financial burden II” is similar to “Financial burden I,” as Figure 4 presents. Financial burden reached the minimum in all three sets of the analyzed traffic companies in 2009. This minimum is mainly the result of the turnover’s decrease in these companies and the decrease of excessive deductions amount, which are closely connected. “Financial burden II” is more realistic because the commercial interest rates are the rates which represent the value of money in a real business life. Interest on loans or mortgages as a cost directly affects the economic (profit or loss) results of companies. The average cost of each company in this point of view was € 41.06 in the analyzed period. In SET I companies, these costs ranged from € 28.73 to € 56.04. In SET II companies, these costs ranged from minimum € 41.75 in 2009 to a maximum €78.76 in 2006. In 2006, there was a good financial and economic situation and also high interest rates. In SET III companies these costs ranged from € 12.96 to € 33.84.
Figure 4: Excessive deduction financial burden development (average interest rates) in traffic companies

Source: Information system of Financial Directorate of Slovak Republic

Figure 5 and Figure 6 present development of interest cost per one calendar year which is caused by a time period between the days of VAT tax return submission to the Financial Directorate by electronic means and between the validity days. SET I companies had average costs of € 217.66. SET II companies had these average costs approximately 1/3 higher, i.e. € 328.14. SET III companies had the lowest cost caused by time changing. The costs were €127.59 in average.

Figure 5: Indicator “value of money I”(ECB) per year

Source: Information system of Financial Directorate of Slovak Republic

In the analyzed period, SET I companies had the average cost € 478.71. SET II companies had the average cost approximately 50% higher at about € 718.46 per year. SET III companies had the lowest financial burden per year of € 281.02.

Figure 6: Indicator “value of money II”(average interest rate) per year

Source: Authors
Conclusion
The main aim of this study is the evaluation and quantification of the impact of value added tax on the cash flows of road traffic companies. The authors have chosen three basic indicators: indicator “value of money I,” indicator: “value of money II” financial burden (base index). Data for analysis were gained from the information system of the Slovak Republic ISFS SR under the condition of anonymity. The analysis presented in this study confirms: time period between the day of VAT tax return submission to the Financial Directorate by electronic means (this is the day of taxpayer’s entitlement to excessive deduction) and between the validity day (the day when the taxpayer receives payment to his bank account from the Financial Directorate) is the cause of VAT financial burden. The measure of VAT influence on Cash Flows (not only of traffic companies but in general all types of companies) depends mainly on two impact factors. The first one is the length of excessive deduction payment period to taxpayer bank account and the second one is the amount of excessive deduction expressed through money.

INNOVATION PROJECT MACHINE IN A SYSTEMS APPROACH TO ENGINEERING MANAGEMENT

Iwona Lapunka,1 Dominika Jagoda-Sobalak,2 Katarzyna Marek-Kolodziej3

Abstract: In recent years, the project approach has become an increasingly popular tool for achieving operational and strategic goals and to generally advance the business activity of organizations in fields such as innovation management. We demonstrate the need of including the project approach in the processes of creating innovative solutions. We posit that these two work methods can be combined into a coherent approach known as the innovation project machine. As part of this approach, innovations are implemented and developed more effectively, while agile project management and consolidated research for project managers, amongst others, are the source of inspiration. A systems approach to this concept could constitute a coherent synthesis of solutions available for engineering management. A proposition to integrate the project approach with innovative processes will enable expedient execution of business strategies in contemporary companies.

Introduction

The rapidly increasing participation of developing countries in the global production industry impels Western European economies to undertake steps aimed at improving the competitiveness of factories who have thus far been operating in local markets. Industry 4.0 (German: Industrie 4.0), a program initiated in Germany, and promoted in other countries, is meant to drive a fourth industrial revolution. Poland, together with other Central and Eastern European countries of considerable industrial traditions, are becoming competitive not only due to low work costs. An increasing number of modern factories are being built in these countries, which, owing to the employed technologies, enable a rapid development of business with substantial added value. In this respect, the global concept of engineering of the future is in line with the ideas and assumptions of the Industry 4.0 program - it evolves towards innovative, adaptive, and intelligent technologies and industrial processes.

The transformation of economic focus from production to market forced entrepreneurs to look for new ways of developing and maintaining their position in the market of goods and services. In industrial practice, we observe a systematic evolution of the fundamental sources of competitive advantage (cf. Table 1). Innovations in companies are directed at implementing changes that lead to an increase in the modernity and competitiveness of a company, its development, and in consequence, boosting its value.

Innovation processes have become an inherent part of contemporary engineering management. Currently they constitute one of the foundations of managing technical functions, in particular: research, design, production, and in the strategic dimension in the areas of managing development projects, as well as production and services companies. This managing is carried out in the context of

1 Opole University of Technology, Faculty of Production Engineering and Logistics, i.lapunka@po.opole.pl
2 Opole University of Technology, Faculty of Production Engineering and Logistics, d.jagoda@po.opole.pl
3 Opole University of Technology, Faculty of Production Engineering and Logistics, k.marek-kolodziej@po.opole.pl
fierce market competition, high technology and under the conditions of rapid changes to production and operation techniques. The approach to innovations and the means of creating them in companies undergo continual changes too. These changes are a direct consequence of the arrival of new concepts and methods that tackle the creation of innovations in an increasingly comprehensive manner, especially at the level of production and in services companies. Contemporary processes of creating and implementing innovations require appropriate competences and knowledge founded on project management principles (Karbowiak, 2005; Kisielnicki, 2013).

**Engineering management paradigm in contemporary science**

Engineering (Latin: *ingenium*, i.e., inventiveness) defined as ‘broadly understood theory and practice of cognition, as well as deliberate influence and control over a process or system’ (Słowiński, 2009) reflects the contemporary development of directions of production. It is concomitant of a particular way of thinking oriented at streamlining processes that can result in a new product or a process closer to ideal than its predecessor. Its aim is to integrate information resources, design, production and control processes, transportation, and storage processes into a unified, comprehensively managed manufacturing process (Komitet Inżynierii Produkcji PAN, 2010). In this respect, a key role is played by engineering management, often identified with production management or managing a production workshop or plant. However, under the conditions of modern manufacturing technique, engineering management is usually understood as (Durlik, 1996):

- managing technical functions, such as: research, design, production (present in every company in which modern technologies are employed),
- managing more broadly understood functions, such as: marketing, manufacturing goods and services, distribution and trading, as well as managing development projects and manufacturing companies at higher levels, when the managing is carried out in the context of market competition, high technology and under the conditions of rapid changes to production and operation techniques.

Theoretical foundations of engineering management can be found in the school of scientific work organization (1890s-1930s), commonly known as scientific management or Taylorism, after its founder. Its aim was to find the best method to accomplish any task as well as to select, train, and motivate workers. Representatives of this trend include Frederick W. Taylor, Henry L. Gantt, Karol Adamiecki, and Frank and Lillian Gilbreth (Koźmiński and Piotrowski, 1998).

At the turn of the 19th and 20th centuries, in researching and optimizing workers’ productivity, Taylor noticed that every piece of work can be divided and subdivided into smaller elements, down to individual movements. In 1903 Gantt worked out a method for graphically representing many different activities performed over different times, comprising a complex enterprise. In 1896 a method similar to the Gantt chart was presented by Adamiecki, a Polish founder of the science of organization and management, and the inventor of chronoanalysis.

Scientific management has introduced scientific approaches for solving operational problems into industrial engineering. Over the years, the assortment of available technologies has increased, and simultaneously new trends in the science of organization and management have developed. Industrial engineering has become increasingly focused on process, defined as an organized sequence of human activities transforming resources into goods and services, abstracted to a degree, from the facet of physical and chemical detail. Gradually, a new dimension of engineering has entered the picture – production for profit. The product of industrial execution processes, resulting from technical thinking, is not manufactured for its own sake. Rather, it is the outcome of specific market expectations, incurred costs, fierce competition, and other economic factors playing part in the transformation of an idea into a product and selling it.

At present, a noticeable market trend is end-to-end product management, i.e., generating the requirements for a new product from the stages of design and test production, through market introduction and distribution, to withdrawing the product from the market and replacing it with a new version or a new product. This demonstrates the need for radical market transformations and innovative changes towards the integration of the processes of creating innovation and managing projects.
Particulars of executing innovation projects

Projects have become the main driving force of social development. Today, the methods for conducting projects used and disseminated by various organizations are mostly based on collections of good practices. Innovation projects have a special place among all enterprises. Companies perceive them as an opportunity to increase their competitive advantage, whereas the European Union has designated them to be the central theme of Horizon 2020, a program for financing research and innovation. Considering the specificity of innovation, the turbulent contemporary environment and the high risk of failure of innovation projects, it was recognized that the current, classical approach to managing innovation projects is insufficient (Spalek, 2016).

According to some authors the recent focus of science on human capital is also based on assumptions resulting from best practices, and therefore it should not be expected to significantly improve project processes. B. Lent sees the role of feedback as a basis for conducting projects, which could become the foundation of theoretical studies (Lent, 2012). The understanding of rules and mechanisms of feedback should lead to an expected significant increase in the effectiveness of executed projects. His rationalist theory is based on Wiener’s (1961) and von Foerster’s (1974) systems cybernetics, which Lent augments with the third degree cybernetic feedback in the project manager’s decision process.

Modern approaches to project management (agile, soft, and lightweight methodologies) (Wirkus et al., 2014) elaborated over the last two decades, constitute a group of alternative approaches to conducting IT projects. These approaches are increasingly applied to managing other types of projects, and innovation projects in particular. To a large extent, these approaches are based on adaptive, agile, and lean management, progressing towards a unified, strategic framework of AgiLean PM projects (Demir, 2013). Somewhat paradoxically, in innovation project management there exists a strong need for employing routine actions alongside new competencies (Czakon, 2012).

Project approach as support for creating market-pull innovations

New trends in innovativeness pertain both to creating goods and services (research and development – R&D, user-driven innovation), and to the changes within the structure of a company (organizational and marketing innovation). New forms of innovation (non-technological, user-driven, open, and social) require business entities to display new skills as well as to conduct an active policy that will stimulate the creation of such innovations in companies (Szymańska, 2012).

Particularly worth noting are the benefits of user-driven innovation (UDI). Progressing globalization processes have a direct impact on the increasing importance of consumers, understood not only as purchasers, but also as co-creators of goods and services. As a result, production and services are better suited to the expectations of the end user, while at the same time the costs of innovation are reduced. UDI is a method of implementing innovation focused on creating new ideas and solutions based on consumers’ knowledge and needs. In other methods of implementing innovation, the consumers’ knowledge is used mainly to assess existing solutions.

User-driven innovation is based on a more thorough understanding of both the explicit and implicit needs of consumers, their expectations and requirements. It consists in acquiring and using information, ideas and ready-made solutions proposed by consumers. User-driven innovation is poised to become the second pillar of programs supporting innovative businesses, alongside technological innovation. In general, there are two main perspectives on user-driven innovation: the voice of the customer perspective, and the lead-user innovation perspective (cf. Table 2). These two ‘schools of thought’ are borne out of the academic research and practical experiences of David Kelley, Tim Brown and Eric von Hippel (among many others) (Nordic Council of Ministers, 2006).

It is assumed that the business activity of companies in the scope of R&D, with active cooperation on the part of consumers (user-driven innovation), can be treated as a specific innovation project serving the effective execution of strategic business goals of a company. Initiated in the scope of R&D, gradually laid out and expanded in terms of results, such a project requires project-oriented management. The management model for R&D processes is reflected in project management methodologies. Classical methodological approaches reflect the philosophy and organization of project processes in the form of waterfall models, driven by the principle ‘plan first to avoid change’. In the waterfall model, it is assumed that precisely defined stages follow in succession, always in the same order. In R&D processes, this is possible when actions are executed in the scope of fundamental and
applied research. The strategy of implementing solutions within such a model is currently termed market-pull strategy.

Table 2: Comparison between traditional and user-driven approach to innovation

<table>

<td>P&amp;G, HP</td>
<td>Intel, Electrolux</td>
<td>Adidas, Lego</td>
</tr>
<tr>
<td>Comment</td>
<td>- higher innovation ‘hit rate’ - faster and less expensive than traditional innovation methods (although not yet ‘scientifically’ proven), - (strategic usage) requires new skill sets, shifts in resources and investment in organizational changes</td>
<td>- high innovation ‘hit rate’ (as commercializing solutions developed by lead users themselves), - fast and inexpensive innovation process, - requires investment in identifying lead users in own and related customer bases, - ‘democratizing innovation’ means that the company partner with users and needs to accept relinquishing control</td>
<td></td>
</tr>
</tbody>
</table>

Source: Authors

Developmental works, on the other hand, based on information processing so as to adjust the developmental process to the changing environment (e.g., target market for developed goods and services), necessitate an agile and adaptive approach to management. They are driven by a different principle – ‘implement incrementally to manage change.’ Efficiency, flexibility and rapid pace are among the most significant features of the agile approach to user-driven innovation (Abbas, Gravell, Wills, 2008). These result from self-organization, adaptability, radical shortening of the development cycle, the introduction of control events ensuring the high incidence of customer or end user feedback, as well as other elements comprising the internal and external project environment.

The unpredictable and unique nature of innovation projects in R&D is a consequence of the market-pull strategy. Innovation projects are characterized by an element of uncertainty as to the course of the project and thus to its future result. As a general rule, at the outset of such projects, only the general aim is known, while the exact course of action is adjusted on the fly, in close cooperation with users/consumers.

**Innovation project machine in a systems approach to engineering management**

Popular innovation management models generally operate according to a similar formula: strategy-creativity-execution. The innovation process itself is typically analyzed along three dimensions: inspiration, ideation, and implementation. The latter two can be compared to two major stages of project management, i.e., planning and execution. In the project approach, ideation as a process of forming and developing new ideas concerns initiating, defining, and planning innovation projects. Implementation, in turn, involves the execution of projects. Therefore, a fundamental question that we
ask here is: why should the methods of working with ideation and implementation in innovation process be any different from the methods for enabling efficient project execution? Arguments presented in this article indicate that these two work methods can be integrated into a coherent approach, termed an innovation project machine (Vedsmand, 2013). Within the scope of this approach, innovations are implemented more effectively, while inspiration is drawn, among others, from agile project management methods and established knowledge for project managers. Innovation project machine proposes a coherent synthesis of solutions available as part of engineering management for processes, projects and innovation (cf. Figure 1).

Figure 1: Engineering management for processes, projects and innovation

Source: Authors

Figure 2: Traditional approach to innovating and project management

Source: elaboration based on Vedsmand (2013)

Project managers responsible for generating ideas often approach this project stage somewhat condescendingly, and as a result their true engagement materializes too late. Despite generating many attractive ideas inspired by creative processes, as a general rule, ideas that lack specified execution models and/or clearly defined vision are rejected. The majority of managers, even the experienced ones, are reluctant to undertake challenges that carry a significant risk. Poor acceptance for generated ideas is one of many problems faced by the traditional approach to innovating (cf. Figure 2). Moreover, compared with other stages in a project lifecycle, such activities are not given sufficiently high priority. Similar observations apply to innovation projects, which in general are less prone to be selected for execution compared with other projects. In this respect, lower risk and established managerial know-how significantly increase the chances of success. Without doubt, the roles of the
innovator and that of a project manager have to be distinguished here, as in a traditional approach, their competences do not overlap.

Innovation projects stand out mostly due to the nature of creating and developing ideas. They cannot directly enter the first or second phase of a stage-gate process, since their end result is often underspecified, and the initial concept itself requires incubation. Innovation projects are hard to assess through standard criteria, such as time-to-market or fitness to strategy. This fuels the negative perception and reluctance of companies to engage in innovative activities. Still, the introduction of innovation through a project has the potential to cause significant changes to a company and its market position. Traditional approaches to innovating and project management, presented in Fig. 2, are two separate branches of idea development. Each of them is in a way responsible for obtaining suboptimal results, despite their strong points in terms of, respectively, creating or executing innovative solutions. Streamlining the innovation process does not necessarily involve designing completely new formulas. It is possible to re-use the solutions that are employed and perform well in project execution. Rather, it is the tools and methods for aiding creative processes that require integration with project processes, so as to comprise a coherent system which will play a pivotal role in increasing the effectiveness of conducting innovation projects. The concept realized through such integration was proposed by Vedsmand and is termed innovation project machine (cf. Figure 3).

Figure 3: New innovation process integrating the best practices of creating innovation and project management

Summary
Engineering management as a dynamic field develops by adjusting to the needs of economy and continually strives to improve organizational processes and increase production efficacy. Over the last years, the shift in economic orientation from production to market-based forced entrepreneurs to seek new methods of development and to stay afloat on the market of goods and services. Increasing uncertainty due to rapid changes necessitated the creation and implementation of new approaches to organizing processes and production systems in almost every branch of industry. An appropriate reaction to the dynamic needs of economy is a sign of the modern times. In the 21st Century, the concept of innovation project management has gained particular importance in the face of the challenges faced by contemporary organizations. Traditional management methods oriented at the harmonization of simple and unrepeatable activities turn out to be insufficient for continually changing situations; however, they offer stability. Management focused on simple and repeatable activities gives way to complex and unrepeatable management, carried out in a turbulent world (Kisielnicki, 2013).
Innovation has become one of the major elements of knowledge-based economy and keeps acquiring strategic importance in the context of generating economic growth, which translates into social prosperity. Up to a quarter of a century ago, Drucker already stated that ‘a company unable to create innovation dies’ (Drucker, 1990). According to experts, due to the increasing pressure of competition in the modern world, the ability to create innovation becomes one of the key factors determining the developmental potential of companies. Customers and consumers increasingly often take part in creating innovation. The most modern of currently known innovation implementation methods, oriented at creating innovative solutions based on consumers’ needs, is user-driven innovation or UDI. Simultaneously, the need to include the project approach in the creation of innovative solutions is acknowledged.

The evolution of innovation project management practices indicates the need to redefine numerous areas of the project approach, to adapt to transformations in the environment, and to shift in the direction of project-based and knowledge-based organizations. Eschewing traditional management concepts for their project-oriented counterparts, while taking into account lean and agile strategies; noticing the opportunities and risks of undertaken projects; feedback in the decision processes; developing soft aspects, such as: a proper conglomeration of competences of project teams, high intellectual capital, precise communication, and project knowledge management – all constitute current trends in innovation project management.

The concept of innovation project management presented in the article paves the way for future studies and could inspire a more in-depth exploration of the presented issues and attempts to fill research gaps in the proposition of systems approach to engineering management of processes, projects, and innovations. The continued search for sources, obstacles and processes related to including innovation creation in project management is an essential element of developing new principles in systems engineering management.

PERFORMANCE EVALUATION IN KOSOVO ORGANIZATIONS
Thëllëza Latifi Sadrija

Abstract: The performance means the behavior and the resultant measured based on certain activities and duties. Enterprises performance could be measured thanks to indicators that express the quality of its activities. While, for individuals and groups, it is hard to identify the link between their performance and that of the company. Performance evaluation is an instrument through which the employees within the organization can reflect, discuss and change their work method that influences the organizational effectiveness. The focus of this paper is to argue that effective performance, feedback, and employee training are necessary for the success of an organization, and at the same time the development plan to support the employees in achieving the best possible results is necessary too. The employees’ training in Kosovo’s enterprises is closely related to the organization, and the planning of employees in a way to so they are prepared at a national level and the attempt to exchange employees and train them in international level. This would affect the effective performance and cultures exchanged.

JEL Classification Numbers: M1, M11; DOI: http://dx.doi.org/10.12955/cbup.v5.n937

Keywords: performance, enterprise, culture, evaluation, effectiveness.

Introduction
Taking into consideration the fact that employees are the most important assets in an organization and the organizations’ effectivity is based on the work and the capabilities of its employees to realize organizational objectives, motivation, and an employee’s evaluation are the most important factors to achieve the aims of the organization. Performance management is a process focused on the employees in a way to contribute to achieving the objectives of the organization. This is necessary for every organization. In fact, performance management includes different types of systems.

The system of performance management is one of the management performance forms. Supervisors and managers are responsible for managing the performance of their employees. Any organizational policy should specify how it will be implemented in the performance management systems. The organizations should adapt their performance management practices, which are in accordance with the requirements of these policies to better fit the nature of the work and mission of the organization.

Of all the activities of human resources management, performance evaluation is the most argumentative, the more voluminous and the least popular method considered by the people who are involved in it. However, despite the impression on the evaluation within the organization is not highly appreciated this must be part of the organization management including some basic rules through which the performance is measured, monitored and controlled.

The aim of the paper: the aim of this paper consists of analyzing methods and practices used in Kosovo organizations to improve their performance, and whether or not the organization applies mechanism like employee training and staff rewards.

Basic hypothesis: to evaluate the performance, motivation methods are used like training and staff rewards.

Research question 1: Are the employees in Kosovo businesses rewarded?

Research question 2: do the organizations use motivating methods like staff rewards and training?

The objective of the study:
The creation of a questionnaire with private businesses in the city of Peja, in a way to show what are the problems that these organizations are facing with HRM. Analysing the qualitative and statistical information. Presenting the conclusions based on the results of the questionnaire that is created, that deals with training and rewards of employees.

Literature review
Human resources are considered to be the most valued asset of the organization. But, only a few organizations use their full human potential in their organizations. The system and human resource

1 University Haxhi Zeka Peja/Kosovo, thelleza.latifi@unhz.eu
practices are defined as a set of activities, functions, and processes that are connected to each other and directed to attract, develop and retain the human resources and the group. An important issue of human resources management is the idea that an appropriate combination of human resources policies and the implementation of the same are necessary to achieve a high performance (Wright & Boswell, 2002).

Performance management is a process that contributes to the effective management of individuals and teams in ways to achieve a high level of organizational performance. As such, it sets equal understanding of what needs to be achieved and an approach in guiding and developing people that will ensure its achievement (Armstrong & Baron, 2004).

Performance management is a systematic approach to improve individual performance and team performance in order to achieve organizational goals…..the approach one should take depends on their organization, its culture, relationship with employees and the types of jobs they do (Hendry et al., 1997).

Performance evaluation - making employees know exactly what is required from them in order to improve their performance or change their behavior and it also helps them to stay focused

Periodic feedback helps employees to self-correct continuously and give them a feeling of control in the results of their performance. The ability to make changes and improve their performance leads to employee motivation and helps them to renew their efforts. Human resource managers who use the objective and scientific performance measures are most able to motivate their employees better.

The employees’ evaluation consists of different forms of evaluation: when employees are evaluated based on the work they do and are trained for additional advancements, where they are rewarded in monetary form when they are motivated by acknowledgments and rotational position, through which the organization determines the value and express their qualities.

The evaluation of the employees is a process that happens continuously within organizations consciously or not. When we appreciate something, we try to determine the value, usefulness, and the qualities (Koli & Llaci, 2001)

Businesses have the advantage to decide the culture and organizational environment for their employees. If we talk about models that explain the connection between managers and employees for Kosovo organizations we are based on the critical-evaluation model of personnel manager (Legge, 1987).

Human resources managers very often behave according to a profitability view and the efficiency of the organization. Based on this view/model the businesses should not focus on the welfare of employees. Human resources managers do not deal with the individual development of employees. All activities of training and development are realized with the aim to improve the affectivity of employees with the aim to contribute more to the organization.

**Methodology used:**

The present paper is divided into two parts: the theoretical part and the empirical part. In the theoretical it part includes all the aspects that are related to human resources and performance evaluation as important factors that influence business effectiveness. The theoretical interpretation of this part explains the relation and the treatment of employees in an organization as a most valuable asset.

The empirical part includes the research that is realized through the questionnaire, the hypothesis is tested, and the interpretation of results is done. For the realization of the research, we are based in primary data. The questionnaire is distributed in private businesses, respectively their employees in the city of Peja in different departments. 280 questionnaires are distributed, and only 200 of them are valid for further analysis.

The research is focused on service and production businesses in the city of Peja. The results will be drawn from the responses of managers of those companies surveyed and based on these results every question is interpreted while also the labor market and employees’ requests are analyzed.

Figure 1: Has your business an evaluation system

To the question: “Has your business an evaluation system?” Based on Figure 1 about 75% of managers have a positive answer result with effectiveness as an important information and necessary for the function, the possibility to express to the employer what they expect to achieve and as well as a general understanding of organizational culture.
To the question: “which form of evaluation you apply”, from a total of 200 managers 100 of them answered that the businesses apply the method “wage based on performance” of evaluation performance, where the effectiveness is that they pay the employees based on merit, incentive wages that increase motivation, rewards, share splits.

To the question: “what kind of reward your company applies,” 92.5% of the answers of managers are a non-monetary reward. In fact, these kinds of rewards influence employee performances, either through intangible benefits of values such as career, social services such as job security, flexible work hours, professional growth, acknowledgments and strong friendship.

To the fourth question, 65% of managers declare that reward incentives influence the productivity growth, 30% of them declare that it influences less, and 5% of them abstained to this question.
To the fifth question, 65% of managers declare that reward incentives influence the productivity growth, 30% of them declare that it influence less, and 5% of them abstained to this question.

According to the statistics presented for the above question, 80% of managers declare that the department of HRM for training activities exists in their businesses and represent an important development factor.

Is the training of the staff a method for strategy implementation?
To this question, 50% of managers have answered positively, and the other part does not support the training of the staff as a part of the strategy.

**Figure 8: Are retrained employees evaluated and do they participate in the decision-making process?**

**Source:** Author

To this question if the trained employees will leave the organization 80% of managers declare positively.

**Conclusion:**

The success of the organization is related to employee training. Here are included the job satisfaction and employee motivation that try to give the best of them for the consumers, and in this way, they achieve success for their owners or shareholders. Through this two objectives are achieved: the objective of the organization and the objective of the employees.

We can certainly say that in Kosovo the application of the modern concept of the motivation of human resources, as is done in Western countries, is the far way in our organizations.

The political and economic instability (wage differences in Kosovo is much lower with respect to other European countries) that exists in Kosovo has created a disadvantage that directly affects the fact that motivation is a very important factor for increasing the performance, the application of a more reward system in the form of cash a reward since our country is facing the problem of low salaries.

Another conclusion, based on the statistics is that employees are evaluated, but they do not take part in the decision-making process. This must be changed, and the employees must have the right to give
their ideas in a way to have more innovations within organizations. Develop a training culture where all the specialized and not specialized employees can participate

_We can conclude that the rewards based on performance motivate and guarantees the success of the company_

COACHING TRENDS IN ROMANIA

Lorena Florentina Popescul, Loredana Jitaru

Abstract: The purpose of this study is to determine the future coaching trends in the Romanian market in the short, medium, and long term. We conducted a qualitative analysis where we administered a semi-structured, in-depth interview with 10 coaches asking them to share their opinions about the incoming trends in the Romanian coaching market. We note that the answers provided by coaches indicate a strong tendency for future growth in coaching; the public’s awareness of this topic is estimated to increase, especially because most organizations will realize that they can no longer cope with the new waves of change in the markets and in people’s behavior. This study can benefit experts interested in the current state of coaching, as well as decision-makers who seek to implement coaching in their organizations or in their personal lives. This work highlights valuable results that can act as starting points for additional research. This type of study is rare in Romania, and hence, this present study is important for understanding the impact of coaching trends in the Romanian market in the short, medium, and long term.

JEL Classification Numbers: L25, L84, M19; DOI: http://dx.doi.org/10.12955/cbup.v5.938

Keyword: Coaching, Trends, Romania, Qualitative research, in-depth interview.

Introduction

Coaching was introduced into Romania in the 2000s in a market that, in the beginning, was slightly apprehensive and distrustful of the results that this process might offer to individuals and organizations. It failed to gain momentum quickly in Romania. Only after the establishment of new foreign capital companies were Romanians introduced to coaching, and they began to view it as a process that helped people to understand and to grow and develop themselves either personally or professionally. Botton (2004) considered that in our meritocratic world, with prestigious and well-paid jobs being filled based on intelligence and personal skills alone, wealth is a sign of strength. Today, affluent people are not just wealthy, they are developed personally.

Often, both small and medium-sized enterprise employees and entrepreneurs realize they need a change in their lives. People seek coaching sessions because they wish to achieve that change. They want to surpass themselves, be better at what they do in their careers and in their personal lives, be richer from a spiritual point of view and wiser, or attain self-fulfillment. People might seek coaching sessions because they have continually ignored their need for self-fulfillment due to money, time, or family limitations. They may have neglected themselves, and this inevitably leads to a feeling of unease. As a result, many people start to develop states of anxiety, stress, fatigue, concentration disorders, panic, and excessive negative emotions.

Considering these notions, we have set out to determine the future trends of coaching in Romania.

Data and Methodology

The purpose of this study was to determine the future coaching trends in the Romanian market for the short, medium, and long term.

To achieve this objective, we conducted a qualitative analysis where we administered a semi-structured, in-depth interview with 10 coaches holding national and international certification, asking them to share their opinions about the incoming trends in the Romanian coaching market in the short, medium, and long term. These timeframes were 2017 - 2018, the next five years, and the next ten years, respectively. The interviewees were life and business coaches with more than three years of experience in the city of Iași, Romania. The interviews were conducted between September 25 and October 30, 2016. The duration of each interview was one hour. Subjects were asked three open questions and were allowed time to think about these and to give free and detailed answers.

The three questions of the interview guide were:“

Concerning the answers almost every coach had a different opinion to the others. Therefore, their answers were unique, except for a few cases involving forecasts for the short term (1 - 2 years):

- The number of coaching schools in Romania will increase (five coaches out of 10),
- The number of e-coaching sessions will increase compared to the face-to-face coaching sessions (10 coaches out of 10), and
- Distance learning via webinars will gain momentum in Romania (five coaches out of 10).

With regard to the coaching trends for the medium term (3 - 5 years), 10 coaches out of 10 said that the public’s awareness of coaching would increase. The rest of the answers were unique.

Then, for long-term trends (5 - 10 years), seven coaches out of 10 said that the number of pseudo-coaches would increase, while 10 coaches out of 10 said that people would learn to become independent and make their own decisions. The rest of the answers were unique.

We note that the answers provided by the coaches indicate a strong tendency for future growth in coaching; the public’s awareness of this topic is estimated to increase, especially because most organizations will realize that they can no longer cope with the new waves of change in the markets and in people’s behavior. People need to become what they must be. Ignoring the need for self-fulfillment leads to anxiety (Bolchover, 2006). Leaders will want to change if they receive support and encouragement. This is the part that coaches will continue to play. Free market capitalism evolves into the knowledge-based economy. Leaders must learn more and more, but there is insufficient time for them to do that (Goldsmith, 2004).

Using Skype and other instant messaging services, coaching sessions can be conducted without the need for either party to travel. Therefore, webinars combined with online discussions can be an efficient way to exchange knowledge within organizations, thus allowing people to learn from one another.

For instance, intranet systems in organizations facilitate both learning and the development and improvement of organizational performance. This is because these systems can reflect knowledge coded in the shape of change and organizational initiatives aimed at helping employees accept and adapt to changes in a way that is compatible with their personal objectives and values (Goldsmith, 2004).

We noticed a certain concern among coaches regarding the increase in the number of pseudo-coaches in the Romanian market. One for this concern is that coaching has yet to consolidate in the market, hand this means that the potential clients could easily be confused about the meaning of coaching. This is true especially considering the existence of so-called coaches who do not hold the necessary certificates to work in this line of business, leading to a great deal of shortcomings in the field of coaching.

While the data in this study cannot be extrapolated, it can be used as a starting point for further research concerning coaching trends.

**Conclusion**

This study can benefit experts interested in the current state of coaching, as well as decision-makers who seek to implement coaching in their organizations or in their personal lives. This work highlights valuable results that can act as starting points for additional research. Furthermore, the findings indicate a constant interest in developing and individualizing coaching as a profession in its own right.

This type of study is rare in Romania and hence, the reason this current study is important for understanding the impact of coaching trends in the Romanian market in the short, medium, and long term.

DEOFFSHORIZATION POLICY: CASE OF RUSSIAN COMPANIES

Anna Loukianova, Egor Nikulin, Alexander Kanivetc

Abstract: This paper investigates the impact of deoffshorization on the market value of Russian companies. The methodology of event study was used. Three events were analyzed, including the announcement of intentions to leave offshore from several major companies and the introduction of anti-offshore legislation (December 2013 - March 2014). We have not revealed any mutually significant market response to the selected events, since some of the firms faced positive cumulative abnormal returns, while the others encountered negative ones. At the same time, an empirical study showed evidence of significant negative effect on the market value for several companies. It can be argued that the deoffshorization impact on companies depends to a large extent on the offshore structure they use. Companies that are significantly exposed to deoffshorization need to adjust their strategy in order to counter potential negative consequences of this process.

JEL Classification Numbers: M10, M40, M41, M48; DOI: http://dx.doi.org/10.12955/cbup.v5.939

Keywords: offshore, deoffshorization, deoffshorization policy, company valuation

Introduction

Offshores or as they are alternatively called tax havens, play an important role in today’s worldwide economy. It is presumed that companies, as well as individuals, use them in order to lower their taxable income. Such a phenomenon is known as tax avoidance. As a result, governments receive less taxes than expected. As Zucman (2015) points out, wealthy individuals hide an estimated $7.6 trillion in tax havens, that leads to an estimated annual loss in government tax revenue of $190 billion worldwide. Not surprisingly, state authorities of different countries have started to elaborate specific instruments in order to hinder the extent of offshorization. For example, General Anti-Avoidance Rules (GAAR) were enacted in the UK in 2012; financial transactions taxes have been developed in several European countries in 2012-2013, etc. Russia made no exception in this regard. The address of the President of the Russian Federation Vladimir Putin to the Federal Assembly of Russia on December 12th, 2013 ushered in the initial stage of state deoffshorization policy in the country.

Deoffshorization generally brings negative consequences for companies, since they lose benefits of offshores they used to enjoy and in addition to that are expected to incur a particular amount of costs. These economic effects can be classified as follows (Desai and Dharmapala, 2004). Firstly, companies lose the tax benefits granted by offshore zones. Secondly, they may incur significant nontax costs because of the necessity to restructure their operations. Finally, companies often have to relocate their business to a less attractive regulatory environment and consequently, take more risks.

The goal of the current paper is to assess and explain the effect of the announcement of the state deoffshorization policy, triggered by the Russian government in late 2013, as well as the consequent corporate decisions to deoffshorize on the market value of Russian companies. Such a task has certain practical implications. The change in share price at the time of announcement would reflect how investors estimate the net present value of all the deoffshorization effects described above. If the change is negative, then a company should develop a set of measures in order to counter the detrimental consequences of deoffshorization. In other words, a company should develop the strategy of how to switch from offshore jurisdiction to the national one as cheaply as possible and to remain competitive at the same time.

Theoretical background

The term “offshore,” as well as some other terms implying the same meaning (i.e. tax havens), are frequently used nowadays in academic as well as professional publications. In a nutshell, offshores are considered to be countries (or strictly speaking, legal units) that provide favorable economic conditions for businesses. One of the first attempts at classifying and analyzing offshores and offshore operations was provided in the reports conducted by several well-known international organizations in late 1990s – early 2000s. (see, e.g., OECD, 1998; IMF, 2000; FATF, 2000). For example, the report of the International Monetary Fund (IMF) distinguished between offshore finance and offshore financial center.

1 Graduate School of Management, Saint Petersburg University, anna.loukianova@gsom.pu.ru
2 Graduate School of Management, Saint Petersburg University, nikulin@gsom.pu.ru
3 Graduate School of Management, Saint Petersburg University, aleksandr.kanivetc@gmail.com
The term “offshore finance” was used in this report in a very broad meaning, encompassing all financial services provided to non-residents. Hence, the concept of offshore financial center that was also used in this report appeared to be somewhat vague, since it covered every financial center that provided offshore services.

Over the course of years, the concept of offshores has become more specific. For example, Kheyfets (2013) outlined the main criteria that needed to be met by legal units in order to be considered offshores:

1. Opportunities for significant tax and other expenses mitigation;
2. A favorable legal environment for establishing and running a business. This usually includes simplified administrative and financial control;
3. The possibility of anonymous financial transactions and concealing the final beneficiaries of such operations.

In other words, the concept of offshores or tax havens started to be used primarily with reference to the tax avoidance phenomenon. A lot of studies show that companies that have part of their operations in offshore are able to decrease their overall tax burden (Lee, 2017). Such an effect can be detrimental to governments all over the world, since they get less revenue than expected. Taking this into consideration, it seems quite feasible that a number of deoffshorization measures were initiated at the national as well as international levels.

The prominent wave of deoffshorization measures in the world was initiated in 2008 and can be attributed to the beginning of global economic crisis. One of the first steps was the classification of different offshore zones (under the three-coloured scale) by the Organisation for Economic Co-operation and Development (OECD, 2009). Subsequent measures included the enactment of the Foreign Account Tax Compliance Act (FATCA) in the USA in 2010; the establishment of an EU-wide tax avoidance countering system (Eurofics) in 2010, etc…

Deoffshorization policy in Russia

The issue of offshores for Russia was and remains significant. Kheyfets (2010) argued that the Russian economy was offshore to a large extent, since many Russian corporations were in fact controlled by holdings incorporated in offshore zones. Thus, the need for deoffshorization was feasible. According to (Glaz’ev, 2014), the purpose of deoffshorization in Russia could be treated in two ways: firstly, as the decrease of quantity of offshores used by Russian companies, and secondly, as the decrease of the flow of money and goods that come from Russia and into Russia through offshores.

The event that in our opinion has triggered the development of deoffshorization measures in Russia was the address of President Vladimir Putin to the Federal Assembly of the country on December 12th, 2013. In this address, he pointed out the existence of a big amount of losses to the federal budget caused by an excessive degree of offshorization of the Russian economy. He touched on the same issue in his address of the previous year however, according to his opinion, the results were hardly visible as of 2013. That’s why he suggested a set of measures targeted at deoffshorization. For instance, he proposed to cut off the Russian companies registered abroad from governmental support measures and to forbid them to participate in governmental purchase tenders (NewsKremlin.ru, 2013). He also emphasized the necessity for increasing the transparency of the Russian economy.

As a follow-up event, several Russian companies (RusHydro, UC RUSAL, Sovcomflot and KAMAZ) announced their intentions to deoffshorize on December 18th, 2013 (Infox.ru, 2013). RUSAL press-secretary Olga Sanarova declared that the company has already developed a plan of reorganizing financial and trade operations to shift to Russian jurisdiction. CEO of KAMAZ Sergey Kogogin announced that KAMAZ shareholders also supported the idea of restructuring. RusHydro planned to finish the elimination of its Cyprus subsidiaries by the end of 2014, according to vice-chairman of the company George Rizhinashvili.

As for the initial legislative measures of the deoffshorization policy, the draft of Controlled Foreign Entities Bill was proposed by the Ministry of Finance on March 18th, 2014. The importance of this bill is that it introduced the notion of a controlled foreign company. It is a company that simultaneously fulfills the following criteria (abridged):

1. It is not considered a tax resident of Russian Federation.
2. It is a tax resident of a country (jurisdiction), which is on the list of low-tax zones approved by Russian Ministry of Finance.
3. It is controlled by companies or individuals, who are tax residents of the Russian Federation.
4. Company shares are not publicly traded on stock exchanges approved by the Russian Ministry of Finance.

The Bill also introduced the concept of control. According to the document, a controlling company or individual was considered to be the one who had implicit or explicit ownership of more than 10% of the controlled foreign company. The main practical importance of the Bill was that it required controlled companies to report its profits in accordance with the Russian Tax Code. This initiative, without a doubt, targeted offshore subsidiaries of Russian companies used for profit accumulation and other aggressive tax avoidance measures.

Although the anti-offshore legislation in Russia continued to develop since then, in the current paper we focus only on the initial measures and events targeted to ensure deoffshorization in Russia (Loukianova, Kanivetc, 2014). In other words, we aim to identify the market’s reaction to the very first steps in the direction of deoffshorization in Russia. Such an approach would enable us to single out companies that are more exposed to the potential negative consequences of deoffshorization. We believe that the strategy of these companies should contain specific instruments tailored to counter these negative factors in order to maintain their enterprise value.

**Methodology**

For our research, we have chosen nine large Russian companies that, according to open sources of information, were involved in offshore schemes. Another criterion was the availability of free-trading stock. The final sample comprised the following companies: JSC Rushydro, JSC KAMAZ, JSC MTS, JSC NLMK, JSC Nornickel, JSC Gazprom, JSC Rosneft, Evraz Plc and UC RUSAL Plc.

An event study methodology was used. There were two types of events: reorganization announcements by the companies' officials and the governmental bodies' actions. The following three major deoffshorization-related events were selected for the study:

1. December 12th, 2013: V.V. Putin’s address to the Federal Assembly of the Russian Federation
2. December 18th, 2013: The declaration of intentions to deoffshorize by RusHydro, UC RUSAL, KAMAZ, etc.
3. March 18th, 2014: The introduction of the Controlled foreign companies (CFC) law by the Ministry of Finance.

One-day, two-day (from day 0 to day +1) and five-day (from day -2 to day +2) cumulative abnormal returns (CARs) around the announcement date (which is denoted day 0) were examined. We also introduce a 5-days gap between the two intervals to exclude any preliminary effects of the event, which could possibly influence the stock behavior in advance to the event itself and add bias to the estimation window. We introduce the following notation: \( T_0 \) is the first day of the estimation period, \( T_1=T_0+249 \) is the last day of the estimation period, \( T_2= T_1+5 \) is the first day of the event window, \( T_3 \) is the last day of the event window (see Figure 1).

Source: Authors
Simple daily returns are constructed using the stock market data for the selected companies’ share prices in the period outlined above. First, usual daily returns are calculated as follows:

\[ R_{i,t} = \frac{P_{i,t} - P_{i,t-1}}{P_{i,t-1}} - 1, \]  

where \( P_{i,t} \) is the share price of \( i \)th company on day \( t \), \( i = 1, \ldots, 9 \), a number of companies in selection (here and further, unless noted otherwise).

Cumulative returns were computed according to the following formulae:

\[
\begin{align*}
1-day \text{ CAR}_i &= AR_{i,t} = R_{i,t} - ER_{i,t} \\
2-day \text{ CAR}_i &= \sum_{t=0}^{1} AR_{i,t} \\
5-day \text{ CAR}_i &= \sum_{t=2}^{4} AR_{i,t}.
\end{align*}
\]

Then the expected returns for the selected companies were constructed. Though Desai and Hines (2002) and Cloyd et al. (2003) propose using simple market daily returns as a proxy of expected return, we aimed to increase the precision of the results and therefore used the CAPM model:

\[ ER_{i,t} = r_f + \beta (R_{m,t} - r_f), \]

where \( ER_{i,t} \) is the expected return for the company \( i \), \( r_f \) is the risk-free rate of return, \( \beta \) is the beta-coefficient, and \( R_{m,t} \) is the market return.

\( R_{m,t} \) was taken as the market portfolio return according to the stock exchange residence of the company. For companies traded at the Moscow Stock exchange the proxy for market return was the MICEX index portfolio behaviour. For Evraz, which is traded at the London Stock exchange, the proxy was return on FTSE100, and for RUSAL (traded at Hong Kong Stock exchange) market return was taken as return on the Hang Seng index.

To obtain the quantitative form of equation (3), a regression of \( R_{i,t} \) on \( R_{m,t} \) was carried out for each company across the estimation period window (250 trading days) preceding the event date. The results are shown in Table 1.

Finally, the possible biases from external events are taken into consideration by taking away the strings of data related to dividends and earnings announcements (based on companies’ press releases and business news, including financial calendars). Approximately 5-10 dates were excluded for each company from the estimation window.

Given the potential negative consequences to deoffshorization we expect that the market value of companies will react negatively to the deoffshorization announcements.

**Results**

Firstly, cumulative abnormal returns of companies were constructed for each event date and compared with each other to reveal, if present, similar direction of returns on stocks movements against the market portfolio. Secondly, a mutual significance of CARs was estimated based on the GRANK statistic.

Figure 2 shows the distribution of CARs by companies selected for the study for the 12th, 18th and 19th of December.

It was reasonable to expect mutual negative reactions at least for the majority of companies. However, no correlated behavior of the companies’ share prices against the market is observed, as some of the firms face positive CARs, while the others face negative ones.

At the same time, CARs are correlated within most companies for consequent days. One of the exceptions would be KAMAZ. We can see that this company has at first reacted positively to the announcement, but afterward had strong negative reaction to the events.
This effect can be attributed to the fact that not all companies’ values are subject to significant market response to the observations in Figures 2 and 3. Furthermore, the average behavior across the portfolio is positive (though insignificant) for all events. This effect can be attributed to the fact that not all companies’ values are subject to deoffshorization implications for the companies, we see no mutually negative (or positive) market response to the introduction of the initial version of the CFC law by the Russian Ministry of Finance. Here it would be reasonable to expect mutual negative behavior of the companies’ abnormal returns, with possible little negative change for KAMAZ, as the market may have already incorporated the expected loss into its share price in December. However, here we do not observe such effect, as only Norilsk Nickel and NLMK demonstrate negative abnormal returns over the selected timeframe. At the same time, Evraz and RUSAL have outstanding positive returns in comparison to the market portfolio. So far, the comparison of absolute values of cumulative abnormal returns does not allow for witnessing the presence of mutual negative (or positive) market responses to the deoffshorization events. To assess this statement statistically, we proceed to estimate the mutual t-statistics by using the GRANK approach. Unsurprisingly to the observations in Figures 2 and 3, but contradictory to the expectations highlighted in the theoretical explanation of deoffshorization implications for the companies, we see no mutually significant market response to the selected events (see Figure 4).
announcements and legislations introduced. Thus, positive or no market reaction for some companies blurs the overall picture for the portfolio.

![Figure 4: Mutual GRANK t-statistics of CARs across the selected events’ dates](image)

We believe that such a difference in results between companies can be attributed to the fact that they use different offshore schemes. That is why they are to a different extent sensitive to the state’s deoffshorization initiatives. This can be shown with the example of two companies: UC RUSAL and JSC KAMAZ.

UC RUSAL is almost fully owned through offshore-registered holdings and companies (RUSAL, 2014). Such a structure makes this company less sensitive to the CFC law. This fact may cause the absence of negative market reaction to the enactment of the initial version of this law on March 18th and 19th. If a company strives to maintain its offshore advantages, it needs to keep the existing offshore structure.

JSC KAMAZ possesses another ownership structure. Some of its owners are registered in Russia, while the other are registered in Cyprus (KAMAZ 2014; Lyapunov et al, 2014). Such a structure renders this company exposed to the deoffshorization policy of Russia, since the owners of this company face the issue of increased taxation. In order to restrain these negative effects, they should consider the following options. Firstly, they can leave the Russian tax residence. However, this option is not very likely, since a significant share of ownership of JSC KAMAZ belongs to the state. Another option could be the dispersion of the ownership of the Russian business across several offshore companies with a small stake in each.

**Conclusion**

The results of our study revealed that there was no universal market reaction to the three events that characterized the initial stage of the state deoffshorization policy in Russia: V.V. Putin’s address to the Federal Assembly of Russian Federation (December 12th, 2013); the declaration of intentions to deoffshorize by several large Russian companies (December 18th, 2013); the introduction of the Controlled Foreign companies (CFC) law by the Ministry of Finance (March 18th, 2014). Some companies faced positive cumulative abnormal returns, while others had negative ones. The difference in results can be attributed to the fact that companies used different offshore schemes that make them more or less sensitive to the state’s deoffshorization measures. The implications of the empirical analysis are that companies should analyze whether their structure is dependent on the state’s deoffshorization policy and if it is, to develop a set of measures in order to mitigate these negative factors.

We believe that the findings of our research are not limited to the companies considered in our sample. Indeed, they can be applied to different companies in Russia that are engaged in offshore operations and serve a useful tool for the development of strategies against the potential negative consequences of deoffshorization.

MEDICAL TOURISM POTENTIAL OF CENTRAL AND EASTERN EUROPE: ATTEMPT AT CLASSIFICATION

Adrian Lubowiecki-Vikuk,1 Justyna Kurkowiak2

Abstract: Medical tourism potential of CEE is currently not clearly identified due to the lack of data concerning the number of medical tourists in respective countries. The aim of the present study is to shed light on potential research topics in the field of medical tourism. A detailed analysis of scientific and consulting literature was used to identify the elements of medical tourism potential. The agglomerative clustering algorithm forms distinct groups of countries that are similar with regard to that potential. Creating the statistical synthetic measures allows one to construct the ranking of countries with respect to their potential regarding medical tourism. Four distinct groups of countries emerge from the cluster analysis. It was found that the countries from the European Union (EU), which are characterized by higher economic indicators, create similar clusters and take the highest positions in the ranking. Surprisingly, the price level is not the top criterion determining the position within the classification. The obtained results fill the gap in the field of medical tourism in CEE and have implications for further research related to medical tourism. This classification could be a useful tool for the various stakeholders interested in the development potential of medical tourism in this part of Europe.

JEL Classification Numbers: 015, I11, Z32; DOI: http://dx.doi.org/10.12955/cbp.u.v5.940

Keywords: Central and Eastern Europe, medical tourism, healthcare, medical tourism potential, Ward’s method.

Introduction

Medical tourism is a characteristic phenomenon of the modern times. Patients take up travel to use health-related services, including services offered as part of tour packages (Connell, 2013; Rab-Przybyłowicz, 2016). The scope of the services is wide – they come from the field of preventive care, dental treatment, plastic surgery, aesthetic medicine and dermatology, orthopedics, ophthalmology, gynecology and other (Beladi et al., 2015; Lunt et al., 2014). The concept of medical tourism varies from country to country. Unlike in Western Europe, where the emphasis is put on prevention and maintaining both mental and physical health, in Central and Eastern Europe (CEE), physical health is the main focus. In southern Europe, treatments based on sea water is popular, while in northern Europe spa tourism is based on natural landscapes and treatments using cold lake water (Smith & Puczkó, 2014). Medical tourism generally takes place at a short distance and has a rather dispersed character, despite being part of an increasingly global medical industry that is linked to the tourism industry (Connell, 2013). There is a need for determination and integration of concepts. Medical tourism is the subject of scientific research by many academics focusing on countries offering medical tourism services: Asian countries, the USA, Mexico, countries of Central and South America. The other medical tourism destinations, CEE countries in particular, are still poorly researched.

The CEE region has a rich tradition in providing a variety of health-related services. Therefore, it is not surprising that this part of Europe is becoming increasingly more prominent on the map of medical tourism destinations (Fetscherin & Stephano, 2016). Smith et al. (2016) report that the market potential is large and more agencies will specialize in medical tourism in the future. The situation is helped along, among others, by the favorable climate, beautiful and often pristine natural environment, a good position on the map of Europe, and competitive prices for international tourists. On the other hand, health tourism in this region still suffers from a number of weaknesses (cf. Kesar & Rimac, 2011; Kiss, 2015). The relatively poor infrastructure and the service quality should be improved. The industry needs better education, more training and new skills. Efforts should be made to change the often negative image of the region and build up trust of potential visitors. Another hindrance is poor cooperation between healthcare and tourism, and country-specific regulations. Migration of medical professionals to the EU countries outside of the CEE area is becoming a serious problem, prevention of which requires government support, an innovative approach to eliminating defects and the use of the opportunities and observation of contemporary trends in the market. All these issues need to be addressed in the research on the development of medical tourism in CEE.

The CEE concept has a dual sense: geopolitical and culturo-historical. The opinions on which country should be qualified as belonging to the region vary depending on historical issues, standardization of

1 Poznan University of Physical Education, Poland, alubowiecki@interia.pl
2 Medical University of Warsaw, Poland, justyna.kurkowiak@wum.edu.pl
geographical names and ideas of representatives of various research centers (UNGEGN, 2016). Each division will spark discussion. Therefore, it is assumed that the CEE region will include the following countries: Albania, Belarus, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Kosovo, Latvia, Lithuania, Macedonia, Moldova, Montenegro, Poland, Romania, Serbia, Slovakia, Slovenia and Ukraine.

Since the early 1990’s, significant socio-demographic changes have been taking place in the CEE region, such as the falling birth-rate, the increasing number of elderly people, the decline in the number of people in households, the changes in the family model and the process of migration (immigration, mainly to larger urban centers of European countries). The region is diverse due to: (i) economic as well as social retardation in comparison with the “old” EU countries, (ii) the varying standard of living in individual countries, (iii) changes in the structure and resources of the healthcare system, and (iv) globalization and its effects (Iordache, Ciochină & Popa, 2013; Karmowska & Marciniak, 2015; Romaniuk & Szromek, 2016). Consumerism encourages the development of tourism, translating into specific benefits for the national economy and changing consumption patterns. At the same time, broadly defined health-related services often become a part of tourist trips or even their main goal. These phenomena significantly shape and differentiate the medical tourism market in the CEE region, which makes it even more difficult to estimate the medical tourism potential. A need has emerged to create favorable conditions for the material and technical, as well as organizational measures in the services sector.

The aim of this paper is to identify the potential of medical tourism destinations in this part of Europe. This would make it possible to prepare medical tourism products that meet tourists’ individual needs. The practice of medical tourism depends on successfully informing potential patients about procedure options, treatment facilities, tourism opportunities, travel arrangements, and destination countries (Crooks et al., 2011). The medical tourism potential itself should be treated as a collection of internal, both structural and functional, possibilities of the country enabling the development of medical tourism in its territory.

This study aims to fill the gap in the research on the process of shaping the image of a medical tourism destination, with particular focus on the medical tourism potential. It is also useful in that it is the first step towards a comprehensive analysis of the potential of the medical tourism market in CEE, from which future promotional strategies can be developed. The results will make it possible for medical tourism facilitators / brokers and destination management organizations, as well as for the interested academics, to comprehend the medical tourism phenomenon better.

**Methods**

This study concerned with the creation of the classification of CEE countries in terms of medical tourism development potential, for which Ward’s method was used along with independent methods of linear order (Ward, 1963, p. 238). The classification is an attempt to determine the potential of individual CEE countries as medical tourism destinations. Nineteen out of 20 CEE countries were taken into account, as Kosovo could not be included in further analyses due to the lack of relevant data. It was assumed that a predisposition to medical tourism development in individual CEE countries is the result of three factors: medical potential and tourism competitiveness of a given country, and the cost of medical services. Ward’s algorithms were used to construct the data structure agglomerative clustering. Cluster analysis divides objects (countries) into homogeneous groups based on the information found within the data, describing the objects without establishing a hierarchy between them. Ward’s method is regarded as very efficient in capturing the natural structure of the data.

The purpose of this method is to join objects into successively larger clusters, using some measure of similarity defined as the error sum of squares (used in the analysis of variance), defined as $ESS = \sum_{i=1}^{k} (X_i - \bar{X})^2$, where $k$ denotes the number of clusters. The choice of the appropriate variable was determined, apart from the substantive criteria and the accessibility of statistical information (Eurostat, 2015; WHO, 2015), also by the usefulness of the diagnostic variables for Ward’s cluster analysis. The analysis requires variables which have sufficient variability and are not too strongly correlated with each other. The threshold value chosen for the coefficient of variation was set to be 0.15, and for the correlation coefficient to be 0.75. Because the range of values differs between variables the standardization of data was done so that all attributes were on the same scale. Finally, medical
potential of the country was determined on the basis of tourists per population, total health expenditure ($ per capita and % of GDP), total number of hospitals, number of physicians, nurses and dentists (per 100,000 population), total density of linear accelerator per one million inhabitants and Euro Health Consumer Index (EHCI) 2015 (Björnberg, 2016). Tourism competitiveness of a given country was specified by Travel & Tourism Competitiveness Index consisting of 14 pillars organized into four subindexes: business environment, safety and security, health and hygiene, human resources and labor market, ICT readiness, prioritization of travel and tourism, international openness, price competitiveness, environmental sustainability, air transport infrastructure, ground and port infrastructure, tourist service infrastructure, natural resources, and cultural resources and business travel (Travel & Tourism Competitiveness Report, 2015). Due to the assumptions of Ward’s method the analysis included the indicators marked in italic. Lack of data on tourism competitiveness of Belarus, Bosnia and Herzegovina and Ukraine was replaced by the average of the corresponding indexes of countries similar in terms of the ratio of GDP per capita and the number of foreign tourists. The average price level ($) of selected medical services for medical tourists in various CEE countries was estimated on the basis of a widely available price list (Treatment Abroad, 2015): dental implant, IVF with donor eggs, breast enlargement and gastric bypass.

In the next analysis, the diagnostic variables from Ward’s method were aggregated to determine the synthetic measure in order to create the ranking of countries with respect to their potential regarding medical tourism. There exist a number of methods for creating a synthetic variable. Three different methods were used to compare the resulting rankings and to check if the choice of a particular method affected the ranking order.

First, we followed the methodology proposed by Hellwig (1968). For the given \( m \) objects described by \( n \) standardized variables \( Z_{ij} \), where \( i = 1,2, ..., m \), \( j = 1,2, ..., n \), the model patterned object \( z_{0j} \) was chosen which is described as follows:

\[
z_{0j} = \begin{cases} 
\max_i \{z_{ij}\}, & \text{if variable is stimulant} \\
\min_i \{z_{ij}\}, & \text{if variable is destimulant}
\end{cases}
\]

Then, for each of \( m \) objects the distance from the patterned object model was computed According to Euclidean measure:

\[
d_{ij} = \sqrt{\sum_{j=1}^{m} (z_{ij} - z_{0j})^2} \]

Those distances were used to calculate the synthetic measure which was next used to construct a linear order:

\[
h_i = 1 - \frac{d_{i0}}{\bar{d}_0 + 2s}, \quad i = 1,2, ..., m
\]

where \( \bar{d}_0 \) and \( s \) denote, respectively, the average and standard deviation for the calculated distances, i.e.

\[
\bar{d}_0 = \frac{1}{n} \sum_{i=1}^{n} d_{i0}, \quad s = \sqrt{\frac{\sum_{i=1}^{n} (d_{i0} - \bar{d}_0)^2}{n}}.
\]

The next two methods are not model methods: the average ranks method (Brazdil & Soares, 2000) and the zero unitarization method (Kukula & Bogocz, 2014). The average ranks method for standardized variables calculates the average rank for each object according to the formula:

\[
r_i = \frac{\sum_{j=1}^{n} r_{ij}}{n}, \quad i = 1,2, ..., m
\]

Stimulant variables that are ranked \( r_{ij} \) from the highest to the lowest, and destimulant variables from the lowest to the highest. If two or more scores have the same value then they are ‘tied’, i.e. first, each tied score is given a rank it would have, if it was different from the other scores. Then, the ranks for the tied scores are added and divided by the number of tied scores. This way each tie gets the same average rank.

In the third method, the selected diagnostic variables were subjected to the normalization process by using the zero unitarization method. If the variables are stimulants the normalization is performed using the following formula:
If the variables are destimulants, the appropriate formula is as follows:

\[ z_{ij} = \frac{x_{ij} - \min_i \{x_{ij}\}}{\max_i \{x_{ij}\} - \min_i \{x_{ij}\}} \]

For each object the synthetic variable \( u_i \) is defined as the average of normalized diagnostic variables:

\[ u_i = \frac{\sum_{j=1}^{n} z_{ij}}{n}. \]

Spearman’s rank correlation coefficient, which is a measure of the strength of the relationship between data, was calculated to check if the selected measures brought similar classification results. All statistical analyses were and conducted using data analysis software system StatSoft, Inc. (2014). STATISTICA, version 12. www.statsoft.com. The significance level was set as \( p \leq 0.05 \).

**Results**

In view of the factors influencing the development of medical tourism in CEE, the countries were grouped, which resulted in a dendrogram illustrating the hierarchical structure of the countries (Figure 1).

The adoption of binding distance of 7 allowed us to distinguish four clusters (Table 1). The first group consists of Belarus and Ukraine. The group is characterized by a medium number of tourists, lower expenditure on health per capita, and at the same time a higher than average number of hospitals, physicians, nurses and dentists. Lower economic indicators are also noticeable, the EHCI at 0 and low prices of selected medical services in the CEE countries. The second group (Czech Republic, Hungary,
Lithuania, Poland, Romania, Slovakia, Slovenia) and the third one (Bulgaria, Croatia, Estonia, Latvia), are characterized by higher than average economic indicators, expenditure on health and EHCI level. The number of tourists constitutes a differentiating factor. In the second group it is at an average level, while in the third group it is higher than average. Both groups are made up of countries belonging to the EU. Albania, Bosnia and Herzegovina, Macedonia, Moldova, Montenegro and Serbia make up the last group which is characterized by a lower than average number of tourists, lower expenditure and economic indicators, lower EHCI level and the highest prices of selected medical services of all CEE countries.

The use of tools of the multidimensional comparative analysis allowed us to create a ranking of CEE countries as shown in Table 2.

The rankings of CEE countries received large consistency of the results confirmed by the high value of the Spearman’s rank correlation coefficient (about 0.93 for each pair). In the general classification, the leading positions are occupied by the EU countries, the last by Moldova and Albania.

Discussion

Medical tourism is an example of not only the possibility of economic revival in the CEE countries, but also specific consequences of various factors affecting decisions about medical treatment abroad (Directive 2011/24/EU, 2011; Fetscherin & Stephano, 2016). This is due to the medical tourism potential. According to our own research, the following countries occupied top places in this regard: Czech Republic, Slovenia, Estonia, Slovakia, Croatia, Bulgaria, Lithuania, Latvia, Hungary and Poland.

Marinou et al. (2009, p. 282) emphasized that countries such as Hungary, Slovenia, Czech Republic, Slovakia and Poland, which made considerable investment efforts to modernize and develop their resorts, are currently major competitors for many countries of Western Europe with tradition of medical tourism. An increase in exports of health services in the countries such as Estonia, Latvia, Lithuania and Croatia has been observed (Langvinienė, 2014, p. 312). Bulgaria, which also continually improves its offer of health tourism, is becoming a major rival of Romania (Marinou et al., 2009, p. 283).

Medical tourism development is possible thanks to the support from EU funds, and drawing particular attention of the representatives of private companies to the quality of medical services, while maintaining an optimal level of their prices. Furthermore, in most of these countries, the health systems are also run properly (Romaniuk & Szromek, 2016, p. 95). Safety as well as attractiveness of
tourist destinations constitute an additional advantage of the leaders in the CEE countries ranking. The Czech Republic, Slovenia, Hungary and Poland are currently a group of safe destinations in this part of Europe (2015 Global Peace Index, 2015).

CEE countries outside the EU (except for Romania in the 13th-14th place) occupy significantly lower places (11-19) in the overall classification in terms of medical tourism potential. The lack of subsidies is a major cause of this situation. The case of Montenegro proves how crucial subsidies are. The country received government support, thanks to which (as Smith et al. suggest) health tourism has increased by 20% in the past five years, mainly because of the medical tourism industry (Smith et al., 2016).

The price of medical tourism products and services, which substantially affects the participation in medical travel (Lubowiecki-Vikuk & Rab-Przybyłowicz, 2015, p. 85), is believed to be an allocative effect of medical tourism market function. In this respect, the lowest prices of medical services in Belarus and Ukraine or the highest in CEE in Serbia, Moldova, Macedonia, and Montenegro (Treatment Abroad, 2015), did not result in high places in the ranking of medical tourism potential in the studied region. Moreover, a low position in this classification may be associated with different health care systems of CEE countries. According to Romaniuk and Szromek (2016), Albania, Belarus, Moldova, and Ukraine are among the countries whose health systems are the weakest and with least improvements in recent years. Given the above, it is the quality, not the price of medical services that is the priority for medical tourism development. Poland occupies 8-10th place in the overall classification of the CEE countries. It should be noted that Poland was the only country in the CEE region included in the Medical Tourism Index (Fetscherin & Stephano, 2016, p. 541).

The authors assumed that medical tourism potential is a collection of internal, both structural and functional possibilities of the country, enabling the development of medical tourism in its territory. Scientists do not have access to many variables because the appropriate data are not available. The created clusters give a general idea of the CEE region, however, it deserves more attention in regard to medical tourism. The variables used speak of the current state of things rather than future.

Given those limitations, the authors are aware of the fact that their initiative should be continued and would constitute a basis for further research in this area, taking into account an increasing number of studies on medical tourism.

Conclusions

The CEE countries, especially those belonging to the EU, in many respects, such as health, economy, tourism, favorable prices, together broadly defined as the medical tourism potential, are becoming more and more attractive for citizens of countries with developed economies. The countries characterized by higher economic indicators create similar clusters and take the highest position in the ranking (e.g. the Czech Republic, Slovenia, Estonia, and Slovakia).

In the future, identification of the CEE medical tourism potential will help to determine the brand of a given destination. It should be noted, however, that the ongoing economic, political and religious instability and conflicts in the region can damage its image and limit the potential.

TURNING DATA INTO VALUABLE INSIGHTS: THE CASE STUDY IN AVIATION SECTOR COMPANY
Daiga Ergle,1 Iveta Ludviga,2 Agita Kalviņa3

Abstract: Since the early 2000s, there is increasing pressure on Human Resource Departments to show their impact on organizational performance. This pressure is related to the shift from industrial based economies to knowledge based economies and positioning people as potential sources of competitive advantage, and to the rise of Evidence-Based Management (EBM), which requires making decisions based on data and analysis. New technologies have enabled HR departments to start a transition from HR metrics to HR Analytics, thus transforming from the traditional administrative HR function to a more strategic HR function that can express qualitative matters and its impact on organizational performance with numbers. This case study describes the implementation of HR analytics in an aviation sector company. Quantitative data gathered from an annual staff engagement survey are analyzed using a Structural Equation Modelling technique with Smart PLS software. The results show that the analysis offers insights which are much more valuable than traditional diagnosis of the level of employee engagement. Thus, management can trace an employee’s journey within the organization and be able to predict their behavior in relationship to the time spent in the organization. Moreover, the changing needs of employees are seen form the analysis and Evidence-Based Management can be implemented.

Introduction
Over the past three decades many researchers have tried to prove Human Recourse’s (HR) impact on business by unraveling the link between HR and individual and organizational performance (Evans & Davis, 2005; Fitz-Enz, 1984; Huselid, 1995; Paauwe et al., 2012). However, still a lot of questions regarding the link between HR and organizational performance remain unanswered (Paauwe et al., 2012) and there is still a lot unknown. In the early 2000s, the pressure on HR to be able to show its impact was increasing. On the one hand, this pressure was caused due to the shift from industrial based economies to knowledge based economies. This shift positioned people as valuable assets within the organization that play an important role in gaining competitive advantage (Pease et al., 2014). Knowing how HR impacts organizational performance therefore became more important as it could help to create competitive advantage. On the other hand, it was a result of the rise of Evidence-Based Management (EBM), which requires making decisions based on data and analysis (Fink, 2010; Rynes et al., 2007). As the opportunities to collect and use huge amounts of data increased over the last decade due to new, fast and relatively cheap technologies, the ability to make better data based decisions grew (Russel & Bennet, 2015). Many organisational functions, such as finance and marketing, nowadays conduct EBM and have successfully adjusted themselves to make data based and analytic decisions to justify their activities (Boudreau & Ramstad, 2005; Lawler et al., 2004; Rynes et al., 2007). However, in most organizations HR still relies on gut-based decisions (Mishra et al., 2016).

As a result, investments in HR cannot be justified due to a lack of available data and it is not possible to quantify the returns on investments (Mondere et al., 2011). It is likely that HR will be able to implement EBM within the next decade. New technologies developed during the 2000s have enabled HR to start a transformation from HR metrics to HR Analytics (Bassi, 2011).

This paper presents a case study of an aviation sector company and describes the value of the implementation of HR analytics by presenting predictive analytics of available HR metrics. The paper is structured as follows: first HR metrics and HR analytics are defined and the transition discussed. Further the methodology is presented, followed by analysis of the company’s HR data and findings.

From HR metrics to HR analytics
In the early 1970s, HR metrics were established by HR practitioners and researchers as a first attempt to quantify HR activities (Bassi, 2011; Fitz-enz, 2010). HR metrics are measurable units describing the personnel related characteristics of an organization, traditional examples are retention rate, turnover rate and cost of hire (Bassi, 2011; Fitz-enz, 2010; Fitz-enz & Mattox, 2014). In the 1980s and 1990s
the established HR metrics were further developed and new HR metrics were created (Fitz-enz, 2010) enabling organizations to conduct benchmarks with other organizations using HR metrics (Bassi, 2011), which marks the first step towards the ability of HR to show its impact on organizational performance.

HR analytics is defined as “the application of a methodology and integrated process for improving the quality of people-related decisions for improving individual and/or organizational performance” (Bassi, 2011, p. 16). Applying HR Analytics goes beyond using HR metrics (Fitz-enz & Mattoo, 2014). HR metrics merely describe personnel related characteristics of an organization in numbers. HR Analytics goes one step further by trying to understand relations and interactions between personnel related characteristics of an organization (Fitz-enz & Mattoo, 2014). The transition of the use of HR metrics towards HR Analytics is seen as the beginning of an evolution of the HR function (Fitz-enz, 2010; Van den Heuvel & Bondarouk, 2016). This evolution entails a transformation from the traditional administrative HR function to a more strategic HR function that is able to show impact on organizational performance with numbers (Fitz-enz, 2010). HR Analytics is seen as an HR tool for conducting Evidence Based Management (EBM) (Falletta, 2014; Fitz-enz & Mattoo, 2014; Mondore et al., 2011).

Effectively conducting HR Analytics means showing HR’s impact on business results (Mondore et al., 2011). This is experienced as a struggle by many starters in HR Analytics as a clear purpose for HR Analytics is often missing (Fitz-enz & Mattoo, 2014). As a result, HR practitioners report on analyses that are not perceived to be relevant for business (Mondore et al., 2011). For example, only reporting on the time it takes to hire a new employee is not relevant for the CEO as it does not show the impact on organizational performance. The purpose of HR Analytics should be linked to the HR strategy as the HR strategy determines the kind of investments and decisions HR makes with regards to the workforce (Pease et al., 2014). Aligning the purpose of HR Analytics with the HR strategy should lead to alignment of HR Analytics with organizational goals as the HR strategy should be based upon the organizational strategy.

When the purpose of HR Analytics is clear, HR Analytics can be used to solve business cases. By using HR Analytics on a particular business case, HR practitioners can figure out how HR activities support improving business results by improving business decisions (Fitz-enz & Mattoo, 2014). The purpose of a specific business case forces HR practitioners to focus on particular data sets, which helps to overcome data abundance and focussing on HR activities that impact organizational development. As HR Analytics combines HR and business data, it is relevant to thoroughly understand the business in which the organization is operating to be able to select relevant HR and business data (Fitz-enz, 2010; Pease et al., 2014; Rasmussen & Ulrich, 2015). Understanding the business will give insight in the critical outcomes of organizations and the problems that organizations are facing (Gardner et al., 2011; Mondore et al., 2011). Furthermore, it will teach HR practitioners to speak the language of the business (Fitz-enz & Mattoo, 2014; Pease et al., 2014).

Since HR Analytics is a new HR tool, only a few organizations have so far succeeded in implementing and using HR Analytics. Many HR practitioners are struggling with HR Analytics as it is difficult to have the right competences and available resources and thereby, HR Analytics should be specifically tailored to the organization (Bassi, 2011; Lawler et al., 2004; Van den Heuvel & Bondarouk, 2016). Since researchers have only recently focused their attention on HR Analytics, there is not much academic literature available yet (Fink, 2010; Van den Heuvel & Bondarouk, 2016). Therefore, HR practitioners who want to conduct HR Analytics are highly dependent on success stories, recommended action plans and advises of HR practitioners that have already implemented HR Analytics within their organizations (Fitz-enz, 2010; Fitz-enz & Mattoo, 2014; Pease et al., 2014). Comparing the current literature regarding HR Analytics, five questions can be constructed on how to approach HR Analytics. Those five questions are: What is the purpose? What data is available? How is the data structured? What kind of analysis is needed? How can the outcome of the analysis be used?

Methodology

The company analyzed in this research paper operates in the aviation industry and has recovered from a financial setback in 2011. During the financial setback, the organization suffered cutbacks and
reorganizations, which also influenced the position and the budget of the HR department. Now the organization is doing better, the HR department envisions a more strategic position for itself. However, the HR department has difficulties building credibility and persuasion power. Consequently, they are not yet able to convince the board and other business executives of their position as a strategic partner and they don’t know how to show their impact on business results. As HR Analytics is referred to as a tool to build credibility of HR and persuasion power by proving the impact of HR on business, the HR department wants to implement HR Analytics within company.

This research starts with assessing the current data capability with regards to HR Analytics. In order to capture the underlying beliefs and understandings of the HR strategy, policies and practices and thoroughly understand the aviation industry, this research starts with a qualitative approach - semi-structured interviews which enable the interviewer to ask follow-up questions if needed to gain a better understanding of the answers given by respondents (Verschuren & Doorewaard, 2010). In total 12 semi-structured interviews are conducted. The interviews with HR practitioners had a duration of 90 minutes and the interviews with business executives were approximately 60 minutes. The HR practitioners provided an insight into the HR strategy, policies, practices and the daily tasks of HR practitioners, which gave insight into the purpose of implementing HR Analytics and the available data. The business executives gave insight in the aviation industry and in business needs. All interviews were recorded and transcribed verbatim to be able to analyze them and construct key word takeaways. In addition, this research used document analysis to figure out what data is available and to analyze the data structure. For the document analysis, HR policy documents, HR documents and notifications on intranet and excel files with collected HR data were used, which were created between 2011 and 2016 by HR practitioners.

The final stage of this research is quantitative - existing data from an annual employee commitment survey was analyzed using a structural equation modelling technique and Smart PLS software thus showing the value of predictive analytics. This research can be classified as an evaluative case study. Through case studies, the researcher aims to interpret the data, moreover, in evaluative case studies, the researcher goes further by adding their judgment to the phenomena found in the data (Zainal, 2007).

Findings

The results of the interviews with the HR department revealed that the recruitment and selection process is the main responsibility of human resources. For some positions, this process is more challenging as the Latvian labor market is shrinking which is enforced by the low wages compared to other countries. Interviews with the business show that their decisions are limited by the international regulations of the aviation industry. Since strategic decisions can only be taken by higher management, employees need to follow the hierarchical chain via the direct manager. Furthermore, interviewees from the business explain that HR only supports them in the recruitment & selection process. They also mention the benefits from having a database in which language capabilities and trainings would be accessible by managers, as currently HR data cannot be easily found. Yet, investments in better systems are often postponed due to budgets.

Looking at the available HR data, it is evident that the company is currently doing basically descriptive analytics. For example, based on the sickness rate of cabin crew, it can describe trends regarding absence due to sickness for this specific employee group. Furthermore, some diagnostic analytics can be conducted on HR data, such as the Commitment Survey results and the results of the Annual Performance Review Dialogue. However, solely using HR metrics for descriptive and diagnostic analytics would not be sufficient for the evolvement of a strategic partner, because these types of analytics give only insights in the past. To support HR as a strategic partner, HR Analytics should provide predictions about the future that can help HR to formulate and execute adequate HR strategy and make evidence-based decisions (Fitz-enz & Mattox, 2014). The type of analytics that would be suitable for the HR department to grow into the position of strategic partner is predictive analytics. Therefore, further an attempt to analyze existing data from annual commitment survey with SmartPLS software and thus provide the company with much more valuable insights is presented.
Implementation of HR Analytics

In the company employee commitment and engagement is measured on a yearly basis using an external consulting company and multiple recommendations for increasing the commitment are provided. However, actions based on these recommendations have not been effective in the past. Since 2012, employee commitment is significantly underneath Latvia’s benchmark. Over the years, there has not been any real indication of improvement in employee commitment.

The data of the Employee Commitment survey is gathered on an individual but anonymous level via a self-reporting questionnaire using a 5-point Likert type measurement scale, where code 1 is assigned to “Not at all satisfied,” and 5 is assigned to “Extremely satisfied.” The questionnaire includes the scales measuring employee engagement (ENG, 8 items) and commitment (COM, 3 items), and employee satisfaction with general management (Man, 5 statements), company in general (Comp, 5 items), team (Team, 5 items), direct management (DirMan, 6 statements), remuneration (Rem, 5 items), growth possibilities (Grow, 3 items), availability of information (Inf, 5 items). In addition, demographic type questions like tenure and department are included.

In total 640 employees participated in the survey in 2016. The overall commitment of employees is identified as 55 points out of 100. Although this is an average commitment score following the methodology, it is underneath the benchmark of Latvia, the Baltic States, Europe and other service providers in Europe. The lowest commitment score is obtained by the cabin crew department, with 44 points out of 100. The highest commitment score is obtained by the administration and support department, with 63 points out of 100. Although almost all commitment scores among departments are either stable or slightly increasing, the commitment scores of the cabin crew show a negative trend. Furthermore, a difference is noticeable between employees that are less than one year working in the company, with a commitment score of 78 out of 100, and employees that are working for 6 to 10 years, with a commitment score of 47.

To identify causal relations, a Structural Equation Modelling (SEM) technique is used to test how management, team, company, information, remuneration and direct management is linked to engagement and commitment. SEM is a statistical method for representing and testing a network of relations between observed and latent variables (Suhr, 2006).

First the validity of the model was tested. To evaluate reflectively measured models the following should be examined: outer loadings (size and significance); composite reliability; average variance extracted (AVE) or convergent validity; discriminant validity (Hair et al., 2011). All outer model loadings, except two, had a loading higher than .70, which indicates that they are good measurements of the latent variables. However, as the two indicators match with the Gallup model of engagement and the indicators have a .85 Cronbach’s alpha, this research does not exclude the indicators from the model. Convergent Validity of the reflective constructs is examined with average communality or Average variance extracted (AVE). All scores were above the minimum threshold which is .50 (scores were between .55 for Rem and .77 for Grow). Internal consistency reliability is estimated by composite reliability (scores are from .086 Rem to .95 DirMan) and all scores exceed the minimum level of .70. Discriminant validity shows if measures of a particular construct differ from measures of other constructs in the model. The Heterotrait-Monotrait (HTMT) ratio of correlation was used and the values ranged from .37 to .78, thus, the discriminant validity is sufficient since all scores are above .85. All collinearity statistics scored lower than 5, which indicate that the model has no problems with collinearity. Thus, the model appeared to be valid for further analysis.

The predicting capacity of the model is evaluated by determination coefficients. As the R2 for ENG is .63, the model has a rather substantial predicting capacity for engagement. The R2 value for COM .38 indicates a predicting capacity of the model which is rather moderate for commitment. Since engagement can be predicted for 63% via the HR related scales, and engagement can predict commitment for 38%; the model has substantial predicting capacity.

First the general model is analyzed. The path coefficients show a strong relationship between engagement and commitment. Information has the biggest impact on the engagement of employees, then team, company, remuneration and growth. However, to identify the cause of low commitment of specific groups, multigroup analysis is required. Descriptive analytics showed large differences
between employees with different years of working experience within the company. These differences are further examined via a multi group analysis and presented in Table 1.

Source: Authors

The Table 1 shows that depending on the stage of the employees’ journey in the organization, distinct factors become relevant for their engagement. When an employee just joined the organization, information is the only and most important factor relating to the engagement of employees. Throughout the journey of an employee in the company, information remains one of the predicting factors for the engagement. When an employee is between 1 to 3 years employed, team becomes significant and remains important for the remainder of the journey. After 4 to 5 years in the organization, when the employee understands the industry, understands the organization and their job; growth becomes an important factor influencing engagement. For the group employees that are employed between 6 to 10 years, remuneration becomes important for engagement. When an employee is longer than 10 years within the company, team becomes again the most important factor for engagement.

Similar multi group analysis is done with seven groups, which represent the different departments: Coalition Rewards, Administration and Support, Cabin Crew, Commercial department, Operations department, Technical department and Flight Deck, since descriptive analytics showed large differences between departments regarding employee commitment and engagement.

Evidence based recommendations for the company

Since analyzing and modelling data provided more information from annual commitment survey than the diagnostic analysis which was done previously, the following evidence based recommendations for company management were provided.

As information, team and remuneration have the highest impact on engagement and commitment throughout the different departments and tenure groups, these topics should be the focus of HR. First of all, the company needs to target and increase the available information for employees. As information is identified as the most important factor influencing engagement, all efforts should be focussed on increasing the information flow and finding the most efficient ways how to ensure that employees obtain the necessary information for them. Thereby, employees specifically need more information with regards to the company’s strategy for their engagement. Furthermore, employees feel rather unaware of the division of responsibilities within the organization which might be linked to departments acting as silos. Therefore, more effort should be taken to increase the linkages between departments, enabling employees with deeper insights into the division. Lastly, employees do not feel that they can give feedback in the organization, enabling horizontal and vertical dialogues can counteract these feelings. Secondly, as team is identified as a strong influence on engagement and commitment, HR needs to foster a good team atmosphere. Targeting remuneration is the third recommendation as it has a rather strong impact on commitment. Although increasing all wages is not realistic, the recommendation provided is to increase information given to the employees with regards to the adequacy of the remuneration compared to the market and to their job performance.

Conclusion

The added value of HR is often questioned due to the inability to show its impact on organizational performance in order to justify its activities. Although researchers have been studying this link between HR and organizational performance a few decades, still a lot is unknown. With the rise of EBM, HR Analytics evolved as a tool for HR to conduct EBM. However, only a few organizations
have succeeded in implementing and using HR Analytics yet, because it is difficult to have the right competences, available resources and HR Analytics should be specifically tailored to the organization. The researched case serves as evidence that predictive analytics provide focused evidence-based recommendations within the low available financial resources. What the entire organization needs in addition to the existing resources is knowledge and skills of an analyst and software. Analysing data with predictive methods, such as structural equation modelling (or regression analysis) allow organizations to gain much more valuable insights and make evidence based decisions.

PRICING POLICIES FOR HIGH DEMAND DATA COMMUNICATIONS,
THE CASE OF ALBANIA

Irena Malolli¹

Abstract: Mobile data traffic has dramatically increased during the recent years. The high demand for data communication increased the challenges for network operators. Communication Network operators are investing to provide more capacities and they are looking for innovative ways to cope with increased market demand for broadband data communication.

The liberalization of the telecommunication market and the competition put the operators under pressure to keep high quality services with low cost. New pricing policies are introduced in order to maintain market share and keep their users in a competitive market. The battle with OTT makes the situation more critical.

This article will analyze the situation in the field of data communication, compare different instruments which are used or are under development in different countries and in Albania. The article will analyze the pricing policies used for data communication as a solution to cope with the high demand of data traffic. The article will identify some critical issues on these practices, draw conclusions and give some recommendations on the proper ways to keep the right balance between technical and commercial solutions and user experience/satisfaction.

JEL Classification Number: E64; DOI: http://dx.doi.org/10.12955/cbup.v5.942

Keywords: data communication, pricing policies, broadband, data traffic

Introduction

The penetration of mobile service subscribers by the end of 2015 achieved a level of 96.8%, the Internet penetration is estimated at 43.5%, and mobile broadband penetration at 47.2% (Ponder, 2016). The mobile broadband penetration is grown fast. This trend is related to a high demand for data traffic. The global mobile data traffic grew 63% in 2016 (Cisco, VNI 2016), while it has experienced an 18-fold growth over the last five years. They forecast that 20% of total IP traffic by 2021 will be mobile and that global mobile traffic will increase sevenfold between 2016 and 2021.

The increased penetration of mobile, internet users, and growth of broadband is closely related with higher demand for data services and traffic, thanks to a great number of applications and online service already in place and under development, due to easy accessibility in any part of the world through the internet.

The growth of smart devices is also a key driver for this phenomenon. On the other hand, different applications ask for a certain threshold of data rate, which means that the networks/service providers need to invest in order to offer these new applications.

Besides all of these factors, competition is one of the strongest drivers of this development and growth, which brings along the need for further investments in order to ensure better QoS / QoE. On the other hand, competition leads to lower prices as well as need for the renovation of tariff plans. New pricing policies are introduced in order to maintain market share, keep the level of profitability, as well as avoid the subscribers churn.

Traffic growth and ARPU in Europe countries

The data usage per SIM user per month in European countries has increased fast during the period 2011-2015 (Tefficient, 2016). The highest consumption is in Finland with an average of 5GB/month per user as is shown in Figure 1.

The same trend of data usage is in Albania. The figures published by the Albanian regulatory body (AKEP, 2016), for electronic communication gives that the average use of data in a month per user has increased 9 times during the period 2011-2016. It was on average 926MB/month at the end of 2015 which is comparable with some European countries, if we refer to Figure 1 above. But which are the drivers of data traffic? The key drivers of mobile traffic growth are related with four pillars as is shown in the figure below (Capgemini, 2012).

---

¹ University of Tirana/Computer Science & Applied Mathematics, Albania imalolli@hotmail.com
Other studies on this topic have linked the growth of mobile broadband with the advancement of mobile technology to provide ubiquitous services and mobility. In the case of Albania and in other countries with low fixed penetration, it is also related to the effect of mobile-fixed substitution due to the low coverage of fixed broadband infrastructure. High data growth is also related to two other factors, the price reduction over the years, due to higher competition, and regulatory intervention. Looking onto data traffic growth it is normal to consider is as the “the cream” of the telecom revenues or, at least, it should be the core of future revenues. But the figures, on different cases, tell this is not the real case.

The growth of data is not associated with the same trend in revenue growth for mobile data. According to (ETNO, 2016), the Average Revenue per User (ARPU) evolution considering fixed broadband, mobile voice and mobile data shows that the total ARPU in mobile combining voice and data is lower during 2008-2016 in ETNO perimeter, but the ARPU mobile data is increased slightly (fig. 3).
If we observe what is happening in our local market, in a specific region, or wider, we can easily notice that while the volumes of traffic or consumption have increased year by year, the revenues or ARPU has reduced. It is noticed that while the fixed and mobile broadband penetration continues to increase, this is not necessarily associated with increasing average revenues (BEREC, 2016). First of all, competition is the main driver leading to lower prices. On the other hand, lower prices lead to more consumption, and yet, new applications and online services are the main drivers for increased demand.

Traffic data and ARPU in Albania

The telecommunication market in Albania is fully liberalized since 2008. There are four mobile market players and a great number of alternative operators providing fixed telephony, internet access and some of them are offering triple services. The main telecom figures show very low fixed telephony penetration and also low fixed broadband penetration, even though, this figure has increased year by year. Mobile broadband has increased fast after its launch in 2010 as it is shown in the figure below.

The mobile market is well developed with good coverage with 3G/4G which is offered from all mobile market players. Mobile broadband based on the HSPA/HSPA+ technology was introduced in late 2010 in Albania, while 4G/LTE technology was introduced in September 2015.
The growth of broadband access based on UMTS/LTE technology, especially during last year, is related to data traffic increase. In 2014 the annual data growth in mobile networks was 148%. This trend continued during 2015 with a 103% growth compared to 2014. But what is happening with ARPU in this market? Figure 5 shows the change of ARPU, versus consumption of voice calls and data per user in a month.

![Figure 5: ARPU evolution in Albania](image)

Source: Author based on data of AKEP

It is clear that the data traffic has increased while ARPU has decreased over the years. The graph above is limited in two indicators of user consumptions: voice calls and data. But, in the trend of IoT and M2M communication, the consumption is a sophisticated calculation “it will take time, education, and tools for consumers to feel comfortable estimating consumption” (CISCO, 2012). In this paper, we focus on data consumption per user and pricing policies related to it.

The explosive growth of data communication asks for more investments in the CAPEX infrastructure and other aspects related to it. In parallel with technical issues, such as the need for endless capacities as well as signaling storms, pricing policies are critical in order to identify the appropriate strategy of pricing in a new era of IoT communications. CEOs of telecom operators have emphasized the importance of developing innovative pricing models in order to ensure that revenues keep pace with growing mobile data consumption will be the top challenge, and is seen as the most critical challenge (Capgemini, 2012).

**Data pricing policies developments**

Data Pricing policies have changed over the years. Different studies on data pricing tell us that different methodologies are used during the years such as: a simple metering price model, flat rate, usage based pricing, data caps, Ramsey pricing, price discrimination in broadband services, tiered services etc.

At the beginning of the internet, during the 1990s early 2000s the data charging was metered based. This experience before broadband development was mainly related with the dial up connection. During the 2000s to early 2010s there were new ways of charging such as a flat rate and after that usage based charging.

The metered method for dial up connections was closely related to the service provision, the technology used, the limited demand for service and applications. For that time dial up connection was considered a value added service compared to basic phone services mainly used for voice.

Flat rate was related to broadband development. It was imposed from the competition and customers need for volume. It gave some positive effects for end users. But even though it was good at the very first stage of broadband, the higher demand for data traffic lead to the necessity of more network capacity and more investment. Higher consumption or heavy users lead to look for other alternative charging ways to monetize the investment. Usage based charging is now often combined with flat rate or other techniques for traffic management.
Usage based pricing policy is combined with different traffic management techniques. Some of the traffic management tools/methods are: throttling, additional charging, policy control, prioritizing etc. Each of these techniques of traffic management has advantages and disadvantages from the user side or provider side. It is difficult to say which will be the best method of traffic management as pricing policy. In theory, it is easier to say the method which avoids any kind of user damage, which keeps the QoS at the required level, which leads to more profit for company etc. In practice, it is quite complex due to the great number of factors that traffic management includes: users, demand, network configurations, capacities, critical point of failures, congestion management, revenues, quality of services, better services than competitor, provider brand name, etc.

All these make network providers to consider the development of policy charge controls seriously. A summary of different techniques used by operators to manage traffic (ITU, 2013) are summarized below:

- Best efforts: No traffic management by provider, no change for tiered QoS;
- Traffic management only applied during periods of high congestion;
- Priority always given to most vulnerable types of services e.g. voice, video, streaming, games;
- Throttling/degrading of some types of traffic e.g. P2P;
- Priority given to some service providers content or applications over other;
- Blocking rival’s content or applications e.g. rival IPTV service;

Recent developments on policy charge control and techniques used for traffic management raised a number of critiques from different institutions such as regulatory bodies and academic studies and also from the users. Filtering of some traffic or applications, prioritization of traffic and also throttling or slow down raise a number of issues regarding the freedom of the Internet, consumer protection, guaranteeing the objectivity and non-discrimination between different applications and users etc. As it is given in the report of (ITU, 2013) “Concerns arise because these same tools can also be used to threaten competing services and providers. In particular, the use of traffic management by an operator for anti-competitive purposes by using its control over Internet access (e.g., to discriminate against any competitors that rely on its network) has been the subject of greatest concern.”

The impact of changes of data pricing policies in Europe

The main objective of any kind of business is to increase revenues, market share and to make more profit. In a competitive market, to achieve this the business’s aim is more difficult especially today with OTT competition. The telecom service providers are offering a great number of service packages, bundle services, different tiered tariff packages to attract different target group of users. The renovation of pricing policies for data is widely used in the European market.

The impact of new data pricing policies and especially the great number of tariff packages is positive from the competition’s and the user’s perspective. The users have more flexibility to choose the best package between different providers based on prices, variety of services, QoS etc. On the other hand, the complexity of packages offered and the combination of different services in packages, combination of flat rate with limited data usage with extra charge for traffic over the cap often is associated with end user confusion. The complex tariff packages are not easily understood by end users.

The changes and renovation of pricing policies in European countries seem to have a positive impact on the market players. It is noticed (GSMA, 2017), that in 2016 key European markets such as Germany, Italy and Spain returned to growth. The principal driver of this turnaround is tariff readjustments, which specifically offer greater data allowances at higher cost, and have been implemented in a number of European markets. Further analysis is needed in order to see the relationship with user impacts in those countries. Considering the continuous growth of data traffic and the forecasted traffic in IoT and M2M, research is also needed to study what might be the best way to address the problem regarding pricing policy, providing a “win-win” situation for both service providers and users.

Data tariff packages in Albania

With the focus on data traffic growth, also conducted in a previous research (Malolli, Sevrani, 2013), on the tariff packages in the local market during in the year 2013 and then repeating the same research in 2016.
The 2013’s research for the Albanian market noticed that an enormous number of tariff packages was offered from different providers. The total number of packages in the market offered from mobile and fixed operators was around 100. These packages often combined voice and data traffic. Almost all operators have adopted similar pricing policies such as flat rate, combination of flat rate with usage based, and application of additional charges after data cap consumed or the reduction of speed after the consumption of data predefined in the package. The tariff packages offered in the market were different for prepaid and the post-paid users. Some tariff packages included 1-3GB, while the extra data traffic was charged with 12 ALL/MB, based on a 10KB step in one operator and 40 ALL/MB based on a 10Kb step in another operator. The speed reduction varies from 256kbit/s to 128kbit/s or lower in upload. Almost all operators offer unlimited data packages, but there is still present the limitation in lowering the speed after the data cap. The combination of packages consists on voice calls on net/off net, voice calls national/international, SMS on net/off net, data caps. In some cases there are offers with unlimited data traffic.

From the research done in 2016, it was noticed that the situation regarding the data pricing policies is similar with the situation in 2013. There is again a great number of tariff packages offered in the market and these tariff packages consist on a combination of voice calls (on net/off net), SMS and data. There are some packages named “standard package” with a monthly base, and also others named “offers,” with a limited weekly/daily time of expiration. The packages generally include on net calls, some of them off net calls or national calls, SMS, and a data tariff of 1-3 GB. Some packages offer unlimited Internet with a noticeable speed reduction after 1GB/2GB consumption. It is noticed that the packages include a high volume of net calls per month such as 2000, 3000 or 6000 minutes (based on the package). Also, the on net SMS included vary from 100 up to 3000 SMS. In some flat rate packages for postpaid users with 4800 ALL/month or 7800 ALL/month the on net voice calls is unlimited or 4000/6000 minutes are included. The same situation with on net SMS is unlimited with additional SMS off net 300 to 500 etc.

The statistical data provided from AKEP (AKEP, 2016), shows that the average consumption per user in a month for voice calls (outgoing) was up to 128 minutes in 2015, while the average consumption of SMS outgoing/month is about 30 SMS/month. The high volume of on net communication (voice and SMS) being sold seems not possible to be consumed in a month. Therefore, the investment needed to cope with such tariff packages with high volume of voice and SMS offered, seems to be unreasonable.

The readjustment of tariff packages in order to be closer with real user demand is a necessity. It is important to build a pricing structure based on the demand of different customer profiles, based on their own usage by using information systems and data analytics. This will offer more value to a specific customer, by providing a balance between the quality of service required, the user satisfaction and network capacity usage, while minimizing the sunk investments.

Conclusions and recommendations

Following the impressive development of the ICT during the recent years, data traffic demand has exponentially increased. This growth in mobile data traffic is a result of many factors, including the rise of internet and mobile penetration, the increase in applications and online services and the technological development of a new area of connected devices. This high demand needs to be addressed from the network operators through adequate optimization techniques for traffic management. Pricing policies need to consider keeping the balance between consumer and provider interests carefully. A detailed analysis is needed to find the technical solutions to pricing issues and their impact on the market. The network operators need to carefully follow the current trends of data traffic and proactively react by assuring demanded capacities. On the other hand, the regulatory bodies need to carefully check the transparency of the tariff plans offered in the market. Their role in ensuring customer protection and non-discrimination is crucial for the normal functionality of a liberalized communications market. The future communications will encompass many new types of online services and connectivity under the framework of the Internet of Things. This imposes the challenge of designing new traffic models and their corresponding charging policies. Future work on this field should be focused on traffic management and charging policies for this new era of communications. Optimizing charging policies is a continuous process that needs to be further studied in order to
identify critical aspects related to traffic management, and helping the innovation of designing tariff policies.

ECONOMETRIC MODELING OF EXTERNAL FACTORS INFLUENCE ON INNOVATION ACTIVITY IN THE CASE OF REGIONAL HETEROGENEITY IN RUSSIA

Oleg Mariev,1 Andrey Pushkarev2

Abstract: Innovations are essential for international competitiveness. In this research study, we analyze factors that affect the involvement of Russian firms in the innovation process. Our objective is to find out which factors on a regional level are the most important for innovative activity that would allow for improving the innovation policy. We overview the main groups of factors that were considered to be significantly affecting innovations. We then proceed to analyze the regional-level data, and classify the Russian regions into three groups based on set of their characteristics. Our results suggest that currently the most important external determinants of innovation propensity for the Russian regions are the share of organizations that carried out scientific research, FDI, appropriate infrastructure and the quality of human capital. It implies that the innovation policy should focus mainly on these indicators. We also found substantial differences between regional groups, both in significance of the considered indicators and in their power. Based on the results, we propose several policy recommendations that would facilitate innovation activities of the Russian regions.

JEL Classification Numbers: O31, H20; DOI: http://dx.doi.org/10.12955/cbup.v5.943

UDC Classification: 338.2

Keywords: innovations, human capital, external factors, regional heterogeneity, econometric modelling, self-organizing map

Introduction
Currently, both in Russia and in many other countries, more attention is paid to the issue of innovation activity and how this activity is related to various economic indicators, both at the micro and meso levels. Nevertheless, according to many studies and reports, innovation activity in the country remains at a low level (i.e. Schwab, 2016; Kuznetsov, 2015).

This paper aims to uncover how the range of external factors affect the innovation activities in Russia. It is done by analyzing different economic and social regional indicators that, according to previous research, may affect the innovative activities.

The rest of the paper is organized as follows. Section 2 provides a brief literature review. Section 3 provides a detailed description of the dataset and empirical methods used in this research. Section 4 discusses the empirical results based on the Russian region level data and their policy implications. Section 5 concludes the paper.

Literature review
To find the most relevant factors for the empirical analysis that affect regional innovation activity we analyzed a number of papers that discuss similar problems. In this section, we will give a short summary of them. Modern research identifies a large number of potential factors that can influence the innovative development of a region. In order to organize a large number of available indicators, we divide them into several groups.

1. Level of human capital in the region
The research of Junge et al. (2012) highlights that the presence of highly qualified specialists in the region is a prerequisite for the development of innovative technologies and products, and their production. To attract specialists to the region and prevent the outflow of highly qualified personnel, a decent standard of living is necessary. Therefore, this group of indicators, in addition to various indicators of the level of education, also may include public spending on medicine and education, the level of crime, GRP, the level of unemployment, the balanced financial result of organizations, etc.

2. Condition for competition development
Currently, among economists, the prevailing view is that the active perception, development and introduction of new technologies requires competition between enterprises. In particular, Dezhina

1 Graduate School of Economics and Management, Ural Federal University, Yekaterinburg, Russian Federation; Institute of Economics, Ural Branch of the Russian Academy of Sciences, Yekaterinburg, Russian Federation, olegmariev@mail.ru
2 Graduate School of Economics and Management, Ural Federal University, Yekaterinburg, Russian Federation, a.a.pushkarev@urfu.ru
(2008), in the work on the role of the state, science and business in creating an innovation-oriented economy, emphasizes that one of the reasons for the reluctance of Russian companies to invest in R&D is the lack of competition and the monopoly of larger companies on various markets. Thus, according to the author, the Russian economy needs to diversify the size of firms. To represent this group of factors indicators reflecting the development of financial institutions and the share of small enterprises in the total number of enterprises in the region are included.

3. Investment climate in the region

The innovation process is impossible without investing. To assess the investment activity of the region, it is necessary to take into account not only the volumes of investments, but also their distribution by industries and sources of financing. The impact of increasing investment in fixed assets on innovation is not obvious. As presented by Shtercer (2005), physical capital and knowledge are mutually reinforcing factors that stimulate economic growth. As it is mentioned in the named research, there is also an alternative point of view according to which the increase in physical capital leads to economic growth only in the medium term, and, accordingly, cannot determine innovation activity, which in most cases has a long-term characteristic.

4. Quality of the infrastructure

A large number of works have been devoted to the study of the influence of the level of infrastructure development on welfare. For example, Calderon and Serven (2004) in their study confirmed the positive relationship between a developed infrastructure and an increase in GDP, and a reduction in inequality in the distribution of income at the country level. The level of infrastructure development in the region affects the transaction costs of enterprises, and accordingly, the market efficiency of innovative products, which, in turn, will affect the desire and ability to carry out R & D. This group of factors includes such indicators as the volumes of cargo transportation, density of roads, number of telephone sets, etc.

5. Degree of involvement of the region in foreign economic activity

It is frequently mentioned that foreign economic activity and innovative activity in many respects are interconnected. On the one hand, without developing and introducing innovative products, domestic enterprises will not be able to compete in the world market. On the other hand, without developing the sphere of foreign economic relations, which is one of the main channels for technology transfer, it will be difficult for Russian organizations to raise the level of innovation activity. This group includes indicators that characterize the volume of exports/imports to near and far abroad; indicators of the number of agreements, the value of the subject matter of the agreement and the receipt/payment of exports/imports of technologies and services of a technical nature, foreign direct investment.

Foreign direct investment (FDI) in this case is not only a source of funds, but also one of the most important channels for technology transfer. However, it is necessary to take into account the industry specificity of FDI. Since one of the goals of the innovation process in Russia is reducing the share of raw-material oriented industries in GRP.

As an indicator of innovative development at the regional level, the number of granted patents for inventions has been chosen in this study. This indicator has a number of advantages. Firstly, it characterizes the effectiveness of the research sector, which is the main source of innovation. Secondly, this indicator can be considered objective, since the only source of information on the grant of patents for inventions in Russia is the Federal Service for Intellectual Property (Rospatent). Thirdly, this indicator is widely used in similar studies, demonstrating good results in reflecting the level of innovation activity (Gorodnikova et al., 2015).

We present a methodology for the econometric estimation in the next section.

**Data and econometric model**

As a statistical basis for the study, we used data from the Rosstat for 68 regions of Russia (regions with a small number of data were excluded from the sample) for the date range 2001-2014 published in official publications, as well as those contained in electronic databases.

However, taking into account the development heterogeneity of the Russian regions, the model was considered not only for the whole dataset, but also for individual groups formed according to certain indicators. For classification of the regions, self-organizing maps of Kohonen (SOM) were used. The
application of SOK allows grouping the analyzed territorial objects in accordance with their characteristics in such a way that objects close in value of these characteristics in the original multidimensional feature space are next to each other on the plane. The use of this method has a number of advantages, in particular, it allows taking into account the complexity of the formation of regional socio-economic systems.

The criteria for assessing the degree of industrial development of the region were chosen as targets for this study, since a high level of industrial development of the region can serve as an indicator of the readiness of its transition to innovative development. Based on the selected five criteria (gross regional product per capita, gross fixed capital formation per capita, urban population share in the total population of the region, industrial production index (as an % increase compared to the previous year), and the share of processing industries in the GRP), 68 regions were divided into three groups (see Figure 1, for indexing and more details see Appendix A).

Figure 1. Regional groups based obtained by applying self-organizing maps of the Kohonen approach

Source: authors’ estimates on Rosstat regional data

The first group incorporates most of the regions (62%). One can say that this group is representation of the general situation in Russia, since all of the five indicators for the average value completely repeat the dynamics and only slightly exceed the average characteristics of the whole array of regions. For the regions included in the first group, there is a high level of well-being and a well-developed manufacturing industry; therefore, it can be assumed that they are the most innovative, as evidenced by statistical indicators. The presence of a direct relationship between the level of industrial and innovative development confirms the correctness of the hypothesis put forward earlier to determine the criteria for breaking down regions.

The second group of regions is characterized by a much lower level of welfare, a relatively low opportunity for the accumulation of fixed capital, and the lowest number of urban population. At the same time, these regions are characterized by the largest increase in industrial production. The level of innovative development is lower than the national average. Thus, we can assume that the regions of the second group have a good potential for innovative development, however, first they need to achieve a higher level of industrial production development.

The third group of regions, at first glance, is characterized by a much higher level of income and a good ability to accumulate fixed capital. However, taking into account the fact that this group includes regions mainly with harsh climatic conditions, in particular, the regions of the Far North and the Northeast of the country, it is necessary to understand that this indicator needs to be adjusted taking into account much higher prices ("the factor of the northern appreciation"). Being significantly lower than the national average, the index of industrial production and the share of manufacturing industry indicate a weak industrial development of the regions of this group. The level of innovative development is inferior to the Russian average. Therefore, stimulating innovation development in these regions is the most problematic. The inclusion of St. Petersburg into this group is associated with a high level of welfare in the region, which, unlike the rest of the group, is not explained by a much higher price level. Thus, the innovative development level of St. Petersburg, rather, is more similar to the regions of the first group.

To compile a generalized econometric model that takes into account all possible factors, we used the modified Cobb-Douglas knowledge generation function with fixed effects at the firm level:
\[ y_{i,t} = \beta X_{i,t} + \alpha_i + \epsilon_{i,t}, \]  

(1)

Where \( y_{i,t} \) is an explanatory variable characterizing the innovative activity of the region \( i \) in year \( t \); 
\( X_{i,t} \) is a vector of explanatory variables for the region \( i \) in year \( t \); 
\( \alpha_i \) is a region-level fixed effect.

**Results**

Results of the modelling are presented in Table 1. They cover both overall model and three models for different regional groups.

Source: authors’ estimates on Rosstat regional data

*Significant at 10%; **Significant at 5%; ***Significant at 1%. – not included in the final model due to insignificance
According to the results of the econometric estimation it can be concluded that out of each of the five initially formed groups of factors potentially affecting the innovation development of the regions, at least one indicator is included in the final model.

According to the test results, the model includes two factors that can be attributed to the field of international effects: foreign direct investment and payment of funds for the import of technologies and services. The significance of the first one may be because products and technologies created through direct foreign investment are often new. However, they may also represent imitations of already used technologies abroad, and in this case, accordingly, may not lead to an increase in the number of issued patents. The inverse relationship between the number of issued patents and the payment of funds for the import of technology is natural, and indicates a decrease in the innovative activity of enterprises with the possibility of borrowing technologies from abroad.

The positive correlation between the level of development of the regional economy (GRP) and the number of patents granted to inventions confirms the hypothesis that the most innovative regions of Russia also have the most developed economy.

The significance of the revenues of the regional budget can be explained as follows: an increase in the budget revenue component can increase the financing of various government programs aimed at improving human potential, infrastructure, and stimulating innovation activity.

The negative impact of gross fixed capital formation testifies to the hypothesis that the increase in intangible assets (including patents) and the increase in fixed assets are interchangeable. Enterprises investing in fixed assets divert a significant part of their income for this and, due to financial constraints, they do not have the opportunity to invest in research and development in parallel.

The significance of infrastructure development is confirmed by the positive influence of the railway's density and investments in the transport industry. Improving the transport infrastructure has a positive impact on turnover, thereby increasing the potential sales markets, which is an important incentive in deciding whether to develop a new product.

The quality of human capital in the model is reflected by two variables (the share of graduates of state and municipal higher education institutes in the total population of the region, and the number of employees of organizations engaged in research and development), which speaks of the exceptional importance of human resources development for innovative development. A direct and rather strong relationship between the share of organizations that have performed scientific research and development, in the total number of organizations, and the number of issued patents indicates a high degree of effectiveness of research activities. In other words, a large number of organizations engaged in R & D achieve the desired result, which is the receipt of a patent. Therefore, further investments in this fields contributes to the emergence of innovations.

Analysis of separate regional groups also shows several noteworthy results. The significance of the logarithm of revenues of the consolidated budget for the regions of the first group indicates that in these regions the state is most active in supporting innovation development through various programs financed (partly) by state funds. It can also be assumed that the amount of investment in the fixed capital of communication industry enterprises turned out to be significant only for the regions of the first group due to the already achieved high enough level of technology development in comparison with other regions.

The significance of the balanced financial result of enterprises for the regions of the third group indicates that innovation activity is carried out, first of all, at the expense of the profit of organizations. This is facilitated by the inadequate development of financial institutions and, consequently, the inaccessibility of the fund for borrowing. Another feature of this group is the strong significance of this indicator of human development, such as the number of employees of organizations engaged in research. Due to severe climatic conditions and the low level of social and economic development, the regions of this group are unattractive for young specialists, which leads to a shortage of qualified scientists and researchers. Thus, with low patent activity in general, an increase in the number of researchers leads to a substantial increase in the number of issued patents.

It can be concluded that each group has individual characteristics that manifest themselves either in the degree of influence of a factor or in the absence/presence of its influence, which highlights the need to improve regional economic policies to stimulate innovation in specific regions.
However, there are also common factors for all regions that determine their innovative development, as evidenced by the high explanatory power of the general model of factors applied to the regions. Such indicators include the share of organizations that carried out scientific research and development in the total number of organizations; logarithm of the number of employees of organizations engaged in research and development; logarithm of direct foreign investments.

At the same time, the absolute values of the coefficients for the first two named variables show a difference in the power of their influence in regions of different groups. The third factor, foreign direct investment, influences positively and equally on the innovation activity of region groups, which necessitates its further detailed study with the aim of stimulating economic policy at various levels.

**Conclusion**

To sum up, in this research we have analyzed effects of different regional level factors on innovation activities. The results suggest that indicators, such as FDI, regional budget revenue, GRP, infrastructure development level and quality of human capital have a positive effect on the number of patents granted. Therefore, it may be beneficial for policies to target fields that these indicators represent, when aiming to increase innovation activity.

Additionally, we find that there are substantial differences between regional groups. For example, the group of Northern regions shows weaker correlation with most of the indicators however, significant ones have a stronger effect on innovation output than in all other regions. Thus, policy should be adjusted with these specialties in mind. We also find that there are several generally significant indicators, such as share of organizations that carried out scientific research and development in the total number of organizations; logarithm of the number of employees of organizations engaged in research and development; and logarithm of direct foreign investments. This means that federal policy should target these common traits first.

As prospects for further research, it would be beneficial to construct a model that would include not only factors on a regional level, but also at the level of separate firms. It would increase the overall quality of the model and provide better understanding, which firms the government should target as the main innovators and how exactly they could be supported.

THE IMPORTANCE OF TANGIBLE FIXED-ASSETS REVALUATION: A COMPARISON BETWEEN ROMANIAN ACCOUNTING REGULATIONS AND THE IPSAS 17 ‘PROPERTY, PLANT AND EQUIPMENT’

Nicoleta Cristina Matei,1 Marin Țole,2 Mihaela Andreea Stroe3

Abstract: The purpose of a tangible fixed-assets revaluation is to establish true values for assets and a genuine picture of the financial position and the result of public institutions. This article presents the legislation needed to implement international provisions regarding the accounting system of public institutions, especially those concerning the revaluation of tangible fixed assets. It contains a comparison between the national regulations and guidelines of the International Public Sector Accounting Standard for tangible fixed assets. It highlights the convergences and divergences regarding the accounting treatment for determining the initial value of tangible fixed assets, the setting out of the reassessed value, the accounting treatment applied to the revaluation results, and the achievement of a revaluation surplus. It also describes the manner in which the revaluation of tangible fixed assets can influence the financial and patrimonial position of a public institution.

UDC Classification: 657

Keywords: tangible fixed-assets revaluation, initial value, fair value, financial position, result of public institutions

Introduction
Since 2005, coinciding with the adoption of the methodological norms, the accounting system of public institutions underwent a comprehensive reform to adapt to the new economic, political, legal, and social context. An objective of the reform is to implement international accounting standards in the public sector. However, the current national accounting regulations have inconsistencies with the provisions of international standards.

This study investigates statements relating to the converging and diverging aspects of adapting the national accounting regulations to the international standards of public sector accounting regarding the revaluation of tangible fixed-assets. These include the accounting treatments applied to determine the value of tangible fixed-assets at the balance sheet date; the new provisions concerning the revaluation of fully depreciated tangible fixed-assets; and how the revaluation of tangible fixed-assets influence the financial position and the patrimony of a public institution.

Literature review
As Ristea and Jianu (2010) wrote, the ever-increasing need for information in the public system as well as the need to provide comparable and transparent information have led to the development and popularization of the International Public Sector Accounting Standards (IPSAS).

Luca (2010) identifies how the accrual accounting principles, as well as the international regulatory framework for public accounting, were considered in developing the methodological norms for organizing and operating the accounting departments of public institutions adopted by the Minister of Public Finance Order No. 1917/2005.

According to Luca (2010) the transition to accrual accounting was manifested amid extensive financial and accounting changes, which include the adoption of the following: Law No. 500/2002 on public finance; new budget classification in compliance with the European System of Accounts (ESA) 1995; Government Ordinance No. 81/2003 on revaluation and depreciation of fixed-assets owned by public institutions; and modification, addition, and republishing of the Accounting Law No. 82/1991.

Data and Methodology
The study involved normative research in analyzing the manner in which the IPSAS 17 ‘Property, Plant and Equipment’ provisions are implemented under the national accounting regulations for revaluating...
tangible fixed assets. It was considered that because the tangible fixed-assets are elements that hold a significant share in the patrimony of public institutions in Romania, their ‘balance-sheet’ value had special importance in decision-making.

Results and Discussion

Accounting Treatments on Establishing Tangible Fixed-assets Initial Value

Fixed assets represent resources controlled by a public institution as a result of past events that are expected to generate future economic benefits for the institution, having a realistically measured cost and which are held with a view for long-term use.

As shown in the Minister of Public Finance Order No. 1917 of 2005, tangible fixed-assets are regarded as an item or, cumulatively, a set of items that meet certain criteria. These criteria include 1) their input value is higher than the limit established by government order and 2) the period of their normal use is greater than one year.

The IPSAS 17 ‘Property, Plant and Equipment’ has no minimum value for recognizing assets as tangible fixed assets, but rather refers to the purpose of acquiring the goods, the employment period, and the cost, which must be realistically measured. The entity retains any future economic benefits associated with the asset.

The tangible fixed assets, both according to the national accounting regulations and the IPSAS 17 ‘Property, Plant and Equipment’, are initially to be evaluated by cost when acquired for consideration or produced by the institution, or by a fair value when obtained free of charge. In this latter case, fair value is not an object for revaluation but represents an amount for which the asset could be willingly exchanged between two knowledgeable parties, in the context of a transaction with an objective set price (Luca, 2010).

The initial cost of a tangible fixed asset can either equal the acquisition cost, in the case of acquiring goods for consideration, or the production cost of goods manufactured by direct labor.

The initial cost of any tangible fixed asset obtained for consideration includes the purchase price, non-recoverable expenses related to the purchase, and any other expenses directly attributable to acquiring the asset, apart from the trading discounts under national regulations. The international accounting standards for the public sector mention that, upon the initial recognition of a tangible fixed asset, one must include in its cost of acquisition the nonrecoverable expenses. Any costs are directly attributable to conveying the asset to the location and provided the conditions necessary for it to function in the manner intended by management.

According to the Minister of Public Finance Order No. 1917 of 2005, the acquisition cost of raw materials, consumables, and production expenses that are directly attributable to the asset are part of the production costs.

The initial cost of an asset plays a critical role in establishing its accounting value, a value against which one compares a fair value, obtained as a result of revaluation, to determine a difference.

Revaluation as a Procedure to Establish Fixed Tangible Assets Current Value

The annual financial statements of a public institution, according to the national accounting regulations, must provide a true picture of the total assets, liabilities, financial position, and performance as well as any patrimony. This requires public institutions to present their tangible fixed assets at the end of the financial exercise as well as the balance sheets showing the assets at their ‘real’ value, a value that can be determined by a basic accounting treatment, an allowed alternative, or by revaluation, respectively.

Both the national accounting regulations and the IPSAS 17 ‘Property, Plant and Equipment’ stipulate provisions that allow public institutions to opt for one of two treatments for setting the value of the tangible fixed assets, as at the balance sheet date.

According to the basic accounting treatment, tangible fixed assets can be presented as at the balance sheet date, as a cost under accumulated depreciation or accumulated depreciation loss, whereas according to the allowed alternative treatment, they can be presented as their revaluated value.

The revaluation of tangible fixed assets updates their value to one considered a fair value.

The fair value is usually determined by a member of the evaluation profession and, generally speaking, it amounts to the market value of goods under the IPSAS 17 ‘Property, Plant and Equipment’. At the
same time, the national accounting regulations state that the fair value is determined by a commission appointed by the Head of the public institution, where where it is not established by authorized evaluators.

The commission appointed by the Head of the public institution must comprise members with the appropriate economic and technical background, and who can assess the condition, depreciation, use, and market value of tangible fixed assets subject to revaluation. The revaluation commission members establish the updated value of these assets by multiplying the accounting entry by the consumer price index, which is released on the website of the National Statistics Institute.

The national accounting regulations and the international standards provide for a reassessment with sufficient regularity so that the accounting value does not differ substantially from that which would be determined by using the fair value as at the balance sheet date. However, there are certain divergences, such as the revaluation of land and buildings, which, according to national rules on a revaluation of tangible fixed assets, must be performed at least once every three years, starting with the year 2008.

For tangible fixed assets with a market value, the fair value is the same as the market value, but there may be cases of assets that are not traded on the market. In these circumstances, the value of the assets is established according to the IPSAS 17 ‘Property, Plant and Equipment’ based on other elements with similar characteristics, in similar circumstances and locations.

The national rules on the revaluation of tangible fixed assets owned by public institutions, provided by the Minister of Economy and Finance Order No. 3471 (2008), categorize the revalued tangible fixed assets as follows:

- Land and land development, buildings, technical installations, means of transportation, animals, and plantations, furniture, office equipment, equipment for the protection of human and material values and other tangible fixed assets;
- Tangible fixed assets in concession, rented, or in free use for persons;
- Legal assets, without any patrimonial purpose, as well as the assets found in the administration of autonomous administrative overheads;
- Capacities commissioned in part, of the kind of tangible fixed assets that have not yet been registered as such;
- Tangible fixed assets that have undergone investment changes (modernization, repairs, rehabilitation and consolidation) that have increased their ‘accounting book’ value, regardless of the source of investment funding;
- Tangible fixed assets acquired by public institutions under finance leasing contracts;
- Tangible fixed assets at the diplomatic, commercial, military representations abroad, in conflict zones.

According to the Minister of Economy and Finance Order No. 3471 (2008), the fixed assets that are not subject to revaluation have the following categories:

- Tangible fixed assets that enter the patrimony of public institutions during the year when the reassessment is carried out and are recorded in books as their cost of acquisition, production, or fair value, as appropriate;
- Tangible fixed assets with a normal service life expiring at the revaluation date;
- Tangible fixed assets on conservation, as well as the mobilization reserves that are highlighted in accounting books as tangible fixed assets;
- Tangible fixed assets that have documents drawn, but the approvals for legal closure are unsettled, and the assets have not been dismantled, demolished or converted into parts; and
- Tangible fixed assets in progress.

Also, the national rules on a revaluation of tangible fixed assets contain some clarifications related to depreciable assets, namely those in the private domain of the state, the administrative-territorial units, and the private property of public institutions. Where these tangible fixed assets have common characteristics shared with the inventory objects, they are fully depreciated, and their value is less than the limit established by the government decision. They are classified in the category of ‘inventory object materials in use’. Inventory object materials derived from the tangible fixed assets that are recorded in
this category will be highlighted in the accounting books as their fair value, established by a committee of institution experts, appointed by the authorizing officer.

As previously mentioned, revaluation represents a procedure of establishing a fair value, which is the current value of the tangible fixed assets. The fair value is set up as a result of applying the alternative accounting method for determining the value of the tangible fixed assets as at the balance sheet date. As an alternative approach, public institutions can opt out of its application for the tangible fixed assets that can be revalued. However, for land and buildings, there is a compulsory treatment established using national rules.

Accounting Treatment of Tangible Fixed-assets Revaluation Results and Influence on Financial Position and the Result of Public Institutions

According to the national rules on revaluation of tangible fixed assets, the value resulting from the revaluation will be attributed to the asset in place of the acquisition cost or the production cost, as the case may be. Therefore, in the balance sheet, the tangible fixed assets that have been revalued will feature their revaluated worth.

The accounting books of public institutions in Romania show both depreciable and non-depreciable tangible fixed assets. In principle, the tangible fixed assets from the private domain of the state, the administrative-territorial units, the private property of public institutions and which are not represented by land, are depreciable. Their depreciation means the inclusion of a part of their initial value as an expense for the public institution until the full amount of the investment is recovered.

The following are tangible fixed assets (Government Ordinance no. 81, 2003) that are not depreciable: the property belonging to the public domain of the state and the territorial administrative units in compliance with the law, including the investments made in this property; tangible fixed assets from the patrimony of local public services performing economic activities, in which wear and tear is recovered using rate or price, in compliance with the law; tangible fixed assets on conservation, as well as the mobilization reserves that are highlighted in accounting books as tangible fixed assets; lakes and ponds that are not the result of an investment; land; property of the national cultural heritage; assets used under a lease; and goods, such as weapons and combat techniques.

According to the IPSAS 17, ‘Property, Plant and Equipment’, land is not depreciable as it does not have a limited service life, but all other tangible fixed assets can be depreciated.

The results of the revaluation are treated in the accounts of public institutions in Romania depending on the depreciable nature of tangible fixed assets.

The increase or decrease in value of the depreciable tangible fixed assets is calculated based on the difference between the value obtained from the revaluation and that recorded in the accounting.

The national accounting regulations and the IPSAS 17 ‘Property, Plant and Equipment’ stipulate different methods for treating results of the tangible fixed-assets revaluation (Table 1).

<table>

Source: Authors

The accounting treatment of results from the tangible fixed-assets revaluation, for international regulations and standards, is similar to the treatment of the national regulations, except that the national
accounting regulations apply this treatment to the results of the revaluation of depreciable tangible fixed assets. The results of the revaluation of non-depreciable tangible fixed assets are treated, in compliance with national rules, as follows:

- as an increase in the revaluation reserve which is simultaneously transferred into the credit of the funds’ account where the revaluation result is an increase in the accounting value; and
- as a decrease in the revaluation reserve which is simultaneously transferred to the debit side of the funds’ account where the revaluation result is a decrease in the accounting value.

According to the national rules on the revaluation of tangible fixed assets, the revaluation reserve related to the depreciable tangible fixed asset is transferred onto the retained earnings when they are fully depreciated, decommissioned, sold, or transferred free of charge. The IPSAS 17 ‘Property, Plant and Equipment’ adds to the national rules regarding the surplus achieved from the revaluation of tangible fixed assets. It specifies that a portion of the surplus made while the fixed assets are being used can be transferred to the retained earnings and is calculated as the difference between the value of the depreciation, based on the revaluated accounting value of the assets and the cost-based depreciation.

As previously mentioned, the tangible fixed assets that are subject to revaluation are presented in the balance sheet as their revaluated value. The value of these assets as at the balance sheet date influences the value of the total assets as an increasing or decreasing trend, depending on the results of the reassessment. The financial position of the public institution is given by the value of its assets, liabilities, and capital. As the total asset value is influenced by the value of the tangible fixed assets resulting from the revaluation, conceivably the financial position equally depends on the results of the revaluation.

The value resulting from the revaluation will replace the initial value of the tangible fixed assets, and in the case of depreciable assets, the depreciation is calculated by taking the reassessed value into account. Therefore, the expenses incurred from the depreciation of the tangible fixed assets will be lower or higher depending on the depreciable value. The patrimony of public institutions is determined as the difference between the recorded revenue and the expenditure, including the depreciation expenses. Thus, the depreciation expenditure will influence the patrimonial result for the public institution.

In conclusion, the revaluation of the depreciable and non-depreciable tangible fixed assets affects the financial position, while the revaluation of depreciable tangible fixed assets influences the patrimonial outcome.

**Conclusion**

The Romanian accounting system has undergone a comprehensive reform. Consequently, the accounting system of the public institutions in Romania follows the accrual accounting principle and has largely implemented the provisions of the international reporting standards for the public sector. The adoption of rules on the revaluation of tangible fixed assets was part of the reform. The revaluation installs the present value of the tangible fixed assets owned by public institutions, providing an accurate and fair presentation of assets. Both, the national accounting regulations and the international standard on the tangible assets of public entities provide accounting treatments for determining the value of the assets as at the balance sheet date. The basic treatment by which the tangible fixed assets appear on the balance sheet as a cost below the depreciation value and the alternative treatment that allows the presentation of tangible fixed assets at their fair value on the balance sheet, both, provide a value resulting from the revaluation process. Public institutions can apply a single treatment to establish the balance sheet value of the tangible fixed assets. Unlike the international accounting standards for the public sector, the national rules on the revaluation of the tangible fixed assets, owned by public institutions, provide for the compulsory revaluation of land and buildings at least once every three years. There are divergences between the national rules on the revaluation of the tangible fixed assets owned by public institutions and that of the international accounting standards for the public sector. These concern who is responsible for determining the fair value resulting from revaluation; setting up the fair value; the accounting treatment of the revaluation results; and the revaluation surplus achievement. The revaluation of the tangible fixed assets plays a major role in determining the current value of assets, thereby presenting a true and fair image of the financial and patrimonial position of a public institution.

Abstract: The authors of this article discuss the tourism development conditions in the municipalities of the Eastern Aukštaitija region, in Lithuania, and the Latgale region, in Latvia. The aim of the research is to explore tourism development conditions in the municipalities of the Eastern Aukštaitija region, in Lithuania and Latgale region, in Latvia. Objectives of the research are to characterize the factors influencing the development of tourism, to perform an analysis of the main factors of tourism development of the Eastern Aukštaitija region in Lithuania and the Latgale region in Latvia, and to define the major factors of tourism management in the municipalities of the Eastern Aukštaitija region, and the Latgale region. The scientific problem - the tourism development trends have not been studied in a local, municipality level in Lithuania and Latvia and tourism in districts is developed without a clear and long-term development strategy and consistent implementation of the program. The authors of the article apply the analysis of scientific literature, quantitative research – a survey and questionnaire data generalization. Six tourism specialists in the eastern Aukštaitija region, and 30 tourism specialists in the Latgale region, were interviewed. Tourism development issues are discussed and the results of the research (analysis of scientific literature and the questionnaire, analysis of strategic documents) are performed. The conclusions of article are: factors which influence tourism in the Lithuanian and Latvian regions most are the image of tourism destination/awareness, quality of tourism services, management of tourism destination, variety of tourism services and tourism infrastructure. Second conclusion: tourism specialists identified management of tourism destination, image of tourism destination/awareness, quality of tourism services in Lithuania region; cultural, natural and human resources and tourism services (travel organization, tourism information services, nutrition in the Latvian region, as tourism development strengths in municipalities of the Lithuanian and Latvian region; tourism diversity and tourist infrastructure in the Lithuanian region and tourism infrastructure and entertainments in Latvia region were identified as weaknesses. Third conclusion: tourism development in both regions is threatened by such factors as unplanned changes of the state economic development priorities, population migration to other countries and other factors. While, tourism development in the region can benefit from EU funds, and the growing demand for active recreation and health tourism products in the hospitality industry and etc. Tourism development at the municipalities of both regions in Lithuania and Latvia is influenced by such factors, as the development of the tourism planning and management system, adequate competence of human resources, cooperation between public and private sectors, planning and organization, legal tourism base, tourism projects development and implementation, tourism development strategy and research in the tourism development area.

Introduction

Due to the influence of economic, social and political globalization processes tourism has become one of the leading industries in many countries. According to the data from the World Tourism Organisation (WTO), tourism, which has a direct and indirect impact on economics, on a global scale creates 9% GDP, 1 in 11 jobs, 6% of the world’s exports, and forecasts an increase of international tourists up to 1.8 billion for 2030. Over the last decade, tourism has become an important economic sector in Lithuania and Latvia - since 2009 each year inbound tourism revenue steadily increases. Many scientists have analysed tendencies of tourism development: Dwyer and Kim (2003), Gunn (2002), Dmitrijeva and Šenavičiauskas (2009) analysed tourism destination competitiveness factors, Dredge and Jenkins (2007), Sharpley and Telfer (2002), Hall (2007) - analysed tourism planning and development, and Go and Govers (2000) - analysed integrated quality management for tourism destination and others. In Lithuania, these issues were analysed: trends and development of modern tourism (Korniečiuk and Pipiriene 2015), assessment of the Lithuanian tourism potential (Andrulienė et al, 2011), conceptualization and trends of tourism development in Lithuania (Žilinskienė and Petravičienė, 2007), tourism development and management (Ligėkienė, 2003), management of tourism development in the regions (Žilinskienė and Skrodenienė, 2003) and others. Tendencies of tourism development at the municipality level were researched by Paulauskiene (2013), who analyzed perspectives of tourism management development in Lithuania and Dapkus and Gaižauskiene (2009).
reviewed tourism development at the municipality level. However, tourism development conditions at the municipality level have not been researched, only sporadic studies have been performed. For these reasons, tourism in many municipalities has developed without a clear and long-term development strategy and consistent implementation of the program.

The object of the research is tourism development conditions in the municipalities of Eastern Aukštaitija region, Lithuania and Latgale region, Latvia.

The aim of this research is to explore tourism development conditions in the municipalities of the Eastern Aukštaitija region in Lithuania, and the Latgale region in Latvia.

Objectives of the research are

- To characterize the factors influencing the development of tourism.
- To perform the analysis of the main factors of tourism development of the Eastern Aukštaitija region in Lithuania and the Latgale region in Latvia.
- To define the major factors of tourism management in municipalities of the Eastern Aukštaitija region and Latgale region.

**Research methods.** The authors of the article apply the analysis of scientific literature, quantitative research – as well as a survey and questionnaire data generalization. The research instrument (questionnaire) was developed by grouping questions into blocks related to the research topic for the qualitative and qualitative studies. Six tourism specialists, responsible for the tourism development in the Eastern Aukštaitija region (Anykščiai and Utena municipalities and specialists of Utena, Ignalina and Zarasai tourism information centres, Molėtai tourism and business information centre) in Lithuania and 30 tourism specialists in the Latgale region; in the municipalities of Daugavpils city, Daugavpils district, Rēzekne city, Rēzekne district, Aglona, Balintava, Balvi, Cibla, Dagda, Ilūkste, Kārsava, Krāslava, Līvāni, Ludza, Preiļi, Riebiņi, Rugāji, Vārkava, Viļaka, Viļāni and Zilupe districts, were interviewed.

Tourism development issues are discussed and the research results are presented.

**Literature review**

The WTO defines tourism as a type of travel, tour, when a person leaves his job and place of residence for more than one day and less than 12 months, and the aim of the trip is not recruitment or paid activities (www.unwto.org). For all countries, welcoming tourists is one of the most important conditions to preserve and develop their national identity. Tourism development is understanding the physical changes caused by increasing tourist interest in the area and this expression of interest in performance - increasing incoming traffic According to Ligeikienė (2003) tourism development can be seen as an assumption for the improvement of life quality of tourists and the local community. Tourism development goals in the overall economic structure have impact on and relate to strategies of other branches of the economy, their actions and measures, and the public sector, such as environmental protection, transport, agriculture, regions, development of small and medium businesses. Tourism and regional development are linked to each other in the national and even global context (WTO, 1980). Sharpley and Telfer (2002) state that tourism has a direct impact on national, regional and local economics, whereas tourism development has potentially beneficial economic effects, which in turn positively affects the destination’s economic development. Hall (2007) has stated that tourism development has a new tradition of sustainable development, formed in the last decades.

In many countries, the most popular tourist attractions are related with natural resources (the sea, beaches, climate, mountains, and so on). This shows that the development of tourism (as well as economic benefits) is based on the natural resources that are free, because they do not need to be built or created (Dredge and Jenkins, 2007). In order to determine the development of tourism destination, tourism resources of the destination have to be estimated.

Tourism attraction affects service development, which is composed of tourism resources (natural, cultural, social/human) and infrastructure; tourism industry components (accommodation, meals, transportation, entertainment, information, management, travel organization, training services); status of tourism destination (for example, a resort, a UNESCO world heritage site, etc.); image of tourism destination; activities of tourism interested agents; and location of tourism destination in the tourism.
network (Andrulienė et al, 2012). Table 1 summarizes various factors which influence tourism destination development.

Source: Authors

As we can see, experts recommend assigning tourism resources, tourism infrastructure, variety of tourism services, tourism management, virtual environment, the quality of tourism services, the image of tourism destination, and the events to the development factors of a tourism destination.

Sharpley and Telfer (2002) note, that the contractual basis of operation of the private and public sectors of the economy, makes it possible to form a common approach to national, regional and local development goals and allows the necessary conditions to evaluate tourism by using a wide range of indicators, such as job creation, economic diversification, support for public services in the development of recreational services for tourists and etc.

In practice, the development of tourism is realized through plans and selected indicators. Gunn (2002) was one of the first scholars to describe tourism planning as a tourism destination development tool. According to Gunn (2002), the aim of planning is related with the increase of income and employment, conservation of resources and conditions for traveler satisfaction. It is noted that in insufficiently or under-developed tourism destinations, plans can become a serious support for further development of tourism, while in the developed countries (regions) they are often used as a tool to ‘revive the tourism sector and to maintain its viability in the future’ (WTO, 1994).

Source: Authors

As we can see, tourism specialists from both regions rated the same factors with similar points, such as image of tourism destination/awareness (5.00 points), quality of tourism services (5.00 points), management of tourism destination (Lithuania tourism specialists are evaluated as 5.00 points, Latvian tourism specialists – 4.90 points), tourism services (4.00 points), tourism infrastructure (Lithuania tourism specialists are evaluated as 4.20 points, Latvian tourism specialists – 4.10 points). Tourism specialists in the Eastern Aukštaitija region, rated image of tourism destination, virtual environment and resources quite high (see Table 2). Improvement of the image of the tourism destination and the popularization of tourism opportunities contribute to local social and economic issues and welfare. Evaluating the resources, the maximum score was given to the human and financial resources, a slightly lower grade was given to the natural and cultural resources (cultural resources are evaluated as 4.60 points, natural – 4.50 points, human and financial resources are evaluated 5.00 points each). Human resources in the tourism sector are very important, because employees of this sector create the country’s tourism and hospitality image and hospitality is an integral part of the competitiveness of tourism sector. In order to strengthen this potential, it is important to continuously develop professional competence of the tourism sector employees, i.e. to constantly improve their skills, knowledge of foreign languages, to improve the image, and develop intercultural competence. A country’s tourism resources are one of the most important competitive advantages to attract tourist flows and increase the economic benefits of tourism. Abundance and diversity of Lithuanian and Latvian natural and cultural tourism resources allows to create and develop products of recreation, cultural and educational tourism, ethnic, rural tourism and eco-tourism, focusing on the segments of respective market. Tourism specialists in the Latgale region rated quality of tourism services and image of tourism destination/ awareness quite high (see Table 2). Evaluating the resources, the maximum score was given to human resources, financial and natural resources (human resources are evaluated as 5.00 points, financial resources are evaluated as 4.90 points, natural resources are evaluated as 4.50 points. Cultural resources are evaluated as 4.00 points). Evaluating the cultural resources, for tourism specialists from the Lithuanian region, the highest score (5.00 points) was evaluated to homesteads and museums, folk crafts were evaluated as 4.70 points, urban heritage and folk traditions –4.30 points each, and arts and archaeological assets –4.00 points each.

For tourism specialists from Latvia evaluating cultural resources, the highest score (4.70 points) was evaluated to urban heritage, folk traditions (4.70 points) and folk handicrafts (4.60 points). Evaluating the tourism infrastructure, tourism specialists from the Lithuania region the highest score (4.80 points) were evaluated to asphalted roads, camping (4.60 points) car parking (4.60 points) and bicycle tracks (4.40 points). Evaluating the tourism infrastructure, tourism specialists from Latvia region the highest...
score (5.00 points) were evaluated to asphalted roads, car parking (4.90 points) and camping (4.20 points).

Tourism specialists, while evaluating management peculiarities in the tourism area in their municipalities, noted the development of the tourism planning and management system, adequate competence of human resources, cooperation between public and private sectors, planning and organization, legal tourism base, tourism projects development and implementation, tourism development strategy and researchers in the tourism development area.

According to the results of research, the following tourism types are developed in the Eastern Aukštaitija region of Lithuania: cultural sightseeing, leisure, recreation, rural, health tourism and ecotourism; leisure, recreation, rural, niche and adventure tourism are developed in the Latgale region of Latvia. The Eastern Aukštaitija region’s rich natural resources create preconditions for the development of all the above mentioned kinds of tourism, and the development of health tourism related to the activities of resort areas of the region. There is a variety of tourism services in the Eastern Aukštaitija region, and Latgale region.

Tourism services are developed according to the current need (conference organization, catering, water, entertainment, transportation and so on) or in accordance with the strategic documents (tourism information, travel organization, health, wellness and other services) in the Lithuania region; tourism services are developed according to the current need (catering, entertainment, accommodation, water services, transportation and so on) or in accordance with the strategic documents (tourism information services, tourism services, catering and other services) the in Latgale region, Latvia (see Figure 1). Tourism specialists identified management of tourism destination, quality of tourism services, image of tourism destination/awareness, the impact of virtual environment on the development of tourism, human and financial resources as tourism development strengths in the Eastern Aukštaitija region. Cultural, natural and human resources and tourism services (travel organization, tourism information services, catering) were identified in the Latgale region as tourism development strengths. Tourism specialists identified tourism diversity and tourist infrastructure (no bicycle path network, the lack of car parking spaces and hiking trails, poor quality of district roads, inadequate infrastructure of water ways) in the Lithuania region and tourism infrastructure and entertainment in the Latvia region, as weaknesses. There are such threats for tourism development in the Lithuanian and Latvian regions as unplanned change of state economic development priorities, population migration to other countries, the worsening demographic situation in the district and others. Tourism development in the Lithuanian and Latvian regions can benefit from EU funds, the growing demand for active recreation and health
tourism products in the hospitality industry, quality improvement and implementation of international standards and other options in domestic and foreign markets.

Conclusions

1. Factors which influence tourism in the Lithuanian and Latvian regions most are the image of tourism destination/awareness, quality of tourism services, management of tourism destination, variety of tourism services and tourism infrastructure.

2. Tourism specialists identified the management of tourism destination, image of tourism destination/awareness, quality of tourism services in Lithuanian region, while cultural, natural and human resources and tourism services (travel organization, tourism information services, catering services) were identified in Latvian region. Tourism development strengths were tourism diversity and tourist infrastructure in the Lithuanian region and tourism infrastructure and entertainments in the Latvia region were identified as weaknesses. Tourism development in the both regions is threatened by such factors as unplanned change of state economic development priorities, population migration to other countries and others, tourism development in the region can benefit from EU funds, the growing demand for active recreation and health tourism products in the hospitality industry and etc.

3. Tourism development at the municipalities of both regions in Lithuania and Latvia is influenced by such factors, as the development of the tourism planning and management system, adequate competence of human resources, cooperation between public and private sectors, planning and organization, legal tourism base, tourism projects development and implementation, tourism development strategy and research in the tourism development area.

Abstract: Nowadays, people are increasingly aware of the importance of a healthy lifestyle, which includes proper nutrition and engaging in sports activities. Sports and physical activity play an important role in all aspects of human life because they improve the quality of life and have positive effects on both mental and physical health. Anyone who is engaged in any sports activities reduces the risk of illness and has a more positive attitude towards life. Therefore, the existence of a fitness center is justified, and there is a growing interest in programs which can positively impact on a person in all aspects of their physical, mental, and social life. The purpose and the aim of this study is to find the most convenient way of communication of a fitness center with target groups of potential future clients. Current members’ preferences regarding the quality of training and possible improvements and means of advertising, were determined through a questionnaire along with how much they are willing to pay for the provided services. The analysis of the results pointed out the best direction to follow in the fitness center business to help to guide development, and ensure the satisfaction of present and prospective members. It was concluded that fitness centers underutilized the marketing activities needed to promote their activities and cement their position in the market.

Introduction
The role of marketing in sport is extremely important since without marketing as a characteristic feature of the modern way of thinking, it is not possible to push a company or any sports facility in the direction of a successful and profitable business.

Different authors provide different concepts of fitness. For example, in the dictionary of Vladimir Anić, fitness is described as a colloquial term meaning “various exercises to be performed in special centers for maintaining physical fitness” (Anić, 2004).

Certain cities in the Republic of Croatia, with the support of city authorities (Osijek and Zagreb), are converting parts of the city to fitness parks available to anyone who wishes to take care of their body and health. This points to the population’s growing awareness of the importance of a healthy lifestyle, wherein exercise becomes a lifestyle, not a useless effort. It is precisely this way of thinking and the interest of the population, which affected the opening of a large number of fitness or sports centers visited by people of all age groups, from adolescents to pensioners. Since a large number of fitness centers opened in recent years, greater efforts are needed to attract potential members. Therefore, the use of market surveys becomes a basis for designing the services or products that are in demand.

According to Sullivan (2004), the main objective of sports marketing is to meet the real need of customers for sports products and services which offer greater benefits than that of the competitors, and simultaneously achieve the highest sustainable profit. Additionally, Novak (2006) believes that: “Sports marketing is a management process, based on the social marketing concept in which individuals and society as a whole, by specific access and use of the business of sports, obtain what they need and want, with the help of an important set of activities which enable the market sharing of primarily sports products and services”.

Sports marketing is becoming an important tool of communication with the market through which one can learn the wishes and needs of stakeholders, and thus design the products and services required.

This study presents fitness centers’ marketing activities relevant to the market. A survey has been carried out with the aim of learning the fitness center users’ opinions on the provided quality, as well as information such as which marketing activities they think can encourage users to reach for their service, and thus improve the sales over an extended period.

Fitness Centre Marketing Activities and Goal Setting
Marketing activities attract potential customers, seeking to have their needs met, thus the aim is to make them satisfied with the provided service. Before designing the most appropriate tool for communication

---

1 College of Applied Sciences “Lavoslav Ruzička” in Vukovar, mnedovic@vevu.hr
with prospective customers, it is necessary to conduct an analysis of the current situation and learn fitness center wants, i.e. what it wishes to become in the future.

For the objectives to be useful, there are several key criteria that must be followed, therefore we can talk about SMART goals (Lan & Ping, 2010):

- **Specific** – the objective must relate to a specific part of the activities
- **Measurable** – the objective must be susceptible to measuring
- **Actionable** – the objective must be able to be put into action
- **Realistic** – the objective must be achievable and appropriate to the market situation
- **Time framed** – the objective must have a completion date

Considering the set objectives, the fitness center goals can be defined more precisely:

<table>
<thead>
<tr>
<th>Table 1: Fitness Centre Goals</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Achieving the desired number of new users/current members of the fitness center (define a specific number)</td>
</tr>
<tr>
<td>2. Achieving the desired satisfaction of users/members of the fitness center (e.g. 95% of users should declare their satisfaction with the service provided)</td>
</tr>
<tr>
<td>3. Achieving increased sales of the fitness center service by 5% by the end of the year</td>
</tr>
<tr>
<td>4. Introduction of new exercising equipment (e.g. two cardio program machines)</td>
</tr>
<tr>
<td>5. Introduction of new exercise programs by the end of the year</td>
</tr>
<tr>
<td>6. Educating trainers for new programs by the end of the year</td>
</tr>
</tbody>
</table>

Source: Author

Table No. 1 lists the goals that should be defined in order to improve business. Only clearly defined goals can help the business to move forward and develop. Well defined objectives include effective management of the fitness center and contribute to its development, therefore they present a prerequisite for the survival in the market, provided that they really are defined so as to be attainable and achievable.

Advertising, licensing and promotional activities have been increasing steadily in the market, therefore it is necessary to invest additional efforts in finding new users and retain the existing ones who can, under the influence of competitors’ advertising, change fitness centers, current coach and reach out for the competition. Fitness center management must therefore make an extraordinary effort to retain the existing members by doing everything to fully satisfy them. This implies deliberate management and business planning. Thus marketing becomes a tool in the market with the help of which one can fight off competitors and secure the customers’ loyalty. However, it should be noted that regardless of the marketing activities, perhaps even aggressive ones, the users will not use fitness center services if they do not feature a certain level of quality of training and customer care provided by the staff.

Therefore, loyal customers are less likely to be lured by a competitor, regardless of the competitor's marketing efforts. Similarly, customers who are dissatisfied with a product are not likely to continue purchasing that product (Gray & Wert-Gray, 2012). Consequently, it is essential to learn more about the effects of various promotion techniques for better marketing planning (Irwin, Sutton & McCarthy, 2002).

A challenge with advertising communications is to fully understand beliefs driving people's reaction toward advertising. Successful implementation of sports communication needs a better understanding of the beliefs composing reactions toward advertising of sports (Aminirosdana, Sharifianb, & Siyadata, 2014).

**Research**

In March 2017, we conducted a survey for the collection of fitness centers users’ opinions. The survey allowed us to learn how marketing activities of the fitness center are received by the target group. We surveyed 40 participants. The questionnaire consisted of 8 questions divided into three segments:

1. Analysis of the basic set
2. Consumer perceptions about services
3. Service pricing level deemed acceptable by the respondents

Close-ended questions were used while creating this survey. The participants were surveyed based on whether they agreed or disagreed with certain claims by using a dichotomous scale (Yes or No).
Also, certain questions were multiple-choice and the participants circled the response which fit them best. The data gathered were grouped, graphically displayed, and analyzed by conventional methods of descriptive statistics using the Microsoft Excel program. Table 2 lists the questions used during the survey:

<table>
<thead>
<tr>
<th>Table 2: List of survey questions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Which of the marketing activities would most likely convince you to go to a fitness center?</td>
</tr>
<tr>
<td>2. Do you think that a fitness center should employ a person assigned only to marketing and promotion?</td>
</tr>
<tr>
<td>3. Do you think that fitness centers in your area are advertised strongly enough?</td>
</tr>
<tr>
<td>4. What would motivate you to go to a fitness center?</td>
</tr>
<tr>
<td>5. In what way is visiting fitness centers useful for health?</td>
</tr>
<tr>
<td>6. Would the guarantee of a coach directing you to your desired result (following compliance with the instructions) motivate you to go to a fitness center?</td>
</tr>
<tr>
<td>7. How much would you be willing to pay on a monthly basis for a group exercise class/training?</td>
</tr>
<tr>
<td>8. How much would you be willing to pay for an individual training on a monthly basis?</td>
</tr>
</tbody>
</table>

Source: Author

**Results and Discussion**

After conducting the survey, we started processing the resulting data by using statistical tables, and the results were shown graphically. The research involved a total of 40 subjects (n=40) from Vukovar-Srijem County. Of the total number of respondents, 62% were female and 36% male (Figure 1).

Considering the fitness center advertising preferences, the participants believe that the most appropriate way of advertising is through TV and radio, 25%; closely followed by advertising on the Internet 24% (Figure 2).

70% of participants believe that a fitness center should employ a person assigned only to marketing and promotion because they think in this way the public can obtain more detailed information about the
services provided and the events taking place, while 30% of respondents believe that the employment of a person assigned to marketing activities only is not necessary (Figure 3).

![Figure 3: Do you think that a fitness center should employ a person assigned only to marketing and promotion?](image)

Source: Author

The majority of participants believe that fitness centers are not advertised strongly enough (75%), while 25% of participants believe that the advertising is sufficient (Figure 4).

![Figure 4: Do you think that fitness centers in your area are advertised strongly enough?](image)

Source: Author

According to data shown in the graph below (Figure 5), it is apparent that the biggest group of participants (38%) is willing to spend 200 HRK on a monthly basis for a fitness center program. 30% are willing to spend 300 HRK, 10% can spend 400 HRK or more, and 23% would spend up to 100 HRK on a monthly basis.

![Figure 5: How much would you be willing to pay on a monthly basis for a group/program training?](image)

Source: Author

**Conclusion**

Based on the results presented, it can be concluded that the frequency of use of particular forms of market advertising (TV/Radio and advertising via the Internet) attract the greatest attention of future and the existing users fitness centers. Today information is readily available on the Internet and the presented
advertising methods provide information to all interested parties in a quick way. It is indisputable that the successful development and market performance of a fitness center is dependent on employment of appropriate marketing activities along with offering quality service, and setting adequate prices. High-quality marketing activities will increase the attractiveness of fitness centers, improve business and sales, and positively affect the number of its clients. Furthermore, through research it can be concluded that fitness centers inadequately implement marketing activities in and presenting and promoting their services, and that this is also noticed by the existing customers. In fact, clients do not have sufficient information on the activities carried out and believe that the employment of marketing specialists would positively affect the attractiveness of fitness centers and increase sales. Following all of the above, it is suggested for the fitness centers to employ a person for carrying out marketing activities, developing marketing programs, intensive advertising, and ensuring continuous customer satisfaction.

FINANCIAL AND SOCIAL SUSTAINABILITY PENSION SYSTEMS IN THE FACE OF DEMOGRAPHIC RISKS
Alexander Nepp,\textsuperscript{1} James Okrah\textsuperscript{2}

Abstract: The ongoing distribution of the pension system is on the threshold of losing its sustainability, financially, which has produced a deficit in the budget of the Pension Fund of the Russian Federation and the deflection of pension funds to the distribution system in 2014. This situation was to some extent caused by demographic risks. Funded systems could become the main instrument for mitigating the demographic problem of the distribution pension system. But the problem is, these systems are unprotected to demographic risks as well. The paper examines the effect of demographic uncertainty on funded pension systems. It describes the process necessary for the financial sustainability of a funded pension system under the force of demographic and macroeconomic factors. It explores the conformity of Russian funded pension systems and that of OECD countries with the status of financial sustainability in the time from 1958 to 2012, making a prognosis for the financial viability prospects.

JEL Number: D53, G28; DOI: http://dx.doi.org/10.12955/cbup.v5.n47
UDC Number: 336

Keywords: Funded pension systems, unfunded pension systems, financial sustainability, social sustainability, demographic risks, retirement age, duration of pension payments

Introduction

Demographic risks of a benefits framework are heterogeneous and now and again include not just demographic factors. The examination of statistic dangers partitions all annuity frameworks into two gatherings: subsidized and dispersion (unfunded) benefits frameworks. The main gathering is influenced by such dangers as:

- An expansion in the future, which will influence the span of annuity installments;
- The expanding time of section into the work showcase, impacting the measure of benefits investment funds;
- Variances in the normal retirement age, which will influence both the length of benefits funds and the term of annuity installments.

Dispersion benefits frameworks are affected by statistic dangers to a more noteworthy degree. In this way, notwithstanding those officially recorded above, there are two different sorts of statistic dangers critical for dissemination annuity frameworks:

- An expansion in the quantity of nationals who are beneficiaries of benefits;
- A decrease in the number of the working populace whose commitments and expense installments subsidize benefits.

The impact of demographic risks on pension systems is estimated by considering their impact on such indicators as pension payments and replacement rate. In economics, these indicators tend to be considered as the most important targets of pension systems Vidal-Meliá et al. (2006). The International Labour Organization has made reports containing the recommended minimal and optimal values of the replacement rate.

Analysing the data of the countries, which met the following criteria, carried out the research of distribution pension systems:

- They have a distribution pension system or at least a part of the country's pension system is based on the distribution principle;
- In these countries pension contributions to the distribution pension systems are separated from the overall amount of taxes or mandatory insurance premiums;
- These countries can provide all the necessary statistical data.

For funded pension plans, the research sample included the countries, which meet the following criteria:

\textsuperscript{1}Ural Federal University, Ekaterinburg, Russia, anepp@inbox.ru
\textsuperscript{2}Ural Federal University, Ekaterinburg, Russia, Jokrah6@gmail.com
These countries have a funded pension system or at least a part of its pension system is based on this principle;

- Pension contributions to the pension system in these countries are separated from the overall amount of taxes or mandatory insurance premiums;
- These countries can provide all the necessary statistical data.

As a result, the research sample comprised Australia, Austria, Great Britain, Hungary, Germany, Italy, Canada, Luxembourg, Mexico, the Netherlands, Norway, Poland, Slovakia, USA, the Czech Republic, France, Switzerland, Sweden, Japan, Russia, on average in the OECD countries.

Impact of demographic risks on the financial and social sustainability of distribution pension systems

Practical Study of OECD Countries

This study of financial sustainability of distribution pension systems was based on the described systems Nepp (2017). The chosen periods were the one from 1990 to 2012 and the forecast period from 2012 to 2050. The study involved nineteen OECD countries meeting the following criteria: a) they should have a distribution pension system or at least a part of their pension system should be based on this principle; b) pension contributions into their distribution pension systems should be separated from the overall amount of taxes or mandatory insurance contributions; c) these countries should be able to provide all the necessary statistical data. Therefore, our research sample comprised the following countries: Australia, Austria, Great Britain, Hungary, Germany, Italy, Canada, Luxembourg, Mexico, the Netherlands, Norway, Poland, Slovakia, the USA, the Czech Republic, France, Switzerland, Sweden, Japan, and Russia.

This research focused on the dynamics of pension payments and the dynamics of the support ratio. Therefore, the rates of pension payments change were determined as the ratio of pension payments in 2012 and 1990:

\[
Temp_{..PS} = \frac{PS_{2012}}{PS_{1990}}
\]

(1)

The rates of support ratio were determined the following way:

\[
Temp_{..Kp} = \frac{Kp_{2012}}{Kp_{1990}}
\]

(2)

To maintain financial sustainability of distribution pension systems however, it is crucial to consider not only demographic factors but also the dynamics of pension contributions, which depend on the average salary and the pension contribution rates.

To achieve this, we compared the rates of change of pension payments (3) with those of the support ratio (15), which is illustrated by the formula:

\[
\Delta TempPS / Kp = \frac{TempPS - 1}{Temp.Kp - 1}
\]

(4)

Where:

\[\Delta TempPS / Kp\] is the excess of rates of pension contributions TempPS in comparison to the rates of the support ratio Kp.

The analysis of different pension systems done by applying the expression (5) led us to conclusions about the chosen countries' financial sustainability or the lack of it:
\[ \frac{\Delta TempPS}{Kp} = \frac{|TempPS - 1|}{|Temp\cdot Kp - 1|} \]

Lack of financial sustainability if \( \frac{\Delta TempPS}{Kp} \geq 1 \) \hspace{1cm} (5)

Financial sustainability if \( \frac{\Delta TempPS}{Kp} \leq 1 \)

The ability to maintain financial sustainability was checked by applying the system (6). If the rates of pension contributions growth exceeded those of the support ratio reduction, that is, the losses of funds as a result of a decrease in the number of employed population were compensated by pension contributions \( \frac{\Delta TempPS}{Kp} \geq 1 \), then the distribution pension system met the requirement of being able to maintain its financial sustainability. If \( \frac{\Delta TempPS}{Kp} \leq 1 \), then the country's distribution pension system became less financially stable, which meant that the growth of pension contributions did not make up for the losses caused by demographic risks or the reduction in the number of working population. The area of financial sustainability of distribution pension systems was, in its turn, divided into three subareas:

\[
\begin{align*}
\frac{\Delta TempPS}{Kp} &\in [1;3] \quad \text{......sufficient financial sustainability} \\
\frac{\Delta TempPS}{Kp} &\in [3;6] \quad \text{......good financial sustainability} \\
\frac{\Delta TempPS}{Kp} &\geq 6 \quad \text{......excellent financial sustainability} \\
\end{align*}
\]

(6)

The results of financial sustainability survey of the countries in question, calculated according to the formula Nepp (2017), are illustrated in Figure 1.

Figure 1: Demographic risks of distribution pension systems. Maintenance of financial sustainability from 1990 to 2012.

Figure 1: "calculated by the authors on the basis of statistical data OECD (Pensions at a glance 2011: retirement -incomesystems in OECD and G20 countries. OECD. 2011. P. 124")"
As it can be seen from Figure 1, the area characterized by the lack of financial sustainability in the period between 1990 and 2012 includes the distribution pension systems of such countries as Germany, Italy, Slovenia, Spain, the Netherlands, Israel, Estonia, France, Japan, and Greece. The rise in pension contributions compensates for the losses caused by demographic risks and the reduction in the number of working population. Importantly, in such countries as Canada, Sweden, Slovakia, the Czech Republic, Luxembourg, Hungary, Russia, Poland, Korea, Finland, Belgium, Switzerland, and Austria, it is the working population, which provides financial sustainability. As Figure 1 shows, there is a significant gap between the countries characterized by the lack of financial sustainability: these countries were divided into three groups. In accordance, the first group includes countries with excellent financial sustainability in distribution pension systems: the indicator exceeds 6. This group comprises Canada, Sweden, Slovakia, and the Czech Republic. The second group consists of countries with good financial sustainability: Luxembourg, Hungary, and Russia. The group with sufficient financial sustainability comprises Poland, Korea, Finland, Belgium, Switzerland, and Austria. (See Table 1).

As it has been mentioned above, the countries, which have managed to preserve their financial sustainability, achieved this through the increase in pension contributions, that is, the tax burden and/or an increase in wages.

Source: Compiled by the authors based on the results of the calculations presented in Figure 1
Such measure as maintaining pension systems' financial sustainability by increasing the rates of pension contributions should not be underestimated. For instance, if pension contribution rates remained at the level of 1990, it would greatly affect financial sustainability (see Table 1). According to this table, with the tax burden staying at the level of 1990, such countries as Spain, Germany, Slovenia, the Netherlands, Greece, Japan, and Italy are bound to experience problems with financial sustainability. Unlike the actual situation (see Table on page 81 and its discussion), this group no longer includes such countries as Spain, Israel, Estonia, and France, which have become financially unstable due to the fall in pension contributions. Nonetheless, excellent and good financial sustainability with the taxation burden remaining at the level of 1990 is preserved only in three countries: Sweden, the Czech Republic, and Luxembourg. Thus, Canada, Slovakia, Hungary, and Russia have maintained their financial sustainability at high or quite high levels by increasing the rates of pension contributions. Otherwise, they would be in the group of countries with sufficient financial sustainability.

Analysing the brunt of demographic risks of the main indicators of pension systems, we assumed that it is essential to maintain financial sustainability of a pension system provided that there is no indexation of wages and growth of pension contribution rates. For Russia, the indicator will make 1.14 if pension contribution rates remain at the level of 1990, which brings to light the Russian pension system's weak financial sustainability and a small likelihood of its being maintained with the help of an increase in wages. The problem seems even more serious if we take into consideration the low replacement rate in the Russian pension system (0.34 as compared to 0.6, recommended by the International Labour Organization) Gurvich (2011). The deterioration of the Russian pension system's financial sustainability became even more evident when the budgetary allocations to the Pension Fund increased from 248 billion rubs in 2005 to 1,940 billion in 2013, Dmitrieva (2013).

Fig. 2 Necessary changes of pension contributions rates to provide financial sustainability of distribution pension systems from 2012 to 2050

Note: the blue line corresponds to the rates of pension contributions in 2012; the red one, to those in 2050. As our analysis has revealed, when faced with demographic risks, the distribution pension systems demonstrate neither financial nor social sustainability (maintenance of the replacement rate). It is obviously impossible to raise the replacement rate only with the help of wages increase and without an increase in tax burden on enterprises.

Conclusion

1. When wages stagnate and pension contribution rates are non-estimated, financial sustainability of distribution pension systems will be determined predominantly by demographic factors, such as the number of retired people and the number of employed population or by the support ratio, which characterized the ratio of the number of working population to the number of pensioners.

2. The impact of demographic risks on distribution pension systems makes it impossible to maintain social sustainability of pension systems, that is, to maintain the replacement rate, provided that the distribution principles in most of the described countries remain the same.

THE ROLE OF SOCIAL INSTITUTIONS
IN THE ACTIVITY OF ENTREPRENEURS IN THE CONSTRUCTION SECTOR

Sergey Oparin,¹ Nikolay Chepachenko,² Marina Yudenko³

Abstract: This paper reports on a study of the methodological principles and roles of social institutions in controlling business activities. The level of their administrative interference in business activities is analyzed, particularly regarding administrative barriers restricting business in the construction sector. The study concludes that social institutions, on the one hand, reduce economic risks of entrepreneurship and encourage the fulfilling of formal norms. However, on the other hand, they perform a restrictive function, increasing entrepreneurs’ transactional costs. The paper provides examples of informal norms that restrict entrepreneurial activity in the construction field, with a conclusion about non-systemic business support measures.

JEL Classification Numbers: M21, M48, B 52; DOI: http://dx.doi.org/10.12955/cbup.v5.948
UDC Classification: 338.246.025.2
Keywords: economic risk, entrepreneurship, social institutions, construction.

Introduction
The relevance of studying social institutions arises because of the significant risks associated with business activity in the construction sector. Social institutions are norms and rules that regulate and coordinate business activities, and reduce the risks of entrepreneurs. In principle, these business risks appear to be the bane of entrepreneurs in regards to their economic freedom. Such freedom coincides with that of others and thus, an entrepreneur’s risk will increase as their market relationships develop. Therefore, the logical question is whether social institutions can influence the level of risk in business activity.

Presently, existing institutions fail to meet market conditions of Russia and hence, fall short of the expected growth in productivity for business entities. This prevails because of a construction sector that is characterized by a low index of entrepreneurial confidence, a significant number of unprofitable organizations, and serious indebtedness of entrepreneurs to the state and counteragents.

This article presents a review of the social institution based on the view that it represents formal norms or a set of norms that are stable in relation to the interests of economic entities. These norms coordinate, regulate, and restrict institutional relations between economic entities that carry out organizational, production, and exchange functions, as well as create conditions for effective business activity. The article does not examine the concept of a social institution as such, since this topic has no current cause for special discussion among scientists.

Literature Review
The analysis of the institutions, institutional structures, and their interaction with the state is covered in the works of Nobel laureates (North, 1997; Stigler, 1995; Hayek, 2006). Hayek (2006) provides elements of institutionalism that deserve mention. Hayek (2006) notes: “Legislation, the intentional creation of laws was fairly called the most important invention by its far-reaching consequences, and even more significant than fire and gunpowder” (p.91). The scientist divides the institutions into formal and informal ones, though, not as a clear definition. He writes about informal rules as follows:

People learned to observe the rules of conduct (and to seek their observance) long before these rules have been expressed in words” (p. 97).

Auzan and Nikishena (2013) emphasize that formal and informal institutions differ by way of coercion and enforcement. An informal institution is one where any individual who believes that

¹ Head of the Chair of Economics and management in the construction Petersburg State Transport University Emperor Alexander I, Saint-Petersburg, Russia, oparing@mail.ru
² Department of Economics and management in construction Petersburg State Transport University Emperor Alexander I, Saint-Petersburg, Russia, nvchepachenko@mail.ru
³ Department of Economics and management in construction Petersburg State Transport University Emperor Alexander I, Saint-Petersburg, Russia, mmspb@mail.ru
the rule in question is to be carried out forces an individual to do so. Moreover, formal norms are specially developed rules of conduct that are codified in laws, decrees, and administrative documents.

Investigating the fundamental work of Knight (2003) within the concept of entrepreneurship, one should pause on an important aspect, i.e., the role of risk and uncertainty in entrepreneurship. From Knight's point of view, the existence of a unique future uncertainty may allow an entrepreneur to profit, despite the overall competition and long-term stability. Knight emphasizes the difference between the terms of ‘risk’ and ‘uncertainty.’ If uncertainty is countable, then such risks can be shifted to the shoulders of others through insurance. Such risks become a cost item that diminishes profits, but not their source.

Such Russian scientists as Polterovich (2012), Shastitko (2010), and many others, with interdisciplinary expertise suitable for examining the role of social institutions in the activities of entrepreneurs, should be noted here. Observation of their works provides the basis for the theory that the effectiveness of social institutions within a country mainly depends on the institutional environment in which it is developed, i.e., the restrictive links and motivations of the institution. According to Shastitko (2010), a new institutional approach allows the existence of an entrepreneurial function, though not exclusively within existing rules, but rather in connection with potential changes. Hence, in explaining a change in rules that mediate the interaction between economic agents, the term of institutional entrepreneurship is used.

In the framework of the research, it was considered important to extend the notion of ‘entrepreneurship’ and to consider it not in the usual, but in a generalized sense. Entrepreneurship in the generalized sense reflects the totality of economic, social, organizational, and institutional relations associated with the entrepreneurial business organization, producing goods (works and services) and obtaining the desired results in the form of profit. Such understanding makes it necessary to account the social component in entrepreneurial activity, i.e., the external environment in the form of social institutions. This then reduces the risk and uncertainty of business and creates conditions for achieving the goals of entrepreneurs in productivity growth and economic efficiency.

**Duality of the Social Institution's Impact on Entrepreneurship**

The final result of the activity of social institutions can be deemed as the creation of a clear status-role structure based on the norms and rules, socially approved by the majority of participants of this social process. However, it should not be considered that state regulatory and coordinate norms fully facilitate the life of an entrepreneur and exclude possible risks in economic activities. These norms also perform a restrictive function. For example, since 2016, quarterly reports to the Pension Fund of Russia have been replaced by monthly ones, causing the staff to learn new forms of reporting. Changes also relate to statistical reporting, as there are more than 300 federal statistical forms. These serve to collect information about the finances, number, and salary of employees, the commissioning of buildings and structures in the construction sector.

Due to the existence of informal norms, the results of implementing formal norms can be different. For example, where the majority of entrepreneurs denounce tax evaders, then with the same force of compulsion to pay, the percentage of tax defaulters will be lower than in a society where tax evasion is considered an imitation. Formation of a taxation institution is designed to reduce the transactional costs by its implementation. Such costs are associated with completing a tax return, queueing for its submission, visiting tax authorities, and the transparency of the rules. In Russia, a tax report with attachments includes about 100 pages of text and calculations, and a declaration for each tax has a volume of up to 20 sheets. Designers constantly change the tax declaration forms, because, in their opinion, all provisions of the Tax Code and all new documents regulating the payment of taxes should be taken into account in the form. Such an approach may not be the most justified. An example of transactional costs is evident where the position of taxpayers has been significantly complicated by the introduction of the twenty-figure budget classification codes. Each tax penalty or fine is assigned with a code that is constantly changed. Recording a wrong code when signing out a payment order or processing information in a tax inspection, results in the payment being categorized as ‘unclear.’ In this case, penalties are charged for each day a payment is allegedly delayed. To clarify the situation, a tax payer needs to reconcile their data with that of the tax inspectors, but due to work overload of
inspectors, it is almost impossible to carry out such reconciliation in time. Nevertheless, changes in the legislation will create an incentive to implement formal norms. The penalty for not providing or improperly presenting statistical data has increased tenfold. Previously, it was between 3 000 and 5 000 RUB. Now, legal entities have to pay between 20 000 and 70 000 RUB. For a repeated violation, this payment is between 100 000 and 150 000 RUB.

However, the current Russian legislation also provides such formal norms that exclude risks associated with the emergence of both transformational and transactional costs. For example, new rules governing entrepreneurial activity in 2016 will help business entities obtain additional profits and reduce the risks of bankruptcy and non-payment. Based on the simplified taxation system, such norms include the following:

- Local authorities can reduce the tax rate for entrepreneurs from 6% to 1%;
- Organizations and individual entrepreneurs may not include VAT in their income.

**Methodological Rules Determining the Activity of Entrepreneurs**

Any business activity directly depends on the methodological rules that determine it. These may include inadequate and changeable information, unfinished contracts, and the incomplete specification of property rights.

**Inadequate Information**

The market is far from flawless; transactions of entrepreneurs are worth certain costs, which are connected with the acquisition of information. Many economists believe that limited and useful information for economic entities gives grounds to classify it as a factor of production, along with land, capital, and labor. Scientists believe there are two principal reasons for inadequate information from an economic viewpoint. First, the selection of comprehensive information is possible, but not profitable. Second, the full information is impossible to obtain. Thus, the lack of profound information makes the activity of entrepreneurs risky and opportunistic.

The base of opportunistic behavior consists of information asymmetry and uncertainty. A business partner cannot know all the circumstances and intentions of another partner on the eve of the contract conclusion and, moreover, cannot know all the details of the partner’s behavior after the contract has been concluded. Therefore, opportunism is always based on the inadequate or distorted information that the subject of opportunistic behavior provides to a business partner before or after the start of the contract. The initial principle of the institutional theory is to pay for information. If all business entities had unrestricted access to information, then they would have full knowledge of their partners’ behavior and would be able to prevent any breach by partners, as well as avoid the risks of failure to comply with the entrepreneurial agreement. Then, the problem of opportunism would not be considered. However, due to the changeability and inadequate availability of information, monitoring compliance with the contract is difficult, and the parties attempt to obtain guarantees that are prescribed in the contract.

Stigler (1995) in Economic Theory of Information notes that:

> It is hardly necessary to remind scientists that information is a valuable resource: knowledge is power. However, in the city, which is an economic theory, information huddles in the slums. For the most part, it is ignored: the best technology is already known; the ratio between the goods and the preferences of the buyers is considered to be settled (p. 507).

**Incomplete Specification of Property Rights**

Specification of property rights assumes a legal authority’s security for each defined owner, rather than the single and absolute owner of the resource. The ownership right is fully specified when each authority has its exclusive owner, and access to it by other entities is limited. In Russia, 88.6% of the enterprises is private ownership, while 6.6% is state and municipality owned. The problem of property rights specification is regarded as a priority, and its relevance increases each year. The number of claims to the arbitration court about the right of ownership is steadily growing, as well as the number of applications for recognizing the right of ownership and reclaiming property from another. The dynamics of indicators confirm the conclusion that there is insufficient institutional security for the protection of property rights of entrepreneurs.
Unfinished Contracts

All business activities of an entrepreneur consist of transactions, the basis of which is an exchange, in which goods (works, or services) are transferred from one entrepreneur to another, subject to a counter flow of money (benefits) or a commitment to transfer in the future. Where the conditions of such exchange are known in advance, then the exchange becomes a contract. A contract assumes existing mutual expectations. However, in practice, implementing contracts has high risk and uncertainty that leads to the incompleteness of contracts or their non-fulfillment. In practice, economic entities operate in a highly competitive environment, and benefits from contracts are low. Moreover, in this case, a contract cannot be self-sustaining, and its execution creates huge risks. It is clear that incompleteness of contracts leads to a risk of invalidity of the contracts.

Administrative Barriers to the Activity of Entrepreneurs

One current problem of the Russian economy is a high level of administrative barriers affecting the business activities of entrepreneurs. These administrative barriers are the rules about conducting certain activities in the market that have been established by decisions of state bodies for compliance, which is an indispensable condition for conducting such. At the same time, it provides payments to fund bureaucratic procedures that are not always identified in the budget. Yudenko and Leontiev (2017) note that the system of administrative and legal regulation in construction remains unfriendly to small- and medium-sized enterprises and does not take into account the specifics of doing business in small forms of management. Business costs associated with the need to meet regulatory requirements are constantly growing.

The construction faces several institutional norms that limit the construction of residential and commercial real estate. Access to land for building, and obtaining approvals and permits for connecting infrastructure, distort the conditions of competition and affect the construction period of a facility. Land plots are often provided with no engineering infrastructure, and the technical conditions are unaffordable for investors. The absence of master plans does not allow a municipal formation to systematically determine how it will develop the territory where construction is to be carried out. This influences the number of orders for construction and repair works that are performed by small businesses.

According to Oparin, Chepachenko, and Yudenko (2016), the problems of estimating costs in construction of buildings and other structures are also an administrative barrier that does not allow economic entities to increase productivity and efficiency in general.

The Russian small and medium business forum was held in Russia in 2015. The forum (Panel discussion of the forum "Reducing administrative barriers for doing business," 2015, June) identified two main reasons limiting the development of small- and medium-sized businesses: 1) administrative barriers that ensure legalization of corruption flows; and 2) monopolization of markets through administrative resources. The costs for small business owners regarding the problems mentioned above are transactional. It was announced at the forum that the cost of administrative barriers was 7% of gross domestic product per year (i.e., 5 628 billion RUB or 125 billion USD).

In regards to the problems, in particular, administrative barriers that ensure the legalization of corruption flows, there are several issues. Payments, due to the existence of such barriers, are not directly related to taxes but remain legal payments for various certificates or documents confirming unnecessary compliance, i.e., legal business and technology for issuing certificates and confirmations. On this issue, there is some opposition between supporters of the introduction of new regulatory measures and those who, on the contrary, favor the weakening of state regulation of small businesses. In difficult economic times, the popularity of both parties and their solutions are growing. Business representatives complain about the lack of funds for obtaining various approvals and permits. The crisis pushes the business into obscurity, while the sector authorities believe that it is possible to resist this process due to certain new permitting procedures. It is clear that the new procedures, as a rule, only increase the administrative burden on businesses and may indirectly send them into obscurity.

The second factor limiting the activity of economic entities is the monopolization of markets through administrative resources. Administrative monopoly arises from actions of state bodies. On the one hand, it grants individual enterprises the exclusive right to perform certain types of activities. Competition, in this case, is absent. On the other hand, the remaining enterprises in the market receive
a high profit in favor of affiliated persons. Signs of monopolies or oligopolies in the housing construction market can be found in all major regions of the country where huge budget money is involved in construction in Moscow, the Moscow region, Saint Petersburg, the Leningrad region, and other regions. According to Kaplan (2016), the director of the Union of Construction Companies ‘Soyuzpetrostroy’, at present, the Northern Capital rates 29th (one of the last) as likely to enter the market of construction services.

Conclusion
In conclusion, costs of entrepreneurs usually have economic as well as ethical and political bases. Irrespective of the official goals of state and municipal bodies in relation to business, their daily activities are determined by decisions accepted by ordinary people through certain incentives, interests, and tasks. Likewise, one should be cautious about statements from entrepreneurs who attempt to convince society of their adherence to public interests, stating that their main criterion when formulating an enterprise policy is not the maximization of profits but the fulfillment of obligations to society. In addition to the above sources that determine costs of entrepreneurs, there is also the institutional dimension of business. Rationally created formal institutions should consider the ‘human nature’ of entrepreneurs and remain open to the growth of informal processes and mechanisms of insurance as entrepreneurs do not have effective mechanisms of insurance against formal norms of certain institutions (e.g., taxation, bankruptcy, and norms governing the process of obtaining a building permit). Gaps in the institutional space can lead to a situation of an official deciding upon the solution. Moreover, this choice may not be in favor of the entrepreneur and could be influenced by the relationship between the entrepreneur and the authorities. Such a situation is common in today’s society, opens the field to corruption, and increases uncertainty of the economic environment. Furthermore, in the absence of sufficient funds in the budget, possibly only the confidence of entrepreneurs and a favorable investment climate will attract private capital for small businesses in the economy. For promoting small business development, it is recommended that the state apply several basic institutional rules. First, the state could disallow property access rights to those who do not own the property by law. This rule would avoid entrepreneurs bearing the high cost of insuring against third parties access to their properties. Such costs can exceed the potential incomes of the economic entity. Second, where entrepreneurs do not accept official institutions, they could be guided by informal norms, depending on the state of the economic environment. Where the market economy is characterized by a predominance of personified norms, spontaneously formed institutions in the field of pricing, investment, construction, and exchange arise followed by institutional contradictions and confines. In this case, when the behavior of entrepreneurs is regulated by a volitional establishment of general norm, and not by a separate agreement of parties, entrepreneurs face a regulatory act or law. Therefore, a mechanism of norms for compliance is necessary, the action of which should not limit an entrepreneur’s profit and would be aimed at increasing efficiency. Third, abolishing unnecessary restrictions and permits, i.e., removing administrative barriers, would be an easy way to increase the value of an entrepreneur’s property (land, fixed assets, real estate, and objects of intellectual value) and allow the opportunity for his or her effective action. Currently, most of the adopted laws and regulations are beneficial only to one party, the legislator, and those supporting it. Finally, forming a single, complete mechanism for administering tax, customs, and other fiscal payments could eliminate inefficient controls. State bodies should consider counting the costs of entrepreneurs. Today, every 1 RUB of the legal wage of an employee incurs up to 0.55 – 0.60 RUB in taxes.

THE DEBATE ON PRUDENCE IN ACCOUNTING

Hristina Oreshkova

Abstract: In support of the critical analysis targeted at substantiating the necessity of reintroducing “prudence” in the Conceptual Framework for Financial Reporting (CF), that is the primary author’s goal, the article provides further results as well as views and arguments, based on research, provoked by the International Accounting Standards Board’s decision to revise the CF (in September 2010) and remove “prudence” in favour of “neutrality” regarded as a qualitative characteristic. The author’s aim is not to discuss the role of the CF as a whole, or its objectives, but to contribute to the current debate on a complicated and highly controversial issue, raised in the Discussion Paper (DP), followed (in January 2014 and May 2015) by the Exposure Draft (ED) containing proposals for a revised CF.

The thesis held by the author, both before and now, is that for a considerable number of reasons it is imperative to restore “prudence” in the CF, subjected to revision at the moment (and yet expected) as an introduction to the International Accounting Standards (IAS)/International Financial Reporting Standards (IFRS), with a clearly defined content of its definition in order to avoid misinterpretation or misunderstanding, which, in my view, will not impair “neutrality”, but will support it.

On the basis of my long-lasting research alongside the thorough observation of the regulatory process, I would argue that as a supranational body, developing the accounting norms for many business entities operating in the EU and elsewhere, the EU accounting standards setter, who is responsible for the ambiguities or at least misconception, due to its prerogatives, has not been consistent in its policy with regard to prudence over the years. Probably one major reason is the influence of political, institutional and other factors in the global process of convergence. The development and deliberations as of December 2016 and January and February 2017 as to the revision of the CF have convincingly confirmed that once more.

Introduction to the Debate on Prudence

Over the past decade, countries in Europe have experienced changes in financial reporting described as “a revolution”. Undoubtedly, the political decision on the IAS adoption by the EU Member States from January 1st, 2005 was a challenge for institutional and professional organizations, national and supranational bodies of authority, and many people at different levels of corporate governance and management. However, a year after the IAS adoption, an EC-sponsored study has found that the adoption of IFRS has proved to be ultimately successful. The study concluded that “there was widespread agreement that IFRS has increased the comparability of financial statements across countries, across competitors within the same industry sector and across industry sectors.”

Long before, and until now, prominent scientists in Europe and overseas have remained indifferent to the enthusiasm of that change even skeptical about its benefits. Insusceptible to the inspired rhetoric of others, Professor Jacques Richard accused EU regulatory institutions for non-applying, avoiding, or adapting accounting principles through compromises in regulations, in favor of particular interests (November 2005, Le Monde diplomatique, no.1:24-25). Now that countries are slowly and unsteadily recovering from the consequences of the last global economic crisis on an unprecedented scale it is unlikely for such an insight to remain unnoticed even by opponents.

In the dispute focused on the nature of the reasons for the profound changes in EU financial reporting, as well as on the essence of the factors that influence the rulemaking and regulatory processes and their efficiency, researchers, experts, specialists are not unanimous – the conclusions and forecasts point to more than one perspective while the estimates range from positive to extremely negative.

Since September 2010 the discussions have significantly intensified due to the fact that the IASB has revised the first chapters of the CF and replaced “prudence” with “neutrality” regarded as a qualitative characteristic. The crucial question was whether it was just a matter of linguistic means of expression

1 Hristina Georgieva Oreshkova, Associate Professor, D-r Hristina Oreshkova, Faculty of Finance and Accounting, University of National and World Economy, Sofia, Bulgaria, e-mail: hristina_oreshkova@abv.bg
3 In the present article ‘International Accounting Standards (IAS)’ and ‘International Financial Reporting Standards (IFRS)’ are used as equivalents.
or a change that undermines the essentials of financial reporting. Maybe under some political pressure, major progress was made at that point to the global consistency, or more likely towards the further erosion of “Prudence” in accounting.

Thus, the foremost author’s goal is to justify the necessity of restoring ‘prudence’ into the CF, and to consistently support that view by sound and cogent arguments. I should specify at this point, that ‘prudence’ should not be considered a qualitative characteristic of financial statement information even less a basic assumption as it was settled in previous texts of the CF. My key observation should be emphasized: ‘Prudence’ may be thought about as a fundamental principle, as a core principle, as a guiding principle, as a major requirement, as an essential theoretical concept underlying financial accounting. However, it should not be regarded as a qualitative characteristic of information provided by financial statements of general purpose as it was previously stated in the CF. It is deeply erroneous from a theoretical perspective, in my view. ‘Prudence’ is, and should be regarded as the primary principle amongst all the traditional accounting principles, to which professional accountants, predominantly analytical and conservative people, i.e., more pessimistic rather than optimistic, have been closely attached for centuries.

By design, not by chance, the article focuses on a rich palette of reasoning from various academic viewpoints. It is subordinate to the author’s objective to reveal in an explicit manner the fundamental and complex nature of the issue of prudence. Due to that circumstance, eminent authors of the past even of the present has dedicated fundamental research to ‘prudence’; that is an undeniable fact which cannot be overlooked; moreover, it should be emphasized, and regarded as an author’s observation of crucial importance for structuring the article, and for future surveys.

Another important objective is to differentiate the author’s view regarding ‘prudence’ as an overriding principle of accounting from opinions inclined to undervalue its importance, and from other more extreme interpretations.

The terminology of the article is mainly in the field of financial accounting and reporting under the Conceptual Framework, the IAS/IFRS, and the interrelated European Directives. The structure of the article is subordinated to the author’s objectives and the regular systematic requirements.

The heuristic methods of knowledge as analysis and synthesis, induction and deduction, comparison, analogy, observation, descriptive method etc. applied for achieving the author’s goal are generally accepted for research in that scientific field, and are commonly used due to their universal nature and the predictable results.

Different Even Conflicting Academic Views on Prudence: A Literature Background

“Give an estimation to the goods and for that does not value them more than they are worth, for it would be to make himself rich in idea.”

Jacques Savary (1675, p. 325)

“... the Superior Council of the OEC is very dedicated to preserving solid links with fundamental research, so that such association is able to avoid the brutal and systematic acculturation of our accounting standards ... The principle of prudence is the perfect illustration of this point. Indeed, this principle is linked to our style of governance, to our traditional manner of representing the activity of companies, based on a long term view of business life and not focused solely on their volatility.”

Joseph Zorgniotti (2010, p. 11)

The principle of prudence or ‘conservatism’ in accounting, as it is mostly understood in Continental Europe, for instance, Germany and France, or the concept or convention of conservatism as it is interpreted in the UK and the USA, respectively, has been the subject of a heated debate for decades now. I consider Professor Barker’s distinction to be valuable from a theoretical viewpoint, although I use both of the terms as it is done in the context of the relevant research depending on the author’s understanding. I believe that this is necessary for the sake of expression and clarity in order to attain precision, admitting that I lend priority to prudence. My motive is based on a solid foundation. The conceptual ideas of prudence have long been ingrained in our accounting system, culture and tradition as it has been developed under the influence of the Continental European accounting doctrine.

Perceived and defined either as a principle or a concept, it is more than obvious that ‘prudence’ raises a highly controversial issue for both researchers and practitioners. Due to a long-lasting thorough observation of the regulatory process, I can reasonably argue that the EU accounting standards settter,
who is responsible for the ambiguities or at least misconception by virtue of its prerogatives, has not been consistent in its policy with respect to prudence. The recent development and deliberations as of December 2016 and January and February 2017 as to the revision of the CF have convincingly confirmed that once more.

The fundamental research, dedicated to prudence or ‘conservatism’, reveal different even antagonistic academic views. Considerations are mostly focused on the concepts evolving over time, the essence of the traditional or ‘conventional’ prudence or ‘conservatism’, and the inherent rules that must be specifically applied in the process of valuation under the imperative of the prudence principle if it is embraced as a primary one. It should be noted that essential theoretical and practical issues of valuation and of entity’s accounting policy are mainly discussed with respect to prudence or ‘conservatism.’ Most of the surveys focus on the issues of recognition and subsequent valuation and disclosure of items which would create difficulties, since an estimation is necessary; in other words, the surveys predominantly treat complicated matters in which the recognition of an item implies an unbiased, unprejudiced, best possible estimate; usually this is due to an item’s specifics and significant uncertainties that give rise to measurement, methodological and disclosure problems. My understanding of ‘uncertainty’ in the case is that ‘uncertainty’ means that any carrying amount under consideration is (or should be regarded as) an estimate that would be difficult to verify, since there is a place for significantly subjective judgement in determining either the initial cost or the carrying amount (value) of an element at the balance sheet date. The subjective judgment can be carefully made; however, it is always hardly verifiable for authenticity as it may be presumed. It is a matter of expertise, professionalism including ethics, and responsibility.

Such problems usually arise in an attempt to look for the most appropriate treatment alongside the search for the most reliable evaluation of an element for its recognition in financial statement; they may refer to a wide range of items, varying in nature and types, as assets and liabilities, expenses and revenues or income, profits and losses, and others; to be specific, among the emblematic examples are: research and development (R&D) costs, also known as expenditure on R&D, costs of litigation, borrowing costs, advertising costs (or expenses), costs of luring new clients, some kinds of intangibles, internally generated goodwill, provisions for restructuring or of another type, contingencies, acquired goodwill and many others; the possible effects of a particular accounting approach or model of initial or subsequent evaluation on the carrying amount of (net) assets and income are mostly discussed in respect of the issue of the “hidden reserves”. The problem has been raised, and, in my opinion, has been exaggerated by opponents claiming to be against prudence or ‘conservatism’, who appear to be advocates of the “true and fair view” or “fair presentation” postulate; the appropriate level of being cautious from the perspective of accountants as practitioners is also often in the focus of researchers and discussions. For example, scientists investigate how the degree of accounting conservatism, reflected in the financial statements information of European companies, evolves over time during long periods, and how the adoption of IAS/IFRS has influenced the differences in the degree of balance sheet conservatism and earnings conservatism between European companies reporting under IAS/IFRS. Most influential authors like Sudipta Basu (2009) describe how their contemporary research on the origins of accounting, including Chinese accounting, is related to their search for an ultimate explanation for conservative accounting.

All these essential issues are exclusively identified with respect to ‘prudence’; thus they should be discussed not in a prejudiced or manipulative manner, but in a straightforward one, not forgetting the rationality that the traditional, i.e. ‘conventional’ prudence embodies. We confidently believe that the resilience of prudence to criticisms over time is due to its fundamental nature as a core principle and its crucial role in accounting as a unity of theory, methodology and social practice for centuries.

One major observation should be taken into consideration primarily. In my view, it is of great importance to underline that a difference should be made between two cases: the first case is when the creation of hidden reserves is being systematically made in a deliberate manner, on purpose; that is the case when one is not faced with whatever kind of uncertainty and can ascertain the actual facts or values without difficulty; the second case is when hidden reserves are created not deliberately, but accidentally, unintentionally, involuntarily, in the absence of any deliberate actions; that is the case when one is faced with some kind of uncertainty or unknown magnitudes. The deliberate creation of hidden reserves and ‘conservatism’ are mistakenly equaled, in my opinion; they seem to be similar,
but it is just ostensibly; such an interpretation implies a superficial view on the problem; however, there is a line that helps to differentiate between the two types of behaviour of accountants. Following that way of thinking, at this point it is appropriate to support our reasoning by Paton and Stevenson’s understanding that, in my view, is perfectly correct and truthful:

“Conservatism is a genuine, prudent response to uncertainty, whereas the “big bath” accounting is a deliberate attempt to mislead the users of financial statements information when there is in fact no uncertainty. W. A. Paton clearly pointed out that “a sheer understatement where it is possible to ascertain the actual facts is not conservatism but concealment” (1916, p. 237; Emphasis added).

Some present-day views on conservatism in accounting, and understandings existing for decades, do not seem to include or permit any deliberate, that is, intentional manipulations in valuation of items, or other abuses with opportunities in accounting as a system, which to be targeted at understating income in a current period, and overstating income in future periods, if there is no or there is just a little economic uncertainty surrounding transactions. In the USA, the accountants’ behavior in favor of the creation of hidden reserves in a prejudiced manner is known as “a big bath” accounting, and such behavior is thought about as inconsistent with the principle of conservatism. It is confirmed, for instance, by the US FASB’s view as of 1980 towards conservatism and hidden reserves exposed in the FASB Framework as of 1980. In that Framework, the US accounting standards setter emphasizes that ‘conservatism in financial reporting should no longer connote deliberate, consistent understatement of net assets and profits (FASB, para. 93)’. At the next point, in para. 95, the US FASB underlines that ‘conservatism no longer requires deferring recognition of income beyond the time that adequate evidence of its existence becomes available or justifies recognizing losses before there is adequate evidence that they have been incurred’ (US FASB Framework, 1980, para. 95).

The recent decades’ tendency of opposing conservatism, and of contradicting its supporters in some circles, in favor of the so-called ‘true and fair picture’ or ‘true and fair view,’ or ‘true and fair presentation’ is well known. It can be confirmed by a quote revealing the judgment of a Professor in finance: ‘Conservatism is under attack … some … even the FASB … are now suggesting it may be better to abandon conservatism … to show more unbiased financial statements.’ Besides that, it is the standpoint of eminent scientists in the field of accounting and economics from France, Spain, the UK, Germany, the USA etc., such as Professor Jacques Richard, Professor Jesús Huerta de Soto Ballester, Professor Stella Fearnley, Dr. Carsten René Beul, Professor Shyam Sunder; and many others, and at this point I will admit, that my perspective and opinion are the same as well.

However, on the grounds of my research so far, I confidently believe that, especially in Continental Europe, the principle of prudence or ‘conservatism’ has been an integral part of financial accounting essentials for a long period of time, and it can hardly be disproved, in my view. One major argument which is put forward by the adherents in this respect is that prudence or ‘conservatism’ serves well the needs of creditors. With a specific allusion to the German accounting system, Haller (2003, p. 92) states that the principle of conservatism is not understood as a sub-characteristic as it is understood in the USA⁶ and in the UK but rather as the core principle of accounting which stems logically from the objective of protecting creditors (following Hellman, 2008, p. 72). At this point, it should be noticed that conservatism also serves well many other stakeholders, such as potential and present investors, employees, and other people in employment, institutions of state authority, as well as the social interests of all society members and the society as a whole, due to its social significance and the favorable societal implications of its consistent application.

Haller (2003, p. 108) continues the explanation with the argumentation as follows: ‘The idea of safeguarding the company as a source of income generation … with the function of the balance sheet in calculating taxable income, leads to an emphasis on capital preservation … The concept of the preservation … of nominal equity … is also the reason for the importance of the principle of prudence, which, in line with the specific author’s wording, leads to the use of the so-called hidden or ‘secret’ reserves … counterproductive in an accounting model whose only objective is to give information

---

⁶ However, Sterling (1967) argues that conservatism has historically been one of the most influential accounting principles even in the USA, where companies to a greater extent turn to the stock market for financing.
because secrecy is the opposite of information. However, it is admitted that: ‘In a model which stresses prudent income calculation with the objective of the preservation of capital and an underlying concept of creditor’ protection … it is a very logical approach’ (by Hellman’s notes, 2008, p. 97). In my view, the ultimate thought seems to be truthful and realistic. However, the hidden or ‘secret’ reserves in themselves cannot be regarded as an instrument or tool for deliberate manipulations aimed at understatement of value of (net) assets or income. Initially, in their origin, hidden reserves are rather the consequence or the effect that might be caused by non-professional approach to valuation process, lack of expertise, more or less impact of stakeholders at a higher management level, other factors of influences etc.; moreover, the biased misstatements of values of financial statement elements when it is not difficult to ascertain the real facts, should be regarded not as conservatism but simply as concealment of data, which in its turn can be misleading. But this is not always the case in practice.

Similar is the view held by Professor Hellman (2008, p.74). He reasonably argues that a long tradition of accounting conservatism exists, predominantly in code-law-based countries. Professor Hellman refers to Haller and Eierle (2004, p. 36), who suggest that it has been a received wisdom in Germany that conservative accounting is ‘... the best way to reach the objective of creditor protection’. Creditors’ preference for conservatism is explained as a way of protecting the priority of the creditors’ claims above the shareholder claims (J. M. G. Lara and A. Mora, 2004, quoted by Hellman; Emphasis added). For that reason, it is argued, that the determination of non-restricted equity, that is, funds which are distributable among shareholders, has been much emphasized on in code-law-based countries. With specific regard to Swedish legislation, K. Artsberg and C. Nilsson (1993, p. 37), suggest that the view, incorporated in the Swedish legislation, is that ‘a single good year should not result in dividends, but that profits shall be retained as reserves for the future’ (K. Artsberg and C. Nilsson, 1993, p. 37; quoted by Hellman; Emphasis added).

On the basis of my investigations so far it can be suggested that in Germany, France, Sweden and other European countries, for a long period of time conservatism was the overriding accounting principle. It still appears to be an essential theoretical concept especially in Continental European countries. Unfortunately, in Professor Jacques Richard’s view, the IFRS ... embody a systematic and all-out assault on a fundamental principle underlying accounting (already fairly well eroded throughout the 20th century) – the principle of prudence, which forbids statements of potential profits and prescribes disclosures of potential losses (by Professor Jacques Richard; Emphasis added).

Although the influence of the IASB’s policy has been powerful for decades, in practically oriented discussions, the principle of prudence is mostly deliberated on in respect of accounting issues arising from uncertainty. Debates on issues of how exactly the principle is being applied in reality regularly arise and they are usually focused on critical questions as, for example, whether particular accounting solutions can be regarded as enough conservative, i.e., prudent and sensible.

Hellman (2008, p. 74) reasonably argues that the strong connection between accounting and taxation in code-law-based countries also tends to work in favour of conservatism, and this is quite logical as it may be presumed that more prudent valuations of assets and liabilities would also lead to lower taxable income. It may be noticed here that it is not necessarily be always so. Taxable income can be calculated depending on specific rules of tax laws designed to regulate the process of transformation of reported financial results for the purposes of taxation. Even accounting losses, not only profits, are subjected to procedure of tax transformation, in order to counteract possible management propensity of creating hidden reserves, or, to neutralize to a certain extent the effects of such practice.

Conservatism is broadly considered to be a tendency of accountants’ behavior of preferring to choose, when faced with some kind of uncertainty as to specific events, to attribute lower estimates of values of assets and revenues, and conversely, higher estimates of values of assets and expenses. It is commonly deliberated that conservatism stipulates that expenses and liabilities are not understated in accounts and consequently in financial statements, and on the contrary, assets and revenues are not overstated in financial statements. In Sterling’s view (1967) conservatism seems to be closely related

---

7 The hidden or ‘secret’ reserves are considered to be the feature of the German accounting and for the reason of that it has been criticized for long in an international context.

8 Moreover, in Hellman’s view, auditors also may have a conservative bias, since they are not expected to get sued on the grounds of financial statements, being too conservative (Hellman, 2008, p. 74).
to the concept of realisation, as conservatism implies that a profit should not be recognized, before it is realized. The approach of recognition of profit in advance, before it is realized, always poses to risks, more or less, and it may prove to be overly unrealistically optimistic. Thus, as early as 1967, Sterling reasonably suggests that conservatism may in fact be the root of the principle of realization. That view is supported by emeritus professors of accounting, such as the French Professor Jacques Richard and many, many others. The debate is still going on and has strongly intensified during the last global economic crisis. The distinction between realized and unrealized profits should be clear to all interested parties, and that view has been predominantly sustained over time.

Scientific and historical evidence confirms that conservatism has been one of the oldest and most important principles of accounting (Sterling, 1967; Watts, 2003a). However, a lot of researchers have found that it has been problematic to completely incorporate conservatism in the normative theory of accounting. Conservatism was a primary principle for the German supporters of the balance sheet approach, known as ‘statists’ (Forrester, 1993, Chapter V). Since 1908 and on, a different view and an income statement approach have been propounded (Schmalenbach’s theory, 1959, and Quire, 1965, emphasizing the ‘matching of flows of production and consumption in order to measure profit’).

Although Schmalenbach disagreed with the static theory, he agreed with the statists with regard to the primary role of conservatism. Schmalenbach (1959, p. 82) argued that an overstated profit is far more dangerous than an understated one. However, at the same time, Schmalenbach (1959) admitted that conservatism can be exaggerated and he also presumed that underestimation of profits can be harmful (Hellman, 2008, p. 74; Emphasis added). By Hellman’s specific wording, it is not clear-cut from reading Schmalenbach (1959) how the appropriate level of conservatism should be determined.

Researchers such as Paton and Littleton (USA, 1940) propounded an extremely different view. These authors intended to construct a framework of an accounting theory conceived as ‘a coherent, coordinated, consistent body of doctrine’ (1940, p. ix), of which conservatism should not be a part. They regarded conservatism only as an attitude to be added when interpreting the accounting numbers (Littleton, 1940, p. 128), and as ‘a rule of caution’ applied by users when interpreting the results of accounting measurements made according to ‘a coherent body of doctrine.’ However, that view has not been acknowledged in practice. In this respect Sterling (1967) argues that whenever conservatism clashes with a conventional accounting principle (for example, the valuation of inventory at the lower of cost or market value or simply at historical cost, in Sterling’s way of expression at the time) there is a preference for the more conservative policy in practice (by Hellman, 2008, p. 75), hence the more conservative accounting approach and method of valuation. A conclusion can be drawn that these differentiating views demonstrate problems of delimiting conservatism to some ‘appropriate’ level. Then the critical question immediately arises, which is the most ‘appropriate’ level of conservatism.

For researchers in the normative accounting tradition, the application of the principle of conservatism has been understood as theoretical (Hellman, 2008, p. 75). Hendriksen (1982, p. 81) argues that the general constraint arising from uncertainty has served as a basis for the traditional accounting concept of conservatism. However, the idea of systematically understating assets and overstating liabilities, recognizing revenues too late and of expenses too early has been interpreted by critics belonging predominantly to the Anglo-American tradition as a way of reducing the relevance of accounting information. In the words of Hendriksen (1982, p. 83) ‘conservatism is, at best, a very poor method of treating the existence of uncertainty in valuation and income. At its worst, it results in a complete distortion of accounting data.’ (Quoted by Hellman; Emphasis added). However, the views of eminent scientists in Europe and in the USA have proved to be far out of this opinion, even just the opposite.

In Hellman’s view, reliable reporting of past events, which implies that stewardship and the feedback function of accounting is emphasised, is often associated with the need for conservatism. Over time, the IAS have become increasingly future-oriented, pointing out decision usefulness as the primary objective of accounting (IASB Framework; 2006a), and that conservatism seems to have become less of a governing accounting principle (Hellman, 2008, p. 72). Other authors like Hendriksen s argue that it is generally stated, that the concept of conservatism is not a postulate of accounting, nor should it be one of the constraints. But in its operational form, as those authors claimed, it serves as a constraint to the presentation of data that may otherwise be reliable and relevant (Hendriksen, 1982 p. 81).

Hellman argues that the normative accounting research tradition went out of fashion in the 1970s, but that critical view on conservatism seems to have been adopted by the US standard setters. Although
the US APB (1970) acknowledged conservatism as ‘a modifying convention of financial accounting.’ FASB (1980) does not deliberate on conservatism as one of the desirable qualitative characteristics of accounting information in its framework.

Researchers like Basu9 (1997) and Watts (2003a) argued that conservatism has the effect of accelerating the recognition of economic losses, and, reversely, of deferring the recognition of economic gains, that is described by Basu (1997) as ‘the asymmetric timeliness of earnings’ (ATM). It (ATM) has turned out to be the basis for further research both empirical and theoretical (Watts, 2003b; Ryan, 2006). Authors argued that ‘the asymmetric timeliness of earnings’, as a feature (property) of conservatism as it is described by Basu, highlighted the intertemporal nature of conservatism – the recognition of unverifiable economic gains or of unrealised economic gains in earnings (and income) is delayed until the uncertain gains turn out to be verifiable or until they are realized. Therefore, in a normal, typical, usual company’s life cycle, earnings tend to lag behind the economic income over several accounting periods. In the early stages of the company’s life when the investment outlays tend to be higher and revenues lower, earnings tend to be lower than the economic income of the company; however, in the mature stages of the company, when its revenues are higher and more stable, earnings tend to get closer to the economic income or even exceed it (Monahan, 2005; Zhang, 2005). However, it should not be argued that accounting conservatism is not always “conservative” merely because it may lead to lower earnings in one period and to higher earnings in another one. The main purpose of conservatism is to create higher standard or, let’s say criteria, of verification for recognition of good news, as a mechanism of dealing with and overcoming economic uncertainties. Thus, the intertemporal properties of earnings are just a consequence of that main purpose of conservatism, rather than the reason for it (Richard, Z. W., 2009).

As to the inherent rule of the inventory evaluation – book value or carrying amount of an inventory should not be written up when market value exceeds cost (cost of acquisition), but it should be immediately written down when market value falls below cost, known as ‘the lower of cost and market value’ rule, according to the eminent historian R. H. Parker (1969), that practice was firmly established in the 19th century. George O. May claimed that by the time he entered the accounting profession (1892) in England, the rule had already been well established (R. Parker, 1969). This suggests that conservatism probably has been around since the 19th century at the latest, while other researchers argue that the time is even longer. Sivakumar and Waymire (2003) conducted a historical study into the accounting of US railroads at the beginning of the 20th century, using empirical methods. Their study demonstrates that the railroad companies in the US around the turn of the 20th century were not only conservative in methods and accounting policies but that their levels of conservatism also gradually increased, in response to changes in regulations and other factors (Richard, Z. W., 2009). This study provides some of the most considerable and persuasive empirical evidence that conservatism in accounting has existed for a long period of time, resonated the similar conclusion of historians based on mostly non-empirical methods (Richard, Z. W., 2009).

The influence of conservatism on accounting standards is pervasive, and examples can be found in many standards (Richard, Z. W., 2009). Apart from the ‘lower of cost and market value’ rule which still remains in the US (Richard, Z. W., 2009) and the international accounting standards at present, many rules exist that can be regarded as illustrative examples of conservatism, e.g., the impairment of fixed assets; the expensing of research and development costs, rules as to depreciation and impairment of some assets, provisioning, contingent liabilities, and many others.

Moreover, it is argued (Richard, Zhe Wang, 2009) that ‘empirical studies on conservatism in the second half of the 20th century have provided ample evidence that conservatism is a fundamental characteristic of financial reporting in virtually all the developed countries in the world, and also in many developing countries’ (Watts, 2003b; Ball et al., 2000; Bushman and Piotroski, 2006; Basu,

---

9 Basu interprets conservatism as resulting in earnings reflecting ‘bad news’ more quickly than ‘good news’ that implies systematic differences between periods of bad news and periods of good news in the timeliness and persistence of earnings. Basu uses firms’ stock returns to measure news and finds out that the contemporaneous sensitivity of earnings to negative returns is two to six times that of sensitivity of earnings to positive returns, and that negative earnings changes are less persistent than positive earnings changes. Earnings response coefficients are higher for positive earnings changes than for negative earnings changes, consistent with that asymmetric persistence (Basu, 1997, p. 3-37). Basu argues that conservatism has been established for at least 500 years in Europe, supported by historical evidence that traces the ‘lower of cost and market value’ rule back to Italy in the 15th century and to France in the 17th century (Littleton, 1941; Emphasis added).
1997; Ball et al., 2003). As we have underline, this is a scientific area of profound research, and many studies have been embarked.

Beginning in the late 1930s, and until the 1980s, conservatism had been criticized by prominent accounting scholars, including Gilman, Hatfield, May, and Paton (Chatfield, 1996). According to Chatfield (1996), the most frequently used arguments against conservatism are: firstly, accounting conservatism is not consistent in that it produces lower income in one period and leads to higher income in another period; secondly, accounting conservatism is arbitrary and gives managers too much discretion for power over reporting, among other problems (by Richard, Z. W., 2009).

However, as Watts (2003a; 2003b) has noted, despite criticisms, not only has accounting conservatism survived numerous accounting reforms, regulations and economic crises in the past century, but also the average degree of accounting conservatism, in the US at least, even (slightly) increased during the past 30 years (Oreshkova, p. 277-292). This claim has been confirmed by empirical studies based on large samples of data from the US and worldwide. For example, with regard to the lower of cost and market rule, Parker observes: “The astonishing thing about the lower of cost and market rule is its ability to survive attack. G. O. May was probably right in suggesting that most accountants are ‘content to regard the demonstrated practical wisdom of the rule as outweighing any supposed illogicality’” (Parker, R., 1969, p. 257, Richard, Z. W., 2009, p. 13).

The inspiration of academics and researchers is to find out the rationale underlying conservatism, and, subsequently, to explain its inherent resilience of criticism even at the present time. “While the search for rational explanations of conservatism is still ongoing, it has already paid big dividends (Richard, Z. W., 2009, p. 13).” Referring to Watts (2003a) and summarizing a large part of the recent developments on the problem, Richard, Z. W. (2009) identified several explanations of conservatism, concerning: the litigation risk and reduction of litigation costs, the debt contracting, the managerial contracting, the political cost, and tax optimization or the tax incentive explanation (Watts, 2003a). These explanations have made conservatism, once unjustifiable in the eyes of Paton and Hatfield, significantly more justifiable (Richard, Z. W., Ibid.).

Due to an existing constraint, it is impossible in the present research to reveal the rich palette of views, considerations, and arguments focused on prudence and ‘conservatism.’ The literature dedicated to that fundamental problem is vast, since the debate has been ongoing for decades, if not for centuries, and we do not exaggerate. The phenomenon of prudence or ‘conservatism’ has challenged researchers since the very early periods of the development of accounting as a theory. Thus some academics (e.g. Richard, Z. W., ibid.) acknowledge that many of the arguments have yet to be resolved.

The erosion of prudence in accounting under the influence of international standards setters and other political factors, besides regulatory bodies, has provoked researchers, professional and institutional organizations, experts, practitioners. The international standards setters have attempted to abandon prudence in favor of “neutrality” regarded as a qualitative characteristic of financial statements information since 2006 (IASB, 2006a; FASB, 2006), and even earlier, I suggest. It was claimed that if neutrality was ensured, there would be no downward bias impact on the reported (net) profit or income, even though uncertainty may exist as to the amount of the profit and the question of whether it is realized or not. The motive of upholding that view was that ‘prudence’ and its inherent ‘conservatism,’ due to the bias it introduces, appears to be inconsistent with the qualitative characteristics of representational faithfulness. It was argued that neutrality in accountants’ behavior will lead to unbiased representation of the underlying economic performance of the entity, thus provide more reliable and relevant information to stakeholders. That way of thinking was very likely to be widely criticized and the ongoing debate has revealed and confirmed all this.

**Are “Prudence” and “Conservatism” Synonymous or Not?**

There has been an eclectic for long as well as a wide range of detached opinions. Semantic meanings were accumulated over time. Different authors used one and the same term, but attributed to it different meanings, and interpreted it in a different way. The strong impact of the accounting tradition and culture as well as the lack of linguistic equivalents created and still create difficulties, which impede the more comprehensive and productive debate. Although prudence and ‘conservatism’ are broadly used by the authors as synonymous, which circumstance, in my view, creates another prerequisite for ambiguity or misconception, we are inclined to support the opinion that a theoretical...
distinction is necessary to be made. It is of importance for achieving precision in defining prudence and in formulating the definition on the grounds of a clear understanding of its essence.

Professor Barker (2015, p. 515) explains that ‘conservatism’ refers to any method of accounting that leads to book value being less than economic value, while he determines ‘prudence’ as a specific type of conservatism arising from a ‘cautious’ response to uncertainty. Barker attains theoretical merit, differentiating between prudence and ‘conservatism,’ which is needed in setting out distinct theoretical concepts that would otherwise be mingled. His first observation is that conservatism cannot be defined in absolute terms, but it must be defined in relation to something. The consideration is that an outcome can only be described as conservative in comparison with an alternative outcome that is not conservative (and which might be described as ‘neutral’).

In the case of conservatism, the term ‘economic value’ is employed as the neutral benchmark. Barker’s idea is that a comparison should be made between the estimated worth of the reporting entity in economic terms and the representation of its worth in accounting terms on the balance sheet. “This ‘straw man’ comparison, in Barker’s words, is important in explaining why financial accounting is not a system for the neutral measurement of economic value, and why conservatism is thereby an intrinsic system property.” However, it is not the purpose of annual financial statements to construct models of economic value (Tracey, E., p. 540-542). Specifically, conservatism is defined as: ‘Accounting is conservative if the economic value of an entity’s equity exceeds its book value’ (Barker, 2015, p. 516).

In Barker’s definition, ‘economic value’ refers to the present value of expected cash flows attributable to holders of equity claims, and ‘book value’ refers to the carrying amount of net assets. In practice, of course, economic value is an estimate, depending as it does upon the forecasting and discounting of future cash flows. No claim is made that economic value can be ‘known’ in practice, and in that sense the benchmark of neutrality employed in the quoted research paper is hypothetical, being invoked to identify conceptually the nature of conservatism in accounting.

At this point, it is appropriate to note that Barker’s major argument is that financial accounting is inherently conservative, and I think it is apparent that I totally support it. A neutral application of the International Accounting Standards Board’s definition of (net) assets leads to book value being less than economic value (Barker, 2015, p. 514). The English professor emphasizes the existence of both conceptual and practical reasons for this, neither of which, in his view, can be explained by an intention to be conservative, by an asymmetry or bias, designed to lead to a conservative outcome.

Financial accounting is not a system for the neutral measurement of economic value, and it is one major observation. Book value and economic value are conceptually different, with conservatism resulting from that difference. This inherent conservatism seems to have been overlooked both by the IASB and by its critics (Barker, 2015, p. 514, p. 515). On the pretext of convergence and under political pressure, after vigorous deliberations, the IASB has removed prudence from the Conceptual Framework (CF) and has been criticised by academics, practitioners and professional organizations. In Barker’s viewpoint the challenges to the CF implied by adopting an agency-based, contracting demand for prudent accounting are criticisms of a problem that for the most part does not exist (2015, p. 514).

Strong disagreements exist between the International Accounting Standards Board, on the one hand, and, academics and practitioners, on the other hand, on the question of prudence. On the basis of my previous and current research I tend to believe, that persuasive arguments exist in support of the view that accounting should be conservative. In my view, financial accounting as a system is designed to be a conservative one. Barker also concedes that the research literature is broadly supportive of the notion that accounting should be conservative. Furthermore, he comes up with empirical evidence which suggests a market demand for conservatism as well as an economic theory to explain that demand.

With respect to this, the literature is aligned with accounting practice, which has long embodied a prudent approach to financial reporting.

---

10 Professor Barker argues that IFRS will always result in such differences, not because of applications of conservatism but because of IFRS’s definitions of assets and its measurement rules. These make gain recognition less likely than loss recognition and impairment losses more likely than revaluation gains (Richard Barker, 2015).

However, in conflict with academics, many institutions and practitioners’ perspective, “prudence” was removed from the CF (2010) since the Board did not consider it a desirable quality of the financial reporting information. It should be emphasised that prudence may be thought about as a fundamental principle, as a core principle, as a guiding principle, as a major requirement, as an essential theoretical concept underlying accounting and financial reporting, but it should not be considered a qualitative characteristic of the financial reporting information, as it was previously stated in the Framework. It is deeply erroneous, in my view.

The orthodox view of the financial reporting integral role in the financial system that is of ‘bedrock importance to capital markets’ is often emphasized (Wallace, UK, 2011) as well as the increased complexity of reporting. As main areas of critical issues in financial reporting are identified valuation, disclosure and comprehension, mostly discussed with reference to the present-day question of whether financial reporting reflects what a business does in reality. It is well known that efforts have been made for the increasing complexity of transactions and business to be reflected in the standards’ rules. However, there is now a lack of connection between financial reporting and the entity’s business model. For that reason, it is quite logical, the critiques to be primarily linked to the long absence of prudence in the CF that in experts’ opinion has been lost as a fundamental concept even in the UK.

I believe that accounting is a powerful practice that shapes and influences social and economic processes. For instance, Baker and Barbu (2007) point out that accounting has been an integral part of human civilization for 4000 years. Soll (2015) proves that accounting practices have played a remarkable impact on the rise and fall of great nations. The founders of modern economic thought – from Adam Smith to Karl Marx – saw accounting as essential to the development of successful economies and modern capitalism. For this reason, Weber (1947) repeatedly insisted on the necessity of studying economy and society together. That view of accounting perceived as a social, political and institutional practice has resulted in a wide range of studies (e.g. Burchell et al., 1985; Napier, 1989; Carnegie, 1993; Dillard et al., 2004). The European Commission also acknowledges that “accounting is not neutral”. Indeed, it affects a great variety of stakeholders, not only companies, investors, bankers and auditors, but also citizens, employees and states, since financial information serves as a basis for determining not only economic but also social rights. Accounting, for instance, serves to set the limit for distributable profits, to calculate taxes and to define the public budget to which social welfare is parametrized (by Palea, 2015).

In my view, conservatism should be understood in a broader sense than prudence. As a core principal that underlies financial accounting and reporting, traditional prudence is considered to comprise some essential rules, which accountants should follow if encouraged to represent the basic economic performance of an entity in a fair-minded, unbiased and unprejudiced manner, and thus provide truthful, sound and verifiable information to stakeholders. Conservatism must be conceived as a wise, prudential philosophy and strategy, the long term benefits of which to entity, state and society should be profoundly considered by each corporate governance and management. It is acknowledged that they, being mostly inspired by extortionately optimistic expectations, and having the prerogatives to influence accountants’ decisions, predetermine their behavior, entity’s results and performance. As a matter of fact, following the rules of the traditional prudence, accountants having their professional expertise and ethics, strive for the viability, durability and sustainable growth of entities.

The Normative Perspective: An IASB’s Exposure Draft Introduces Prudence

Does the Debate on Prudence End or Does It Not?

My long-lasting observation of the development of the debate on prudence has given me grounds to argue that the International Accounting Standards Board (IASB) has demonstrated a policy of inconsistency regarding its approach towards ‘prudence’. Without difficulties I can provide ample proof for that. Even Macintosh has publicly admitted recently that they, IASB’s members, have experienced the influence exerted by the US Financial Accounting Standards Board (FASB). “At the

---

12 Even the UK Statement of Accounting Practice (SSAP) 2 included the fundamental accounting concepts of going concern, accruals, consistency, and prudence. Then in 2010 the IASB published a revised Conceptual Framework for Financial Reporting which favoured “neutrality” over “prudence” or “conservatism”.

time – the IASB Vice-Chairman admits, “I didn’t think it should have been taken out. But there were people who thought it conflicted with neutrality. There are still people who see things that way. But I don’t.” Further on, Macintosh admits that the influence of the United States Financial Accounting Standards Board (FASB) is less strong than it has been that is slightly compromising, in my opinion (ICAEW Economia, 2015).

Further on, answering the question of why it is worth bother setting prudence back into the Framework (CF), Mackintosh explains that prudence gives people some comfort. He argues that some investors equate prudence with the “true and fair” view, as they believe it will give auditors a tool to help counterbalance management optimism and aggressive accounting policies. Singleton-Green, a manager in ICAEW’s Financial Reporting Faculty and his supporters, are quite pleased to see prudence back into the Framework (CF), but others are not, particularly those who see tension between prudence and the concept of neutrality, which, in my view, does not actually exist and this issue is artificially inflated. Professor Stella Fearnley from Bournemouth University (UK) rhetorically questioned opponents and comments further on: “What’s neutrality? It’s rubbish. Accounts can never be neutral because there are so many judgements in them.” As a final point, Mackintosh concludes: “This is an exposure draft. So people can comment again about whether prudence should be in.”

However, on the IASB’s meeting as of May 18th, 2016 the Board tentatively decided to confirm its previous decision and belief, namely that the Exposure Draft ‘should’ propose to reintroduce an explicit reference to the notion of prudence. However, once again the Board admitted, after prolonged persistence, that: ‘2.18. Neutrality is supported by the exercise of prudence, which is my thesis and view I have been standing up for since the outset of the debate, specifically, since the debate was triggered. The proposed definition is as follows: ‘Prudence is the exercise of caution when making judgments under conditions of uncertainty. The exercise of prudence means that assets and income are not overstated and liabilities and income are not understated. Equally, the exercise of prudence does not allow for the understatement of assets and income or the overstatement of liabilities and expenses’ (emphasis refers just to the ‘newly’ added extension of the definition). I have discussed in my previous research on this problem the reasoning that underlies the change (Oreshkova, 2014, p. 282); the notion (idea) is that such kind of misstatements can lead in future periods either to the overstatement of income or to the understatement of expenses. That was the notion of prudence after the decision to change the definition as of May 21st, 2014 (IFRS Foundation IASB Meeting, May 2014, 20th to 22nd).

In the BC two types of prudence are distinguished: ‘cautious prudence,’ defined as ‘need to be cautious when making judgments under conditions of uncertainty, but without needing to be more cautious in judgments relating to gains and assets than those relating to losses and liabilities. It is in this sense that the Board proposes to reintroduce prudence in the Conceptual Framework; and ‘asymmetric prudence,’ defined as ‘need for systematic asymmetry: losses are recognized at an earlier stage than gains are.’ The Board upholds the opinion that the Conceptual Framework should not identify ‘asymmetric prudence’ as a necessary characteristic of useful financial information. However, it explains that accounting policies which treat gains differently from losses could be selected in accordance with the proposals in the Exposure Draft only if:

- they are selected in a manner that is not intended to increase the probability that financial information will be received favorably or unfavorably by users of financial statements (i.e. neutral accounting policies are selected); and
- their selection is intended to result in relevant information that faithfully represents what it purports to represent.

---

16 On May 21st, 2014 the IASB tentatively decided: to reintroduce a reference to prudence in the CF. The description was – the exercise of caution when making judgments under conditions of uncertainty. Contrary to the previous description of prudence, it was acknowledged, for the first time, that the exercise of prudence is consistent with neutrality and should not allow the overstatement or understatement of assets, liabilities, income or expenses; secondly, to discuss in the Basis for Conclusions the significance of prudence for preparing financial statements and for the IASB in setting Standards.
On 18th May 2016 the Board decided to confirm that the revised CF should include a reference to prudence described as the exercise of caution when making judgments under conditions of uncertainty, as proposed in the Exposure Draft. The Board tentatively decided that there is no need to explain in the Basis for Conclusions on the Conceptual Framework that the notion of prudence cannot be used by preparers to override the requirements in IFRS because the Conceptual Framework already includes a statement that it is not a Standard and does not override any specific Standards. In addition, it shouldn’t be overlooked that the Board directed the staff to explore further whether and how the Conceptual Framework should acknowledge that asymmetric treatment of gains (or assets) and losses (or liabilities) could be selected if such selection is intended to result in relevant information that faithfully represents what it purports to represent.

The Board tentatively decided (September 22nd, 2016) that the main body of the revised Conceptual Framework should acknowledge that, in some cases, income may need to be treated differently from expenses and assets differently from liabilities. The Board directed the staff to develop the wording for such an acknowledgement for discussion at a future Board’s meeting. On 18th October 2016 the Board tentatively decided that Chapter 2 – Qualitative characteristics of useful financial information of the revised Conceptual Framework should acknowledge that the exercise of prudence does not imply a need for asymmetry – for example, a need for more persuasive evidence to support the recognition of assets than of liabilities or to support the recognition of income than of expenses. Nevertheless, it is admitted that in financial reporting standards such asymmetry may sometimes arise as a consequence of requiring the most useful information.

I tend to argue that with its most recent proposals endorsed as of January 2017, the confusion will reign over everything. The Board differentiates between ‘cautious prudence’ and ‘asymmetric prudence,’ purporting that this would contribute to more clarity, or at least would diminish the ambiguity but specialists and academics, including myself, are afraid that the effect will be just the opposite. One observation is, that way the Board will prescribe the appropriate level and type of prudence. Regarding this reasoning and the above-mentioned proposals IASB is once again criticized because of academic and institutional disagreements.

Authoritative professional institutions like ICAEW thoroughly comment on that issue claiming that the conflict between the CF and the essentials of some IAS/IFRS will be intensified and that is true. The view of AAT is also worth to be supported. They believe that while a principles-based approach to standards prevails, prudence provides a greater degree of assurance than neutrality does, and it is supportive of the inclusion of prudence within the CF.

However, the conceptual idea of prudence is embedded into already existing IAS/IFRS to a certain extent and in different ways; the notion of the so-called by the IASB ‘asymmetric prudence’, for example, can be seen in the standards themselves; as per IAS 11 Construction contracts, losses on a contract are recognised as soon as they are foreseen, i.e. predicted or expected; specifically, when it is (highly) probable total contract costs to exceed total contract revenue, the expected loss should be immediately recognised as an expense.

In this respect, some disclosure requirements seem to be prudential. As per IAS 11, an entity discloses any contingent liabilities and contingent assets in accordance with IAS 37 Provisions, contingent liabilities and contingent assets. It is specified that contingent liabilities and contingent assets may arise from such items as warranty costs, claims, penalties or possible losses. For example, IAS 37 requires disclosure, in specified circumstances, of major assumptions concerning future events affecting classes of provisions. IFRS 13 Fair Value Measurement requires disclosure of significant assumptions, including the valuation technique(s) and inputs the entity uses when measuring the fair values of assets and liabilities that are carried at fair value.

In compliance with IAS 37 Provisions, contingent liabilities and contingent assets full provision must be made for all the expected losses on onerous contracts, regardless of whether these items have been delivered or not. IAS 37 prescribes asymmetric treatment of contingencies as it differentiates between positives and negatives. Contingent assets can only be recognized if their receipt is virtually certain, whereas contingent liabilities must be recognized if the outflow of resources is more likely than not.

The IFRS criteria prevent recognition of items such as internally generated intangibles (for example, internally generated goodwill) or provide greater thresholds of probability regarding some items
recognition as it is the case with capitalization (or not) of development costs. Non-financial and non-current assets are initially recognised at historical cost, and the basic rule is that a decline in value (carrying amount) must be recognised immediately as an impairment loss for the period over which the entity incurred the loss, whereas increases in values are not recognised until the asset is sold (in case that the cost model of valuation is preferred as a component of the entity’s accounting policy).

The depreciation charge for each period should be recognized in profit or loss unless it is included in the carrying amount of another asset, while the revaluation surpluses (excesses) are treated in a more prudential manner, as components of other comprehensive income. Some disclosure requirements as to the notes, designed to reveal the policies relating to sensitivity of evaluations to changes in assumptions, can be seen as prudential. The so-called by the Board ‘asymmetric prudence’ can be seen in variable consideration in IFRS 15 Revenue from contracts with customers. However, in the area of financial instruments, there is basically no asymmetric recognition.

No doubt that there can be found many examples of non-prudential approach in the IAS/IFRS. For instance, provisions shall not be recognised for future operating losses, since future operating losses do not meet the definition of a liability (in paragraph 10, IAS 37) and the general recognition criteria set out for provisions (in paragraph 14, IAS 37); this is a big question and a key issue; the reasoning is that an expectation of future operating losses is an indication that certain assets of the operation might have been impaired; and what's next, an entity should test these assets for impairment under IAS 36 Impairment of assets, the application of which is highly complicated and creates problems in practice.

ACCA’s members, whose view is always interesting, also do not agree with the way prudence has been dealt with in paragraph 2.18. The approach to prudence regarded as ‘a quality (caution in the face of uncertainty) which should be followed in the preparation of financial statements’, is risky, ACCA argues as it encourages earnings management by giving companies the freedom to reduce profits by applying prudence in the preparation of the accounts when it is convenient.

Further Considerations and Inferences

In general, the policy of pursuing prudence in accounting, especially in an enterprise operating in the real (non-financial) sector of the economy, can manifest itself in a number of management decisions, which, different in nature as they might seem, are targeted at achieving the same goal – not to overstate neither understate the value(s) of (net) assets of the entity. Keeping up with that way of thinking we can give a lot of examples including primarily the following:

- Well-grounded classification and/or re-classification of the different assets and liabilities in interrelationship with the opportunity of choosing the model of valuation, and of allowing change if necessary (only in case the alternative model turns out to be the most appropriate);
- Searching for a sound judgment on the matter of the useful life of each depreciable asset supported by its most appropriate estimation;
- A reasonable choice of the method or methods of depreciation based on thorough preliminary analysis;
- Allowing for changes of a useful life and/or a method of depreciation as an exception in order to observe consistency (only if these changes are necessary for the faithful representation);
- Sound determination, including the use of unbiased expert assessment, of the residual values of all depreciable assets;
- Well-grounded judgement as to the presence of all criteria for recognition of an existing obligation as a provision; this is an important issue since if one of the criteria is not met, a disclosure of a contingent liability should be made unless the possibility of an outflow of resources embodying economic benefits is remote; and this is in regard to the necessity of providing sufficiently transparent information in the supplementary notes in order to enable users to understand the nature, timing, and amount of the provisions;
- Provisioning which should be more future-oriented rather than past-oriented;
- Capitalization of research and development expenditure only if it is certain that the prescribed criteria have been cumulatively met;
- An urge for recognition in the financial result for the reporting period of sufficiently highly liquid profits primarily;
• Creation and maintenance of sufficient highly liquid reserves taking into consideration the scale of the enterprise, the nature of its operating activities and all inherent risks to which it could be exposed at present or in the future;
• Identifying precisely the amount of borrowing costs that are eligible for capitalization in relation to acquisition, construction or production of assets adequately determined as qualified;
• Sensible choice of adequate approaches to the recognition of revenues; it is well known that in the process of applying the entity’s accounting policies, management makes various judgements, apart from those involving estimations, that can significantly affect the amounts recognised as items of the financial statements; for example, professional judgements are needed for determining whether particular sales of goods are, in substance, financing arrangements, and if so, they do not give rise to recognition of revenue;
• Continuous observation of the process of collecting receivables from the contracting parties; determining a criterion (threshold) for the amount of receivables in arrears embodying high risk, beyond which the supplies to the counterparty should be suspended;
• Substantiated classification of all lease contracts (particularly in cases of uncertainty and necessity of judgment as to whether the contract in its nature is a finance lease or operating lease (until the effective date of the new IFRS 16 Leases);
• And many more to follow.

For now, we shall not comment opinions, which do not support the idea of ‘neutrality’ in accounting, and not consider it a qualitative characteristic of financial statements information. However, we do not argue that this specific understanding is devoid of good sense or judgment, rather just the opposite. In my opinion strong arguments exist in support of the thesis I maintain not from that moment: the use of fair value valuation raises an important problem with respect to the “going concern principle” and “the liquidation basis” of accounting. Under the going concern basis, the assets are or should be treated together as a unit, as the essential elements for implementing the business model, and as such they are only considered from the point of view of their utility as opposed to their sales values. The “going concern principle” supports measurement at historical cost and justifies the existence of goodwill that comprises and therefore recognizes a part of the unrealized profits associated with the acquired assets whereas under the liquidation basis, this unit is broken down into a series of individual assets that can be liquidated separately. The liquidation principle supports fair value measurement of each individual asset but appears inconsistent with the recognition of goodwill. However, the IAS, developed and issued by the IASB, seem to reflect a certain opportunism, in which they allow ‘fair value’ and ‘goodwill’ to coexist. It is also worth acknowledging something else, which is important; even the most accurate and detailed descriptions or definitions would be inadequate if the necessity of exercising policy of prudence in accounting were not perceived as a priority or as an essential prerequisite for resilience and viability of the enterprise, as well as a vital social necessity.

I confidently maintain the view that financial accounting is a powerful tool for sharing the wealth among all members of society, for its fair distribution between present and future generations, between short- and long-term perspectives. Unfortunately, through the accounting standards high priority has been given for many years to the short-term rather than the long-term performance. From an academic standpoint I argue that criticism from researchers and other specialists are based on sufficiently reasonable arguments. It reveals significant management weakness and errors made under the influence of short-sighted policies and decisions aimed at ensuring the best results of the present at any cost without particular concern for the future that the CF and IFRS apparently have been allowing, in many cases in conflict with the philosophy of prudence in accounting. In my view, many empowered people belonging to various managerial, regulatory and other authorities of different hierarchical levels from many countries across the world are responsible for admitting grave errors, and having unreasonable behavior as officials, executives, administrators etc. The need for a paradigm shift in financial reporting has been increasingly discussed by leading scientists in Europe and overseas.

Conclusions
My belief is that the principle or the concept of prudence, not just the term even less ‘the word’, should be considered to be of the highest priority among all the traditional accounting principles as it
has been inherent in the philosophy and unique technique of double-entry procedure and accounting ever since its inception as a social practice, later gaining the status of science. In my view, prudence is consistent with neutrality rather than in antagonism with it. It is hard for me to agree that the foundational idea of prudence, if it is correctly understood, is incompatible with neutrality as it was previously stated.

In my view, the re-introduction of prudence would not obscure the transparency of financial reports information nor would it weaken their ability to represent the economic essence of a transaction or process in a credible way.

‘Prudence’ should be restored into the CF and its importance as an integral part of financial accounting and reporting essentials should be emphasized. The description should be sufficiently distinct and explicit to avoid misunderstanding or misinterpretation. A thorough description would contribute to greater clarity and consistency. If not, the CF prescriptions would not comply with the essence of a number of standards which embody the conceptual idea of prudence (for example, IAS 36 Impairment of Assets, IAS 16 Property, Plant and Equipment, IAS 37 Provisions, Contingent Liabilities and Contingent Assets, IAS 38 Intangible Assets, IAS 2 Inventories etc.). If restored, it would provide for a reasonable and balanced judgement under conditions of uncertainty and would contribute fair estimates to be achieved in the process of valuation.

My earlier hypothesis for the presumable existence of types of conservatism has been confirmed. The understanding varies across countries, accounting systems and cultures. We tend to consider that despite its decades-long development, convergence has not significantly advanced. The major differences still exist due to the clash between traditions and long-lasting influences (historical, legal, political, institutional, economic, social, cultural, linguistic, psychological etc.) under which the accounting models (for example, Anglo-Saxon or Continental) have developed. The prevailing factors contribute to the establishment of approaches which have dominated the accounting model. The principle of prudence is closely related to the European continental style of governance, the traditional manner of representing companies’ activity which is based on the long-term vision of business life. Scientists claim that the assumed conceptual superiority of IFRS reflects a strong Anglo-American bias in describing continental European accounting models and reasonably question the assumption that the Anglo-American accounting model is superior to other accounting paradigms.

The CF contains the basic concepts, assumptions, key definitions etc., and the way they are interpreted in practice impacts the quality of financial statements information. It is explicitly stated in the CF that it is not a standard, hence a comprising part of the international normative base, therefore of the regulations as regards the financial reporting in the EU member-states and other jurisdictions, and cannot override any standard; However, the Framework is assigned the role of a political chart which is supported and endorsed by all the member-states and their political leaders; so, the problem regarding its relevant importance and conformity to accounting standards should not be compromised. However, the CF is an introduction or a prelude to the IAS/IFRS and for that reason it is illogical for the core concepts not to be consistent with basic precepts, embodied in the accounting standards.

The moral of the probably subsiding crisis is that transparency, based on commonsense, optimally combined with prudence, must become a priority in financial reporting and the presentation and disclosure of relevant financial and non-financial information, both historical and prospective. For that purpose, the approaches, models and rules for recognition and measurement of assets, liabilities and capital components, of costs and revenues/income must be designed, developed and implemented in the spirit of this underlying philosophy.

First of all, we need to restore confidence in the quality of corporate reporting and the information it provides as well as to reestablish trust in the respective bodies and people, authorized to be responsible for its credibility and verifiability.

1 Pauline Wallace, Head of Public Policy and Regulatory Affairs at PricewaterhouseCoopers, reasonably argues that there is increasingly voluminous reporting relating to mandatory disclosure, but limited disclosure in key areas such as financial risk and volatility. ‘With a growth in the volume of reporting and its complexity coupled with a lack of comparability between different GAAPs (UK versus US in a non-uniform world), there are questions over the usefulness of reporting to stakeholders and their comprehension of what is reported, leading to a consequently reduced reliance on financial statements.’

2 ‘Prudence also seems inherently inconsistent with neutrality, so, prudence cannot be incorporated within that concept’, in the ACCA’s view, and we definitely cannot agree with that understanding specifically.

3 Mackintosh (2015) admitted that ‘when prudence was taken out, the concepts were being developed jointly. The US didn’t have it and didn’t see why it should be in there, so that probably swayed the IASB at the time. After the Framework became an IASB-only project, a door was opened for prudence to walk back through’ (Mackintosh, 2015; Quoted by Lesley Meall).

4 For example, if an asset’s carrying amount is increased as a result of a revaluation under the revaluation model the increase must be recognised in other comprehensive income and accumulated in equity under the heading of revaluation surplus. However, the increase must be recognised in profit or loss to the extent that it reverses a revaluation decrease of the same asset previously recognised in profit or loss. If an asset’s carrying amount is decreased as a result of a revaluation, the decrease must be recognised in profit or loss. However, the decrease must be recognised in other comprehensive income to the extent of any credit balance existing in the revaluation surplus in respect of that asset. The decrease recognised in other comprehensive income reduces the amount accumulated in equity under the heading of revaluation surplus.

5 In the ACCA’s view, when there is significant uncertainty with regards to an asset or a liability then that should be reflected in the risk premium or adjustment made in reaching either an assessment of any impairment of a historical cost element or one at fair value. It is often the case that external parties may place more weight on downside rather than on upside risks in valuing assets and liabilities. ACCA see an important role for what could be termed prudence in standard setting, particularly in the possibility that there should in some cases be asymmetric recognition of assets and liabilities and gains and losses. This possibility of asymmetry is confirmed in the Basis of Conclusion but being so important, in their view, it should be dealt with in the CF itself as a possibility (not a necessity) in Chapter 1 and under the recognition criteria in Chapter 4.
MODEL FOR ASSESSMENT OF HEALTHCARE INSTITUTIONS’ COMPETITIVENESS

Vadim Pashkus,1 Natalie Pashkus,2 Asya Chemlyakova3

Abstract: This article discusses competitiveness of public health institutions, which relates to their market position as ranked by various entities (including government). For this purpose, a model of competitive positioning is designed for assessing healthcare organizations. This model allows one to assess the level of competitiveness of a medical organization, evaluate its market positioning, and develop a strategy for furthering its development using features of their position provided by the model.

JEL Classification Numbers: I11, D81, L25; DOI: http://dx.doi.org/10.12955/cbup.v5.950

Keywords: healthcare institutions, strategic positioning, matrix of competitive positioning.

Introduction

The functioning of a public health policy requires clear priorities for its strategic development. It is necessary to rank healthcare organizations based on their contribution towards goals in the framework of the current economic policy and financial priorities. These priorities include, but are not limited to, improving the health of the nation and providing a high quality of life for the population of Russia (Altunyan & Kotcofana, 2016). Some institutions are better at coping with the tasks assigned and demonstrate high-performance indicators. Identifying those institutions is important for implementing the healthcare policy (Lyakin, 2015). It is also important to identify those healthcare institutions that are unable to provide the proper level of quality in medical services, including perceived and actual quality (Starobinskaya & Andrianova, 2010). Monitoring of competitiveness indicators and the ranking of quality should be carried out both in terms of prioritizing financing and the timely implementation of regulatory and anti-crisis measures (Rybakov, Lyakin, & Cisko, 2013; Plotnikov, Vertakova, & Polozhentseva, 2015).

Healthcare markets are highly competitive. Institutions compete for consumers and financial resources in the markets of paid services and those related to compulsory health insurance. Healthcare organizations are interested in identifying their market position and determining a promising strategy for reaching leadership. Therefore, it is important to have a tool to determine the competitive status of a healthcare institution in order to rank such institutions for financial assistance in funding medical facilities and projects, and other financial transactions (Lanska & Hartz, 1998). In using such tools, healthcare organizations could find problem areas in their strategic development and then correct their market strategy.

Assessing the competitive status of a healthcare institution requires linking information about the positioning of a medical organization on the market with the competitive strategy that it implements. Matrix strategic methods are designed to identify structures needed in the positioning of health organizations according to their competitive potential and competitive environment.

This paper describes a model for assessing the competitive positioning of healthcare organizations. This modified model makes it possible to assess and compare the competitiveness of healthcare based on the competitive strategy implemented and the characteristics of the competitive environment of the medical organization. At the same time, assessments should take into account the impact of a number of external positive and negative trends that affect the competitive status of the healthcare organization.

The modified methodology allows not only comparison of the competitive positions and competitive strategies but also the development of specific strategic recommendations.

Data and Methodology

An analysis of the competitive status of public health organizations was constructed based on a modified McKinsey model of strategic positioning (Pashkus & Pashkus, 2011). It involved an assessment of the strategic potential of health institutions and building an effective strategy to ensure their

competitiveness. The McKinsey methodology works mainly with profitable processes and involves an evaluation of competitive advantages of the product in the context of changes in the appeal of the selected industry. The features of the healthcare market impose a need to modify classical techniques.

The modified McKinsey model for assessing competitiveness under changing environmental factors involves the setting of two integral indicators, which serve as axes for constructing a positioning matrix. Factors of the first indicator, the competitive potential of healthcare institutions, include resource and strategic potential and are plotted along a horizontal axis (X). This integral indicator includes factors that depend on the actions of management in response to changes in another indicator: the competitive environment (Y). The factors of this latter indicator affect the functioning and competitiveness of the healthcare organization and the synergistic effects that can develop under such influence. Estimations of risks are used as correction coefficients to evaluate and select priorities for the competitive strategy of healthcare organization (Kliestik & Dengov, 2015).

Figure 1 shows the matrix designed for the competitive positioning of healthcare institutions. The entire positioning plane contains nine identical zones. Each competitive position requires separate approaches to the strategy for developing resource potential and implementing various actions aimed at improving both actual and perceived quality of health services. The aim is to prioritize the competitive strategies to develop the resource potential and achieve a competitive position for the healthcare organization by responding to a specific set of conditions about the competitive environment.

![Figure 1: Matrix of competitive positioning of healthcare institutions](source)

**Results and Discussion**

Healthcare organizations placed on the plane of coordinates (X, Y) yield three types of competitive positions according to the model. The first type is competitive, the second parity, and the third noncompetitive. Each has three specific positions. The following provides the characteristics of each competitive position in brief.

**Competitive Position One**

This position denotes a high potential of competitiveness with a high level of influence for synergetic effects of the competitive environment.

It is a priority area for the strongest and most well-known organizations that can effectively implement innovative, competitive strategies, including breakthrough strategies to promote health services and healthcare organizations as part of their competitive strategies. Medical services of such healthcare organizations are distinguished by high actual and perceived quality. The consumer aspires to select a priority regarding these aspects, both for services included in the list of compulsory health insurance and for paid medical services. At the same time, in such health organizations, as a rule, there are high barriers to accessing medical services under compulsory insurance (Lyakin, 2015). This position presupposes the preservation and strengthening of the competitive status and priorities in the investment from the state and as well as from stakeholders.
Competitive Position Two

This position had average attractiveness, average synergetic effects, and high competitive potential. This strategic position is quite strong and stable. At the same time, the healthcare organization is not the leader in terms of competitiveness, but it is relatively promising and attractive. Its medical services have reasonably high levels of actual and perceived quality. The consumer audience is wider than in others. As well, access to medical services under the compulsory health insurance is slightly less complicated (Rybakov, Lyakin, & Cisko, 2013). As a rule, the development of the resource potential of such a medical institution has been uneven. Therefore, it needs development directed at its resource potential and investment targeted at overcoming weaknesses and consolidating strong points.

Competitive Position Three

This position in the matrix denotes average competitiveness potential and high levels of external effects. It is somewhat unstable; even slight change in the competitive environment can cause the fall of an organization into a parity zone or even exit into an uncompetitive zone. Position requires a clear identification of the most promising areas for quality resource development (Chesnokova & Ermakov, 2013). Usually, the services of such organizations do not differ in their actual quality from the average level of the market, but their perceived quality is significantly higher than those of competitors.

Parity Position One

This position signifies high competitive potential and low influence of synergetic effects of the environment. These institutions, as a rule, have a high ‘actual’ quality of services. They are characterized by advanced skills in certain areas, but their image potential is not well developed. Such organizations have alternatives. One is to transition to high competitiveness through creating and developing an organizational forte or a forte in selected areas of its activities. This would require implementing activities targeted at improving the resource potential and proper positioning within the healthcare market.

Such a medical organization should focus on optimizing financial and information flows. This would mean the rational use of financial resources from consumers and stakeholders. In particular, it includes carrying out investment targeted at developing priority areas and programs and in the formation of the image. The lack of a developed image prevents the attraction of additional resources.

Another alternative growth strategy in terms of competitive potential is to descend to the uncompetitive zone. This competitive position is unstable. Therefore, in the long term, such organizations will either rise to the competitive zone or lag. It should be noted that underfunding of healthcare organizations in this cluster can lead to an unfavorable alternative trend. This area is most promising for parity organizations due to the high potential of the health organization itself. However, further weakening of image and associated low financing can lead to loss of initiative and, therefore, in the foreseeable future, to further loss of competitiveness. Thus, the state policy of underfunding healthcare organizations within the competitive position will be not only economically inefficient but also unethical concerning the future of the organization, its consumers, and the healthcare system as a whole.

Parity Position Two

This position denotes average competitiveness potential and the average level of synergetic effects of the environment. It fits the mediocre healthcare organization in all respects with medical services that have average actual or perceived quality. Consumers choose such organizations for their medical services where no other alternative is available. Such medical organizations are highly available, but not all of their current patients are interested in returning to these same healthcare organizations. The health organizations in this competitive zone can only have a highly selective investment in greatly promising and least risky activities. Financial resources are at the minimally acceptable level for state subsidies and are restricted by other stakeholders. Thus, the exit from this position in the direction of increasing competitiveness is limited by its budget. Therefore, the most important direction for developing the resource potential for this organizations is the introduction of new financial instruments aimed at optimizing the internal financial structure. A long duration in this position leads to further decline in the competitive status and decrease in the actual quality of medical services.

Parity Position Three

This one depicts low competitive potential and a high level of synergetic effects of the competitive
environment. With a low competitive potential, even an extremely high level of positive environmental effect would not ensure an increase in the efficiency of the organization and high level of actual quality of services. Such health organizations, due to the positive influence of competitive environmental factors, experience astounding short-term improvement in their image. However, this increase in attractiveness is not justified by actual actions of the healthcare organization (Chesnokova & Ermakov, 2013).

The flow of investment associated with image appeal will most likely be inopportunely used by the organization to strengthen its resource potential. Under qualified or unreceptive staff will not be able to carry out the necessary procedures, the purchased equipment will be idle, and cutting edge medical materials will not be used efficiently. Thus, financial resources attracted in the short term are likely to be spent in an unplanned manner and most likely wasted by management. This zone has the most strategically unpromising positions among the other middle zones.

Only effective short-term investments are possible for such healthcare organizations. There is a high probability of abrupt closure of programs and activities. These organizations require tools to control the expenditure of public and stakeholder-provided funds. It is important for such organizations to focus on the organizational, economic, and managerial effectiveness of these processes to form a more open management structure and ensure activation of their resource potential. Therefore, where the healthcare organization can use their latent attractiveness and potentially increase funds by devoting all resources to developing and strengthening the resource capacity, it has a chance of improving their competitive position (Lyakin, 2015). Otherwise, such a healthcare organization will lose its parity position after a certain period, which can be lengthy and possible with a general drop in the quality of medical services and lack of activities on the part of the main competitors.

Nevertheless, actions targeted at developing their resource potential provide a chance for a breakthrough and ensure competitiveness. The organization has the means to act, though there is not always the motivation or ability to effectively use their full potential.

Noncompetitive Position One

This position displays potential for average competitiveness and synergy of an insignificant but positive competitive environment. These factors are mediocre in terms of competitiveness of the organizations; their image is not fully developed. There may be a generally negative opinion about such a medical institution. The strategy of the organization should be aimed at developing areas with a minimum level of risk and obtaining a feasible (minimum) competitiveness and acceptable quality of services based on their strengths. Changing from this position is difficult since the organization does not have the necessary resources, nor the motivation or ability to implement activities targeted at building the resource potential. It is typical for such organizations to choose a niche strategy where they can achieve some success and strengthen the competitive status through campaigns promoting their image.

Noncompetitive Position Two

This position entails low competitiveness potential and medium influence of the competitive environment. As a rule, it involves weak organizations with the inadequate level of quality. Their image is not appealing but rather average for the market. These organizations need to concentrate on reducing risks and protecting positions in some of their most promising areas. Changing from this position is even less likely than from the previous one since the potential of the organization is extremely low.

Noncompetitive Position Three

This position depicts low competitiveness potential and low influence of a competitive environment. These are the weakest healthcare organizations; they barely survive. They require practical measures to change position but have difficulty implementing these as an independent.

Overall, to implement the proposed methodology, it was necessary to specify two sets of factors for assessing the specific positions of a healthcare organization according to two indicators: competitive potential and the competitive environment, in which the organizations operate. As noted in Starobinskaya and Andrianova (2010) and Chesnokova and Ermakov (2013), a faulty system of indicators can destroy all advantages of the model.
Conclusion

The analysis of competitiveness and the identification of positions in the healthcare market allow an organization to outline the most effective path of further development and determine crucial strategic priorities. An understanding of stakeholder involvement, the development of resource potential, the creation of a positive image, and the brand building of a healthcare organization are all possible following a comprehensive analysis of competitiveness.

THE PROBLEM OF QUALITY CORRELATION AND EFFICIENCY OF MEDICAL SERVICES AS A FACTOR OF HEALTH ORGANIZATIONS COMPETITIVENESS

Vadim Pashkus,¹ Natalie Pashkus,² Asya Chemlyakova³

Abstract: In the present day, in the context of the toughening of global competition in the field of health care and the efforts that different countries of the world spend on improving the efficiency of the public sector of economy, the problems associated with determining the factors of competitiveness of healthcare organizations come to the forefront. The research conducted by the authors showed that assessing the competitiveness and development potential of medical companies with the Keigan-Vogel positioning map often gives incorrect results. The study showed that a significant part of errors (22-28%) is due to an incorrect evaluation of the quality and effectiveness of medical services, which necessitates a clear delineation of these concepts. The work shows how these indicators effect the competitiveness of organizations in the health sector and what happens if we do not distinguish between these two concepts.

Introduction

Today, the health sector plays a crucial role in the state's economic and social policies. In modern conditions, increasingly more stringent requirements are imposed on healthcare institutions, both on the part of the society interested in improving the quality of life, on the part of the state that finances health development programs, and the work of budget institutions within the framework of the current economic policy. (Altunyan & Kotoofana, 2016) In this way, healthcare institutions find themselves in a highly competitive environment, and even in global competition, because modern consumer of health services can choose not only between private and public institutions, but also between domestic and foreign ones. (Rybakov et al., 2013) One of the key issues in this area is the correlation of the quality and effectiveness of medical services, which often are mixed by many researchers. To date, there is no single methodology for assessing the quality of medical services - as a rule, quality is replaced by compliance with standards, and the standards themselves are developed either arbitrarily or based on the amounts allocated to the health care system. Therefore, if we ignore the problems of medical services’ quality in modern studies, research gaps arise. In modern works a concept is used that is expressed in the classical work of Lanska and Hartz (1998). However, to analyze the competitiveness of organizations in the healthcare sector this, as the authors' research has shown, is clearly not enough.

Methodology

To analyse the competitive position of companies providing medical services, the breakthrough positioning model proposed in 2000 by Jonathan Keigan and Craig Vogel was chosen (Cagan & Vogel, 2013) With this model, we can determine the competitive position of the organization, the priority directions of building the company's strategy, and the matching of available resources and capabilities. All companies providing medical services can be divided into 4 types depending on the level of technology, design, and ability to "close" the SET break (generic, kitsch, high-tech, breakthrough). For every type of company, there are winners and losers (in accordance with the modified GE / McKinsey matrix). At the same time, when researching medical companies (unlike universities, museums and other social organizations), a big error arises: research conducted by the authors of the work and the Department of Economic Theory and Economic Policy of St. Petersburg State University in 2007-2016 showed that in the assessment of competitive positions of medical companies, in about 22-28% of cases there are distorted results because of an incorrect evaluation of the quality of medical services.

This problem is increasing as the state, which sets priorities for the development of the health care system and the ranking of the funding for specific projects and the organizations doing them, and the

¹ St. Petersburg State University. v.pashkus@spbu.ru
² Herzen State University. nat.pashkus@gmail.com
³ Russian State Hydrometeorological University.
society that sets a high standard of quality of medical services, often make very contradictory demands. (Lyakin, 2015) This problem arises from the fact that the aspiration of healthcare institutions for high competitiveness and service demand is not always consistent with their high quality and efficiency from the point of view of the society. (Lanska & Hartz, 1998) Consequently, it becomes necessary to clarify the concepts of the quality and effectiveness of medical services in their relationship to the competitiveness of the medical institution and the quality and effectiveness of the health system as a whole.

**Quality and effectiveness of medical services as factors of competitiveness**

The quality and effectiveness of the provided medical services are the main indicators of their competitiveness in the market and one of the most important indicators of the consumer preferences of medical services, both in the domestic and global markets. It should be understood that the quality and effectiveness of medical services are indicators of consumer preferences only if the consumer is able to understand that they are really high and that they affect the value of their medical service. (Lifits, 2009) The degree of influence on the value of a medical service must be considered both from the point of view of the consumer and from the point of view of its involvement in shaping the further value of a higher-level service, in particular, the quality of the functioning of the health care system. Usually, consumers tend to pay attention to the perceived qualities of the medical service (Fleming & Asplund, 2009, p. 96), based on its perceived consumer characteristics and the prestige of their provider. These indicators cannot be completely correlated with real indicators of the quality and effectiveness of medical services. They may not depend on the high value of medical services for direct and indirect consumers (for example, hospitals, or polyclinic complexes, etc…) of medical services. (Lanska & Hartz, 1998)

The image and prestige of a health care institutions can be created according to a number of external signs of medical services that cause certain attractive associations in the minds of their consumers. This can be a beautiful, sonorous, mysterious name of a service, its technical support, the appearance of the reception rooms, treatment rooms and laboratories, specific image personalities with whom this medical service is associated, an attractive, bright complementary activity of the healthcare institution that involves directly the consumers and many other image indicators (Chesnokova & Ermakow, 2013). But all of them are not directly related to the quality and effectiveness of the medical service, which can be assessed only by specially trained consumers or by the representatives of health organizations or health authorities themselves.

Moreover, even employees of all kinds of health management organizations and services cannot separate actual quality and performance indicators from their perceived counterparts. For example, the ideal workflow of medical institution, the absence of formal complaints and the exact observance by the medical staff of the service provision rules are associated with the high quality of management of the health care institution and the high quality of the medical services that it teaches. At the same time, in practice it can only testify to the smooth functioning of the bureaucratic system and the full compliance of the declared complex of services, formal requirements, and standards imposed on them. Thus, it is quite difficult to separate perceived quality characteristics from real ones.

The quality and effectiveness of health care services is usually seen as a single and inseparable inherent in them (Valievich & Parola, 2008, p. 28). At the same time, a situation can be realized when the service will be effective, but will not be high quality, or will be of high quality, but not effective. Therefore, it is necessary to introduce concepts of the quality and effectiveness of medical services and to explore different approaches to their evaluation.

It should be noted that the medical service is a typical public service, and the quality of public services is a set of service characteristics that ensures:

- high value for their consumers;
- possibility of public service consumers participation in the further chain of values formation;
- achieving a high net return from the public sector of the economy for a dedicated cluster of services;
- Low individual consumer risks and risks of the integrity and efficiency of the functioning of the public system, which determine the high level of the population life quality, the growth of human capital and the wealth of a society.
Consequently, the indicator of the quality of health service is a high level of prevention and recovery of patients without further relapse of diseases with a low level of individual risks of consumers associated with side effects of treatment. This high availability of medical services for all segments of the population, as well as a high level of prevention of serious diseases, aids in the development of a healthy lifestyle and medical culture of the population. The quality of medical services and the quality of the functioning of the healthcare system in general also means a high degree of coherence in the activities of institutions of all types in the timely and full provision of medical services that ensure a high life expectancy and expand the boundaries of the working age of the population.

Medical services are closely associated with a particular institution and even with a specific specialist. At present, medical institutions in Russia are only indirectly linked by the chain of health of the individual. These links are manifested mainly in the availability of regulations for the provision of referrals from polyclinic institutions to obtain routine medical services by hospitals. In addition, some medical services are provided by other medical institutions. For example, ordering specific analysis by one medical institution from another specialized agency for their patients. In fact, there is no effective system of comprehensive provision of medical services, as there is no well-developed system of prevention and detection of serious diseases. Most of the medical services are exclusively of a consumer nature.

However, due to the implementation of a system of compulsory and supplementary medical insurance, an indirect consumer of medical services became the organization which provides the health insurance. Insurance companies that carry medical insurance, on the one hand, assess the quality, formal requirements and completeness of medical care in the customer’s case, and on the other hand, regulate the admissible costs under the insurance contract and the patient's actions in obtaining medical care. When implementing health insurance services by several healthcare institutions consistently involved in the provision of health services, the degree of coordination between institutions of different types in the detection, prevention and treatment of patients' diseases is not actually taken into account. As much as possible within the framework of insurance medicine, this problem is taken into account when allocating funds within the allotted sum insured between the various institutions involved in the procedure of medical care. At the same time, if we consider the quality of medical services not from the point of view of insurance conditions but from the point of view of society's needs and ensuring a high quality of life for the population, the problem of coordinating the actions of various medical institutions in the process of identifying, preventing, and treating patients' diseases becomes more important. Indeed, each specific medical service can be provided to the patient in the proper amount, the formal and visible characteristics of the quality of services taken into account by insurance companies are met, and the patient's quality of life not only improves, but may even worsen. Thus, there is a clear discrepancy between the quality of the medical service and its effectiveness, as well as between the quality of a particular service and the quality of comprehensive medical care for the population, i.e. quality of the health system.

It should be noted that a number of medical services are directed not so much to treatment as to the prevention of diseases. In combination with medical measures, preventive measures have a direct impact on the quality of life of the population and the quality of human capital of all economic entities of the country, since only a healthy person can effectively realize his labor functions and take an active vital position necessary for prosperity in the modern economic environment. (Gregova & Dengov, 2015) Thus, the quality and effectiveness of health services and especially the quality of the functioning of the health care system in a complex has a strong impact on the level of wealth of society. The evaluation of the quality of medical services should take into account the degree of influence of the institution in the characteristics of the human capital of Russian society. At the same time, the effectiveness of medical services has a clearer structure. The effectiveness of medical services is the maximum level of the ratio of the effectiveness of the service (the ability to achieve the stated goals of the implementation of the medical service) to the costs of its creation and implementation.

(Lanska & Hartz, 1998) It should be noted that this ratio should be realized while maintaining the performance indicators of the health care institution within the given (and normally accepted) limits. In addition, the health services’ effectiveness of the service is considered subject to a high degree of satisfaction of the consumers and society with the activities of the health system as a whole.
Already from the definitions it can be seen that the indicators of quality and efficiency track different characteristics of health services and health system activities. The quality of the medical service is an indicator of the compliance of the service with the requirements and wishes of the consumers (basic and indirect), the compliance of the service with formal requirements and standards, and achieving controlled characteristics of the patient's condition and the results declared by the health care institution in the service certification. At the same time, the effectiveness of the work of a medical institution is the degree to which the goals of the medical institution or the health care system are achieved, with no more than the costs of achieving these results. (Donabedian, 1988) This is why the effectiveness of achieving the goal can be high in the absence of real quality, because the purpose of the service may be different. At the same time, a high quality of service can be achieved, but its effectiveness, both from the consumers of medical services point of view, and from the society’s point of view will be low or simply unacceptable. Insurance companies and controlling organizations regulate the formal components and outcomes of providing medical care and providing specific types of medical services. Thus, the quality of the service can meet all the necessary criteria, but it can have only a short-term effect or even no impact on the health and well-being of the patient. Moreover, to justify that the quality of the medical service was inadequate if the formal requirements and visible indicators of its delivery are met is rather difficult, as the examination of the results of medical intervention is also limited by an understanding of all aspects of the quality and effectiveness of the service. The moral and physical costs of the patient, as well as missed opportunities for the timely provision of medical care in the proper amount and composition, are generally not accepted for consideration by either health care institutions or the entities that control their activities.

Correspondence of the quality and effectiveness of medical services is possible only if the targeted services of the health care system are targeted at improving the quality of life of the population, increasing the wealth of the society and strategic priorities for ensuring public health and quality of life, raising human capital, and social orientation of the service, taking into account all possible risks, including in the social sphere. (Kliestik & Dengov, 2015) Evaluation of these indicators also faces serious problems. This is due to the fact that most of the results of the implementation of medical services are of a qualitative nature and cannot be directly quantified. When assessing these indicators, we must refer to an evaluation system specially developed for them. The method of evaluation will depend on the selected evaluation system, and the choice of the characteristics of the evaluation system depends on the type of information available about the socio-economic system indicators in which the service is being implemented and the service itself. (Chesnokova & Ermakov, 2013).

Paradoxically, the evaluation of the quality and efficiency of a paid medical service appears simpler if the evaluation criteria do not pursue the global goals of achieving the individual's overall health. If the goal of the medical service is to be effectively sold, that is, to attract the maximum number of consumers who will be satisfied with this purchase, then this case can be approached from the point of view of the ratio of the costs of promotion (creating the image and prestige of the service and health care institution) and the profit received from its implementation. But in this case, there are no positive effects for the society and strategic priorities for improving the quality of the population’s life, there is no question, as it is not necessary to observe the real quality of the service. There is a product that needs to be best sold and the same marketing approaches apply to it, which are applicable to any other similar products. In this case, it is necessary to focus exclusively on the perceived quality of medical services and the formation of associations with it that are necessary for the health care institution. Here you can go to profitable indicators, which greatly simplifies the assessment and does not require the construction of integrated quality assessment systems.

In fact, such a situation is possible in which the real and imaginary quality of medical services will be presented in the complex, and the services being implemented will demonstrate high efficiency. But most often, the implementation of such situations in the public sector of the economy is unintended. Usually it is typical for organizations that are recognized leaders in their class. Their image is formed not in the course of specially implemented procedures for promotion, but over a long period.

The positive image of such organizations is formed due to the consumer's evaluation of the value of the results of their activities and the long-term impact of the results of the provision of health services on the health of consumers, which is an important indicator of the real quality of the services of these organizations. Although even for such organizations of the healthcare system, the real quality of
medical services is estimated by the consumer over a long period of time and extrapolated to the future without changes, which seems unacceptable, since in real life the real quality of services undergoes significant changes without remaining unchanged.

**Conclusion**

The analysis showed that the concepts of quality and efficiency, commonly used as synonyms, with respect to medical services, have essential differences. In assessing the competitiveness of health care institutions and in implementing programs for the advancement of health services and institutions themselves, the focus is primarily on the perceived quality of the service and its apparent differences, but only partly on their effectiveness. At the same time, the state health policy is nominally oriented towards achieving the real quality of medical services, but does not explain which priorities in the field of health care are paramount. The guidelines of the state health policy do not explain how the real and perceived quality of medical services, the effectiveness of the results of services provision, the health of the population in the long term, the activities in the health sector, and the quality of life of the population should be agreed upon. Therefore, in order to ensure their competitiveness, healthcare institutions are oriented only to consumers of medical services and are trying to raise the level of the perceived quality of services, following the same requirements of the state, they are forced to focus only on the real quality and efficiency of services, but do not have effective incentives to do so.

As a result, healthcare institutions find themselves in a very complex and contradictory situation, which makes them, in order to survive, give preference to the perceived quality of services, with formal observance of real quality and efficiency. This situation seriously harms not only the health system and its consumers, but also society as a whole and the Russian economy. Thus, it demands acknowledging that the situation in the healthcare sector is rather complicated and contradictory, and it requires serious rethinking and overcoming.

EVALUATING WORKPLACE HEALTH PROMOTION PROGRAM

Melita Peršolja¹

Abstract: Due to the complexity of health promotion interventions, uneconomical evaluation indicators are recommended. The purpose of this study was to determine the effects of multi-component workplace health promotion intervention. The goals were to study the association of health promotion with health status. In a controlled study trial, 278 workers of primary schools and municipal administration had the chance to participate in six-month workplace health promotion program. Employees have fulfilled a questionnaire at baseline and then again after completion of the program. The results showed that in the test group, the incidence of problems with health significantly declined, but the rating of health status decreased and the average absence days increased over time. The higher working hours per week correlated to obesity and high blood pressure. It can be concluded that workplace health promotion activity could support a change in health status and therefore contribute to higher quality of life.

UDC Classification: 614.2, 331.4; DOI: http://dx.doi.org/10.12955/cbup.v5.952

Keywords: management, evaluation, quality of life, evidence-based practice

Introduction

Problem statement

Health promotion includes many meanings under which are hidden all the activities and programs that support human health (Development, 2004). In Europe, organizations introduced health promotion mainly due to pressures from laws, requirements of workers and their health problems, and in order to raise their reputation. The European model treats the individual and his environment includes a wide range of work methods and tries to integrate into the existing structure of the organization. Europe is therefore somewhat less focused on the risk factors in an individual and more on the quality of working life and working environment (O'Donnel, 2002). As is clear from the research, there are many potential benefits of health promotion in the workplace (Aldana et al., 2005; Baxter et al., 2014; Goetzle & Ozminkowski, 2008; Rongen et al., 2013): improved satisfaction with work, increased loyalty, increased involvement of employees, improved interpersonal relationships at work, enhanced self-esteem, creativity, employee productivity, improved organizations’ reputation, smaller turnover, easier recruitment of new personnel, improved health of employees, reduced absenteeism, tardiness, and injuries at work, less use of health services, reduced treatment costs, amongst many others.

Health is determined by changes in which a person can consciously make decisions and achieve the best in given circumstances. Understanding health as a complex entity, therefore, sets health promotion as intricate, and health interventions as difficult to synthesize (Waters et al., 2006). Workplace health promotion efficiency evaluation is crucial for managers to support these activities in organizations. Process evaluation provides an analysis of the development during implementation of the program and measures the ratio between the result and the expectations. The program evaluation measures the changes that have occurred in connection with the activities carried out. A cause-effect relationship between health promotion and its outcomes could be revealed with evaluation research (Thorogood & Coombes, 2010). In this study, it was assumed that a workplace health promotion program would improve the health status of employees.

Methods

The population consisted of eleven organizations in public administration and elementary schools. The organizations were divided into tested or control groups according to their involvement in health promotion activities. The subjects from test groups were included due to their voluntary participation in workplace health promotion programs. The control group subjects were selected with simple random sampling. The data were collected in two time periods (T1, T2), with a six month time interval.

The instrument for the current study was a combination of research questions implemented by the Clinical Institute of Occupational, the Traffic and Sports Medicine of University Medical Centre Ljubljana (Strgar & Urdih Lazar, 2005), the Tri fit Organizational Health Audit (Tri Fit, 1998), and

¹ Melita Peršolja, Faculty of Health Sciences, University of Primorska, melita.persolja@fzv.upr.si
other questions developed for the purpose of the actual study. The questionnaire consisted of 14 questions divided into three sections, namely sample characteristics and health outcomes.

IBM SPSS Statistics, version 20.0 was used for data analysis: A paired, independent samples, one-way ANOVA T-test was used to examine the differences between organizations, and follow the changes within groups over time. Correlation and regression analyses were performed to find associations within variables.

The researched population consisted mostly of women, with an average age of approximately 40 years, and who were married. Most respondents had attained a higher education degree. Employees worked mainly morning schedules and in average 40.64 hours per week. Two observed groups differed significantly in autonomy at work.

**Findings & Results**

**Program activities**

Program activities included obtaining management support, preparing health education materials and newsletters, online specialist support, measurements of health risk factors, six two-hour health education workshops including risk factors, physical activity, stress management, and healthy meals. Employee participation in workplace health promotion activities was in general low. The sum of 341 (20.4%) employees from the tested group participated in all health promotion activities. Minimum participation was for the Walk test (n=2, 0.72%), and the highest participation was for the Risk factors educational workshop (n=187, 67.0%)

**Health status descriptors**

Most of the respondents rated their health in general as "good" (average 3.85±.68 on the scale from 1 to 5). In a tested group, the trend of average self-perceived health decreased over time (by .15 points). The average number of days absent in 6-months caused by health problems decreased in control but increased in the tested group. The changes within and between the observed groups were not significant.

The majority (81.4 to 100%) of employees expressed that they had some problem with their health in the last six months. This proportion significantly declined over time for 15.0 in the test group (t=-2.23, Df=67, Sig.=.03) and increased for 4.1 in the control. According to the data, the employees’ health problems consisted mostly of headaches, neck and low-back pain. In the test group, the pain incidence persisted over time, but in the control low back pain decreased significantly (t=2.212, Df=102, Sig.=.02). The differences between groups were not statistically significant.

The proportion of people with elevated blood pressure in control group significantly decreased (t=2.14, Df=81, Sig.=.03), and in tested group retained below ten percent (Table 1).

Average body mass index (BMI) slightly increased with time in both groups. In a tested group, the proportion of people with BMI above the recommended value of 25 kg/m2 increased 1.3%, average body weight for 0.9 kg, and abdomen circumference for 1.94 cm. In control group, the proportion of excessive BMI increased by 3.1%, the average body weight of 2.1 kg, and the average value of abdomen circumference increased for 4.6 cm. The differences between groups were not statistically significant.

**Health status correlations**

Good health status was positively correlated with the level of education. Self-perceived health was not significantly correlated to socio-demographic variables, but it was higher in younger, single, highly educated men, those with fewer children and working fewer hours per week. Women often indicated to have more health problems than men, while men had more problems with obesity. The abdomen circumference was significantly associated with age, male gender and long working hours. The analysis showed that higher working hours per week correlated to obesity, high blood pressure, but connection with health issues and absenteeism was not significant (Table 2).

A regression model showed that health status index, could be defined by abdomen circumference (r=.39, p<0.01), health problems (r=.38, p<0.01), blood pressure (r=.35, p<0.01), BMI (r=.33, p<0.01), absenteeism (r=.29, p<0.01), and self-perceived health (r=.28, p<0.01). The proposed variables define nearly 90 percent ($R^2=.88$) of the health statuses.

Discussion

The link between health status and the health promotion program was not significant. In this study, the health status of employees’, which was included in the workplace health promotion program, did not change significantly over time. Surprisingly, the trend of average self-perceived health in the tested group decreased after six months of the health promotion.

The perception of one’s own health is an important indicator, as it is correlated to the number of days absent due to sickness. Self-perceived health rating depends on leisure-time physical activity, occupational workload, gender, age, stress and many other factors. However, it seems, that the strongest connection of health-related self-report comes from physical activity, which increases resistance to physical and mental health problems (Bogaert et al., 2014; Kaleta et al., 2006; Paulik, 2010).

A health promotion strategy that aims to encourage healthy behaviors compel participants to think critically and responsibly (Cancelliere et al., 2011) but hardly impacts perceived self-efficacy which determines whether an individual will implement and insists on the healthy lifestyle (Babnik & Štemberger Kolnik, 2013). In fact, the tested group tried to take care of health and implemented exercising at the workplace, but failed to insist on regular physical activities. The result achieved did not comply with the aim of the workplace health promotion program, and raised concern about the complexity and the importance of self-regulation in life style.

Organizations in public administration and elementary schools offer good working conditions, but in this study, the highly educated had longer working hours.

Abramowitz (2016) stated that 10 additional hours spent working are associated with an increase of 1.13 kg for women and 0.63 kg for men. Similarly, Berniell (2012) has found that working time
reduction positively affects individuals’ health behaviors. This study showed that the increase in BMI and body weight was lower in the tested group than in the control group and that visceral obesity was more common in older aged men with greater working hours per week. It could be that the study observation time could not find a direct effect because the health promotion activities were too short.

But considering that obesity is a serious health risk factor and that its’ prevalence is constantly increasing in developed countries, the slowdown in weight gain of the tested group should not be ignored.

The majority of employees indicated to have some health problems in both researched groups and at both observation times. The most common health problems of respondents were headaches, low back-pain, and neck pain. Women reported more health problems, but in general, their health status indicators were not worse. A larger indication of health problems in women is partly a reflection of the culture, stereotypes and increasing congestion of informal work compared with men (Toš & Malnar, 2002). In addition, fewer women participate in regular exercise and thereby lose the direct benefits of movement on one’s welfare and health (Zaletel-Kragelj & Fras, 2004).

Studies have shown that musculoskeletal disorders are the most common cause of sick leave and disability, and that neck pain is very common in the general population (Aas et al., 2011). However, it is important to explore the history of employees’ past work, lifestyle, health assessment and domestic work (Ravnik, 2012), this is not the aim of health promotion program. A workplace health promotion program mostly used traditional methods and was prepared considering organizations’ but not individual employees’ specific needs. Nevertheless, the proportion of health problems in a tested group significantly decreased over time and in general employees of the tested group always felt better. Similarly, some researchers indicated that overall well-being of participants was the most common effect of health promotions (Kumar & Preetha, 2012), even though the course and the interactions of agents are still a mystery.

The health issues and the absenteeism variables were not correlated in this study and the average absence days caused by health problems increased in the tested group over time. The cause is probably reduced presentism, as previous studies have demonstrated that the number of days of sickness absence from work correlate to critical and responsible assessment of health (Cancelliere et al., 2011), to perception of one’s own health (Paulik, 2010), to self-perceived job strain and to social support at work (Magnavita & Garbarino, 2013). Social support is conceptualized as the resources provided to an individual in a difficult situation (Yayan & Celebioglu, 2017). Health promotion activities support interpersonal relationships since it operates through cooperation, promotion of informal contacts, warmth and friendly relations (Peršolja, 2012).

**Conclusion**

In this study, the association of health promotion activities with a change in employees’ health status was not confirmed. Despite describing fewer health problems, the tested employees expressed lower health rating and were absent more frequently compared to control group. Workplace health promotion can, therefore, be beneficial but can give atypical outcomes which are not always congruent with the program’s objectives.

Future research should be built with a long-term perspective in order to accurately assess the impact of programs on employee health management. The data should be maintained by more organizations and a representative sample.

**Conflict of interest:** None declared.

**Funding:** This research was not funded.

**Ethical approval:** Approval was obtained from the organization’s management and informed consent from employees. The study was conducted in accordance with the code of Ethics of the World Medical Association (Declaration of Helsinki)

Abstract:

Objective: In the study conducted accentuated personalities related to daily cigarette smoking in college students were investigated.

Material of study consisted in a case-sample of 349 daily smokers (49.3% females, 50.7% males) and a control-sample of 880 non-smokers (65.3% women, 34.7% men) from an initial group of 1364 (aged 19-30 years) surveyed students.

The method was an observational case-control inquiry with two questionnaires applying: Health Questionnaire (60 items-8 items for smoking) and Accentuated Personalities Questionnaire (88 items, alpha-Crohnbach index-0.823). Statistical analysis (chi square and gamma correlation) was performed by SPSS 20 Program.

Results: Three accentuated personalities were more prominent in daily smokers in comparison with nonsmokers and were related to daily-smoking with statistical significance: IV-unruly (answers to items: S30-χ²=14.73, γ=0.23; S42-χ²=30.25, γ=0.36; and S52-χ²=32.71, γ=0.35; Sig.0.000), I-demonstrative (S7-χ²=18.89, γ=0.27; S44-χ²=16.24, γ=0.27; and S88-χ²=20.05, γ=0.27; Sig.0.000) and VII-cyclothymic nature (S72-χ²=32.24, γ=0.35; Sig.0.000).

CONCLUSION: a relation between accentuated personalities and cigarette smoking is suggested.

UDC Classification: 614, 159.94; DOI: http://dx.doi.org/10.12955/cbup.v5.953

Keywords: cigarette smoking, accentuated personality, college students

Introduction

The traits of accentuated personalities exhibited at high-intensity levels affect human personality, and when they are emphasized even more, they can disrupt the structure of the personality. The direction of this disruption could be negative (psychiatric disease – personalities’ disorders) (APA, 2013) or positive (accentuated personalities) (Leonhard, 1972). In this study, Leonhard analyzed both clinical cases and characters and typologies described by authors in fiction. Accentuated personalities questionnaire (Schmieschek, 1970; Nestor, 1975) explore the inner world of the person (feelings, intentions, attitudes, desires).

Personality structure through motivation (Bonilha et al., 2013), attitudes and self-efficacy (Mee, 2014; Ford et al., 2013) depression (Mee, 2014), and impulsivity (Balevich et al., 2013) was confirmed in recent research as being related to cigarette smoking.

Cigarette smoking inhibits the secretion of monoamine-oxidase (MAO), decreases hunger, anxiety, depression, and anger (Hughes, 2000), increases concentration capacity and stimulates Dopamine secretion (Robins & Regier, 1991). In another study, the most robust indicator of vulnerability to high levels of self-reported smoking dependence was a general vulnerability to depression and negative emotions (Kahler et al., 2010). Cigarette smoking is a behavior that has become a growing problem among college students.

The aim of this study was to investigate the relation between accentuated personalities and daily cigarette smoking in college students.

Material and method

Participants

This study was performed on a sample comprised of 1364 college students (60.7% females and 39.3% males, aged 19-30 years) chosen from 13 universities through stratified random sampling. From the initial group 2 samples were selected (cluster sampling): the case-sample (349 daily smoker students, 49.3% females and 50.7% males) and the control-sample (880 nonsmoker students, 65.3% females and 34.7% males). I did not consider occasional smokers (9.9% students).

Material and procedure

---

1 “Victor Babes” University of Medicine and Pharmacy Timisoara/ Romania, cpetrescu64a@yahoo.com
The method was a case-control observational inquiry applying two questionnaires: Health Questionnaire (60 items from which 8 items for smoking were selected) and Accentuated Personalities Questionnaire (PA - 88 items).

The reliability of the Health Questionnaire (HQ) was good for couples of questions: q36, q37 - alpha-Crohnbach index = 0.702 and q41, q42 – alpha Cronbach's index = 0.844. These items referred to: q36 “How often do you smoke at present, in a month?”; q37 “How often have you smoked in the past, in a month?”; q41 “How frequently do the family members smoke in a month?”; q42 “What is your motivation for smoking?”.

The reliability of Accentuated Personalities Questionnaire (PA – “H. Schmieschek” Questionnaire) (Schmieschek, 1970; Nestor, 1975) was good – alpha-Crohnbach index = 0.823. The items (marked with S) refer to symptoms of 10 accentuated personalities: I-demonstrative (12 items), II–hyperexact (12 items), III-hyperperseverant (12 items), IV–unruly (8 items), V–hyperthymic (8 items), VI–dysthymic (8 items), VII-cyclothymic (8 items), VIII–exalted (4 items), IX–anxious (8 items), X–emotive (8 items). The application of both questionnaires was: individual, anonymous, 1 hour and a half long; with free consent and with an explanation of the aim of the study. Accentuated personalities profiles (Schmieschek, 1970; Nestor, 1975) of daily smoker and nonsmoker students were built and accentuated personalities between daily smokers and nonsmokers were compared. Roman numerals indicating each of accentuated personalities were kept in the same form in the profiles built. Statistical analysis (chi square, Fisher tests and gamma correlation) was performed by SPSS 20 Program.

**Results**

Smoking behavior among college students

Daily smoking behavior was present in the past (25.3% students) and maintained in the present (25.6% students). A gender difference of daily smokers in favor of males (33% males and 20.8% females) was registered. A percentage of current nonsmokers (5.92%) were in the past occasional smokers (16.12%). The pattern of daily cigarette smoking was offered mainly by the father (29.1%), the partner (33%) and the mother (17.9%) for the entire sample, and equally by the father (40.1%) and the partner (40.1%) and less frequently by the mother (30.1%) for the daily smokers. Although the investigated students entirely agree that smoking is an unhealthy habit (48.5% -entire sample, 59.3% -daily smokers), they also totally agree that smoking calms them when they are nervous (15% -entire sample, 41.8% -daily smokers) and that it is a way to relax (14.9% -entire sample, 45.6% -daily smokers). The students’ age when they began to smoke was 15 years (median=15, mean=15.25 with SD=3.35 years). They used to smoke half a pack of cigarettes/day (mean=10 cigarettes). 47.44% of smokers tried to give up smoking and only 9.26% affirmed that they did manage to do so. A real difference of 5.9% between the present and the past non-smoker students was found.

Accentuated personalities of daily smoker and nonsmoker students

Most symptomatic (frequency of symptoms higher than 50%) accentuated personalities (V- hyperthymic, III-hyperperseverant and X-emotive) were similar for the initial group and daily smoker students and different for the initial group and nonsmoker students (V, X and III) (figure 1).

Three accentuated personalities were more symptomatic in daily smoker group than they were in nonsmoker students: IV-unruly (75%/50%), I-demonstrative (66.4%/49.8%) and VII-cyclothymic nature (62.5%/50%). The IX-anxious (37.5%/12.5%) and VI-dysthymic (25%/12.5%) were not accentuated personalities (under 50% of symptomatic answers) (figure 1).

Three other accentuated personalities were more symptomatic in nonsmoker than in daily smoker students: II-hyperexactly (58.1%/49.8%), VIII-exalted (75%/50%) and X-emotive (87.5%/75%). Still, daily smokers were symptomatic as emotive nature, too (figure 1).

Significant statistical differences were found between daily smoker and nonsmoker students for three accentuated personalities and one accentuated personality between nonsmoker and daily smoker students:

- **IV-Unruly nature** - There is a significant statistical difference (table 1) between the frequencies of positive answers of daily smokers and nonsmokers to the items: S30 – “Are you quickly angry?” (Yes - 56.44% daily smokers and Yes - 44.32% non-smokers); S42 – “Did you ever run away from home, when you were a child?” (Yes - 34.39% daily smokers and Yes
- 19.57% for nonsmokers); S52 – “When someone upset you a lot and intentionally, are you likely to lose control and start a fight?” (Yes - 61.03% daily smokers and Yes - 31.60% non-smokers).

- **I-Demonstrative nature** - A significant statistical difference (table 1) was also found between the rate of positive answers of daily smokers and nonsmokers to the items: S7 - “Usually, in a friendly meeting, are you in the center of the others’ attention?” (Yes - 60.11% daily smokers and Yes - 46.14% non-smokers); S44 – “Has it ever happened to you that you became so troubled by conflicts or grievances that it became impossible for you to work?” (Yes - 33.91% daily smokers and Yes – 22.73% non-smokers); S88 – “If you were involved in acting in a theatrical production would you become so involved in the role you were playing on a stage that you could completely forget you were actually someone else?” (Yes - 54.31% daily smokers and Yes - 40.23% of nonsmokers), and S51 – “Would you dislike to give a speech in public?” (No - 64.65% daily smoker and No - 54.20% in nonsmoker students).

- **VII-cyclothymic nature** - A statistically significant difference (table 1) was noticed between the answers of daily smokers and nonsmokers to the item S72 – “Can you change your mood by alcohol consumption?” (Yes - 66.95% in daily smokers and Yes - 48.51% in nonsmokers), too.

- **X-emotive nature** – A significant statistical difference (table 1) was found between the “Yes” answers of nonsmoker and daily smoker students to the items: S3 – “Do you burst into tears easily?” (78.69% - nonsmokers and 21.03% - daily smokers), S13 – “Are you very merciful?” (75.57% - nonsmokers and 24.42% - daily smokers), S57 – “Can a tragic movie affect you so much that you burst into tears?” (76% - nonsmokers and 24% - daily smokers), S79 – “Are you very affected by the suffering of other people?” (63.31% - nonsmokers and 36.87% - daily smokers), and between the “No” answer to the item S25 – “Are you able to sacrifice an animal?” (66.66% - nonsmokers and 33.33% - daily smokers).

A positive gamma correlation between the answers to specific items of IV-unruly nature, I-demonstrative nature (except item S51 where the “No” answer is rated as positive), VII-cyclothymic nature and daily cigarette smoking sustains these results (table 2). A negative gamma correlation was found between the “Yes” answers to the questions of X-emotive nature and cigarette smoking (table 2).

Discussion

College students aged between 19-30 years (young adult - intimacy/isolation stage of human psycho-social development (Erikson, 1968) were approached in this study. Cigarette smoking is a risk behavior that starts and becomes an addiction at this age group. The smoking habit appears and continues due to behavioral problems manifested in early adolescence (Brook et al., 2008). A real danger of cigarette smoking in young adults is that they become perpetual smokers (McLure et al.,
2013). In this study daily smokers in the past are daily smokers at present. Daily smokers proved to have frequent positive responses to active smoking-related cues which may play an important role in maintaining smoking behavior (Haight et al., 2012). Family pattern (the father daily smoker and the partner daily smoker) was significant in this study. The smoking patterns could be associated with parenting styles (Bottorff, 2010) and with the perceived family life (Foxcroft & Lowe, 1995). In the conducted study the students chose relaxation and calming when they are nervous as the main motivations for cigarette smoking. The nicotine interacts with all levels of motivation (West, 2009), therefore dealing with stressful situations (Fields et al., 2009) can influence decisions to smoke. Other studies found that young people with low confidence in their ability to avoid smoking would have higher levels of smoking intention and smoking behavior (Hassandra et al., 2011). Combating cigarette addiction requires attention to the predictors of cigarette smoking (Burris et al., 2013) and to the role of gender in preventive actions against smoking (Lotrean & De Vries, 2012).

I found differences in cigarette smoking between male daily smokers and female daily smokers. In research literature smoking continues to be more frequently found in more masculine populations (Mahfouz et al., 2014) possibly due to a relation between smoking and masculinity (White et al., 2012) than in more feminine populations, where female subjects reported concerns about their weight (Morgenstern et al., 2010).

In research literature, cigarette smoking was approached in relation to personality traits (Patton et al., 1997). In this study, the profiles of the accentuated personalities in daily smokers and nonsmokers were different. The statistical results of this study reveal that certain accentuated personalities (IV-unruly, I-demonstrative, VII-cyclothymic) are more frequent and more symptomatic in daily cigarette smokers than in nonsmokers, in a population of healthy young adults. Therefore, IV-unruly nature presented significant statistical differences between daily cigarette smokers and nonsmokers. The increased anger (S30), the tendency to run away from home in childhood and breaking the rules (S42) and the lack of control of aggressive behavior and fighting (S52) found in the daily smokers in this study argue for the role of smoking in decreasing anger, impulsivity, hostility and the presence of sociopath behavior that is mentioned in literature (Hughes, 2000; Patton et al., 1997). Another study (Littlefield & Sher, 2012) demonstrated that from ages 18 to 35, changes in smoking involvement are significantly associated with changes in impulsivity. Other studies reveal more frequent engagement of smokers in antisocial behaviors (Alloy et al., 2009) and a strong association between antisocial personality disorder and smoking (Zvolensky et al., 2011).

This study found that I-demonstrative nature was more symptomatic in daily cigarette smokers than in nonsmokers. The tendency of daily cigarette smokers to be in the center of attention (S7), to display emotion openly (S88) and to like being on a stage (S51 - negative answer was considered symptomatic) is sustained by literature through extraversion personality characteristic in cigarette smokers (Ferguson, 2013). Yet, demonstrative nature, as Karls Leonhard affirms, is difficult to compare with present-day literature research, which refers especially to extraversion personality characteristic. However, extraversion in combination with neuroticism increases the risk of cigarette smoking dependency (Kleinjan et al., 2012).

Frequent changes of mood (VII-cyclothymic accentuated personality) were more frequently found in daily cigarette smokers than in nonsmokers in this study. Cyclothymia means stable feeling at a baseline level with the shift to an emotional high (symptoms similar to mania but less severe) or an emotional low (symptoms similar to depression but less severe). The greater tendency in daily smokers to change their mood by alcohol consumption (S72) – emotional high – was found in this study and it is supported by the way mania is approached in research literature. Research literature indicates impulsiveness as shared personality vulnerability for bipolar spectrum status in adult individuals (Alloy et al., 2009). Regular smoking also correlated with borderline personality disorder, that correlation being explained by common genetic factors (Distel et al., 2012).

This study showed that nonsmokers were much stronger in X-emotive responses than daily smokers and a statistically significant difference was found in favor of nonsmoker students. Therefore, easily touching and expressing of his/her emotions (S79, S3), compassion (S13), easy changing of his/her disposition depending on external events (S57, S25) are more prominent in non-smokers over smokers.
Two accentuated personalities remained constant in this study as being powerfully symptomatic and without significant statistical differences between smoker and non-smoker students: **V-hyperthymic** and **III-hyperperseverant**. They are specific for the investigated stage of development intimacy-isolation (young adults aged 19–30 years) (Erikson, 1968) and for the professional forming and performing.

A limitation of this research is that it is a qualitative one and the relation between daily cigarette smoking – and certain accentuated personalities is therefore only suggested.

**Conclusions**

This study offers a new perspective through which to look at daily cigarette smoking in young people – in relation to accentuated personalities. The main outcomes of this study showed profiles of different personalities in daily smokers and nonsmokers, an association of daily cigarette smoking with the traits of accentuated personalities (IV-unruly nature, I-demonstrative and VII-cyclothymic nature) and several aspects of smoking phenomena met in investigated populations. Therefore, the tendency of cigarette smoking to become an addiction, the role of the family pattern, gender differences, and relaxation and tranquilization as primary or important motivations for cigarette smoking were found.

Two accentuated personalities (V-hyperthymic and III-hyperperseverant) were similarly high symptomatic in the initial study group, case-sample and control-sample. X-emotive nature was more symptomatic in nonsmoker than in smoker students.

Knowing the accentuated personalities of young adults, practitioners can help them to avoid starting to smoke or can help daily smokers stop their smoking habit. This study suggests the existence of a relation between the traits of accentuated personalities in young adult daily smokers – and cigarette smoking.

REGIME CHANGE AND TREND PREDICTION FOR BITCOIN TIME SERIES DATA

Osamu Kodama,1 Lukáš Pichl,2 Taisei Kaizoji3

Abstract: Bitcoin time series dataset recording individual transactions denominated in Euro at the COINBASE market between April 23, 2015 and August 15, 2016 is analyzed. Markov switching model is applied to classify the regions of varying volatility represented by three hidden state regimes using univariate autoregressive model and dependent mixture model. Causality extraction and price prediction of daily BTCEUR exchange rates is performed by means of a recurrent neural network using the standard Elman model. Strong correlations is found between the normalized mean squared error of the Elman network (out-of-sample 5-day-ahead prediction) and the realized volatility (sum of minute returns squared throughout the trading day). The present approach is calibrated using simulated regime change in standard econometric models. Our results clearly demonstrate the applicability of recurrent neural networks to causality extraction even in the case of highly volatile cryptocurrency exchange rate time series data.

Introduction

Bitcoin is a cryptocurrency released as an open-source software in 2009, which represents a transaction payment system as well as a sort of digital commodity (Bohme et al., 2016). The bitcoin market capitalization as of early 2017 has reached USD 20 billion (CoinDesk, 2017). Free of any interventions from regulatory authorities, such as central banks, the distributed block chain system on which Bitcoin is based meets varying levels of demand for transaction settlement, and the Bitcoin exchange rate series to major currencies such as USD, EUR or GBP are known to highly fluctuate – it is not uncommon that gains or losses in tens of percent occur within a week, if not during a single day. There exist various Bitcoin exchange markets, such as BitBay, Btcde, Kraken, LocalBtc, or Rock for EUR currency, to name just a few of the currently active BTCEUR exchanges. The highly volatile nature of the exchange rate represents an ideal environment for the study of the extreme events in the field of financial time series. Prediction of extreme events is a key issue not only in economics, but also in climatology, geosciences, civil engineering, space technology, etc. In spite of its importance, the topic is rather under-studied, in our opinion.

In this work, we explore the applicability of computational intelligence methods from financial analysis to the series of Bitcoin exchange rates (data shown in Fig. 1). Since the Bitcoin price process is not stationary but exhibits an appreciation trend, we transform the time series data to the logarithmic returns. If the absolute value of the log return is large, it corresponds to an extreme event (bullish or bearish, based on the sign). Next we adopt the Hidden Markov Model to categorize the market regime into 3 modes: stable, intermediate, and volatile. This approach is excellent in ex-post analysis of the data, however lacks in the predictive power for future trend prediction. Consequently, we add the realized volatility as an intraday indicator of market stability, and develop a recurrent neural network configuration, which uses the past log return history in a moving window to predict the next week’s log return behavior. Since the market process mixes both deterministic and stochastic modes, it is not a priori clear where the limit of the predictive power of the recurrent neural network is bound. This paper shows as the principal result that the mean squared error of the prediction is only limited by the level of the realized volatility.

This paper is organized as follows. Following the literature review in the next section, in Section 3 we explain the dataset and outline the methods of its analysis. Section 4 wraps up our results and discussions, which are followed by the concluding section.

**Literature Review**

Among the notable attempts to model the prediction of extreme events in a systematic way are those of Hallerberg et al., (2008) assessing under what circumstances the extreme events may be more predictable the bigger they are, or the recent work by Franzke (2012) who develops a nonlinear stochastic-dynamical model. In the economic context, extreme events mean a bubble formation or a bubble burst, and their precursors are of vital importance in risk management. To extract the causal extent (deterministic segment) buried in the noisy data, various techniques have been proposed, for instance recurrent neural network with memory feedback (Elman, 1990) or support vector machines (Cortes and Vapnik, 1995). A survey of recent methods can be found in the work of Akansu et al. (2016). Binary classifiers separating the upward and downward trend (positive or negative sign of logarithmic return), which easily evaluate against the dataset in terms of hit ratios (precision of binary classifier output), are common.

**Data and Methods**

The dataset of BTCEUR tick data between 2015-4-23 and 2016-8-5 contains 809,489 records in 478 trading days transacted at COINBASE market. All data analyses were performed on a Dell PowerEdge T420 server, with 2 Intel Xeon E5-2407 2.2 GHz processors and 8 cores, running the GNU/Linux Fedora 23 operating system.

Figure 1 shows the EUR exchange rate data of BTC, including the logarithmic returns on daily scale ($R_t=\log(P_t/P_{t-1})$) and the realized volatility (RV), which is computed as the sum of the logarithmic...
returns squared on minute sampling scale during the trading day. The higher the realized volatility, the bigger are the uncertainty and spread of trading values typically observed during the day. The probability density of these two quantities is depicted in Fig. 2.

Figure 2: Density functions for the log return and realized volatility from Fig. 1

The first approach to classification of the market trend regime is the state switching model based on Hidden Markov Model (HMM). The observable quantity is the sequence of the logarithmic returns. We set the number of hidden states to equal to 3, that is a stable, non-volatility regime, highly volatile regime, and an intermediate state in between the two. The extraction of the underlying state probabilities is performed using the R-packages depmixS4 and MSwM (https://cran.r-project.org/). The theoretical approach closely follows that of Kirikos (2000). While the categorization results are quite reasonable, which can be seen in Fig. 3, namely the 3-states are correctly classified in regard to the magnitude of the logarithmic return, the predictive power of this approach is quite low (i.e. if we assume that the state for the next day is the one for the current day computed by the HMM model). We have to therefore resort to a more powerful causality extraction model. See (Gyorfi et al., 2012) for a list of possible candidates in the field of machine learning algorithms.

Figure 3: 3-state HMM for data of Fig. (1) (State #1: stable, #2 intermediate, #3 volatile)
In order to account for the time series correlations accurately, we have decided to apply the recurrent neural network (RNN) in Elman configuration (Elman, 1990). We have adopted two different topologies, one with a single hidden layer (8 units), and another one with two hidden layers (each from 5 to 8 units). The contents of the hidden units are fed as an extra input to the network in a feed-back loop, thus implementing the concept of the state memory. The implementation is that of the Stuttgart Neural Network Simulator, available as an R-package RSNNS. The main research question is whether the RNN model can extract the causal extent of the time series, and how it relates to the series of realized volatility, which are a measure of the stochastic content of the time series data.

Results and Discussions

The main result of the study is given in Fig. 4 for the configuration with two hidden layers, each containing 8 units. Thus there are two feed-back loops in the network configuration of RSNNS. The following procedure has been used: the RNN model is trained on the past 40-days of input data, and evaluated using a 5-day ahead prediction. The possible error outcome is therefore the precision set from \{0.0, 0.2, 0.4, 0.6, 0.8 and 1.0\}. The subset of \{0.0, 0.2, 0.4\} – that is majority-winning correct classification of the binary trend (sign of the logarithmic return) – has the frequency of 70.5\%, attesting to the causal content of the series. More importantly, we evaluate the RNN model using the standard measure of the Mean Squared Error of the logarithmic return for the 5 predicted values. Because of the 40-day moving window, this indicator is unavailable for the first 40 days (zero-level flat start in Fig. 4), and the curve is further 5 days shifted, in order to compare with the realized data of the 5-day ahead prediction window. In addition, normalization is used, i.e. the neural network receives data standardized to zero-mean and unit standard deviation; these units are applied to the evaluation of the MSE. The resulting curve (thick line in Fig. 4, red color in online version) shows an almost perfect coincidence, enveloping properly scaled graph of the realized volatility. Since the realized volatility measures the noise in the system, i.e. the unpredictable component of the time series, we can infer, based on Fig. 4, that the underlying deterministic content, i.e. the causal behavior mode, has been extracted properly using the RNN model. The results in Fig. 4 practically do not depend on RNN topology within the limit described above.

To further substantiate the scope of the validity of the RNN model, we have simulated econometric series of ARMA model (auto-regressive moving average model) with a single propensity parameter on the scale of 0.1 to 0.9. The RNN model reacts to the model discontinuity by the increase in the MSE, thus detecting the regime change. The bigger the parameter change, the better the chance is that the model change is discovered by means of an MSE increase.

Figure 4: Learning power of the RNN model: comparison of MSE vs. realized volatility

Conclusion
This work has established the applicability of the Recurrent Neural Network (RNN model) to the time series of Bitcoin exchange rates denominated in EUR currency. We have derived the average time series for each day in a 478-day-long sample of tick data from the COINBASE market, computed the realized volatility, and analyzed the causal extent of the daily time series using both the standard HMM model and the RNN model. The HMM is a poor predictor of the regime changes as well as market trends. The RNN model, on the other hand, showed a predictive power related to the spikes of the MSE value. Using the realized volatility, we could see that the model performs up to the theoretical bounds of its applicability, capturing the full scope of the deterministic contents, with MSE therefore closely following the distribution of the stochastic error given by the RV distribution. The present results show a good agreement of the MSE curve and RV distribution. This agreement is the better the higher the volatility spike is, which would conform to the model “the bigger the extreme event is, the better predicted it can be.” Nevertheless, the presented results are still confined to a relatively short period and a single market, and thus further investigation is required to make a more general conclusion. We also plan to study the effect of market-making information using open access texts (cf. Kim et al., 2016). The present findings may also be useful in considerations of the design of future cryptocurrencies other than Bitcoin (Extance, 2015). The presented work is also relevant and interesting due to the limited number of available data analysis papers on the Bitcoin subject, although the situation has improved recently (Houey, 2016; Kim et al., 2016, Kristoufek, 2013; Lahmiri, 2011; Ron and Shamir, 2013) as new cryptocurrency journals are introduced and technical reports of central banks all over the world start to pay attention to this still relatively young phenomenon.

PRICING MODELS IN A CAPTIVE MARKET: A CASE STUDY OF LCC DORMITORIES

Dragomir Popov, Femi Odebiyi

Abstract: The purpose of this study is to identify the residents’ preference among three pricing strategies: a la carte pricing strategy, limited choice pricing strategy, and bundled pricing strategy. The study analyzes the correlation between the year of study of the dormitory residents and the preferred pricing strategy. It uses an online survey for LCC International University students who were enrolled for the 2015-2016 academic year. A fixed choice set analysis is performed to analyze 126 valid responses. The results show that 42.4% of the respondents prefer an a la carte pricing strategy, contrary to the currently limited choice pricing strategy employed by LCC residency halls. Additionally, the study finds out that the residents are more likely to switch their preference from a bundled pricing strategy to an a la carte pricing strategy the higher their year of study is. Resident preferences for pricing strategies can provide dormitory operators with valuable information on establishing best pricing structures.

JEL Classification Number: M31; DOI: http://dx.doi.org/10.12955/cbup.v5.955

Keywords: Pricing strategy, Accommodation sector, Dormitory, Bundle pricing, Partition pricing, Captive market

Introduction

Price is the primary concern for the majority of people facing the decision of renting a temporary place of residence. According to a study by Repetti et al. (2015), customers prefer bundled pricing strategies in the hospitality industry. A possible explanation for this behavior is the “inferred bundled saving effect” which states that consumers generally believe that bundles involve a discount (Heeler, 2008). However, all-inclusive packages do not always imply a discount. Kaitlyn Wells (2014) states that customers choosing an all-inclusive vacation package may not be any cheaper than a standard version. A study conducted by Gillian Naylor finds the anecdotal evidence that “consumers would rather pay more for an all-inclusive package than deal with separate charges, even if the total bill is less” (2001). This represents a paradox from the standard economic model, which assumes that people behave rationally and selfishly. Yet, the same research concludes that this effect does not apply for repeat guests because they have the knowledge to pick the bundle that fits best their needs and expectations (Naylor, 2001).

This research paper aims to find out if the existent economic models about pricing strategies and customers’ choice in the hospitality industry apply in the accommodation sector as well. The logical assumption of the study is that since the accommodation sector is part of the eight branches of the hospitality industry then the theories developed in the hospitality industry should apply in the accommodation sector as well. There are no other known research papers that attempt to answer this question.

Research Questions and Hypothesis

In order to find out if the existent theories about the pricing strategies and customers’ preferences in the hospitality industry hold in the accommodation sector as well, the research will focus on the case study of LCC International University dormitories. There are two dormitories located in Klaipeda, Lithuania which accommodate students who study at LCC. These dormitories have a total capacity of 360 beds. Two research questions have been formulated to provide richer insight on the issue:

- RQ1: What pricing strategy (all-inclusive, limited choice, a la carte) is preferred by most of the LCC students?
- RQ2: Is there a correlation between the LCC students’ year of study and the pricing strategy preferred?

Consequently, two hypothesis have been concluded after analyzing the existent literature:

- H1: Most of the LCC students will prefer the present limited choice pricing strategy.
- H2: The longer the time a resident lives in the dorm, the more likely s/he is to switch from a bundled fee to a partitioned pricing strategy.

Literature Review

Lockyer and Roberts (2009) found that the price is an important trigger point in the hospitality industry. Hence, it is critical for both managers and customers to understand the reasoning of pricing strategies in this industry. Repetti et al. (2015) found that hotel consumers prefer bundled pricing over partitioned pricing in a report of 2 to 1, favoring the former. Similar findings are reached by Bambauer and Gierl (2008) in a study about purchasing decisions in commerce. They state that “The overall effect of price partitioning on product evaluation proved to be negative compared to using total prices.” They sum up their results by advising marketers to avoid partitioned prices because the disadvantages of this technique outweigh the advantages. Furthermore, Johnson et al. (1999) conducted a study about the psychological processing of bundled or de-bundled price information. They find out that consumers prefer “to integrate losses, in the form of price information, into a single bundled price.” Again, the outcome is that consumers prefer price bundling over price partitioning.

The reasons why the consumers prefer price bundling over price partitioning are explained by Johnson et al. (1999). His research study proves the existence of heuristics such as mental accounting and framing effects. Mental accounting is defined by Cartright (2014) as “the process of coding categorizing, and evaluating choices and outcomes.” In other words, mental accounting refers to the fact that people assign any sources of spending or income into different accounts for separate purposes. In the context of the hospitality industry, mental accounting is present when a tourist divides the budget for his vacation in separate accounts. Johnson (1999) concludes his study by acknowledging that consumers tend to segregate gains and integrate losses. Consequently, tourists are more likely to book an all-inclusive vacation package and feel one big loss instead of having to deal with a la carte pricing where there is uncertainty about the gains and losses they might encounter during their vacation.

Another reason consumers prefer price bundling over price partitioning is that most of the time, people estimate that the bundle is cheaper than the actual price. A study by Heeler et al. (2007) finds the existence of an “inferred bundle saving effect,” that assumes that generally, consumers believe that bundles involve a discount. Furthermore, the study suggests that the inferred bundle effect is a better theory than mental accounting and framing effects found in the study by Johnson (1999). Inferred bundle saving effect implies that customers have a reference point (anchoring effect), which was not present in the study conducted by Johnson et al. (1999), where “the bundled and unbundled prices were treated as losses regardless of whether inferred bundle discount exists” (Heeler et al., 2007). The study by Heeler et al. (2007), provides further evidence that “the inferred bundle saving effect is real, and is a probable explanation of pre- and post-purchase bundle effects.”

Another study suggests that the complexity of the pricing strategy cannot explain the customers’ evaluation of the offer. Thaler’s (1999) theory of “integrated outcomes,” which states that people prefer to segregate gains and integrate losses. For example, a customer buying an all-inclusive vacation package would evaluate the offer more positively if she knows how much money she saves on each service (segregate gains). However, the same customer buying a partitioned vacation package will evaluate the offer less positively if it is too complex (integrate losses).

Price bundling loses its “inferred discounting” effect with repeat customers. A study by Naylor and Frank (2001) found that first time guests prefer to pay more for an all-inclusive package than deal with separate charges, even though they could pay less choosing a partitioned package. Naylor and Frank (2001) explain this paradox that “consumers perceive that there are psychological, or hassle savings with an all-inclusive package that outweigh monetary savings.” The same study, finds that this is not true for repeat customers, because “they have the knowledge to pick the bundle that suits best their needs” (Naylor et al., 2011). This finding is consistent with the “discovered preference” hypothesis that states that over time people make choices that are consistent with the standard economic model.

Cartright (2014) attributes this effect to the “ample opportunity to learn from experience.” Therefore, the price bundling strategy becomes less effective for repeat guests, if the client’s initial reference point is lower than the price paid for the all-inclusive package.

Dormitory pricing strategies across countries

In order to acquire a better perspective on pricing strategies in the accommodation sector, the authors analyzed the pricing strategies across various dormitories in different countries. The dormitories are
from the following countries: Lithuania, Latvia, United States of America, Romania and Moldova. The universities were chosen randomly to provide a general impression of pricing strategies in different dormitories. The results are presented in the following table:

<table>
<thead>
<tr>
<th>Country</th>
<th>Pricing Structure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latvia</td>
<td>Limited choice. <em>Stockholm School of Economics in Riga, Latvia, has an identical pricing strategy for the dormitories to that employed by LCC. The residents pay one fee per semester in the form of a limited choice fee.</em></td>
</tr>
<tr>
<td>Lithuania</td>
<td>Limited choice. <em>At Vilnius University, Lithuania, the dormitories are charged a fixed fee each month. The fee includes only the rent and the utilities.</em></td>
</tr>
<tr>
<td>Moldova</td>
<td>Limited choice. <em>The Musical College “Stefan Neaga” in Chisinau, Moldova, charges a single payment per year. The residents pay for rent and utilities in one price. However, the fee does not include other expenses such as Wi-Fi, parking, or storage options.</em></td>
</tr>
<tr>
<td>Romania</td>
<td>A la carte fee and limited choice fee. <em>The State University of Pitesti has a partitioned pricing strategy. The dormitory residents pay each month a rent fee and consumption fee based utility fee. However, in Bucharest at SNSPA University, a monthly fixed fee is paid that includes both the rent fee and the utilities.</em></td>
</tr>
<tr>
<td>United States of America</td>
<td>All-inclusive fee. <em>At NYU, the residents pay one all-inclusive fee. The fee includes the rent expenses, the utilities and all the amenities including WiFi and access to gym. Similarly, at Alfred University, NY, the dorms are charged one all-inclusive fee that includes WiFi and gym membership. The fee is charged each semester.</em></td>
</tr>
</tbody>
</table>

Source: Authors

The majority of dormitories apply an a la carte pricing strategy and a limited choice fee. Only in the United States of America, the dormitory included many amenities all bundled together in an all-inclusive price.

**Methodology**

To find out what preferences LCC dormitory residents have, it is required to formulate several realistic pricing scenarios. The first questionnaire was pilot tested before administering it to students. With a population size of 309 and 126 responses, the margin of error for the survey is 6.7% on the 95% confidence level (‘Sample size calculator’, n.d.). The survey had a response rate of 40.8%. When asked to choose the two most valuable amenities that the dormitories have to offer, the respondents picked WiFi (99 responses) and Access to Storage Room (49 responses). The mean value for all options was 34.1 EUR per semester and the median value was 27.5 EUR. Therefore, the student residents’ willingness to pay (WTP) was 30 EUR per semester for the amenities most valuable to them.

When asked to choose two amenities they would like to pay in the form of a bundled rate, the respondents picked: laundry tokens (60 responses) and the meal plan at the cafeteria (52 responses). The mean value for all options was 86.5 EUR per semester and the median value was 59.5 EUR. Therefore, the student residents would be willing to pay on average 80 EUR per semester for the extra amenities most valuable to them.

However, the authors observed that 80 EUR per semester for a meal plan and laundry tokens is not a realistic scenario that could be implemented successfully at LCC University because the estimated fee is too low. According to the employees of the LCC cafeteria and the meal plan of LCC Basketball

---

3 The authors approximated the value of the identified amenities to the average value of the median WTP and mean WTP.
team, a more appropriate figure for the student meal plan would be 161 EUR per semester. As for the washing tokens a value of 14 EUR⁴ per semester is an acceptable figure.

The second questionnaire was constructed based on the values identified in questionnaire one. It presents five fixed choice sets and each choice set includes the following attributes:

a) Housing Fee: Presented as bundled rate or a partitioned rate
b) Deposit: Presented as bundled or partitioned to the housing fee.
c) Amenities: Presented as all-inclusive, choice of two, or a la carte.

Each scenario asked the respondents to assign a rating (definitely not acceptable, somewhat acceptable, definitely acceptable) to each script. A “none” alternative was available in the event the respondent had no opinion on the scenario. The non-residents were given an average value of 370 Euros to consider when completing the survey. The value was established as a median value of the room rates LCC dormitories have. Scenario one presents an all-inclusive fee for the housing rate, no deposit required, and it includes the price values for the amenities identified in questionnaire one. The second scenario is similar to the first scenario, except it presents a bundled deposit fee rather than the bundled housing fee as presented in the first scenario. Scenario three is the least expensive choice because it is formulated on the a la carte pricing strategy. It subtracts the value of the previously included amenities and offers a charge based on usage. The fourth scenario is the scenario currently offered by LCC dormitories and it presents a limited choice fee. Lastly, scenario five is identical to scenario two and it was added as a manipulation check to validate that the respondents were answering the questions and not randomly selecting options. There was no significant difference in the mean scores between these two scenarios, suggesting participants were responding consistently when answering the survey questions.

**Empirical Findings**

Of those participating in the survey, 33.6% were male and 66.4% were female. The age of the participants fell in the 18-22 years old range with more than 80% of responses. The respondents represented a variety of education stages with 29.6% Prime students⁵ and freshmen, 14.4% sophomores, 16% juniors, and 40% seniors and graduates. Approximately 62% of the respondents were on-campus residents and the remaining 38% were off-campus residents. As a further reliability method Cronbach’s Alpha value is .676, which is an acceptable coefficient.

To address the first research question concerning what pricing strategy is preferred by most of the student dorm residents, respondents were asked to choose their preferred scenario. Table two summarizes the results collected by showing the number and the percentage of the respondents who choose the option “Definitely acceptable” for each of the five scenarios.

These findings are opposite to the results discovered in the hospitality industry. According to the study by Repetti, Roe and Gregory (2015), the customers in the hospitality industry preferred the bundled pricing strategy over the partitioned pricing strategy. Therefore, the results presented in table four reject the first hypothesis of this study, which stated that the residents will prefer the current limited choice pricing strategy.

⁴ The value of a washing token is currently sold at 1.15 EUR.
⁵ Students part of the intensive English program
To address research question two, concerning any correlation between the respondent’s age and their preferred pricing strategy, a Pearson correlation was used. The level of studies (Prime, freshmen, sophomore, junior, senior and Master) was used as a proxy for determining customers’ living experience in the dormitories. Table three presents the correlation between residents’ year of study and their preferred pricing strategy. The first observation is that the Pearson correlation values are close to zero. In table three, all of the identified correlation coefficients are small to insignificant. The reason for such values is that the study was conducted for a population where more than 80% of the respondents were in the 18-22 years old range. This represents a very narrow age category. Therefore, because of limited age demographics, the Pearson correlation is so weak.

The second observation is that scenario one and scenario two which represent bundled pricing strategies have negative coefficients. It shows that the more a student is advanced in his study and thus is older, the less likely he is to choose a bundled strategy. This finding is consistent with hypothesis two which states that the longer time a resident lives in the dorm, the more likely he is to switch from bundled fee to a partitioned pricing strategy.

Similarly, scenario three representing an a la carte pricing strategy has a positive coefficient meaning that the more advanced a student is in his studies the more likely he is to choose a partitioned pricing strategy. Therefore, hypothesis two is not rejected. The third observation is that scenario four that represents LCC’s current pricing strategy in the form of a limited choice pricing strategy, got one of the strongest correlation coefficients. The result proves that the more a student has advanced in his studies and thus his age, the more likely he is to dislike the LCC dormitories’ current pricing strategy. This finding is consistent with the “discovered preference hypothesis,” which states that over time customers make better choices, and in this case, with the less costly choice. Furthermore, this observation is consistent with the findings of the study by Naylor and Frank (2001), which states that price bundling loses its “inferred discounting” effect with repeat customers. Lastly, scenario five got a similar score to scenario two, proving that the respondents were not randomly choosing answers.

Further investigation was done for the pricing strategy preferred by the non-residents of LCC residency halls. The results are presented in Table 4.

Source: Authors
The results presented in table four are similar to the results presented in table three. The non-residents, however, show stronger preference for the partitioned pricing strategy in scenario three. Moreover, the non-residents have a stronger aversion towards the current pricing strategy offered by LCC dormitories. Therefore, the non-residents are more price-sensitive than the current dorm residents. This finding can be explained that the non-residents have acquired enough knowledge over the years about their own needs and personal consumption and would therefore prefer to pay separately for their expenses than pay an average bundled fee. However, it is unclear if the non-residents do not live in the dormitories because of the limited choice pricing strategy applied, or because of other inconveniences.

Discussion

Rates and fees remain one of the most important trigger points of consumer behavior. This research suggests that the customers in the accommodation sector prefer a partitioned pricing strategy over a limited choice fee or a bundled price. Moreover, the results of this study suggest that the longer the stay of a resident in the dormitory, the higher the probability that he will prefer a partitioned fee. Correspondingly, the shorter the stay of a resident in the dormitory, the higher the probability that he will prefer a bundled fee.

Contrary to the findings in the hospitality industry of the study conducted by Repetti et al. (2015), the customers in the accommodation sector preferred a partitioned fee over a bundled fee or a limited choice fee. This preference is inconsistent with the pricing strategy employed by most dormitories across multiple countries. One reason why dormitories are charged a limited choice fee could be that the residence halls belonging to a university represent a captive market. Therefore, a dormitory may use a limited choice fee or a semi-bundled fee for increasing its profitability. As noted by Knutson (2011), bundling fees together can serve as an effective tool to increase sales or profit for companies, or in this case - dormitories. However, the practice of bundling services together can represent an advantage for the residents as well. Duke (1994) states that price bundling can serve as a method to attract price-sensitive consumers who “are attracted to purchase more goods and services by bundling independent products”. In the case of residency halls, paying for rent, utilities and Wi-Fi, seems like a good deal for potential residents, because the housing fee includes the independent product – Wi-Fi service. Therefore, both the dormitory managers and the residents have advantages from offering a limited choice fee or a bundled residency fee. The mutual gain of both parties can serve as an explanation for a limited choice fee in the accommodation sector.

The second research question found significant statistical evidence that the longer time a resident lives in the dormitories the more likely he is to prefer a partitioned pricing strategy. This finding is consistent with the proposed hypothesis and does not contradict the conventional literature about the subject. In terms of pricing strategies, this finding suggests that over time people are more likely to choose a partitioned pricing strategy over the limited choice package or the all-inclusive fee. However, this effect should be tested for different brand perceptions. As suggested by Love (2012) the practice of price bundling works well only for low tier brands. Interestingly, dormitory fees are different than the other surcharges evaluated in previous studies (i.e. shipping and handling charges). Dormitory fees include amenities that some consumers may not use or find value in, and yet still pay for them.

While this study provides interesting contributions, there are limitations to the work. The survey attempts to replicate actual consumer behavior purchasing decisions, but it is possible that participants can have different behaviors than those indicated in the responses. This study also exposes additional areas of research. Further, in-depth examination of pricing strategies in other dormitories in Lithuania, and other countries would be useful for modelling consumer behavior in the accommodation sector. Comparing various pricing strategies among privately owned dormitories and publicly owned dormitories is another suggestion for further research.

CYCLIC DYNAMICS OF INFLATION: EMPIRICAL ANALYSIS
Alexander Protasov,¹ Tatyana Kotcofana,² Polina Stazhkova³

Abstract: The paper is dedicated to the study of nonlinear dynamics of inflation. We hypothesize that in the second half of the twentieth century, inflation cycles replaced the pre-existing inflation-deflation cycles. This hypothesis is based on the study of data about price levels in various countries of the world for the period of 1950 to 2016. The paper shows some results of a spectral analysis that was applied to the dynamic series of prices. The results of the spectral analysis confirmed the hypothesis about the existence of inflation cycles.

JEL Classification Numbers: C22, E31; DOI: http://dx.doi.org/10.12955/cbup.v5.956

Keywords: inflation, cycles, spectral analysis, spectral density function

Introduction
Two characteristics can be distinguished among the features of modern inflationary processes, both in developed countries and in countries with emerging markets. The first characteristic is the permanent nature of inflation, and the second one is the uneven nature of inflation’s development. The study of these characteristics has certain scientific and practical value. In particular, the study of the nonlinear dynamics of inflation makes it possible to predict the development of inflationary situations and apply adequate anti-inflationary measures. The observation of price dynamics in the world economy reveals that inflationary outbursts are periodic. An analysis of the rate of price levels in developed countries in the second half of the twentieth century shows that there is a clear periodicity in the acceleration and slowdown of inflationary processes. This means that inflation has acquired a permanent character, but it has also gained a new feature – cyclical dynamics. This fact raises questions about the existence of a specific “inflation cycle.”

Unfortunately, the cyclical dynamics of inflation is not yet widely covered in economic literature. Although there are works with inflation cycles as a direct subject of research (Banerji, 2005), but there are very few of them. Most often, nonlinear dynamics of inflation is considered by researchers in the context of studying other macroeconomic issues: monetary policy and business cycles (Gali, 2008; Niemira and Klein, 1994), history of changing the role of money in the economy (Skene, 1992) or the relationship between inflation and economic growth (Simran, 2015; Malkina, 2006; Zoidov, 2001).

Thus, the aim of this paper is to demonstrate the historical dynamics of inflation on the example of developed countries and to isolate a cyclical component in a dynamic series of prices with the use of non-standard methods of statistical data processing.

Cyclic dynamics of inflation: historical data
There is no clear definition of the inflation cycle in the studies on non-linear dynamics of inflation. Therefore, in this article the inflation cycle (IC) refers to a regular, relatively stable, rhythmic, regular and periodic reproduction of the alternating phases of acceleration and slowing of inflation. The acceleration phase is a consistent annual increase in the rate of price growth in relation to every preceding year, and the slowdown phase is a consistent annual reduction in the rate of price growth.

Four countries with developed market economies (USA, Great Britain, Germany, and France) were selected for the empirical analysis of the cyclical dynamics of inflation. The study of the dynamics of consumer price indices in these countries from 1950 to 2016 confirms the existence of cyclical fluctuations in inflation levels. First, in all the analyzed countries there was a stable presence of alternating phases of acceleration and slowing down of price growth rates. This can be seen in Figure 1. For example, in the USA during 1968-1969 there was an annual increase in the rate of growth in consumer prices: 1968 – 4.7%; 1969 – 6.2%. Then in 1970 trend has been replaced by an opposite one and during the next two years there has been an annual slowdown in the price growth rate: 1970 – 5.6%; 1971 – 3.3%. In the subsequent period (1972-1976) the picture of inflation dynamics was repeated.

¹ St. Petersburg State University, a.protasov@spbu.ru
² St. Petersburg State University, tankotsofan@mail.ru
³ St. Petersburg State University, p.stazhkova@spbu.ru
The annual rate of price growth accelerated from 3.4% in 1972 to 12.3% in 1974, and during the next two years there was a gradual slowdown from 6.9% in 1975 to 4.9% in 1976. Thus, each inflation cycle consists of a phase of acceleration and a phase of slowing inflation.

Figure 1: Dynamics of inflation in developed countries (1950 - 2016)

Secondly, the periodicity is traced in the dynamics of fluctuations in the rate of inflation. That is, fluctuations have a clear direction that changes after a certain period of time. Thirdly, there is a rhythm of fluctuations in the inflation rate. This means that the duration of the phases of acceleration and slowing of inflation in neighboring cycles (i.e., cycles that follow one another) often coincides. However, over time, as follows from the graphs presented in Figure 1, the inflation rhythms can vary. The change in the rhythms of inflation cycles, as our analysis has shown, is associated with the impact on the price dynamics of shocks of a different nature. For example, the sharp rise in world prices for hydrocarbons in 1973 - 1975, or the switching of state regulation from the Keynesian model to a monetarist model, as it had happened at the turn of the 1970s and 1980s.

Table 1 shows the grouping of consumer price growth indices and the inflation cycles in the respective countries. Analysis of Table 1 shows that during the period from 1950 to 2016, the UK, Germany and Canada experienced 16 complete ICs, 17 ICs were observed in the United States, and 15 in France. The average duration of IC for these countries was: 3.8 years in the US, 4 years in Germany, 4.1 years in France and Great Britain, 3.9 years in Canada.

Such differences in the dynamics of inflationary processes in the countries represented show that inflation in each country has specific features. This is due to the economic conditions of reproduction processes, pricing practices, monetary circulation and anti-inflationary policies, dominance of intangible assets and global competitiveness (Pashkus et al., 2016), as well as features of state regulation of the economy. (Kirillovskaya et al., 2016) However, it is clear that for all the countries studied, the uneven development of the inflationary situation is common. It manifests itself in a cyclical nature.

**Empirical analysis of inflation cycles**

The results of the spectral analysis of the dynamic series of prices confirm the existence of inflation cycles. This method of data processing was chosen due to two main reasons. First, it eliminates the need to apply the procedure for removing the trend from the original series. This is important because the long-term trend determines the long-wave dynamics of inflation, so removing it becomes impractical.
Secondly, this method allows identifying the most powerful harmonics in the frequency spectrum of price fluctuations and thereby determining the cyclical fluctuations that have a determining influence on the dynamics of inflationary processes. There is a brief description of the method of spectral analysis below, a more complete version of which can be found in (Granger and Hatanaka, 2015; Harvey, 1975; Sitnikova, 2009; Glazyev, 1991).

The long price series are oscillatory processes, similar in shape to the sinusoid. In mathematical form, the sinusoidal series can be represented as following:

\[ X(t) = A \cdot \cos(\omega t - \varphi), \]

Where \( A \) is an amplitude of the oscillations of the values of the series; \( \omega = \frac{2\pi}{T} \) – angular frequency; \( \varphi \) – phase shift; \( T \) – time; \( 1/T = f \) – frequency (the number of oscillations per unit of time).

The dynamical series \( X_n \), which describes the oscillatory changes in time of the values of any statistical indicator (for example, price indices or their increments), consists of the sum of harmonics that are periodic over a certain frequency interval with amplitudes and phases constant around average. These oscillatory changes in each given point in time are \( X(t_1); X(t_2); \ldots; X(t_n) \), with \( t_1, \ldots t_n \) as specific points in time in which the investigated indicator of the dynamic series takes specific values. These oscillatory changes are described by the probability density with the use of indicators of mathematical expectation (\( \mu \)), variance (\( \sigma^2 \)), autocovariance function (\( \gamma(\tau) \)) and spectral density function (\( S(f) \)):

\[
\mu = \int_{-\infty}^{+\infty} X f(X) dX \\
\sigma^2 = \int_{-\infty}^{+\infty} (X - \mu)^2 f(X) dX \\
\gamma(\tau) = \int_{-\infty}^{+\infty} \left[ (X(t_1) - \mu)(X(t_2) - \mu) \right] f(X) dX \\
\tilde{S}(f_i) = \frac{1}{2\pi} \left[ \gamma(f) + 2 \sum_{i=1}^{N-1} \gamma(2\pi f_i) \cos(2\pi f_i t) \right]
\]

Where \( \tilde{S}(f_i) \) is an estimate of the power of the spectral density function (SDF), which makes it possible to analyze the frequencies of the oscillatory processes in a given dynamical series and it is also related to the autocovariance function \( \gamma(\tau) \) by mutual Fourier transform. \( \gamma(\tau) \) is autocovariance with a lag \( \tau \); \( N \) is the length of given series; \( f_i \) is a frequency of oscillations of the index of the series.

In any given point of time, the value of the series can be represented as a Fourier series in the form of a sum of sin and cos:

\[ X(t) = A_0 + \sum_{i=1}^{n-1} A_i \cos(\omega_i t - \varphi_i) + A_n \cos(\omega_n t) \]

with \( \omega_n = 2\pi f_n \); \( f \) is main frequency, determined by the length of the series \( f = \frac{1}{N} \). The variance of the series is represented as the sum of the squares of the amplitudes of the oscillations (harmonics):

\[ 1/N \sum(Xt - A0)^2 = 12Nt = 1 \sum Ai 2n - 1i - 1 + An2 \]

Since the dynamic series, and especially the series of prices, are filled with a "mixture" of regular and irregular (random) oscillations, a procedure is performed to estimate the contribution of the variances that make up the totality of the oscillatory processes in the investigated series to the overall variance of the oscillatory process. In particular, the dynamic process can be represented by the sum of elementary oscillations with random amplitudes and phases (Glazyev, 1991). In this case, the variance of the random process is obtained in the form of a continuous sum of variances of all oscillations:

\[ \sigma^2 = \int_{-\infty}^{\infty} dF(\omega) \]
The contribution to the total dispersion of a dynamic process with frequencies from a certain interval \((\omega, \omega+d\omega)\) is equal to \(dF(\omega)\). The function \(F(\omega)\) is the spectral distribution function of the dispersion of the oscillatory process with respect to frequencies, \(S(\omega) = \frac{dF(\omega)}{d\omega}\) is a function of the spectral density of the distribution of the dispersion of the oscillatory process over a continuously varying frequency. The peak points on the SDF graphs determine the average amplitude of the oscillation amplitude in the defined frequency interval. Thus, the SDF makes it possible to estimate with mathematical rigor an individual harmonic (oscillations with a certain period) as part of the overall process from SDF values or from SDF graphs. In other words, the SDF shows the presence of periodic oscillations at the any given interval and their variance. This method was used to determine the presence of oscillations in the dynamics of inflation, its period (frequency) and amplitude.

Table 1 shows the periods of the observed cyclic components in the dynamics of the growth rates of consumer price indices in the studied countries with developed markets and the power value of the spectral density function for the corresponding frequency.

**Conclusion**

The conducted research has shown that the development of inflationary processes has inherited the property of multicyclicity. The method of spectral analysis made it possible to reveal cycles of different duration in dynamic series of prices. In particular, over the past 65 years, the dynamics of inflation in developed countries have seen harmonics characteristic of the rhythms of Kondratiev waves, Kuznets swings, business cycles and shorter Kitchin cycles, all of which have wide coverage in economic literature. The same analysis revealed the presence of specific 2 to 4 yearlong fluctuations that do not fit into the well-known cycles. This confirms the hypothesis of inflation cycles existence.

The nonlinear dynamics of inflation is determined by the intensity of the distribution conflicts, the strengthening and weakening of which creates impulses for the cyclical development of inflationary processes. This statement follows the traditions of post-Keynesian theory (Palley, 1996), the theory of “conflict inflation” (Rosenberg and Weisskopf, 1981; Gordon, 1981), and our previous research. In (Protasov, 2013; Protasov, 2015; Kotcofana, 2007), it is shown that inflation is a monetary expression of the fundamental distributional conflict of the capitalist economy – the struggle of various social groups and classes for their shares in the national income.

THE ROLE OF ECONOMIC ACTIVITIES’ CLUSTERS IN GROSS VALUE ADDED GENERATION IN THE BALTIC STATES

Rima Rubčinskaitė, Gindrutė Kasnauskienė

Abstract: Economic globalization affects regional development through different economic value creation chains. The structure of regional economic activities’ groups and size of clusters could also influence the structure and size of gross value added in a particular region. This paper examines the impact of the main labor force indicators on the generated gross value added in diverse economic activities in the Baltic States and the neighboring regions of Finland and Poland in the period of 2000-2013 according to Eurostat data. The research has shown that the structure of economic activities clusters in the Baltic States (Estonia, Latvia, Lithuania) significantly differs from the neighboring regions of Poland and Finland. We also found that the labor force input has a significant impact on the following economic activities’ clusters in the Baltic States: “Industry (except construction)”, “Wholesale and retail trade, transport, accommodation and food service activities”, “Construction”, “Professional, scientific and technical activities; administrative and support service activities”, “Financial and insurance activities”, “Arts, entertainment and recreation; other service activities; activities of household and extra-territorial organisations and bodies”. The impact of the labor force on generated gross value added differs in diverse economic activities. The authors believe that the results of this study could be useful for policy makers in building more progressive national and regional economic development strategies.

Keywords: economic clusters, labor force, gross value added, regional development, Baltic States

Introduction

The empirical research results indicate that the composition of clusters as groups of specific economic activities has a significant impact on value creation in the studied regions. The structure of regional economic activity groups and the size of clusters could also influence the structure and the size of gross value added in a particular region. The questions we discuss in this paper are of considerable importance to the Baltic States: Does location (i.e. region) matters in the Baltic States? How much do the Baltic States vary or are similar in terms of the distribution of labor force across economic activities? How much do the Baltic States vary in the structure of gross value added of economic activities? How much does the input of the labor force matter to the generation of gross value added in a specific economic activity?

There are two main strands of research used to analyze clusters and the agglomeration impact on regional development that are briefly presented in the paper. The Porter’s cluster theory is widely accepted by policy makers at the regional, national and the European Union levels. The clusters and networks became part of the EU strategy “Europe 2020” and the industrial policy “An Integrated Industrial Policy for the Globalisation Era Putting Competitiveness and Sustainability at Centre Stage.”

This study aims to evaluate the role of economic activities’ clusters in gross value added generation in the Baltic States (Estonia, Latvia, Lithuania) and neighbor regions of Finland and Poland. The originality of the paper lies in the fact that it has been for the first time, to the authors knowledge, that a few small open economies of the same geographical location were analysed as one region and compared with the neighbour regions of other countries in terms of labour distribution across clusters of economic activities and its impact on gross value added.

The following part of the paper reviews the modern regional development theories. Further, the methods used to investigate the subject are described. Then follows the discussion on a geographical scale of the research. The next part highlights the analysis of labor and gross value added structure of the selected regions and the main results of a regression analysis on the impact of labour force on gross value added in selected clusters and regions. The last section discusses the main findings and conclusions.

Literature review: Cluster Theory and New Economic Geography

Two different research strands on regional economic development were developed in the end of the 20th century and the beginning of the 21st century: a cluster theory by Michael Porter and a new economic geography by Paul Krugman. Both of them highlight the location being quite little under

1 Faculty of Economics of Vilnius University, rima.putiene@gmail.com
2 Faculty of Economics of Vilnius University, gindra.kasnauskien@ef.vu.lt
consideration in economics earlier. M. Porter and his followers argue that the location defines the specific structure of interrelated economic activities and the patterns of such collocation can be called clusters (Porter, 2003; Brachert, Titze, Kubis, 2011; Delgado, Porter, Stern, 2012). The analysis of the USA County Business Patterns (CBP) data allowed M. Porter to classify clusters in the following categories: traded, local, and resource-dependent (Porter, 2003). According to Porter’s cluster theory, clusters have an impact on the economy and innovation of the region and use the concentration, correlation and regression analysis to prove this (Porter, 2003; Sölvell, Ketels, Lindqvist, 2008; Brachert, Titze, Kubis, 2011; Delgado, Porter, Stern, 2012; Pires et al., 2013; Ketels, Ch., Protsiv, S., 2013). The main variables used are employment, establishments, wage size, and patent indicators (Porter, M., 2003; Brachert, Titze, Kubis, 2011; Pires et al., 2013; Delgado, Porter, Stern, 2013).

Paul Krugman focuses attention on the relationship between the location and trade (Krugman, 2010). According to Martin and Sunley (1996, p. 6), Krugman’s theory “combines the models of imperfect competition and scale economies used in a new trade theory with the location theory’s. It highlights the emphasis on the significance of transport costs and “the interaction of external economies of scale with transport costs” to be the key to his explanation of regional industrial concentration and the formation of regional “centers” and “peripheries.” Others add that new economic geography explains “market expansion effect” (i.e. the increased local demand for upstream activities when a new company starts production in a certain location) and “market crowding effect” (i.e. a local supply for downstream activities) (Ottavianno, 2002).

While discussing regional economics, there are two main groups of theories: a location theory that analyses “economic mechanisms that distribute activities in space” and a regional growth (or development) theory where research objects are “spatial aspects of economic growth and the territorial distribution of income” (Capello, 2011). New Economic Geography (NEG) as a location theory analyses the diversity of locations, determinants of local growth using quantitative approach. The cumulative causation model (Myrdal, 1957; Kaldor, 1970) and the endogeneous growth model (Luca, 1988; Romer, 1987) belong to the same local growth theories where growth is treated as territorial competitiveness (Capello, 2011). It should be added that Porter’s cluster theory also deals with competitiveness as the main source of inspiration for a cluster concept in the region.

While both new theories deal with spatial distribution as such, they both received critique and were widely discussed and compared. While Porter’s cluster theory received much critique on the empirical basis (Woodward, 2012) and the geographical scale of cluster (Martin and Sunley, 2003; Brachert, Titze, Kubis, 2011), this means that the definition of a region matters. Krugman’s new economic geography was criticised because of focusing “on forces and processes that were important a century ago but much less relevant today” (Krugman, 2010, p.3). Both theories are still under the scholarly focus, and both are exploited in regional economics studies.

**Methodology and geographical scale of the research**

Most of the research carried out into clusters mainly measures cluster strength exploiting spatial agglomeration of labor force such as location quotient, Gini coefficient. Input-output methods, network analysis, discriminant analysis methods are used for defining clusters (Hill and Brennan, 2000; Porter, 2003; Delgado, Porter, Stern, 2013; Kies, 2008). The multidimensional approach developed by Titze et al. (2011) exploits the combination of spatial concentration and input-output methods (Brachert, Titze, Kubis, 2011). This combination allows to identify horizontal or vertical dimensions of clusters, where horizontal dimensions mean “clusters of firms producing similar output” and compete in the same market, and where the vertical dimension means that a cluster includes “firms linked through input-output relations” (Malmberg and Maskell, 2002; Brachert, Titze, Kubis, 2011).

It is argued that cluster measures should be compared with agglomeration measures as industry employment and firm’s concentration and should be analyzed together with regional policy’s key variables - productivity, employment growth and innovation (Woodward, 2013).

The school of NEG applies economic models with the focus on the economy of scale and agglomeration of firms and labor (Martin and Sunley, 1996; Cumbers and MacKinnon, 2004). Diverse approaches to analyze the spatial distribution of clusters of economic activities are exploited. Most research exploits administrative units of analysis, for example counties, districts, regions, etc... (Pablo-Marti and Arauzo-Carod, 2011).
This research exploits the percentage of individuals in employment and gross value added to avoid the problem of the regional size. For example, the population size of Lithuania was more than 3 million during the given period, while in Latvia – 2.5 million and 1.0-1.5 million in other selected regions. The population size impacts the size of the number of persons employed in the region. The distribution analysis was done by exploiting labor percentage share through clusters of economic activities in the selected regions. To understand which region is homogeneous and has the same economic function, i.e. the input of labor impacts the outcome of gross value added, a regression analysis of the selected regions and the selected clusters of economic activities was exploited.

To define geographical unit of analysis one should have in mind how much regions are similar in economy, social and political development, cultural values. This study focuses on the geographical scale of the Baltic States – Estonia, Latvia and Lithuania (NUTS 2 classification) – and their neighboring regions in the North (Finland regions - Länsi-Suomi, Helsinki-Uusimaa, Etelä-Suomi) and in the South (Poland regions - Warminsko-Mazurskie, Podlaskie). The Baltic States have similar history, similar political systems and comparable economic development as well as similar local resources. According to the report “The State of the Region. The Top of Europe - Striving for Direction in a Complex Environment” (Ketels and Pedersen, 2015), the Baltic States belong to Europe’s macro-region – the Baltic Sea Region which includes Denmark, Finland, Iceland, Norway, Sweden, North Germany regions (Hansestadt Hamburg, Mecklenburg-Vorpommern and Schleswig-Holstein), North Poland regions (Pomorskie, Warminsko-Mazurskie and Zachodnio-Pomorskie) and Russian regions (Archangelsk Komi Republic, Nenetski AO, Vologodsk district). Other researchers see the Baltic States as part of the region of Central and Eastern Europe which also includes Czech Republic, Poland, Romania, Slovenia, Hungary (Blajer-Golebiowska, 2014). To confirm that the Baltic States are similar in economic outcomes, their gross value added (GVA) structure was analyzed. The neighbor regions were added to examine whether there is some relationship between the neighbor regions and the Baltic States in labour and GVA structure.

The main aim of the research was to analyse the impact of labour input on gross value added in the main clusters of economic activities in the Baltic States and the neighbour regions (Estonia (EE), Latvia (LV), Lithuania (LT), Länsi-Suomi (FI19), Helsinki-Uusimaa (FI1B), Etelä-Suomi (FI1C), Podlaskie (PL34), Warminsko-Mazurskie (PL62)). The regions were classified according to the EU NUTS2 classification. The Eurostat data of economic activities’ clusters of 2000-2013 period was used. The cluster research exploits labour indicators as the main measure of agglomeration in the region and as the main indicator of the impact on regional economy. Thus, the employment indicator (i.e. the number persons employed) was exploited in this study which was assumed as the independent variable in further analysis. The dependent variable was assumed as the gross value added in clusters of economic activities. The following clusters of economic activities according to NACE Rev. 2 data were analysed (AFF) “Agriculture, forestry and fishing”, (IND) “Industry” (includes “Mining and quarrying”), (MNF) “Manufacturing” (includes “Manufacturing”, “Electricity, gas, steam and air conditioning supply”, “Water supply; sewerage, waste management and remediation activities”), (CONS) “Construction”, (WHRT) “Wholesale and retail trade; repair of motor vehicles and motorcycles, Transportation and storage, Accommodation and food service activities”, (ICT) “Information and communication”, (FINS) “Financial and insurance activities”, (RE) “Real estate activities”, (PRFSC) “Professional, scientific and technical activities, Administrative and support service activities”, (PAEDU) “Public administration and defence; compulsory social security; Education; Human health and social work activities”, (ARTS&) “Arts, entertainment and recreation; Other service activities; Activities of households as employers; undifferentiated goods-and services-producing activities of households for own use; Activities of extraterritorial organisations and bodies”.

Main results and discussion

Firstly, the structure of GVA and employment was analyzed. Then the regression analysis was done using panel data. The data of cluster of economic activities “Public administration and defense; compulsory social security; Education; Human health and social work activities” was used only for the calculations of the percentage share. One limitation of the research was that the EUROSTAT data did not have gross value added data of all the above listed clusters of economic activities of Poland’s regions. The main research question was what share of gross value added of a cluster could be explained by a share of the persons employed. The shares of indicators were calculated in percentages.
The economic activity clusters were grouped by the mean of the percentage share of GVA and the persons employed of a 5-year period (Table 1). This analysis aimed to have the first insight on how similar or diverse the locations were. The main aim was to decide if we could assume that the Baltic States are similar in GVA and labor structure.

Table 1: The mean of the percentage GVA share and the mean of percentage share of persons employed of economic activities clusters in the Baltic States and NUTS2 neighbor regions of 2009-2013 period

As the main variable for the spatial distribution and the agglomeration analysis is labor, the indicator of share of employment was the main argument for further grouping of locations. Thus, for further research the following clusters and regions were selected:

- “Construction” – all regions (FI19, FI1C, EE, LV, LT, PL34, PL62);
- “Industry” – FI19, FI1C, EE, LV, LT, PL62;
- “Wholesale and retail trade; repair of motor vehicles and motorcycles, Transportation and storage, Accommodation and food service activities,” (ICT) “Information and communication” – EE, LV, LT;
- “Information and communication” - FI19, FI1C, EE, LV, LT;
- “Financial and insurance activities” - FI1C, EE, LV, LT;
“Professional, scientific and technical activities, Administrative and support service activities”
- FI19, FI1C, EE, LV, LT;
“Arts, entertainment and recreation; Other service activities; Activities of households as employers; undifferentiated goods- and services-producing activities of households for own use; Activities of extraterritorial organizations and bodies” - FI19, FI1C, EE, LV, LT.

While grouping, the main focus was laid on the homogeneity criteria of the Baltic States, i.e. the percentage share of the cluster’s persons employed in the three Baltic States should fall into one group. Other regions were analyzed in the same group in case the share of employment of these regions belonged to the same percentage share group.

Further research was done by exploiting a classical linear regression model (CLRM). For this purpose, the data was analyzed using „MS Excel” and „Gretl” software. First, scatter diagrams were exploited where the independent variable was the percentage share of persons employed in a cluster and the dependent variable was the percentage share of GVA of a cluster. The assumptions of CLRM for normality, autocorrelation and homoscedasticity were tested using Jarque-Bera test, Durbin-Watson statistics and the White test.

The regression models of the selected clusters in the selected regions which vary in composition follow hereafter. There was no possibility to exploit the analysis with dummy variables for the regions because of the small number of observations. There was no possibility to use the multiple regression analysis because the variables were calculated as the percentage share inside the selected region. The applied level of significance was 0.05 ($\alpha=0.05$) in all the applied tests.

The “Construction” cluster was analyzed using two different region scales (Table 1 in Annex 1), one of which was the Baltic States and the other – the Baltic States and the Northern neighboring regions and the Southern neighboring regions. Both the regional models are statistically significant according to F statistics. The interesting findings are that the larger scale regional regression model meets all the CLRM model assumptions for normality, autocorrelation and homoscedasticity and could predict the average value of the “Construction” cluster percentage share of GVA by the percentage share of persons employed, i.e. if one increase percentage share of persons employed by 1%, the percentage share of GVA of this cluster will increase by 0.91%. To evaluate why the assumption for normality in the EE, LV, LT region was not fulfilled, we used a scaterdiagram (Figure 1, Annex 2). The normality assumption was employed because it is assumed that the number of independent variables in the model is optimal and there is no influence of omitted variables is small. Thus, in the case of the EE, LV, LT region, we could assume that there could be other independent variables that have the influence. The “Industry” cluster was analyzed using two different region scales (see Table 3 below), one of which was the Baltic States and the other – the Baltic States and the Northern neighbor regions FI19, FI1C and the Southern neighbor region PL62. Both the regional models are statistically significant according to F statistics. Both the models do not meet the normality assumption even though the adjusted determination coefficient is high in both cases.

The analysis of the scatter diagrams of the “Industry” cluster (Figures 2, 3, Annex 2) demonstrates that the linear model is not suitable for predicting a stochastic relationship. The analysis of the “Wholesale and retail trade; repair of motor vehicles and motorcycles, Transportation and storage, Accommodation and food service activities” cluster was done only for the Baltic States (EE, LV, LT). Even though the linear model is statistically significant and has high determination coefficient, it does not fulfill the normality criteria. Thus, it could not be used for prediction. The analysis of the “Professional, scientific and technical activities, Administrative and support service activities” cluster was done for two regions (Table 4 in Annex 1): one - FI19, FI1C, EE, LV, LT and the other was the Baltic States. We could note that these models also do not meet the normality criteria even though the determination coefficients are high and F statistics is significant. The cluster “Information and communication” was analyzed in two regions scales (see Table 5 in Annex 1): one of FI19, FI1C, EE, LV, LT and the other for the EE, LV, LT. The models are statistically significant. The determination coefficient is lower than in the previous models. Both the models do not meet the normality criteria. The second model (EE, LV, LT) also does not meet the homoscedasticity criteria. Both the models could not be used for prediction of a stochastic relationship. It could be noted that in earlier research, a negative correlation between the labor variable and the GVA was identified in the LT region (Rubčinskaitė and Kasnauskienė, 2016). The cluster
“Financial and insurance activities” was analysed in two different composition regions (see Table 6, Annex 1). The models could not be used for prediction because they do not meet the normality criteria. The “ARTS&” cluster was analysed in two different regional scales (see Table 7, Annex 1). Though both the models are statistically significant, they do not meet the normality criteria. Though, it could be noted that the determination coefficients and estimators are different in both models.

We could argue that the labour input impact on the generated GVA is similar in the following clusters “Construction,” “Industry,” “Wholesale and retail trade; repair of motor vehicles and motorcycles, Transportation and storage, Accommodation and food service activities.” It should be also noted that the concentration of labor force in these clusters is high and falls into the groups of $\leq 10-15<$ and $\leq 15-20<$. There are also different means of the determination coefficient in clusters. While the determination coefficient in clusters “Industry” and “Wholesale and retail trade; repair of motor vehicles and motorcycles, Transportation and storage, Accommodation and food service activities” is high and comparable, the determination coefficients of the regression models of clusters “Information and communication”, “Financial and insurance activities”, “Arts, entertainment and recreation; Other service activities; Activities of households as employers; undifferentiated goods-and services-producing activities of households for own use; Activities of extraterritorial organisations and bodies” are very different and lower.

The authors argue that all the models require improvements on including more variables and possible employment of non-linear regression models. The different scales of regions proved that the location scale matters. Even the structure of a cluster composition is similar, the relationship model is different on the regional scale and in a cluster.

A preliminary analysis of the economic activity composition in the selected regions confirms that “center-periphery” forces could matter. An example could be Finland Helsinki-Uusimaa (FI1B) which has very different cluster composition compared to other Finland’s regions under analysis. This could also be explained by a higher level of urbanization in the region. This fact confirms the assumption that regions matter. The specificity of the regions and agglomeration is important in both the theories presented earlier which confirms their relevance in our research. This is proved by a different composition of activities of the neighboring regions of the Baltic States. The neighboring regions under analysis, except for Helsinki-Uusimaa, are periphery regions of Poland and Finland and the identified differences in labor and the GVA structure could suggest that center-periphery forces work well on the national or state level.

**Conclusion**

According to the author’s knowledge, this is the first attempt to analyze the Baltic States as the whole region and compare it with the neighboring regions that belong to other nations and states. Also, this is an attempt to refuse the usual Cobb-Douglas production function while analyzing the labor input impact on GVA. This research was also an attempt to evaluate critically and assess the labor as the main indicator of agglomeration in cluster research by analyzing its possible impact on gross value added of the selected sector. The impact of labour force on generated gross value added is statistically significant in the selected clusters and regions. The impact is very different in the selected clusters and this implies that we should look for other than labor indicators when it comes to assessing the impact of clusters or industries agglomeration. Thus, we could accept Woodwards suggestion to explore more deeply the industries’ agglomeration variables to assess the impact of clusters and industries on the economic development of regions.

The research results could be useful for regional development policy makers. A more in-depth analysis of regions’ structure of economic activities’ clusters could be recommended and the regional development policy should take into account the center – periphery forces and to invest smartly in regions.

THE EVALUATION OF IMPACT OF MUNICIPALITIES’ FISCAL COMPETITIVENESS ON ECONOMIC GROWTH

Dovilė Rupliene, 1 Lina Garšvienė, 2 Dalia Rudytė, 3 Solveiga Skunčikienė, 4 Roberta Bajorūnienė 5

Abstract: The competition between municipalities is problematic due to a common misconception that rivalry is impossible because documents regulating finances are the same across all local self-governments. In contrast, scientific research shows that the livability of one municipality can differ to another because of differences in their social-economic benefits. This distinction is not conditioned by geographic location or other special features of the municipality but rather by the amount of funds assigned and allocated to social and public welfare. This article aims to reveal the factors pertaining to the municipalities’ fiscal competitiveness that affect economic growth within the state. This has relevance as a reallocation of a municipality’s expenditure could provide new possibilities towards increasing future revenue of the municipality. For reaching the aim is examined by evaluating the effect of municipalities’ fiscal competitiveness on Lithuania’s economic growth using the volume and structure of expenditure in its municipalities. Results show that the major channels determining the fiscal competitiveness of a region are human resources, the business sector, and the institutional environment, and that these differ among municipalities.

JEL Classification Numbers: H75, H76, R50; DOI: http://dx.doi.org/10.12955/chup.v5.958

Keywords: municipality, fiscal competitiveness, budget revenue, budget expenditure.

Introduction
The competition between municipalities is problematic due to a common attitude that such competition does not exist because municipalities have the same regulatory documents to manage finances at the local self-government level. Currently, scientists are interested in the issues of financial management of the local self-government, while the amount of research into evaluating the municipality’s competitiveness is rather modest. The problem, which has initiated this research, is the need to ascertain the factors that affect the economic growth of Lithuania through fiscal municipalities’ competitiveness. In this article, fiscal competitiveness of a region is defined as the ability of the region to allocate budget expenditure in such a way that develops the potential to collect more taxes for the municipality budget. The article aims to reveal the opportunities for a municipality to increase its budget revenue through greater focus on expenditure disbursement in local self-government. The objective of this research is to examine the effect of budget expenditure of the region (municipality) as elements of fiscal competitiveness on economic growth.

Literature Review
Fiscal Competitiveness and its Relation with Regional Competitiveness
The scientific literature contains extensive discussion about the definition of ‘competitiveness’ with this concept interpreted and analyzed at employee, company, city, region, state, and sector levels. In addition, the notion of competitiveness in scientific literature has often been associated with international trade, high exchange rate, and labor productivity (Gardiner et al., 2004; Kitson, et al., 2004; Meiliene & Snieška, 2010).

Competitiveness of regions is discussed in the scientific literature. However, there is no uniform opinion about the concept of ‘regional competitiveness’. To date, the works evaluating regional competitiveness have overlooked fiscal competitiveness apart from including it in calculations of competitiveness indices. Indicators of tax collection and expenditure of the public sector have been included as the constituent parts (Avila, 2014). This means that in scientific research the analysis of revenue and expenditure of the public sector contribute to evaluations of regional competitiveness. In scientific literature (Matuzevičiūtė et al., 2015; Rudytė & Skunčikienė, 2015), the factors that

2 Department of Economics, Šiauliai University, Lithuania, lina.garsviene@gmail.com
3 Department of Economics, Šiauliai University, Lithuania, daliarudyte@gmail.com
4 Department of Economics, Šiauliai University, Lithuania, skusolveiga@gmail.com
5 Šiauliai University, Lithuania, bajoruniene.roberta@gmail.com
predetermine competitiveness are given as follows: institutional environment, macroeconomic situation, labor market, infrastructure, financial market, education, commodity (services) market, business, social environment, scientific infrastructure, and technology advances. Hence, numerous factors predetermine competitiveness, and moreover, they are closely related.

Despite no direct analysis of fiscal competitiveness and its impact on economic growth, several studies evaluate such when assessing the economic effects of fiscal decentralization (Kim, 2013; Baskaran & Feld, 2013; Amagoh & Amin, 2012). In addition, the scientific works examining the economic effects of fiscal policy measures evaluate fiscal competitiveness indirectly (Cottarelli & Jaramillo, 2012; Boskin, 2012). When taking into account the collection of the municipality’s budget revenue, fiscal competitiveness of a municipality becomes its exceptional appeal and ability to compete with other municipalities and ensure favorable conditions for business, create workplaces, and, at the same time, successfully collect budget revenue. According to the authors of this article, such a definition of fiscal competitiveness raises debate with budget expenditure depending on budget revenue.

The Channels of Impact of Regional Fiscal Competitiveness on Economic Growth

The scientific research that has evaluated factors determining the economic growth of regions has concentrated predominantly on the following aspects: the effect of human resources, the business sector, and institutional environment.

Fiscal competitiveness of a region depends on the amount of freedom the region has in determining their tax rate, applying for tax relief, or establishing procedures for allocating social benefits. There are many articles reporting the effect of fiscal decentralization on economic growth (Baskaran & Feld, 2013; Kim, 2013; Boskin, 2012; Amagoh & Amin, 2012; Thornton, 2007), although the research results have been disputed on occasions (Hammond & Tosun, 2009).

Human resources are connected with the fiscal competitiveness of the region regarding both budget revenue and expenditure aspects. The greater the amount of human resources in the region, the greater the number of products produced by business and, therefore the higher amount of revenue for the budget. In scientific research, the effect of human resources on regional competitiveness and economic growth has been assessed using various indicators for human resources. Some research (Faggian et al., 2016; Gennaioi et al., 2011; Unger et al., 2011) is of a general nature where the factor of human resources has been assessed together with others determining competitiveness and economic growth. Several other studies have assessed the impact of human resources and institutional environment regarding the possibilities of state institutions having an effect on economic growth (Acemoglu, Gallego & Robinson, 2014; Dias & Tebaldi, 2012).

Education and the quality of the education system often serve as indicators in evaluating the impact of human resources on regional competitiveness and economic growth (Hanushek, 2013; Castello-Climent & Hidalgo-Cabrillana, 2012). Others researchers assessing the impact of human resources on economic growth (e.g., O'Connor 2013; Audretsch & Pena-Legazkue 2012) evaluate human resources by considering entrepreneurship under the assumption that initiative market participants are creative and contribute to the establishment of new companies.

The effect of the business sector on regional competitiveness is extensive and includes various factors: the structure of economics, foreign and local investments, entrepreneurship, and the number and size of companies, etc. These factors also affect the fiscal competitiveness of the region because they predetermine budget revenue and expenditure. In scientific literature, most attention is paid to evaluating the effect of foreign direct investments (FDI) on regional competitiveness and economic growth.

Methodology

The scientific methods employed in this research included analysis of scientific literature and legislation and a multiple regression analysis.

Considering fiscal competitiveness lacked a clear definition, for the purposes of this study in assessing regional competitiveness, fiscal competitiveness of the region was defined as the ability of that region to allocate budget expenditure in such a way that the people, economic entities, and all spheres of activity contribute more taxes to the budget of the municipality.
An assumption of the study was that the ability of the municipality to collect additional revenue for the budget was directly connected with its economic growth. The study period was 2005 to 2014. This timeframe was chosen to provide enough observations for a statistically sound conclusion. Also, it partly eliminated the influence of cyclic economic recurrence that included periods of Lithuania entering the European Union resulting in rapid economic growth, the economic recession since 2008, and the current economic growth phase. In addition, this duration matched that typically used in research evaluating municipalities (regions), i.e., 10–20 years (Gennaioli, et al., 2011; Gardiner et al., 2004). The data from 60 municipalities of Lithuania were used.

The municipalities of one country are often chosen in similar types of research as in choosing several countries, or their groups, introduces the possibility of confounding differences relating to the regulation of municipalities (Jenčova et al., 2013). A limitation of the study was that the territory of Lithuania is small with municipalities close enough that business conditions of one municipality could affect the business sector of another. An overall assumption of the study was that the municipalities were comparable for purposes of the study. All municipalities were evaluated using the same methods. Data from 60 municipalities provided several variables for comparison and enabled a complex evaluation of the impact of factors determining economic growth.

This study used a two-stage model to achieve the research aim and determine how expenditure of municipalities influenced their economic growth. The variables in the model were calculated using the data of the Lithuanian Department of Statistics and Ministry of the Economy of the Republic of Lithuania (Lithuanian statistical system, 2017).

A primary econometric model was used to determine the general control factors, specific factors of budget expenditure influencing economic growth, and trends associated with the economic growth. Other factors expressed by the control variables in the model were also assessed. Three main factors were distinguished from the model: human resources, the business sector, and the institutional environment were each assigned two indicators.

The two indicators for ‘human resources’ were ‘labor force content’ (i.e., labor force per 1000 people) and ‘cost’ (i.e., average municipality wage) in the municipality. The study used the metric of labor force per 1000 in contrast to the level of labor force because the former reflected the number of people in general, rather than the working-age population. It was deemed more appropriate for revealing the municipality’s potential productivity given the situation where a municipality’s economic activity is high, but there may be many economically inactive groups (children and retired people). Children may be considered as the future labor force, but in the meantime, require municipality expenditure in maintenance of educational institutions. Retired citizens are not participants of the paid workforce and thus, do not contribute to such productivity. Therefore, it was assumed that the labor force content per 1000 people best reflected the municipality’s productivity.

The two indicators for ‘the business sector’ were the ‘number of companies’ and the ‘annual FDI per 1000 people’. The FDI indicator was used because it related to raising capital from external sources and providing greater opportunities for productivity and economic growth. In separate specifications of the model, the total number of companies, the number of small- and medium-sized enterprises, and the number of medium- and large-sized companies were evaluated. These latter additions were chosen because small- and medium-sized businesses are often perceived as the main business entities that promote economic activities and growth (Opafunso & Adepoju, 2014; Smeaton et al., 2011; Grigienaitė & Ivanovié, 2010; Nwoye, 2010).

The two indicators for ‘the institutional environment’ in the model were ‘state subsidies per 1000 people’ and a ‘dummy variable’ denoting the existence or not of special status zones in the municipality, i.e., Industry Parks (IP) or Free Economic Zones (FEZ).

Each statistical indicator in the econometric model was treated as a separate variable, and the conclusions were drawn taking into account the statistical significance of the variables and the value of their coefficients (positive and negative).

Panel data was used in the research to deal with the different periods of time and different entities. In this way, it was possible to evaluate the impact of analyzed factors on municipalities’ economic growth for the full period under analysis and in all municipalities of Lithuania. Therefore, the results
of the regression analysis showed the overall results of all Lithuanian municipalities. A regression analysis was carried out using the method of least squares, and coefficients were calculated using robust heteroscedasticity-consistent standard errors. In the model, the differentiation of data was used to evaluate annual change in all variables, and logarithms were used to transform all analyzed dependencies into linear models.

The data analysis was done using GRETL econometric package. Multiple regression models were formed with gross domestic product (GDP) growth rate as a dependent variable. The expenditure indicator, calculated per 1000 people, removed the confounding effect of municipality size. The econometric model involved the following equation:

\[
\Delta \ln(gdp_{it}) = \alpha + t_d \cdot 2007 + \ldots + t_d \cdot 2014 + \beta_1 \Delta \ln(exp_{it}) + \beta_2 \Delta \ln(\text{exp}_{it}) \cdot \text{dens} + \beta_3 \Delta \ln(\text{lab force}_{it}) + \\
+ \beta_4 \Delta \ln(\text{wage}_{it}) + \beta_5 \Delta \ln(\text{ent}_{it}) + \beta_6 \Delta \ln(fdi_{it}) + \beta_7 \Delta \ln(\text{sub}_{it}) + \beta_8 (\text{ip feas}) + \beta_9 (\text{gdp}_{it-1}) + \epsilon_{it}
\]  

(1)

Where:

- \(gdp_{it}\) = GDP per 1000 people in a municipality \(i\) in period \(t\);
- \(\alpha\) = a constant;
- \(t_d\) = time dummies;
- \(\beta\) = coefficients that reveal the impact of an independent factor on a dependent variable;
- \(\text{exp}_{it}\) = a municipality’s expenditure per 1000 people in a municipality \(i\) in period \(t\);
- \(\text{lab force}_{it}\) = labour force content per 1000 people in a municipality \(i\) in period \(t\);
- \(\text{wage}_{it}\) = average monthly wage per 1000 people in a municipality \(i\) in period \(t\);
- \(\text{ent}_{it}\) = the number of companies per 1000 people in a municipality \(i\) in period \(t\);
- \(\text{fdi}_{it}\) = annual FDI flow per 1000 people in a municipality \(i\) in period \(t\);
- \(\text{sub}_{it}\) = state subsidies per 1000 people in a municipality \(i\) in period \(t\);
- \(\text{ip feas}_{it}\) = the existence or not of an industry park or special economic zone in a municipality \(i\) in period \(t\);
- \(\text{gdp}_{it-1}\) = gross domestic product per 1000 people in a municipality \(i\) in period \(t-1\); and
- \(\epsilon_{it}\) = error of the model.

In different modifications of the model (Modification 1, Modification 2, Modification 3), \(\text{ent}_{it}\) revealed the total number of companies (ent_total) or the number of small- and medium-sized companies (ent_sm), or the number of medium- and large-sized companies (ent_mb).

Municipalities were distinguished by clusters according to population density (dens), and the interrelation between municipalities’ expenditure and population density was included in the model (exp*dens). Municipalities whose population density exceeded 77.3 persons per km² were ascribed to Cluster I, whereas municipalities with a lower population density were ascribed to Cluster II.

**Results and Discussion**

The results of the regression analyses evaluating the effect of the total expenditure of municipalities on economic growth are shown in Table 1. The main variable of the model for assessing the impact on municipalities’ economic growth was municipalities’ expenditure. This factor had a statistically significant effect on municipalities’ economic growth (99% of probability), as well as on municipalities’ expenditure per 1000 people. When increased by 1%, the gross product of municipalities increased to about 0.80% on average. The interrelation between municipalities’ expenditure and the population density influenced economic growth was statistically relevant. The inclusion of this interrelation variable into the model aimed to prove whether the impact of municipalities’ expenditure per 1000 people would be greater in municipalities with higher population density. The research findings failed to substantiate the assumption of a higher population density higher and higher expenditure per 1000 people corresponding to a higher level of absolute expenditure, and, thus, a larger concentration of expenditure for the territory experiencing such.
The model included two indicators for each of these three factors: human resources, the business sector, and institutional environment. Four of these indicators displayed a statistically meaningful result (Table 1). The human resources indicator of ‘average monthly wage per 1000 people’, the business sector indicators of ‘number of companies’ and ‘annual FDI per 1000 people’, and the institutional environment factor of ‘state subsidies per 1000 people’ showed a significant relationship with the municipalities’ economic growth. All were positively related to economic growth, except budget subsidies, which had a negative result (Table 1). In respect to the condition of the business sector, the added variable of the number of small- and medium-sized companies also showed a significant and positive relationship with the municipality’s economic growth.

The impact of the average monthly wage indicator for human resources can be explained by the growing wage increases that not only reflect the cost of labor (which is often thought to slow economic growth) but also the surge in purchasing power that occurs with increase in wages. The services sector is highly receptive to the increased earnings of the community. In addition, this factor is critical in presenting the municipality as an economically successful territory. In this respect, the territory can attract FDI, decrease emigration, and promote the establishment of small- and medium-sized companies within its territory.

Source: Authors

Despite there being much variation considered about the effect of small- and medium-sized companies on economic growth, the results of this research show that such enterprises had a significant effect on the economic growth in Lithuania’s municipalities during the period under analysis. Meanwhile, the evaluation of the effect of the number of medium- and large-sized companies on economic growth was based on the assumption these businesses operate more efficiently, achieve economies of scale, and be
more competitive in local and international markets than the smaller ones. However, their impact on economic growth of Lithuania’s municipalities was not evident.

While analyzing the influence of the FDI in this study, it was noticed that, on the one hand, FDI had a direct impact, whereas, on the other hand, it has a contrary relation with economic growth of the state. Kuliaviienė & Solnyškinienė (2014), Moraru (2013), Sandalciar & Altiner (2012), Rupliene & Garšvienė (2008) observed that the impact of FDI on advances in technology in the state depended greatly on the state’s economic regulation (particularly concerning the regulation of labor and financial markets). A divergent relationship between FDI and economic growth was analyzed by Antwi, Atta Mills, Atta Mills & Zhao (2013). The authors highlighted that a negative impact of FDI surfaces in cases where local producers lose their position in the market, where companies in a particular sector increase, and where the capital earned from investments outflows from the state in which the investments have been made. As well, the impact of FDI on economic growth depends on the state’s institutions.

Study results for the business sector indicator of ‘annual FDI flow per 1000 people’ were encouraging, although the actual impact would be rather small. When FDIs increase by 1%, the municipality’s productivity grows by an average 0.06%. On the one hand, the impact of FDI may be less apparent. However, on the other hand, there has been no research to support such notion.

The factor of the institutional environment was described by two indicators in the model: ‘state subsidies per 1000 people’ and a ‘dummy variable’ denoting the existence or not of special status territories (IP and FEZ). This study found the state subsidies flowing into the municipalities’ budget as supplementary revenues inversely related to the economic growth of a municipality. When a municipality receives relatively large sums in the form of subsidies, it possibly fails to seek other ways of creating productivity to collect tax revenue since the subsidies fill the shortage of funds. A statistically meaningful effect on the municipality’s economic growth regarding whether IP or FEZ exist was not evident in this study.

Overall, the results of the model examining the effects of municipalities’ total expenditure and control on economic growth, show that the municipalities’ expenditure, the amount of an average wage, and the number of companies are indicators relating to economic growth, whereas the state subsidies, in contrast, appear to limit such growth.

**Conclusion**

Findings in scientific literature concur that the factors determining competitiveness are interrelated. Thus, an effect on one factor signals potential change in others. Fiscal competitiveness of a region may be defined as the ability of that region to allocate budget expenditure in such a way that people, economic entities, and all spheres of activity contribute more taxes to the budget of the municipality. The major channels determining the effect of regional fiscal competitiveness on economic growth in allocating expenditure for municipality programs are human resources, the business sector, and the institutional environment. In conducting this study and taking into account the amount and structure of expenditure in Lithuania’s municipalities, summations were made with reference to the statistical significance of variables and the value of coefficients. The impact of the municipality’s expenditure had no connection with the population density. The average wage in a municipality, the number of companies (size of no consequence), and the annual FDI were found to be indicators positively relating to economic growth. In contrast, an indicator negatively relating to economic growth was state subsidies to the municipality budgets. Thus, the research results show that the institutional environment can affect economic growth, though negatively in this case. As well, based on results with the average wage indicator, the greater the amount of human resources in the municipality the greater the productivity of business, and thus, more revenue for the budget. The amount and structure of human resources, when considering its value in education, entrepreneurship, and creativity of the community, provides for economic growth and collection of revenue for the municipality’s budget over a longer period. The business sector affects the fiscal competitiveness of a municipality quite broadly as it includes a great number of imperative channels, such as the structure of economics, foreign and local investments, entrepreneurship, and the number and size of companies. All affect the fiscal competitiveness of a municipality because they affect budget revenue and expenditure.

TO THE QUESTION OF THE CLUSTER APPROACH IN TOURISM OF KAZAKHSTAN

Rysty Karuevna Sadykova,1 Assem Madysheva2

Abstract: In recent years, the cluster approach has become the main instrument of an effective state strategy for the development and management of tourism in countries with a high level of competitiveness. It is based on the interaction and cooperation of organizations operating in the tourism industry and government structures, without which innovation activity cannot be managed, new approaches emerge that involve an indirect impact on the development of the region within the national innovation system by creating conditions for increasing innovation activity and susceptibility of economic entities. The development of many regions is constrained by the lack of necessary conditions: inadequate material and financial resources, underdeveloped research base, inconsistent regional policies.

JEL Classification Number: Z32; DOI: http://dx.doi.org/10.12955/cbup.v5.959

Keywords: Competitiveness, tourism, tourist product, clustering of tourist activity, infrastructure.

Introduction

Tourism in modern society is one of the most important aggregated branches of the state economy, involving in its orbit a whole set of directions - both at the level of direct contact with the traveller (transport, tourist firms, accommodation and food systems, cultural and entertainment, sports and health, sanatorium- Resort complexes, etc.), and indirectly involved in the formation of a comprehensive tourist service (agriculture, processing industry, fuel and energy complexes, the automotive industry and the production of other means of transportation, communications, the construction complex, souvenir industry, and others).

In the tourist industry, there are various tourist organizations. Balabanov et al. (2001) stated that some of them provide clients with exclusively tourist services, while for others, tourism is one of several areas of their commercial activities. Organizations that exist only at the expense of tourism are called tourist organizations of primary services, and organizations that receive incomes not only from tourism activities are tourism organizations in the sphere of secondary services.

In this paper, the following methods were used:
- monographic (when collecting data from primary documents available in the presence of tourist infrastructure);
- grouping method (when grouping enterprises by homogeneous characteristics);
- settlement-constructive (when calculating indicators for medium- and long-term prospects);
- economic and mathematical methods (in the formation of models and variants of tourist clusters).

Role of tourism in the socio-economic system of the region

As Bogolyubov et al. (2005) stated, traditionally, the development and sale of tourism products are engaged in two types of tourist organizations that are part of the tourist industry: tour operators and travel agents.

Tour operator (in the international practice, sometimes the term "tour operator" is used) is an organization engaged in bundling of tours under contracts with service providers and in accordance with the needs of tourists. The tour operator develops tourist routes, provides them with services, organizes advertising, calculates and sets prices for tours on these routes, sells tours to a travel agent for the issue and sale of vouchers. The tour operator is responsible for providing the services included in the tour package. Sometimes he provides these services himself, receiving them from a counterparty or being the owner of hotels, restaurants, etc.

Most often, tours are compiled by a tour operator for a wholesale agency that offers these packages under its own name through its retail agents or through airlines.

According to Azrilian (1997) a travel agent is an organization that purchases tours developed by a tour operator, issuing permits for these tours and selling them to the consumer.

1 Kazakh National University of Economics, Finance and International Trade, Astana, Kazakhstan, rystysadykova@mail.ru
2 Kazakh National University of Economics, Finance and International Trade, Astana, Kazakhstan, asem_madysheva@mail.ru
According to Gulyaev (1996) travel agents perform two main functions:

1. provision of information services (report on tourist areas, accommodation options, help to make an estimate of the cost of travel);
2. marketing of tourist services.

In this regard, we can conclude that the organization of the tourism industry is divided into three groups:

- tourist organizations in the sphere of primary services;
- tourist organizations in the sphere of secondary services;
- tourist organizations (travel companies, travel agents, travel agencies), which act as a link between the tourist-consumers of services and the tourism industry itself, which offers services. This group includes organizations of transport and communications that carry tourists to a place where they will be given hospitality, moreover, transportation costs and services of tour operators are included in the cost of the voucher.

In the statistics of the country there is no criterion for identifying the sphere of activity occupied by the hospitality industry. It is very difficult to single out the tourism industry as a separate industry and to consider it outside of the connection with other objects of the tourism industry. Certainly, sanatoriums and boarding houses belong to the sanatorium and resort sector, restaurants and cafes to public catering, but if they are concentrated within one tourist-recreational, sports-recreational or cultural-entertainment complex, this is the tourism industry.

The services of the tourism industry are of a complex nature and thus, cause demand for a number of other goods and services. Therefore, for a more correct understanding of the structure of the hospitality industry, taking into account the existing motivations for consumers of tourism services, as well as analysis of current trends in world and Kazakhstan tourist flows, the services of the hospitality industry should be classified as shown in Figure 1.

At present, it is difficult to single out the tourism industry as a separate industry. If about twenty years ago there were clear spheres: hotel industry, sanatorium and health resort, catering, leisure, now there is a mass of tourist-recreational, sports and recreational, cultural and entertainment complexes that unite these spheres into a single whole. Particularly there are difficulties with the placement sector. Institutionally, tourism is a branch of the national economy (Figure 2).

**Scientific approaches to the definition of cluster and cluster development of tourism**

According to Pyatinkin et al. (2014) clusters are a community of organizations from closely related industries, mutually contributing to the growth of each other's competitiveness, playing the role of "locomotives" for the development of industries.

Raisberg et al (2005) found that beginning from the 1990s, clusters around the world began to play a major role in the formation of innovative development strategies related to the orientation to local competitive advantages of socio-economic, scientific and production systems, which led to a revision of the foundations of economic and technological policies, and dominated earlier models of centralized development.

As Medynskiy (2007) stated for the first time the concept of "cluster" was introduced into scientific circulation by the American economist M. Porter, who defined the cluster as a group of geographically neighboring interconnected companies and related organizations operating in a certain sphere, characterized by common activities and mutually complementary.

Soziева (2009) found that the experience of many countries shows that clusters really contribute to the high efficiency of the economy and, thus, improve the welfare of the nation. In the world practice, a great deal of experience has been accumulated in the development of clusters, studies are conducted on a whole range of directions (Table 1). A special role for foreign scientists is given to the development and stimulation of cluster initiatives, as well as the formation of a policy to support clusters.

By definition of Ivanenko (2008) a cluster is a group of geographically integrated interconnected enterprises, equipment suppliers and their components, specialized services, infrastructure, research institutes and universities and related organizations operating in a particular industry, combined and complementary to each other Friend, enhancing the competitive advantages of individual companies and the cluster as a whole.

The cluster approach used in the studies of competitiveness, over time, has been used to solve an increasingly wide range of problems: in analysing the competitiveness of the state, region, and industry; as the basis of a nation-wide industrial policy; when developing regional development programs; as a basis for interaction between big and small businesses.

Kazakhstan's economic science in this area is based on the borrowing of foreign experience. Thus, the domestic economists Baymuratov (2005) stated, on the basis of studying the European experience, that

---

3Locomotive – driving force
the cluster is defined as a network of suppliers, producers, consumers, elements of industrial infrastructure, research institutes interconnected in the process of creating added value.

Source: Authors

Another group of domestic economists Suraganova (2006), Ketels (2005), Nazarov (2005) cites the following definitions of the concept of cluster:

1. Regionally limited forms of economic activity within related sectors (technological affinity, for example, a biotechnological cluster), usually tied to one or another institution in the knowledge industry (research institutes, universities, etc.).

2. Vertical production chains: rather narrowly defined sectors, in which adjacent stages of the production process form the core of the cluster (for example, the chain "supplier - collector - marketer - client").

Namazbekoy (2005) defines a cluster as high-tech industries defined at a high level of aggregation (for example, a "chemical cluster") or a set of sectors at an even higher level of aggregation (for example, an "agro-industrial cluster").

Within the framework of this research, the theoretical aspects of the cluster approach in the tourism industry were summarized, systematized and refined, namely: the definition of the concept of a "tourist cluster" was defined, the object, subjects, the purpose of the functioning of tourist clusters were determined, and the subjects of interaction of the target groups of tourist clusters were identified.

The results of an empirical assessment of the relevance of the cluster approach to tourism regulation

The purpose of this research is to study the prospects of creating a tourism cluster and the necessary forms of state support in the North-Kazakhstan region. The subjects of the analysis are:

- trends in the development of small businesses in the tourism (in terms of the main segments: health, cognitive, congress (business), sports, entertainment, religious tourism, etc.);
the needs of small business entities that carry out activities in the field of tourism, in state support (in accordance with the main forms of state support);

- problems that hamper the formation of the cluster and the development of small business in the tourism industry and recommendations on the mechanisms for their solution;

- prospects for the development of small business in the sphere of tourism;

- factors contributing to the formation of a cluster in the region.

Within the framework of the research of development trends, the following issues were studied: the financial situation of small business entities working in the sphere of tourism, the main segments of entry and domestic tourism in which they operate, the most attractive regions for tourism development and the places of the region, the development of certain types of tourism, and others.

When conducting an analysis of the needs of entrepreneurs in government support, measures of support for small business entities were considered. Currently, the state program "Road map of business 2020" is operating in the region.

The entrepreneur has the opportunity to receive on a free basis:

1. Support for start-ups (start-up projects), which includes:
   a. short-term training of entrepreneurs and the public on the basics of entrepreneurial activity (the "Business Advisor" project);
   b. provision of a standard package of documents necessary for the entrepreneur;
   c. information and analytical support and organization of free access of entrepreneurs to a single enterprise base;
   d. providing marketing research results in priority sectors of the economy.

2. Service support for running an existing business. This is aimed at improving the enterprise management system in order to improve its efficiency and includes the provision of the following specialized services to support business processes:
   a. maintenance of accounting and tax accounting and reporting;
   b. compilation of statistical reports;
   c. customs procedures;
   d. advising on the implementation of quality management systems;
   e. lawyer consulting;
   f. consulting on marketing issues;
   g. service in the field of information technology.

In addition, the attitude of entrepreneurs to measures for the development of tourism in the area, which does not directly relate to supporting small business, was explored.

On the basis of the study, recommendations were made for creating a favorable climate for the formation and development of a cluster in the tourism sector in the North Kazakhstan region. In accordance with the Law of the Republic of Kazakhstan No. 211-II from June 13, 2001 "On Tourist Activities in the Republic of Kazakhstan", "inbound tourism" means travel within the Republic of Kazakhstan to persons who do not reside permanently in its territory and, "domestic tourism - travel within Of the Republic of Kazakhstan of citizens of the Republic of Kazakhstan and persons permanently residing in its territory. Within the framework of this study, segments of inbound and domestic tourism were studied, which for the purposes of the study were understood as travel of tourists to the North Kazakhstan region.

Empirical research base

The empirical basis for the study was an oral survey and a survey conducted in July-October 2015 and January 2016. Both studies were conducted in a comparable manner.

General population

The total population of the study is the participants in the tourism cluster. The participants of the tourism cluster are considered by us as a homogeneous aggregate, represented by a single sign "factors affecting the development of the tourism cluster in the North Kazakhstan region."

Selective aggregate

The study used a systematic probabilistic sample. Out of 80 enterprises, a route (a uniformly stretched chain of interviewers) selected 37 enterprises for interviewing. With a homogeneous population, a
probabilistic systematic sample gave an equal opportunity for each participant in the cluster to become a respondent. The sampling error was 1.1 points with a probability of 95%.

Method of collecting information

The following methods of information collection were used:

1. Formalized interview on the questionnaire (see below) 37 enterprises of participants in the tourism cluster of the North-Kazakhstan region.
2. Included monitoring of the group of experts in the process of seminars, conferences. Information was collected on the factors that affect the development of the tourism cluster, the assessment of the business environment of the tourist cluster by the criteria of M. Porter's model

Research toolkit

A questionnaire containing closed questions was used. In the sample, during the survey of small enterprises operating in the sphere of tourism, 37 enterprises from all regions of the North-Kazakhstan oblast were involved. Practically all respondents of the survey are organized in the form of limited partnerships (33 enterprises), two respondents are individual entrepreneurs.

The youngest enterprise among those who were in the sample was registered in 2015, the oldest in 1996. At the same time, the average age was 5 years.

The maximum number of employees of enterprises from the number of respondents in 2015 was 12 people, the minimum - 3. The average number of employees in 2015 was 6 people. Over the past 4 years, the number of employees of the small business subjects surveyed has changed insignificantly, in rare cases, in the direction of its increase.

Tourist activities are carried out by the overwhelming majority of their surveyed entrepreneurs - 25 respondents, tour operators - 5 enterprises and 5 enterprises combine these two activities.

In this subsection, an analysis is made of the development trends of small business entities that carry out their activities in the field of tourism, including their financial and economic situation, specialization in certain types of tourism, the most attractive regions and places in the tourist area.

The financial and economic situation of the enterprises surveyed is currently at a stable level. Thus, 47% of respondents rated it as good, 50% as satisfactory and 2% as very good. At the same time, it is possible to talk about the insignificant annual turnover of enterprises: the turnover of 6 enterprises surveyed in 2015 fell into the group to 500 thousand tenges, 11 - to the group from 500 thousand to 1 million tenges, and 5 - to the group from 1 million tenges Up to 2.5 million tenge. At the same time over the past 2 years only one of the small business subjects interviewed has made quite large investments.

As targets for the near future, more than half (51% of respondents) plan to "slowly but develop," 30% set the task to develop at a fast pace, 5% - to keep the volumes. One respondent proposes to close the business.

Within the framework of a survey of small business entities operating in the tourism sector, problems characteristic of all small businesses were investigated, and factors that hampered the formation of the cluster and the development of domestic and incoming tourism in the region were identified.

Based on the results of the survey, it can be stated that respondents estimate the impact of problems typical for all small businesses on their activities as small.

Among the factors hampering the formation of the cluster and the development of domestic and inbound tourism (it was suggested to choose 3 options for the answer), the surveyed enterprises noted:

- Lack of sufficient tourist resources (16 respondents);
- insufficient level of development of the tourist and recreational infrastructure of the region (13 respondents);
- lack of well-developed tourist products (11 respondents);
- insufficient level of development of the service sector (6 respondents).

An important area of research is the assessment of the prospects for the development of a tourism cluster in the North Kazakhstan region by small business entities that carry out their activities in the tourism sector. Figure 3 shows the regions of the North-Kazakhstan region with the largest tourist potential.
Main findings:

First, the reduction in the impact of factors that impede the formation and development of a cluster of tourism in the region should be conducted out by carrying out complex measures by the regional authorities. It should be noted that to level out such a factor as the lack of a sufficient number of tourist resources, it seems almost impossible, since it is conditioned by the inherent features of the territory (natural, historical, sociocultural and others).

Second, the analysis of the dynamics and trends in tourism development carried out in the work showed that, given the significant tourist and recreational resources in the North Kazakhstan region, there are all prerequisites for the competitive development of tourism and recreation and the consistent formation of a tourist and recreational cluster in the region.

Third, in order to attract foreign tourists to Kazakhstan, it is necessary that tourist products of Kazakhstan be included in the catalog of foreign tour operators and these tour packages should be installed at a low price to attract the largest number of tourists.

Fourth, the cluster functions only in a certain environment, namely under favorable conditions (political, socio-cultural, economic, natural), which are a combination of external factors that ensure the competitiveness of tourist services.

Fifth, to ensure the formation of favorable conditions for the development of clusters, it is necessary:

1. Enhancing the system of professional and continuing education.
2. Creation of industrial parks and industrial parks as an infrastructure for the development of clusters.
3. Implementation of targeted investments in the development of engineering and transport infrastructure, housing construction, which is implemented in view of the tasks of cluster development.
4. Implementation of tax regulation measures for cluster members.
5. Reducing administrative barriers.

Conclusion

Today, Kazakhstan can be viewed as a new emerging market for the development of cluster tourism with its biological and geological diversity, minimal population density, rich historical and cultural
heritage. The state program will create a modern highly efficient and competitive tourism industry in the republic and ensure the development of related sectors of the economy.

The development of the economy made it possible to identify the specific features of the cluster approach, which consist in the formation of innovative clusters in three directions: developing policies to support the formation of clusters and creating an environment conducive to their effective functioning; determination of the main ways of development on the basis of an analysis of their potential, market needs and the overall external environment; development of its strategy, identifying and justifying the need and profitability for themselves in the creation and development of the cluster.

At the same time, the competitiveness of each organization is linked to the performance of others involved in the value chain with supplier-buyer relations, local and regional institutions, resulting in a general increase in the competitiveness of the interconnected organizations (cluster) and, consequently, the region as a whole.

CONTRIBUTION FROM THE FIELD OF FAMILY BUSINESS TO BUSINESS INCUBATORS, MICRO AND SMALL ENTERPRISES

Yolanda Saldaña,1 Fernando Miguel Ruiz,2 Laura Leticia Gaona,3 Juan Jesús Nahuat,4 Kelly Alejandra Muñoz2

Abstract: Most micro and small businesses start as family businesses, as they start from family savings as their main source of financing. However, the methodology used to incubate businesses in Mexico does not include tools to effectively manage family influence. This paper outlines the reasons why government agencies that allocate federal resources for business incubation should incorporate such tools into their methodologies. A documentary and a field investigation were carried out. The results show the tendency to start a business with family savings and therefore, with family interference. Likewise, it was found that newly created businesses show a high failure rate. It concludes the need to include in the methodologies used by business incubators in Mexico tools and knowledge in the field of family business. This, with the purpose of contributing towards the increase in the length of time that new companies last and the consolidation of existing micro and small enterprises in Mexico.

Keywords: Family business, business incubators, micro and small enterprises.

Introduction

At global level, companies are classified as micro, small and medium-sized enterprises (Valdez & Sánchez, 2012). The National Institute of Statistics Geography and Informatics (INEGI) in its press bulletin 285/16 reported that the business sector in Mexico is constituted as follows: microenterprise - 97.6%, small business - 2.0%, and medium-sized enterprise - 0.4% (INEGI, 2016). This classification is also used by government programs that allocate federal economic resources to boost them. However, classifying firms in micro, small or medium enterprises is the easiest, but not the most useful method, because the type of ownership conditions affects more the continuity of firms than the size of these firms (Tàpies, 2014).

Cabello et al. (2004), Mendoza et al. (2010), Simón (2013), La Salle (2013), Tàpies (2014) and Arthursen (2016) agree that most micro and small enterprises are family owned, since they start with their own from family savings. As a result, they are affected by the conflicts inherent in any non-professionalized family enterprise (Tàpies, 2014). Therefore, the objective of this work is to support the proposal that Mexican government agencies that allocate federal economic resources to promote the creation of new businesses, incorporate in their methodologies knowledge and tools in the field of family business. This in order to assist in reducing the failure rate of micro and small enterprises in our country.

Literature review

The National Institute of Entrepreneurs (INADEM), Mexico’s main government agency for business incubation, does not include in its methodology, knowledge and tools in the field of family business. INADEM implements and coordinates the national policy to support micro, small and medium-sized enterprises (Romo, 2013). As a public body, it fosters and promotes entrepreneurial culture; supports the creation and consolidation of businesses, and promotes access to financing and capital for micro, small and medium enterprises (INADEM, 2016). To participate in the calls for funding, the entrepreneur must take the Online Incubation Program (PIL). This course gives entrepreneurs who have a business idea the basic knowledge to “create and operate their company with greater opportunities to keep growing and to be competitive.” Currently, the course consists of four modules: Create your Company; How to make a business plan; Resources to operate your Business and finally, Evaluation and Development of the Business Idea (INADEM, 2016).

In addition, INADEM uses the Canvas Model designed by Osterwalder & Pigneur (2014). This model describes through nine blocks the logic of how a company seeks to make money and covers the four

main areas of a business: customers, supply, infrastructure and financial viability (Osterwalder & Pigneur, 2014). These nine blocks allow us to determine ways to make the company profitable; Distribution channels; Benefits and income; Essential resources and activities; The most important costs and alliances necessary to operate (Andrade, 2012). Table 1 summarizes the nine blocks of the Canvas Business Generation Model.

Similarly, methodologies for business incubation of other organizations such as New Ventures (2007); CORPODET (2016); CETYS, (2016) and others that operate in Mexico do not include tools and knowledge on how to run a family business. Despite the fact that most businesses tend to start with family interference (Tàpies, 2014).

Reasons for including in the methodology for incubating companies, topics on family business:

1. Most of micro and small businesses start as family businesses.

Micro and small businesses are not synonymous with family businesses. However, most of these businesses in the initial phase are family businesses, as they find it difficult to access external sources of financing and depend on their own and family savings to start their business (Tàpies, 2014).

In order to verify what was expressed by Tàpies (2014), in October 2016 a census was carried out in the Faculty of Accounting and Administration of the Autonomous University of Coahuila. The objective was to identify how many of the 1st students who currently own a business had recourse to family savings; And how many of those who have the plan to create a business within no more than 12 months, will have funding from the family. 99 students said they have a business. But of these, only 57 agreed to respond to the administered census. This corroborates the tendency of the Mexican population to prevail in the informal economy (Vidales, 2013).

The results showed that 80.7% of the 57 who currently have a business resorted to financing from family savings. While of the 71 students who plan to open a business, 80.3% said that the financing will come from their own and family savings. These data corroborate the findings of Cabello et al. (2004), Mendoza et al. (2010), Simón (2013), La Salle (2013), Tàpies (2014) and Arthursen (2016).

2. The interference of the family in the new business puts the survival of the business at risk.

A business with a family influence is a complex issue, since the family, its internal dynamics and the management of the company are involved, which must be adequately addressed with rational policies and decisions. Since within the family business two very different systems interact: family and company, each with its very particular characteristics and attributes. It is therefore not uncommon for conflicts to arise in the business and in the family arising from the coexistence of these two systems; And conflicts in the family affect the company and vice versa (Saldaña et al., 2012).

Family businesses suffer from problems that are different from unfamiliar ones. For example, in a family-run business, there is no clear distinction between the company’s economic flows and those of the family; A confusion prevails between the bonds of affection of the family and the contractual relations in the company; The assignment of posts is based on family relationships and interests, and there is an inadequate organizational structure that responds more to the needs of the family than to the needs of the company (Vásquez, 2010). In addition, there is evidence to affirm that family and organizational norms conflict in a family business (Rodríguez-Fornos 2008; Belaustegui-gotita, 2010; Grabinsky, 2010; Álvarez-Martínez, 2011). This conflict is reflected in the processes of staff recruitment, compensation and staff assessment. For the impartiality has a different connotation if it is the family or the company. In the company, impartiality is based on the concept of merit, while in the
family it is based on equity and necessity (Lansberg, 1983). If the new business owner does not know how to strike a balance between the demands of the family and the profitability of the business, it jeopardizes the survival and consolidation of the business. This is one of the reasons why family firms show a high failure rate (Gallo, 1998).

3. Newly created businesses in Mexico have a high failure rate.

According to INEGI figures for every 100 businesses created in Mexico, 70% close during the first five years and only 11% survive at 20 years (INEGI, 2015). On the other hand, the National Commission for the Protection and Defense of Financial Services Users (CONDUSEF, 2014) indicated that only half of the small companies in Mexico survive to 18 months and state as one of the causes: Family. López (2016) notes that while in Colombia 59% of new companies subsist for more than two years, 75% of newly created businesses in Mexico close operations before two years of existence and only 25% are kept in operation. Among the causes, they point out are weak finances, lack of goals and poor planning. These figures are perplexing since incubator methodologies include and emphasize precisely these issues.

Conclusion

Most businesses in México begin with family interference. However, these businesses do not have the tools to manage the influence of the family effectively. This contributes negatively, among other causes, to the high failure rate among micro and small enterprises in Mexico.

Therefore, it is proposed to include in the methodology used by the various business incubators in Mexico and especially in the one employed by INADEM, tools such as: family protocol, code of ethics, guidelines for hiring and firing relatives, etc. As well as knowledge about the differences between the family and the business system; The concept of family in the Mexican culture and its impact on the family business; The human resources within this type of company; The conflict of rules between the family and the organization: The professionalization of this, and how to move from family business to families of entrepreneurs, among others. This will allow the new entrepreneur to have the knowledge and tools necessary to effectively manage the influence of the family and establish a balance between the demands of the family and the profitability of the company. The implementation of this proposal can contribute to increasing the survival of new companies and the consolidation of existing micro and small enterprises in México.

Abstract: Due to the interaction of two incompatible systems: family and business, family business managers may have cognitive biases that result in ineffective management. Therefore, the objective of this research study was to identify and determine the most common biases in the management of a family structure business. A documentary investigation was carried out with the purpose of compiling in a single document such biases. The analysis made it possible to conclude that the identified biases arise precisely from the interaction and incompatibility of these two systems; and that the absence of knowledge on the part of the business family and of directors of familiar companies of the presence of these biases impacts the permanence and consolidation of the familiar company.

Keywords: Cognitive bias, effective management, family business.

Introduction

The domestic family prepares their offspring to develop their life independently (Gordon & Nicholson, 2010). The business family moves in the opposite direction to the domestic one, because it continues economically united beyond its original generation (Nogales, 2007). When a domestic family becomes an entrepreneur, its dynamics become different and complex since in the family business two divergent systems interact: family and business (Belusteguigoitia, 2010).

Often family business managers tend to lack the technical and formal skills to manage the family business effectively. They are guided primarily by intuition and family interests and do not clearly define the roles and responsibilities of family employees (Antognilli, 2009); They lack an organizational structure that is congruent with business needs and resources (Rodriguez, 2008) and give little importance to human resource practices as a means of control (Sánchez, 2012). In part, the origin of this problem is related to the distortions, perceptual flaws and defects that operate silently, which are called "cognitive biases" and that influence our actions and decisions (Libertad & Álvarez, 2000).

Therefore, this research aims to identify and determine the most common biases in the management of a family structure business. By effective management of a family business we understand the set of operations that are carried out to direct and properly and rationally manage a family structure business with the purpose of ensuring the profitability of the company and the corporate patrimony.

Literature review

The management of a family business where the members of the different branches are the owners and, in turn, work in this one, becomes a difficult matter since the management of the company must be with rational policies and decisions (Navarro, 2008). However, there are repeated biases in the management of the same. Some of the most frequent are: Irrational management of family influence in business.

In the case of Mexico, the existence of the extended family and its growth through the inclusion of political relatives and influence peddling, exerts an increasing and considerable pressure on the family business for the following reasons: First, a profitable business is attractive to family members who even try to incorporate their political relatives, friends, and people they think they should support. Second, when we have reached the second or third generation there will be many more family members - husbands, grandchildren, grandchildren, in-laws, in-laws, etc. - who will feel entitled to be hired. Finally, there are those relatives who, because they are not well qualified, do not manage to be placed in other companies and therefore expect to be supported by a job through being part of the

family. This becomes a dilemma for the director, because if he accepts them he jeopardizes the profitability of the business, if he rejects them, he will be violating the rules of support that govern the family (Belausteguigoitia, 1996).

Putting the interests of the family to the interests of the company

Of the 5 '144,056 companies that exist in Mexico, 3'724,019 are family businesses (Alcaraz, 2012). This means that more than 70% of companies in Mexico are family run and source of employment of more than 54 million Mexicans (Grant-Thornton, 2011). However, family businesses show a high failure rate. One of the causes of this problem is related to the tendency to satisfy the demands of the family without considering the needs of the organization. This is corroborated by a study by Banamex (2008) who found that for 67% of family businesses in Mexico, the family goes first. Only 33% of these businesses put the interests of the company before the family. 72% of family businesses lack policies for hiring and firing relatives; And 58% do not have a family council or hold formal meetings to address family matters related to the company.

Bias in the decision-making process

People have distortions and flaws in perception that influence silently during the decision-making process. These failures are called "biases" (Libertad & Álvarez, 2000). One of the cognitive biases that exert the greatest influence in family business corresponds to that of emotions, which constitute a potential obstacle to logical, rational and objective decision making. "All people subjected to intense emotion can think and act wrongly, distorting reality. The impulses that originate, to a greater or lesser extent (greed, ambition, unbridled power) also influence the thinking, reflection and deliberation necessary to carry out the decision-making process "(Bonatti, 2014). In a family business, emotions permeate throughout the organization affecting not only how the business is managed but also, in the process of strategic decision making Kellermanns et al. (2014). For the decision-making is made by the family and therefore the emotional component, the emotional conflicts and the norms that govern the family influence in that process Braidot (2012).

Confusion between the norms that govern the family and those that guide the company

A rule is a line of conduct and indicates what a person should do or not, given a particular situation and what is expected. The norms that guide the behavior of the individual in the family environment are different from those that are managed in the organizational. This implies that what is expected of an individual according to family norms is opposed to what is expected of the same individual according to the principles of the organization (Gross, 2009).

In the family, two rules operate to guarantee impartiality: in vertical family relationships (parent-child relationship) the dominant norm of fairness is the concept of necessity. Parents have the moral obligation to distribute the necessary resources to meet the needs of their children. In horizontal family relationships, as it is between siblings, each individual has the right to receive equally the same resources and opportunities (Belausteguigoitia, 2010).

Transferring the roles of the family environment to the company

The set of behaviors that the person must play are called roles. Status and role are closely related. A status entails a set of roles and, for its part, the role originates from the status. The coherence between status and the roles played makes it possible for social relations to happen smoothly (García, 2011). Roles also allow you to predict the actions of others. When we interact with others, we make use of the role that is appropriate to the environment. However, experience shows us that this is not always the case. For in life it may happen that a person plays a social role in a context that does not belong to him. This is called asymmetry between the role played and the social situation that corresponds to it (O’Neil, 2006).

According to Belausteguigoitia (2007), members of an entrepreneurial family tend to interact following the same patterns that occur in the family, regardless of the context in which they find themselves. Since they transfer the patterns of behavior that are given in the family, to the company. Especially if the interaction occurs among the same members of the family. The conflict arises when we confuse the role that we must play in the house with the role that society has established to play in the company (Trevinyo-Rodriguez, 2010). The roles become blurred and conflicts arise marked by confusion. The slide of family roles to the labor scenario is reflected when:
A) The director of a family business continues to play the role of father when the children or relatives are employed: he scolds and uses a tone of voice and words that usually correspond to a more intimate environment as it is in the family context.

B) The director does not comply with the prescribed behaviors for the role of boss, as he does not dismiss a relative for breach, the salary is not assigned according to performance, nor apply the same penalties that would apply to a non-family worker.

C) Family business directors often do not take into account their vocation and pressure them to take over the business. This behavior is more congruent with the role of the father than with the director of a company (Pelliza, 2011).

Avoiding the professionalization of the family business

There is a difference between the dynamics that are generated within a family business and a business family. The unprocessed family business is that "... in which the interactions between the family members and the company of which they are owners have not been identified, analyzed and formalized, it is usual for there to be 'traps' Or ‘confusions’ that are subtracting competitiveness ..." (Scerpella, 2006). In this type of family business there is no clear distinction between the economic flows of the company and those of the family; the owner believes that by the fact that they are the proprietor, they automatically acquire the capacity to direct. A confusion prevails between the bonds of affection of the family and the contractual relations in the company. The assignment of posts is based on family relationships and interests, and there is an inadequate organizational structure that responds more to the needs of the family than to the needs of the company (Vásquez, 2010).

On the other hand, the business family has achieved the professionalization of the same: the allocation of posts is based on individual competencies and not on the basis of family relationships and interests; The organizational structure is congruent with the needs of the company and not with those of the family. Succession is achieved through merit and not by kinship. Direction is objective and rational. The business has a developed management system and promotions are achieved on the basis of good performance. There is strategic planning with a clearly defined vision (Vásquez, 2010). "It is a team of people, with family ties between them, that promote the implementation of 'good practices' and the development of competitive advantages in the businesses of which they are owners, understanding that these companies are and / or will be a source of generation of value to them "(Scerpella, 2006).

Conclusions

In this paper, the most common cognitive biases that can contribute to an ineffective management of a family business were collected and described. Such biases usually operate in a hidden way and are not easy to detect, as we tend to reject any data that contradicts our opinion or belief and select only that information that ratifies what we consider correct; to overestimate our abilities, knowledge and experience; to choose to take as a reference previous experiences or information of the past and to give in to emotions, which impede the logical and rational scrutiny of the options that are best suited.

To ensure effective management of the family business the first step is to become aware of the existence of these cognitive biases and how they operate. Yet, if the present owners of family business cultivate the conviction that the business is not only of their property; but belongs to later generations and if they have the will to guarantee the livelihood and business heritage for them, it will be more feasible to the owners to make greater use of a logical reasoning in order to reduce the impact of such bias on the management of the family business.

MARKET ORIENTATION OF COMPANIES WITH THE BRAND “ZNAČKA KVALITY SK”

Simona Šályová,1 Janka Táborecká-Petrovičová,2 Alena Kaščáková3

Abstract: Market orientation represents an established concept whose implementation leads to the achievement of superior performance. Specific features of market-oriented companies are the subject of many studies for years. The purpose of this article is to examine the market orientation of two types of companies from foodstuff industry in Slovakia. In this article we compare the market orientation of food producers who are holders of certificate of quality “Značka kvality SK” and those who are not. “Značka kvality SK” is a certificate awarded by Ministry of Agriculture and Rural Development of the Slovak Republic. In our research, we would like to find out if the companies which are awarded as leaders in food quality have a predisposition for market-oriented behavior. In our research we used statistical parametric t-test and the non-parametric Mann-Whitney test. The results indicate that there is no significant difference between market orientation of producers who hold the certificate of quality “Značka kvality SK” and those who do not. These findings support the assumption that concept of market orientation is applicable for all kinds of companies. This article presents partly the results of complex research focused on investigating the relationship between market orientation and business performance.

JEL Classification Numbers: L15, L66, Q13; DOI: http://dx.doi.org/10.12955/cbup.v5.962

Introduction

Businesses operate in increasingly intensive competitive environment and therefore become necessary for them to generate, distribute and use market information efficiently. This market-oriented behaviour could be the competitive advantage for all kinds of businesses. The purpose of this article is to examine the market orientation of two types of companies from foodstuff industry in Slovakia. In this article, we compare the market orientation of food producers who are holders of certificate of quality “Značka kvality SK” and those who are not. In our research, we would like to find out if the companies which are awarded as leaders in food quality have a predisposition for market-oriented behaviour. We used the MARKOR scale developed by Kohli and Jaworski (1993) for data gathering, and statistical tests for data processing. The results of our research could be useful for companies in the foodstuff industry during the process of developing their market orientation.

Theoretical background

Business and market environment are changing in different countries what influence consumer perception, needs, and behavior in various ways. Dynamic changes, such as the consumers’ increasing access to information allow them to make smarter decisions about their consumption, or intensifying of the buyer’s market made it critical for businesses to monitor situations in the market and satisfy the evolving needs and wants of customers. Regarding the current situation in the market, businesses need to be more market-oriented than ever before in order to succeed in the global economy (Chakravorti, 2013). Since the 1990s, market orientation one of the key concepts in marketing literature, which was the subject of numerous empirical studies (Bodlaj and Rojšek, 2010). Market orientation has been developed from two perspectives, which are market orientation as behavior and market orientation as philosophy (Cadogan and Diamantopoulos, 1995).

Market orientation

Market orientation from the behavioral perspective was defined by Kohli and Jaworski (1990, p. 6) as an “organization-wide generation of market intelligence, pertaining to current and future customer needs, dissemination of the intelligence across departments, and organization-wide responsiveness to it.” Kohli et al. (1993) characterize market intelligence generation, the first element of behavioral perspective, as the collection and assessment of customer needs and also the forces that affect the development and refinement of these needs (Dong et al., 2013). Market intelligence dissemination refers to the quick distribution of information and involvement of all members of a business unit into the generalized discussion about customers and competition. This is the way how to maximize the

1 Ing. Simona Šályová, Faculty of Economics, Matej Bel University, simona.salyova@umb.sk
2 doc. Ing. Janka Táborecká-Petrovičová, PhD., Faculty of Economics, Matej Bel University, janka.taborecka@umb.sk
3 Ing. Alena Kaščáková, PhD., Faculty of Economics, Matej Bel University, alena.kascakova@umb.sk
value of generated information. Lastly, the responsiveness to market intelligence is characterized as implementation of activities consistent with the accumulated market intelligence, and planning the supply in line with the customer needs and wants (Varela and Rio, 2003). Piercy (1992) developed the behavioral-strategic approach to market orientation which according to him is comprised of three elements: strategies, plans, and information. Strategies are related to the critical decisions about the market definition, market segmentation and the differentiation of products in comparison with competitors. Plans concern the marketing mix policies, development, and information as referred to the whole market and used for strategy design, planning, and control (In: Avlonitis, Gounaris, 1997). In the original study of Narver and Slater (1990, p. 21), they defined market orientation from cultural perspective as an “organizational culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers and thus, continuous superior performance for the business.” The cultural perspective of market orientation consists of three components, which are customer orientation, competitor orientation and inter functional coordination (Ngai and Ellis, 1998). Gadimi et al. (2013, p. 3495) summarized approaches to customer orientation and concluded that “it definitely involves a focus on customers by identifying, analyzing, understanding, and answering their needs, demands, and expectations, and generating, creating and increasing their satisfaction, acceptance and reliability.” Competitor orientation can be understood as knowledge of competitors’ short-term strengths, weaknesses and also long-term strategies and capabilities (Narver and Slater, 1990). Woodside (2005) explain that inter functional coordination consists in the willingness of different functional departments’ members to cooperate in order to achieve their objectives, competitive advantages, effectiveness and better performance (Gadimi et al., 2013). Abiodun and Mahmood (2015) concluded that behavioral and cultural perspectives are both based on efforts to understand market needs and wants, and to react to market opportunities and overall cross functional integration. Grbac and First (2011) add that many researchers have examined the impact of market orientation on business performance irrespective of whether market orientation is viewed as the culture or as the behavior of a business.

Market orientation and the quality in the context of foodstuff industry

Gellynck et al. (2012) summarize two consequent phenomena of the European agro-food market over the past ten years. On the one hand, globalization caused an increase in competition from large enterprises while trade liberalization led to the decrease in market protection. On the other hand, there is an increase of interest of consumers in food quality not only in the range of health and safety, but also from the country of origin point of view. Origin and methods of production became the important criterion for consumers while choosing the product. Musová (2013) states that in the context of Slovak consumers there is an increase of interest in the origin of food products while the majority of consumers would like to be better informed about the origin of food products from Slovakia. The brand “Značka kvality SK” is connected to the origin of food products and it is used as a marketing tool which has the impact on ethnocentric behavior of consumers while it emphasizes the country of origin and also quality of the product. This claim is also supported by Tábořecká-Petrovičová, Šedo, Zajková (2014) who state that ethnocentric behaviour is closely linked to the country of origin. Product orientation is considered an opposite to the market orientation in marketing literature Kotler (1988). Poliáčiková (2007) states that the product concept is guided by the view that consumers look for those products that offer superior quality, operational reliability, performance and modern design. Product improvement and innovations are crucial in businesses applying this concept. The problem with this concept is the fact that the enhancement of the product may not meet the needs and demands of consumers. Lewis et al. (2001) cite Harmsen et al. (2000) who consider product orientation as a supplement to market orientation in the meaning that objective quality of product can definitely enhance performance and satisfies the customers’ needs and wants, especially those segments which seek product quality.

Data and methodology

The main aim of this article is to examine the market orientation of food producers in Slovakia who are holders of certificate of quality “Značka kvality SK.” “Značka kvality SK” is a property of the Ministry of Agriculture and Rural Development of the Slovak Republic and is used as certificate of quality for Slovak producers of food products. It was put into practice in 2004 when the program of a national quality mark for Slovak agricultural products and foodstuffs was established. The main
priority of the program was to promote domestic quality products and thus strengthen their competitiveness in the domestic market. The next priority was to differentiate domestic products from foreign products and provide customers a better orientation in food products. This mark of quality on a product is a guarantee for the consumer that this product was produced in compliance with the requirements of national legislation and the legislation of the EU, while the determined technological process was followed during the production. “Značka kvality SK” can be awarded to a Slovak manufacturer whose products are produced from domestic raw material. The next condition is to maintain the declared technological process parameters of quality and food safety, while at the same time required the declaration of raw materials, i.e. from the total raw material consumption by at least 75% must be consumption of domestic raw materials and all stages of the production process must take place in the Slovak Republic. The quality mark is awarded by an expert commission to registered products. The commission is appointed by the Minister of Agriculture and Rural Development, who based on the recommendations of this commission and the principles for assessing and qualifying the quality mark, awards “Značka kvality SK” to manufacturers (Ministry of Agriculture and Rural Development of the Slovak Republic, 2017).

Our research was conducted on the sample of Slovak manufacturers of food products. The research sample consists of 33 manufacturers, while 45.45 % of them (i.e. 15) hold the certificate of quality “Značka kvality SK” and 54.55 % of manufacturers (i.e. 18) do not hold this certificate of quality. We addressed companies of all sizes from the number of employees’ point of view. Questioning was realized through the online questionnaire sent via email. For measuring market orientation, we used the MARKOR scale (Kohli and Jaworski, 1993). We reduced the original 32-item MARKOR scale to a 20-item scale as a resulted from pilot questioning and feedback from manufacturers. We applied a 7-degree Likert scale like other authors (Pitt et al., 1996; Puledran et al., 2003, Hooley et al., 2003). In our article, we wanted to find out if there is a difference in the market orientation level between holders of quality certificate “Značka kvality SK” and non-holders of quality certificate “Značka kvality SK.” We were interested in the assumption that the product’s quality might be a predictor of market orientation. We have formulated following the research question (RQ):

RQ: Are food producers with the certificate of quality “Značka kvality SK” more market-oriented than the other food producers?

In order to answer this research question, we conducted a statistical verification. We used the Kolmogorov-Smirnov test of normality and a t-test for equality of means.

**Results and Discussion**

We examined if there is difference of the market orientation level between holders of the quality certificate “Značka kvality SK” and non-holders of the quality certificate “Značka kvality SK.” In Table 1 are presented the means of the market orientation components and overall market orientation of respondents. Respondents could reach from 1 to 7 points for each component. The first component of market orientation is intelligence generation. Surprisingly, non-holders of “Značka kvality SK” achieved higher means (5.269) of intelligence generation than holders of “Značka kvality SK” (5.189). The second component of market orientation, intelligence dissemination, achieved higher means (5.390) by holders of “Značka kvality SK” in comparison to non-holders of “Značka kvality SK” (5.005). The biggest difference of means between these two groups of respondents was in responsiveness to market intelligence. Non-holders of “Značka kvality SK” achieved mean 5.201 and
holders of “Značka kvality SK” achieved mean 5.938. We were also interested in the means of the overall market orientation. Non-holders of “Značka kvality SK” achieved 5.172 points and holders of “Značka kvality SK” achieved 5.577 points.

For statistical verification, we used IBM SPSS 19.0 and we set the significance level α=0.05. We used statistical tests for the examination of significant differences between market orientation of holders and non-holders of the quality mark “Značka kvality SK.” Firstly, we tested the normality of the data. The results of the non-parametric Kolmogorov-Smirnov test of normality are shown in Table 2. Data are normally distributed (Sig. = 0.074, resp. 0.200).

Source: SPSS output.

If the data could not be normally distributed we would use a non-parametric Mann-Whitney test. However, the data were normally distributed. Thus, we could use the t-test for verification of difference between the variables. According to the result of this t-test there is no significant difference between market orientation of holders and non-holders of “Značka kvality SK” (Sig. = 0.235).

On the basis of our results we can state that our assumption that food producers which hold the certificate of quality “Značka kvality SK” are more market-oriented than food producers which do not hold the certificate of quality “Značka kvality SK” was not confirmed. This kind of study is very specific and it is difficult to find similar studies. In scientific literature, there are several studies which partly deal with the issue of market orientation and quality. Through this research we can understand the studied issue from a little bit different point of view. Raju and Lonial (2001) examined the relationships of market orientation and quality context with organizational performance within the hospital industry. The results show that both constructs have significant effect on performance. However, the direct effect was proved only within the market orientation and organizational performance relationship. Quality context is only indirectly linked to organizational performance through its effect on market orientation. Ramayah et al. (2011) investigated the mediating role of service quality in the relationship between market orientation and organizational performance. According to this study, service quality partly mediates the market orientation – organizational performance relationship. Both studies indicate only partial links between quality and market orientation. There are several studies which deal with the market orientation of foodstuff businesses (Lewis et al., 2001; Gellynck et al., 2012; Nwokah, 2008). However, these studies are focused mainly on the investigation of the level of market orientation and its relationship to business performance.

Conclusion
The main aim of this article was to examine the market orientation of food producers in Slovakia who are holders of the certificate of quality “Značka kvality SK.” From this research results it can be stated that certificate of quality “Značka kvality SK” does not influence the level of market orientation, because there was no significant difference between two groups of businesses (non-holders and holders of “Značka kvality SK”). We consider this result partly positive, because it indicates that all businesses could be market-oriented and the certificate of quality is not a warrant of a higher level of market orientation. This research has several limitations. The research sample of 33 businesses is relatively small and we would expect different results if we would use larger sample. For measuring market orientation, we used the MARKOR scale according to the (Kohli and Jaworski, 1993) which covers the behavioural approach to market orientation. However, there is also the possibility to use another scale which refers to the cultural approach.

THE ECONOMIC CONSEQUENCES OF CRIME AND OTHER ANTISOCIAL ACTIVITIES

Viktor Šoltés,1 Katarína Repková Štofková2

Abstract: Crime and other antisocial activities are the social phenomena that adversely affect the lives of people. Besides the negative impact on the quality of human life, the crime has a negative impact also on the economy. Damage caused by criminal acts can also be quantified in economic terms. This damage consists principally of the assets stolen from victims of crime, e.g. material damage. A substantial part of the damage also represents the financial losses that were caused by the economic crime. Another part of the damage is financial compensation provided by the state to the violent crime victims or their family members.

The paper deals with the analysis of the economically quantified damage caused by different types of crime in the Slovak Republic. The aim of this paper is to identify and analyze types of crimes that cause the largest economic losses and subsequently propose measures for elimination of critical types of crime to prevent greater economic losses.

JEL Classification Numbers: A12, H76; DOI: http://dx.doi.org/10.12955/cbup.v5.963

Keywords: Economic damage, crime, victim, financial losses, antisocial activities

Introduction

Several factors influence the quality of life. The most important are the socio-economic and security situation. Deterioration of the quality of life occurs when the state for its inhabitants cannot guarantee the required level of security. In this case, occurs searching for better living conditions and is increasing the risk of migration (Štofková, 2016). The consequence of leaving inhabitants abroad is the economic loss from them.

An indicator of the poor security situation is primarily crime and other antisocial activities. However, crime statistics cannot objectively evaluate the current criminal situation. Considering the latent (hidden) crime is necessary. Even though crime statistics are not an objective indicator of the current crime situation, it is a representative indicator useful for assessing the security situation.

Consequences of crime and other antisocial activities arise in the society a sense of fear, insecurity or worry for lives, health, and property of citizens. In addition to the psychological impact of crime, it has an adverse effect on the physical integrity of people. However, the society must realize that crime has a negative impact also on the economy.

For the state and society, it is necessary to recognize the economic impacts of crime. Monitoring the development of damage caused by each type of crime, it is possible to set priorities in the fight against crime. For the state, it is necessary to arrange that the damage caused by the crime will be the lowest which leads to better tax collection and acquisition of funds to the state budget. Then it will be possible to invest these funds in the development of society and thus improving the quality of life of the population.

Crime

As Gašpierik (2010) writes, crime and other antisocial activities is a negative social phenomenon that has various aspects. Their common feature is

- disruption of the harmonious development of society,
- disruption of existing law,
- disruption moral and moral values,
- disruption the desired development of personality (and thus the whole society),
- inciting an atmosphere of fear, anxiety, panic, mistrust, and insecurity.

The consequence of crime and other antisocial activities is damaged. According to Štôfko & Štofková (2011), victims suffer mainly physical and mental damage. Regarding society, it comes to the spiritual and material damage. In addition, in most cases, there is also the economic damage (caused to the victim or to the whole society).

2 Faculty of Operation and Economy of Transport and Communication, University of Žilina, Slovakia, Katarina.Repkova@fpedas.uniza.sk
Act no. 583/2008 Coll. on the Prevention of Crime and Other Anti-Social Activities says that crime is conduct that is a criminal offense. The criminal offense is an illegal act whose characteristics are given by the Criminal Code (Act no. 300/2005 Coll.). Act no. 583/2008 Coll. on the Prevention of Crime and Other Anti-Social Activities also defines other antisocial activities. It is conduct that is an offense or other administrative offense. For other antisocial activity, it is also possible to regard conduct that is not an offense or other administrative offense but hurts society.

Crime can be precisely expressed by specific quantitative and qualitative parameters. Phenomenology of the offense deals with examining these variables (Kubás, 2017). As Svetlík & Veľas (2016) say, among these variables, it is possible to include the structure of crime, which determines the proportion of each type of crime in the total number of the offenses committed at a certain time in a certain place. The structure of crime in the Slovak Republic consists of:

- violent crime,
- moral crime,
- property crime,
- other crime,
- residual crime,
- economical crime.

Figure 1 shows the evolution of the total number of each type of crime in Slovakia.

The economic damage of selected types of crime

Every kind of crime is specific by type of damage that is perpetrated. The economic damage is typical mainly for economic and property crime. However, the economic damage is also in the remaining types of crime (Šoltés, 2016). Its incidence is minimal (virtually zero) in the moral crime since it is a specific kind of crime, the consequences of which are mainly psychological but also physical and health.

Figure 2 shows the evolution of the economic damage to different types of crime in thousands € in 20 years.

To the total economic damage caused by the crime have a dominant share economic crimes. Property crimes also cause greater economic damage. The largest economic damage was caused in 2003 when the amount of damage exceeded € 2 billion. At present, the amount of damage has a downward trend and is about 400 million €.

As Fomich (2016) writes, the offender of economic crime cannot be anyone, but only a person with particular social or economic status. The offender must have a high degree of intelligence and knowledge than needing the offender of another type of crime. A typical feature of economic crime is higher latency and rigorous investigation.

Committing economic crimes are committed far greater economic damages than committing another type of crime. Among typical economic criminal offenses belong Criminal Offence Endangering Market Economy, Criminal Offences against Economic Discipline, Currency and Tax Related Criminal Offences and Criminal Offences against Industrial Property Rights and Copyright.

Figure 3 shows the evolution of the economic damage of economic crimes in thousands € in 20 years.

Figure 3: Development of the economic damage caused by economic criminality [thousands €]

Source: Authors

Development of the economic damage caused by economic crimes follows the development of the overall economic damage caused by the crime. Extremes were reached in 2002-2005. In the last ten
years, the situation has stabilized, and economic damage does not exceed € 600 million (in the last three years did not exceed € 400 million).

Property crime has a major part of total crimes. Regarding the caused damage, it is the second most serious form of the offense. Figure 4 shows the evolution of the economic damage of property crime in thousands € in 20 years.

![Figure 4: Development of the economic damage caused by property criminality [thousands €]](source: Authors)

Evolution of economic damage caused by property crime is declining in the long term (except in 2014). The highest damage caused by property crimes (as with the economic crime) was achieved in 2004 and 2005 (nearly € 150 million). In 2016, damage slightly exceeded € 50 million. Regarding dynamics, it is necessary to point out that every year damage decreases by almost 20 million €.

**Conclusion**

Crime and other antisocial activity is a socio-pathological phenomenon that undermines the individual's life and development of the society. Crime can be objectively quantified by the number of registered crimes. Their number in recent years is steadily declining. Regarding the total number of crimes, it has dominant position property crimes.

Crime is a negative phenomenon as it causes various forms of damage, e.g. psychological damages, and damages to the physical integrity of the victim, but also economic damage. Evolution in recent years shows that the economic damage caused by crime has decreasing character. The peak was reached in 2003. Overall, the economic damage caused by crimes is in the hundreds of millions of €. This amount of funds cannot be considered as a negligible. Therefore, the state should do everything possible to avoid such high losses. The aim of the state should be to take preventive measures related to reducing the severity of the crimes (mainly economic, but also property). Among other things, the state should increase its activity in the field of detection and investigation of economic crime. However, it is necessary to take sufficiently effective measures in the field of generally binding legal regulations. In recent years, state policy focuses on improved tax collection and reducing tax evasion. The struggle with these negatives over the past few years is partly reflecting the reduction of the economic damage caused by the (economic) crime.

EMPLOYEE BENEFITS AS ONE OF FACTORS OF WORK MOTIVATION

Nátalia Stalmašeková1, Tatiana Genzorová2, Tatiana Čorejová3

Abstract: Behind a successful company there are several factors which affect its activities and performance. These are various economic issues, production processes, capital and people – employees. The human resources of a company largely depend on how the company is able to respond to challenges of the market. Employers are recently trying to take care of their employees much more than just rewarding them with a salary. They provide them a variety of employee benefits with which they try to motivate them to better perform. The aim of the paper is to describe the system of benefits provided by companies in general. The first part of the paper contains a general framework of the issue and the second part describes the current situation of providing benefits in Slovakia and abroad, specifically in the United States. The paper highlights the differences in understanding of importance of benefits in each country. The final part of the paper contains research about opinions of students of the University of Žilina about providing benefits at the workplace.

Keywords: work motivation, employee benefits, research, survey

Introduction
Štofková et al (2011) says that employees – human resources – are an indispensable source for success of any company. It follows that we should treat them at least with the care we treat material, finance and information resources. Therefore, the key task of human resources management is to motivate its employees to give their best performance. One part of this motivation is through rewards. Beside typical money rewards, non-monetary rewards, also known as employee benefits, gained importance in last few decades. For companies, they represent opportunity to differentiate themselves from other companies, lure new employees and retain current employees. Nowadays many companies are building their corporate identity on interesting and unique employee benefits. A typical example is the company Google.

Employee Rewards
Employee rewards are one of the main parts of a motivation program in the company. Generally, we can incorporate rewarding into three categories (Kachaňáková, 2003):
- direct money rewarding – it includes salary, bonuses, fees and commissions,
- indirect money rewarding – it includes stocks, insurance, loans, extra fee for food, clothing and more,
- non-monetary rewarding – material values – company car, phone, a variety of social benefits and services, for example. use of recreational facilities, counseling services, child care and various other.

Rewarding of employees
Employee benefits are rewards that the company provides to employees only for the fact that they are its employees. Usually, they are not tied to employee performance. Sometimes however, they depend on status of employee in the company, his merits and the time he has worked in the company.

Employee benefits can be segmented into three basic groups (Strenitzerová, 2015.):
- benefits of a social nature (corporate pensions, life insurance, business loans and guarantees for loans, child care workers (nurseries and kindergartens), etc.),
- benefits of work nature (food, discount for company products to employees, language tutor, etc.).

1 Ing. Natália Stalmašeková, University of Žilina, Faculty of Operation and Economics of Transport and Communications, Univerzitná 8215/1, 010 26 Žilina, natalia.stalmasekova@fpedas.uniza.sk
2 Ing. Tatiana Genzorová, University of Žilina, Faculty of Operation and Economics of Transport and Communications, Univerzitná 8215/1, 010 26 Žilina, tatiana.genzorova@fpedas.uniza.sk
3 Dr. h. c. prof. Ing. Tatiana Čorejová, University of Žilina, Faculty of Operation and Economics of Transport and Communications, Univerzitná 8215/1, 010 26 Žilina, tatiana.corejova@fpedas.uniza.sk
benefits associated with the position in the company (prestigious company cars for managers, pay phone in the apartment, allowances for clothing and other expenses representation of companies, corporate apartment, etc.).

Trade unions when collective bargaining generally create pressure on providing employee benefits. If the company wants employee benefits to have a positive impact on employee motivation, their satisfaction and stability as well as good relations with trade unions, it should be interested which employee benefits employees prefer. Due to differences in the preferences of employees, companies have begun offering an optional benefit system (i.e. Cafeteria system). Employee can choose such benefits that are currently most interesting for him. In the case that his preferences will change in time, he has a possibility of choosing different benefits. (Striček and Štofková, 2013)

The optional benefit system is convenient for the company and employee for several reasons: (Strenitzerová, 2015):

- The optional system is economical and provides the ability to better control costs and becomes more diverse and attractive;
- It leads to an increased awareness of employee benefits;
- Employee benefits are useful in the acquisition and stabilization of employees. If the company offers tailored benefits, it becomes more attractive to potential and current employees;
- The system may have a positive impact on the attitudes and behavior of employees, employees feel they are more equal partners;
- Optional systems provide companies and employees (i.e. Trade unions) the possibility of better control over the distribution of benefits, because the choice of each employee is registered and recorded.

Koubeck (2007) says that the disadvantage of optional benefits system is its administrative complexity. Employees also may not always recognize their current needs, which can result in inappropriate selection of employee benefits, which can then manifest into their dissatisfaction.

Current situation of issue in Slovakia

Employee benefits were brought to Slovakia by foreign companies which employee a significant number of people in our part of the market. For many companies, these benefits are part of their corporate culture. Slovak companies are not lagging behind and also under pressure by unions to provide employee benefits. In 2016, Slovak web journal platy.sk published on its site surveys for employee benefits where they concentrated on the most used benefits in Slovak companies during 2015. Corporate teambuilding was identified as the most common benefits provided by the employer at top of the range (26%). Second place at 20% were both free drinks at the workplace and employee education. Education of employees includes training in their profession (meetings, workshops...), but especially the teaching of foreign languages, which is especially preferred by foreign companies. They try to educate their staff in case they need travel to other branches where they are forced to communicate with English or German-speaking colleagues. Another very common benefit is the possibility to use flexible working hours (18). Employers try to provide to employee some freedom to decide about arrival to work. Employees reported at considerable level that they can use both the company mobile phone and the PC, which is provided at work, for private purposes. Furthermore, frequent benefits are holidays, reimbursement of transport, a housing allowance or reimbursement of sporting activities. In the survey for web journal platy.sk, 32% of respondents from a sample of 65000 people admitted that their work still has no employee benefits.

Many international companies in Slovakia offer the same benefits as in abroad branches. For example, one of the most famous employer in Žilina provides its employees financial bonuses in the form of variable pay, Christmas bonuses, and extra for overtime or additional retirement savings. Many foreign companies have acceded to promote marriages and families by giving bonuses to families with new born baby. Many companies take care of the culture of the company and its corporate social responsibility and they want to learn from their employees by using benefits, for example car factory Kia rewards blood donors. These benefits include ‘eco-friendly’ shopping, when on purchases friendly home appliances or use a bicycle as a means of transport provided by certain funds bearing the costs of employees. Slovak company Topvar concerned with the production of beer is giving their female employees contribution for babysitting, so they can come to work earlier. (Berecz, 2016)
Current situation in USA
Abroad, the employers understand benefits quite differently. They realized that generous benefits are needed to attract talented employees. Based on the survey of employee satisfaction conducted by the company Glassdoor (2016) it is shown that for 60% of respondents, benefits are the main reason according to which people decide whether to take a job or not. To attract prospective talented employees, large American companies offer their employees massage chairs, private chef, and yoga classes. Large companies seek to reflect the benefits of their employees in the work carried out. For example, Airbnb, which in 2016 was declared as the best place to work, provides its employees an annual salary of $2,000 just to travel.

Table 1: Ten most desirable benefits

Data and methodology
The aim of this research is to find out which employee benefits do students of University of Žilina prefer. The results show the most attractive employee benefits of students-future labor. This research can point to benefits which employers can use in the future to attract good skilled graduates.

The task of the questionnaire was to find out:
• which of the following employee benefits would be most attractive for students of the University of Žilina.
• have the students ever been employed?

The research sample contains 100 students of University of Žilina. The research was performed in February 2017. For research, we had to suspect that more than half of respondents had had working experience.

We presume that young people are influenced by international companies which are doing business in Slovakia and they expect different types of benefits. Further, we expect that women desire different types of benefits than men.

Results and Discussion
The research sample consists of 100 respondents, 43% male and 57% female. Figure 1 shows that most desired employee benefits are flexible working hours, a company car for private purpose and extra paid vacation. The use of a company car is a benefit often offered in Slovakia and employees appreciate it. Flexible working hours is a new type of employee benefit for Slovak employees which is more and more required. In the past regime, this benefit was not offered. There is only 20 paid vacation days for absolvents in Slovakia, therefore extra paid vacation is also desired.
If we look at answers only from female respondents, the most desired benefits are flexible working hours, extra paid vacation and of course home office. This shows that women are concerned about time, because they have to split time between work and family more than men. On the contrary, the most desired benefits by men are a car and a phone/notebook for private purpose.

**Conclusion**

Employee benefits are powerful tool in the hands of companies. Benefits are a great opportunity to lure, raise and keep employees. Already Tomáš Baťa emphasized the importance of keeping employees satisfied. (Štofková et al, 2015). Only satisfied employee can identify with the company and do their best work. Based on the results of the research, we recommend incorporating the Cafeteria system into the motivation program of companies if it is possible. It is convenient not only for employees but also for companies. The company could have a better control of costs as well as appearing more attractive and diverse.

CONVENTIONAL AND SHADOW BANKING SECTOR – COMPARATIVE ASPECTS OF THE POST-CRISIS PERIOD IN TAIM OF THE CURRENCY BOARD - BULGARIA’ CASE

Elena Velkova Stavrova

Abstract: The shadow banking or financial institutions specializing in lending take an increasingly larger share of today's markets and channels for the movement of financial resources in the markets of resources between economic agents or households.

The main scientific question of this paper is to analyze the reasons of dynamic trends of development of the shadow financial system, and how that contrasts with the conventional model of financial intermediation of commercial banking: “The chains for value creation through credit intermediation that move free financial resources in economic systems for realizing more efficient operations with fewer risks; In non-banking credit intermediation chain trades that take place on weighted average price - and exchange rates in the markets for short-term securities; yield creation in the shadow banking industry are intensively secured strongly which personally are guaranteed both, from individuals and the firms; value chains in the alternative banking system have carried out extensive conventional financial transformation outside the banking system. This means that this type of intermediation converts illiquid, risky fixed assets in "safe" and liquid short-term liabilities.”

The used methods are: content analysis, and econometrics analysis of empirical databases of the years 2012 – 2016 by two financial sectors from BNB.

The finding based on the econometrics analyses supports the scientific hypothesis about relations between the process of the increasing role of the informal banking sector, which pushes conventional bank financing due to high credit standards of banking institutions and limited access to finance for individuals who receive their income in the area of the gray economy.

JEL Classification: G21, G23, G28; DOI: http://dx.doi.org/10.12955/cbup.v5.965

Keywords: shadow banking, value chain, financial innovation, financial intermediation

Introduction

„The rapid development in financial innovations have changed the landscape, for moving free financial resources into the economic system - from savers to individual and corporate investors. Enhanced interference by national and international regulators has restricted innovative creativity and competitive competition between conventional banks by taking additional types of risks. This purposeful intervention has provided additional incentive for these banks to look for an opportunity to secure efficient operations through the development of alternative credit forms whose assets are guaranteed through diversified portfolios. Regulatory arbitrage, limited capital requirements, and post-crisis recovery processes gave further impetus to companies and non-bank credit institutions to provide access for borrowers who would hardly respond to conventional banks' access to credit forms to meet their needs.

Although the shadow banking business is a broad term we use to name nonbank institutions that conduct bank operations, shadow banking is an alternative to the conventional because of the significantly more liberal financial safety net, which otherwise engage conventional banking with the formation of reserves, and the performance of a complex system of regulatory and supervisory rules specified as with national and international banking law.

On the other hand, significant is its role and contribution to improving the competitive environment for increasing the efficiency of the banking business, a process that is stimulated further by the significant losses that the real economy banking industry bore during the global financial and economic crisis (Patonov, 2013; Tanchev, 2015; Tsenkov, 2016 and Tsenkov, 2016).

Body text

The banking system is critical for the economy as a whole and fluctuations in it are a function of money supply. In this context Minsky's theory about the importance of endogenous money (Ganchev, 2015) in the economic system are critical to the relationship between conventional and alternative shadow banking systems.

The structure characteristics of the Bulgarian non-banking sector of credit institutions is the representation of both national and mixed - national and international capital, of which - 179 credit intermediaries with national capital, Improving the business environment and profit growth in the financial sector is likely to reduce the projected demand for debt to finance investments and simultaneously stimulate further investment attitudes of the business. This resource is not included in economic turnover and expects profitable future investment projects. Given that endogenous money is closest to the activities of banks that create demand, they limit short-term loans to individuals and businesses. This economic recovery in investment banking, where it is investing internal resources of retained earnings, but in conventional commercial banking or the process this happens slowly, because the return on investment through cost of labor or wages and household consumption take place with lags in time. So, to finance investments empirical reality shows that firms take on new debt to finance assets.

Figure 2: Main credit aggregates by conventional banking sector

Source: Author
Banks’ behavior to introduce financial innovation, especially when in financial markets’ interest rates are negative or close to 0, follows a conscious violation by moving deposits to shadow financial sector’s credit institutions even in most cases violate the liquidity management regulations.

Working under the Currency board, the Bulgarian banking system is highly regulated and the central bank is limited to using a single tool - the mandatory minimum reserves. The change in the system of taxation of income and profits in proportion to the progressive tax rate of 10% trigger implementation of the "paradox of Keynes' for saving, which loaded the system with excess liquidity. An elevated criterion for access to credit in a crisis restricts the activities of banks to banking services and loans primarily to borrowers in the gray zone of the economy and directs them to the area of shadow banking.

The requirement for registered capital and funding sources in both types of banking is clearly defined - with transparent sources and restrictions on crossing the minimum limit. The difference between the two sectors lies in the ability to attract deposits on open financial markets, which is why financial Institution of the informal banking sector attract resources through equity shares and contributions, but not as deposits of individuals and companies.

As a consequence of the above, and the analysis (Stavrova, 2012, Stavrova 2013, Stavrova & Zlateva, 2016) and comparison of major credit performance of the two types of banking systems, respectively, Figure 1 and Figure 2 give way to formulate some basic differences and similarities:

The processes of global financial and economic development have reached a varying degree, the direction of development and the residual effects both on the synchronous functioning of the banking and non-banking sectors as inseparable parts of the financial system. While significant deviations from the mean represented as fluctuations and the peak in the variable "rate of increase in problem loans" in the third quarter of 2015, which noted the conventional banking sector, the same time interval banking sector shows a systematic, offensive upward development. The explanation of this trend is the specific feature of the currency board system, which allows bankruptcies of banks and prohibits the central bank to be a lender of last resort. This is the reason for the significant amount 5,592 690 000 BGN, which is referred to as an increase in non-performing bank loans in the aforementioned period. During the same period, the conventional banking system has a symbolic rate of increase or decrease in the provision for new loans. This process may in each case be assessed as risk-sharing and transferring a system of shadow banking which creates a dangerous precedent for a new credit bubble.

Undoubtedly and significantly, the advantage that ensures the functioning of the shadow banking sector is the possibility of regulatory arbitrage - a considerably simplified licensing procedure, limited requirements for professional expertise of management. Undoubtedly and significantly, the advantage that ensures the functioning of the shadow banking sector is the possibility of regulatory arbitrage - a considerably simplified licensing procedure, limited requirements for professional expertise of management, the independence of decision-making without coordination with the regulatory authority.
The reporting activity is also simplified - instead of the monthly statements provided by traditional banks, credit institutions submit quarterly data, the independence of decision-making without coordination with the regulatory authority. The reporting activity is also simplified – instead of the monthly statements provided by traditional banks, the credit institutions submit quarterly data. This simplified procedure spur market participation of the non-banking sector and this makes it significantly more effective compared to the conventional banking sector.

Another important difference between conventional and shadow banking is that it provides an opportunity for gains from specialization in the financial intermediate and receiving the benefits of products’ specialization in one segment of the financial market. From this, the realization of economies of scale is made possible by learning, and improving offering specialized credit in specific forms of credit intermediation functions. Alternative forms of credit intermediation are widely represented in the form of leasing in co-operation with car and industrial equipment manufacturers and dealers, purchase of debt commitments such as factoring and franchising, etc.

The customers of non-banking credit institutions are looking to borrow a much smaller amount than the banks would have made. The average value of the loans granted by its company is about BGN 700 and the maximum amount that can be borrowed - BGN 2,500. Thus as a result, they fill the consumer micro-credit niche, which is not as attractive and profitable for the banks and until recently this kind of lending was offered by illegal lenders.

A key advantage of shadow banking companies is that their operations are really negotiated short-term - usually the time between bidding and receiving is at most a few days and usually up to several hours. Unlike banks, bureaucratic procedures are limited to a minimum, loans are available at home, on the phone, and recently online. Thus, their services can benefit households and firms in remote areas where branches of conventional banks do not operate. An important advantage is that non-bank institutions are more flexible in terms of proof of income and past credit history, which is key to the majority of the population which works in the gray and no-tax pay economy in Bulgaria.

Finally, it should be underlined the special social role of the informal banking sector, namely providing accelerated access to loans to individuals and companies that cannot meet the high requirements for obtaining loans put up by their conventional banks. These small-volume loans, albeit expensive enough, as the new credit agreements are used to solve the urgent needs of households. A steady growth trend shows that this sector is represented by a relatively stable volume of loans and a continuously increasing importance in the credit market segment as a whole.

Conclusion

As, seen above, and in the resulting analytical comparison between two sectors – the conventional banking and the shadow banking sector, both are in a sharp competitive game for the same group of users, these sectors carry differently the ways to structure the fluctuations experienced by the non-financial sector during the global financial and economic crisis. Although the efforts of financial and political authorities were directed exclusively to the stability of the conventional banking sector, this same sector, although in arrears, suffered considerable losses that caused the banks to fail and hence shake the banking system as a whole.

At the same time the shadow banking sector going through all these events prepared and generated high levels of risk in the price of credit resources, and therefore not suffered any significant losses.

During the same period the conventional banking system has a symbolic rate of increase or decrease in the provision of new loans. This process may in each case be assessed as risk-sharing and transferring a system of shadow banking, which creates a dangerous precedent for a new credit bubble. These trends of development, except that those that register, need to be monitored, controlled and guided to limit the possibilities of occurrence of new crisis fluctuations. Development of an international framework for the operation and oversight of shadow banking will limit the realization of regulatory arbitrage and hence - the possibility of concentrating significant risks in some regions.

CONCENTRATION INDICES IN ANALYSIS OF COMPETITIVE ENVIRONMENT: CASE OF RUSSIAN BANKING SECTOR

Polina Stazhkova,¹ Tatyana Kotcofana,² Alexander Protasov³

Abstract: This article is devoted to the analysis and evaluation of competitive environments by using some indicators of market concentration. An analysis was made of the key (main) concentration indices most often used in countries with developed market economies. The state of the competitive environment in the banking sector of the Russian Federation is estimated with the use of indices. The consistency of these indicators to the basic antitrust regulations was investigated. The authors show that in order to obtain reliable results each of the available methods of monopoly power detection requires a detailed market analysis.

JEL Classification Numbers: D21, D43, G21, L13, L49; DOI: http://dx.doi.org/10.12955/cbup.v5.966

Keywords: concentration ratio, Linda Index, Herfindahl-Hirschman Index, market share, kernel

Introduction

The presence of monopolistic structures is one of the main problems while forming a competitive environment in a market economy. The challenge for antitrust authorities is to identify the monopoly and monitor its operations. This applies to firms that occupy a dominant position and abuse it. Traditionally, the most favorable condition for the emergence of a monopoly is a highly concentrated market.

The concentration of sellers reflects the relative sizes and number of firms operating in the industry. The concentration level will be the highest with the minimum number of firms on the market. It is also affected by the size of firms. The more firms differ in size, the higher the concentration level.

In turn, the level of concentration can determine the behavior of firms in the market. As a rule, the higher it is, the more firms will depend on each other or on the dominant firm. The monopolistic structure of the market is an exception. It is characterized by the maximum degree of concentration, but the only firm, the monopolist, does not depend on its actions from the behavior of competitors because of their absence. The market will have a lower degree of competition with a higher concentration level.

However, firms that occupy a dominant position, as a rule, do not recognize their position as monopolistic and they are trying to prove the absence of monopoly power. Thereby, there are clear criteria for determining the level of concentration. This makes it possible to assess the market structure, to establish the existence of a monopoly and to determine it quantitatively.

Economists have developed quite a lot of indices to measure concentration. Research by Khan et al. (2016) shows that the final assessment of the degree of competition and its impact on the effectiveness of economic policy depends on the choice of the concentration indices. In practice however, only the two most popular indicators are usually used. The Federal Antimonopoly Service of the Russian Federation in its analytical reviews and reports uses the concentration index – CR-3 and the Herfindahl-Hirschman index – HHI. In our view, it is necessary to expand the set of concentration indicators used to assess the competitive situation of the market more realistically.

Data and methodology

One of the first coefficients used by economists to analyze market structures was the market concentration index (CR). It shows the percentage of one or more large firms in the total volume of the analyzed market in terms of key economic parameters (sales volume, value added, money turnover, asset size, own and attracted capital, number of employees, etc.). Competition authorities are primarily interested in the firm’s share in sales, so most often the concentration indicators, including CR, are calculated based on this parameter. Later, when analyzing concentration indices, we will speak specifically about market share as a proportion of income from sales of the company (or group of companies) in the total income from the sales of industry or market, implying that other parameters can be used.

US antitrust authorities have been actively using the concentration index to investigate market structures since 1968 (Gosudarstvo i rychnoyye struktury, 1993). This indicator is simple to calculate, that undoubtedly is its advantage. Usually this ratio is calculated for the largest companies in the market of a certain product. It gives an estimate the ratio of market shares of enterprises with the largest shares to the total market volume. The number of such large companies can vary. In the US (U.S. Department of Commerce, 2006) and France, the index is calculated for 4, 8, 20, 50 or 100 of the largest companies. In Germany, England, Canada, data on 3, 6, 10, etc. companies are considered. In Russia, this indicator has been calculated and published in official statistics since 1992 for three (CR-3), four (CR-4), six (CR-6) and eight (CR-8) of the largest sellers (Knyazeva, 2007). The formula for concentration index can be represented as follows:

\[ CR_n = \frac{\sum_{k=1}^{n} V_k}{\sum_{k=1}^{n} V_k + \sum_{j=n+1}^{N} V_j} \]

where \( CR_n \) is the concentration index of the given market, \( V_k \) is the volume of sales for \( k \)-th large seller, \( V_j \) is the volume of sales for \( j \)-th smaller seller, \( n \) is the number of largest sellers in the market, \( N \) is the total number of companies in the market.

The concentration index presents relative shares or percentage. The higher the values of this indicator are, the stronger the market power of the largest firms is, and the stronger the degree of concentration in the market is, the weaker the competition. Thus, for the same number of largest firms, the higher the degree of concentration, the less competitive is the industry.

As it was already mentioned above, this index can be calculated for a different number of major companies in the market of certain products. However, it is more appropriate to examine the values of this index for three or four large firms.

In Knyazeva (2007) the following criteria for comparing market structures are distinguished:

1. For three firms, the market is considered to be un-concentrated with an index below 45%; \( CR-3 < 45\% \);
2. The market is considered to moderately concentrated at the values of the index \( CR-3 \) between 45% and 70%;
3. The market is highly concentrated when the index values are bigger than 70%; \( CR-3 > 70\% \).

Despite the fact that the concentration index is fairly simple to use and interpret, it has a number of drawbacks. Firstly, it does not take into account the size of the firms, which were not included in the sample \( k \). Secondly, it does not reflect the distribution of shares both within the group of the largest firms and between outsider firms. To solve this problem, the Lind index is actively used in the countries of the European Union. It allows identifying the largest firms on the market (Waterson, 1984), the so-called “oligopolistic core.” Its calculation will be shown below. Thirdly, \( CR \) characterizes only the sum of shares of firms, but the gap between these firms can vary. There is a possible inaccuracy in its implementation due to this fact. It has some limitations in the application, since it does not allow differentiating the role of different producers in the market. This index can show the same numerical value for fundamentally different markets, distorting the true state of affairs.

Consider two markets with a set of share distributions where one firm controls 80%, the second - 5%, the third - 3%, the fourth - 2% and a set where the first firm occupies 24%, the second - 23%, the third - 22%, the fourth - 21%. Concentration will be measured as 0.9 for both markets, although it is obvious that in the first case the dominant position is occupied by one company and in the second case the distribution of the shares of the first four companies is more or less even (Pakhomova & Richter, 2009). The use of the Herfindahl-Hirschman index makes it possible to overcome this drawback.

The concentration index is the simplest indicator of the presence or absence of a monopoly, but it is not precise enough, and moreover, has low information content. To address the above shortcomings, other indicators of market power can be used. We will look into those that are currently actively used in economically developed countries, and are the most successful in the facilitating antitrust policy.
The Linda index was proposed by Remo Linda and is widely used in the European Union. Like the concentration index (CR), the Linda index is calculated only for a few of the largest firms, so it also does not take into account the situation on the periphery of the market. But unlike the concentration index, it is focused on accounting for the differences in the core of the market. The Linda index can show how many and what firms occupy dominant positions in the market. For this purpose, the index is calculated step by step. First for the two largest firms, then for three and so on, until the continuity of the function is violated (here, the tendency of the index decrease will be replaced by its increase). This violation of continuity shows that the latter company added to the calculation has a significantly smaller market share than any of the previous.

For the two largest firms the Linda index will be equal to the percentage of their market shares. According to Gosudarstvo i rynochnyye struktury (1993) we number the market shares of individual firms in a decreasing order, and then the Linda index for these firms will look as follows:

\[
IL = \frac{k_1}{k_2} \times 100\%,
\]

Where \(IL\) is Linda Index, \(k_1\) and \(k_2\) are market shares.

Based on Gosudarstvo i rynochnyye struktury (1993) the Linda index for the three firms \(k_1, k_2, k_3\) will be the arithmetic mean of the two ratios: the ratio of the share of the largest firm to the arithmetic average of the second and third largest firms; the ratio of the arithmetic average of the two largest firms to the share of the third largest firm.

\[
IL = \frac{1}{2} \left( \frac{k_1}{(k_2 + k_3)/2} + \frac{(k_1 + k_2)/2}{k_3} \right) \times 100\%.
\]

The Linda index for the four firms \(k_1, k_2, k_3, k_4\) will be the arithmetic mean of the three ratios: the ratio of the share of the largest firm to the arithmetic average of the other three largest firms; the ratio of the arithmetic average of the first two largest firms to the share of the other two largest firm; the ratio of the arithmetic average of the three largest firms to the share of the fourth largest firm.

\[
IL = \frac{1}{3} \left[ \frac{k_1}{(k_2 + k_3 + k_4)/3} + \frac{(k_1 + k_2)/2}{(k_3 + k_4)/2} + \frac{(k_1 + k_3 + k_4)/3}{k_4} \right] \times 100\%.
\]

In the same manner the Linda index for five, six and more firms can be calculated. If for two firms the index is 200, for three is 170, and for four is 230, the continuity of the function is violated after adding the fourth firm. This means that the first three firms are the core of the market. Their market shares are significantly larger than the proportion of the fourth largest company and all the rest. If one or two firms occupy a clearly dominant position, the index will rise from the very beginning. In this case adding a third firm to the calculation increases the inequality of forces of the firms considered in the index.

The Linda index overcomes the above mentioned drawback of the concentration index. It is reflecting the distribution of market shares among the largest firms, and not just the ratio of the shares of the largest firms to all other sellers.

Another disadvantage of the market concentration index (CR) is the concealment of the true position in the market and the determination of the same numerical value for fundamentally different markets. To a certain extent it can be avoided while using the Herfindahl-Hirschman concentration index (HHI). The US Department officially refused CR, and adopted the HHI as the main characteristic of the market structure. Since June 1982, the HHI serves as the main reference point for the US antitrust policy in assessment of all kinds of mergers (Avdasheva & Rosanova, 1998). This index can be used as a measure of concentration however, its main task is not to determine the market share controlled by several of the largest companies, but the characteristic of the distribution of “market power” among all the subjects of this market. Exactly this is the advantage of HHI over CR.

The firm’s specific weight in the industry is used to calculate HHI. Just as for other concentration indicators, different parameters can serve as the basis for determining the specific weight, but the most important of them is the market share. It is assumed that the greater the share, the greater the potential for the emergence of a monopoly. In the calculation of this index all firms are ranked by weight from
the largest to the smallest. Market shares of all producers of a certain product are needed to accurately calculate. It is not possible for a large number of firms.

The Herfindahl-Hirschman index is calculated as the sum of the squares of the shares of all firms operating in the market. It is the percentage of each firm present in the market in the total sales volume squared and sum while arranged in decreasing order:

\[ \text{HHI} = Y_1^2 + Y_2^2 + Y_3^2 + \ldots + Y_n^2 \]

or

\[ \text{HHI} = \sum_{i=1}^{n} Y_i^2, \quad i = 1, 2, 3, \ldots, n, \]

Here \( Y_1, Y_2, \ldots, Y_n \) are shares in decreasing order. Market shares can be expressed in fractions or as a percentage. In the first case, HHI will take values from 0 to 1, in the second – from 0 to 10000.

According to international practice, the HHI value, close to zero, corresponds to the minimum concentration, \( \text{HHI} < 0.10 \) (or \( \text{HHI} < 1000 \)) – low level of concentration. In accordance with US law, the index value \( 0.10 \leq \text{HHI} \leq 0.18 \) (or \( 1000 \leq \text{HHI} \leq 1800 \)) corresponds to the average concentration level, and \( \text{HHI} > 0.18 \) (or \( \text{HHI} > 1800 \)) indicates a high level of market concentration (Knyazeva 2007).

European legislation sets this limit at 0.2 (or 2000) (Guidelines, 2004).

It should be noted that this index reacts to a big number of firms as well as to the individual market share of each firm. It provides an opportunity to obtain information on the comparative capabilities of firms to influence the market situation in conditions of varying degrees of concentration. Petria et al. (2015) consider HHI to be the most correct of the concentration indices, since it takes into account the market shares of all firms and gives greater weight to firms with large market shares. However, the main advantage of the index is its ability to react quite sensitively to the redistribution of shares between firms operating in the market. Due to this sensitivity, it can indirectly indicate the magnitude of the economic profit obtained as a result of the exercise of monopoly power.

Source: Authors

As we could see, each of the concentration indicators examined has its advantages and disadvantages. The most adequate for reflection of the real market situation, in our opinion, is the Herfindahl-Hirschman index. However, with a large number of firms operating on the market, its calculation presents a certain complexity. The Linda index is also complex in calculation; it estimates the concentration only among the largest companies. Nevertheless, the use of IL helps to clarify the distribution of market power in the oligopolistic core.

The following criteria can be proposed to assess the merits of different concentration indices.

1. The concentration indices should give qualitatively consistent results both for the analysis of the market in general and for the analysis of the core of the market. For a less concentrated market this indicator should be less than for a more concentrated one, even if we do not calculate it for all sellers, but only for the largest ones.
2. The concentration index should increase with the increase in the share of a large firm by reducing the share of a smaller firm.
3. The concentration index should decrease when a new firm enters the market, if its size is not larger than the size of the largest of the already existing firms.

4. The concentration index should increase when firms conduct M & A transactions.

From the indices considered, only the Herfindahl-Hirschman index meets all four criteria listed above. The Linda index and the CR only partially meet these conditions.

**Results and Discussion**

The concentration indices were calculated for analyzing the competitiveness of the Russian banking sector and six largest banks: Sberbank, VTB Bank Moskvy (together with VTB 24), Gazprombank, FK Otkrytiye, Rossel'khozbank and Al’fa-Bank. The key areas of banking activities are attracting deposits and lending to individuals and legal entities. The indices were calculated for each of these two areas, dividing each of them into two segments: services for individuals and for legal entities.

The market shares of these banks are shown in Table 2, the concentration indices (CR-3 and CR-6) and Herfindahl-Hirschman are presented in Table 3, and the dynamics of the Linda index is in Table 4.

4 The sixth biggest bank on the individuals’ loans market is Raiffeisenbank

5 The sixth biggest bank on the market of individuals’ deposits is Binbank
CR-3 and CR-6 show that there is a medium level of concentration on all markets, while in services for individuals it is slightly higher. In loans for legal entities CR-3 is quite low but CR-6 is the highest. This can be explained by more equal distribution of shares among the three largest banks.

The Linda index is rising right from the start. Table 2 shows that Sberbank is the only dominating bank, for deposits for legal entities there are two dominant banks – Sberbank and VTB group. Not for all the markets IL will be the same. According to other indices the least concentrated is the segment of deposits for legal entities, it is also the lowest in IL.

HHI shows high concentration in deposits for individuals, moderately high (high by American standards) in loans for individuals and moderate in services for legal entities. The most competitive according to HHI is the segment of deposits for legal entities.

For the Russian bank system as a whole (600 banks) HHI in January 2017 was 1220. It indicates a moderate concentration. As Parsons & Nguyen (2016) noted, in G7 countries the HHI for banks in the 2000-s was not lower than 5000, and after 2010 it is over 6000.

The level of concentration in Russian banks is moderate according to other criteria. CR-5 in January 2017 was 59.04%, but in 2008 it was 42%, in 2010 – 48% (Khandruyev & Chumachenko, 2010). The HHI based on 957 banks in 2010 was 907 (Raksha, 2010). The growth rate is moderate. As a result, the concentration of the first five banks in Russia is comparable to European levels. As Leigh & Triggs (2016) showed the market share of the four largest Australian banks is 94%.

The Linda Index shows higher levels of concentration compared to the HHI, CR-3, CR-6. It is due to the fact that IL shows the concentration of the core, not the whole market. Due to the fact that in Russia most of the 600 banks have really small market shares, concentration levels look moderate. The six largest banks occupy less than 70%. But there is clear dominant in the core of the market. The market share of Sberbank according to different estimates can be from 23% to 47%. This can be seen only with the Linda index.

On the one hand, IL points out the leader and probable monopolist. On the other hand, it is unable to detect competitive forces presented by a number of smaller firms on the periphery.

**Conclusion**

These indices of concentration show the market structure with different levels of accuracy, they describe different aspects of the situation. In different circumstances, depending on the specific objectives of the antimonopoly policy, different concentration indicators may be most appropriate. However, in any case, detailed and multilateral analysis of the market is needed while using each of the considered indices, and possibly, their combination for a more realistic assessment. It is important not only to adequately assess the results obtained with the help of quantitative methods, but also to understand the reasons why the market has a high or low concentration. Without a meaningful analysis of the data used for calculating the concentration indices and their results, the approach to the implementation of the antimonopoly policy will be formal, one-sided, and, therefore, most likely, will not give the desired results.

CONTINUOUS IMPROVEMENT AND APPLICATION OF QUALITY MANAGEMENT METHODS IN RAILWAY TRANSPORT PROCESSES

Vladimíra Štefancová,1 Anna Šatanová,2 Danka Harmanová3

Abstract: The basic principle of continuous improvement of each enterprise is to comprehend its particular transport processes. For better understanding and detailed analysis there are available lots of quality improvement toolkit. The relationship between consequence and potential causes can be monitored through various fundamental and specific tools. This article is oriented on train delay which belongs among the typical problems in the railway sector and is considered significant from the customer's perspective. The aim of this paper is to highlight the possible applications of quality management methods in the framework of the train delay issue. These delays influence a train's punctuality and therefore it is important to identify most prevalent causing these problems reasons as well as to analyze them and propose solutions.

JEL Classification Numbers: M11, L15; DOI: http://dx.doi.org/10.12955/cbup.v5.967

Keywords: Flowchart, Ishikawa diagram, Pareto, delay causes, quality management, process

Introduction

With growing competition, a company is forced to increase the efficiency and productivity of its work and thus improve its final product or service. The implementation of new procedures and pioneering technique can positively change unresolved issues of any enterprise. The Six Sigma is considered an integral part of quality management with the aim of continual improvement. The principles of the Six Sigma methodology were applied in the past particularly in manufacturing, but nowadays there is a tendency also to use these methods in the services sector.

The goal output of rail transport is supplying the services in the required time frame as well as at the desired quality. This all depends on the quality of the resources, with regard to the utilized vehicles, properly scheduled timetable, individual operating processes as well as the staff willingness. This article emphasizes that the Six Sigma is an essential tool to increase customer satisfaction and simultaneously improve the quality of processes in railway transport. In order to achieve the desired results, it is necessary to focus on customer requirements and to become a customer-centered organization gradually. The aim of this article is to highlight the possible application of quality management methods with the goal of averting extraordinary circumstances such as train delay.

The importance of acquisition and evaluation uniform data about train delays

An important determinant for the customer when deciding about the use or non-use of services of the transport company becomes the quality of the provided services. Therefore, if we want to assess the quality of services effectively, it is necessary to take into account the factor of time, which is possible through dynamic models that take into account the procedural character of provided services (Nedeliaková & Panák, 2015).

One of the goals of a railway company that operates in the area of services in railway transport is to obtain a lasting market share with a view of increasing it (Majerčák & Nedeliak, 2010). This goal can be achieved through continuous monitoring and evaluation of the quality of the services provided, and taking into account the specific characteristics of all the parts of the transportation process (Nedeliaková & Panák, 2016).

Abroad there exist several models of service quality, which are often concerned about this problem however, with different aspects, different from conditions of railway transport. It is therefore necessary to apply those tools of the quality model that will be suitable for rail transport. In regards to rating a company's service quality, it is important to take into mind the approaches of quality methods, and the techniques and models of quality, which connect objective and subjective aspects of the rating.

1 Faculty of Operation and Economics of Transport and Communications, University of Žilina, vladimira.stefancova@fpedas.uniza.sk
2 Department of Economics, Management and Marketing, International School of Management Slovakia, Prešov, satanova@ismpo.sk
3 Faculty of Operation and Economics of Transport and Communications, University of Žilina, danka.harmanova@fpedas.uniza.sk
That was the initial impulse for creating a scientific research study, of which one of the results is this article (Nedeliaková, Sekulová, & Nedeliak, 2015).

While solving any issue, accurate information is very important. In accordance with analyzing the current state it is essential to have constant data available intended for understanding the interrelations in order to improve the processes. Furthermore, the quality of information is correlated to the precise ability of the staff to collect data objectively and should be correctly entered into the information system (Majerčák & Majerčák, 2015).

The main indicator of train delay is the punctuality of trains. This is measured regularly and represents the comparison between the time stated in the train timetable and the factual running time of a train. In general terms the range of train delay is usually reported in minutes. The continued provision of dynamic information on train movement are the basis for further in-depth analysis of the delay causes. The complete effect of train delays is considerable not only for passenger themselves but also for the Infrastructure Managers and for Railway Undertakings. (ŽSR, 2009).

One of the methods which can be applied in processes of railway transport is a flow diagram. The flowchart is a versatile tool for describing any process where the structure and sequence of activities is depicted by blocks showing operational activities and blocks showing decisions (Nenadál, 2008). It defines the continuity of the process and is used to gain a better understanding. Figure 1 shows a flowchart when the train is delayed. The initial sample consists of data about the passenger trains and there is a decision-making process if a train is delayed or not. If the train is late, the entrusted employee will assign to the train number its delay code. Otherwise, it is not necessary to deal with trains that arrive on time. Individual delay codes are defined in the Regulation (SR 1012) concerning operational information system (PIS) of infrastructure manager in Slovak Republic.

**Figure 1: Flowchart of the train delay process**

![Flowchart of the train delay process](image)

Source: Authors

According to the circumstances, it is needful to properly identify the reasons for the delay and also it is recommended a coding system is used.

**Utilization of an Ishikawa and Pareto diagram to improving the quality of processes in the railway sector**

The requirements for quality service is increasing therefore it is necessary to look for new ways of improving quality that will meet international standards and reflect the increasing demands of customers (Nedeliaková & Sekulová, 2016).

The implementation of processes is fundamental to create a successful and functioning enterprise. While the processes have constantly been changing, there must be connectivity between input and output (Fišer, 2014). That's the reason why particular elements, which enter into the process have to be continuously controlled.

The methods in an Ishikawa and Pareto diagram are included among the quality management methods for continuous improvement. These methods can also serve for monitoring problems in railway transport. The cause-and-effect diagram (Ishikawa diagram) is one of the fundamental tools used in the Six Sigma methodology. The line (spine) represents the effect and is typically labeled on one end as
the head of the fish, each diagonal line (major bone) branching out from the spine corresponds to a major cause or group of causes (Brue, 2005).

The initial Ishikawa diagram consists of five groups (materials, machines, methods, measurements, men), but nowadays there are more used in a modified version such as management, environment and so on. The specification of delay reasons is a rather complicated creative process, which is usually carried out within a team where it is appropriate to use brainstorming or brainwriting. (Lusková, Hudáková, & Buganová, 2013).

Source: Authors

Figure 2 above represents using Ishikawa in practice for the conditions of railway transport from the point of view of an infrastructure manager and for railway undertakings. The purpose of the Ishikawa diagram is to lead a company in the direction of never-ending and continuous improvement which is pursued by continual application of eligible quality improvement tools. The research shows that in the conditions of railway transport, this diagram is able to describe an objective assessment of the quality within providing transport services (Nedeliaková, Sekulová, Nedeliak, & Abramovic, 2016).

Illustratively it describes the main spine of the diagram, which is made up of seven basic parts:

- People – errors in personnel planning, disabled passengers, large amount of luggage, large number of passengers
- Operations – inadequate organization, sending a train to the wrong track, direction
- Surroundings – insufficient communication, delays caused by other infrastructure managers (previous or next), state bodies, the introduction of regulation UIC 450-2
- Vehicle – error in train composition, locomotive destruction, exceeding journey time
- Rail accidents – obstruction on line
- Machine – obsolete technical equipment, failures of signaling equipment, failures of ETCS and infrastructure components, defects in data-transmission system
- Management – mistakes in timetable compilation, late editing of timetables and other operating schedules

Another tool is the Pareto chart that can be used extensively for identifying the items that have the greatest cumulative effect in the process of railway transport. Pareto charts consist of bars, which represent the relative contribution of each cause or component of the problem and are arranged in a descending order (George, 2003).
Statistical significance is analyzed by using the Pareto principle and that is visible through the Pareto diagram in Graph 1.

Graph 1: Pareto in railway processes

Approximately 80 percent of train delays are the result of only five main delay causes. The most prominent of them are train succession, rail connection, other railways and delay caused by following railway undertakings. Other steps for more detailed analysis can be using brainstorming with experts.
in the transport sector, that can offer an explanation for delays and why these causes are so numerous and often occurring.

**Conclusion**

The aim of each enterprise is to strengthen a competitive advantage. In any organization, the hidden downside or disadvantage can also occur in common operation. Oftentimes it may be related to lack of information as well as inadequate communication between departments. The solution to this problem involves finding an acceptable way to transmit the accurate data so as to achieve comparable results. Developing reliable data collection can take lots of time but successful process improvement are dependent on it. In connection with the use of certain methods of quality management can be recognized as important factors of train delay.

The conducted research shows that some of the quality methods are applicable to the processes in railway transport, regarding to train delay. These methods were chosen because it is completely transparent. The cause-and-effect diagram is dedicated for mapping processes and consequently the Pareto diagram can be used to analyze the possible delay causes. This study was focused on evaluating the available data from information systems in order to compare the various reasons for train delays.

**SELECTED ASPECTS OF SUBSISTENCE MINIMUM IN SLOVAKIA**

Alžbeta Suhányiová,1 Ladislav Suhányi2

**Abstract:** The subsistence minimum is a socially recognized minimum level of income for a person; any person whose income is below this level is considered to be in material need. It is one of the key elements of socio-political interventions; in that it binds with important functions in different areas. The level of minimum wage in Slovakia has not changed for the last four years, and now, this issue is a subject of extensive discussions in professional and scientific circles. The paper describes the subsistence minimum and presents the significant legislative changes that affect the functions of the subsistence minimum. The paper analyses, examines, and evaluates the development of the subsistence minimum of: an adult natural person, of another jointly assessed adult person, of non-dependent underage children, and of dependent children – in the period from 1998 to 2016 (the present). The paper also reflects on the current situation in dealing with the issue of the subsistence minimum and its impact on selected social benefits and personal income taxes in Slovakia. The results of the research helped us to propose recommendations on the issue of setting the subsistence minimum and the whole issue as such.

**JEL Classification Numbers:** E64, H24, I31; DOI: http://dx.doi.org/10.12955/cbup.v5.968

**Keywords:** subsistence minimum, legislative changes, social benefits, income tax.

**Introduction**

According to the Act no. 601/2003 Coll. on the subsistence minimum, it is the socially recognized minimum level of personal income below which a person is considered to be in material need.

The first federal law on the subsistence minimum (Act no. 463/1991 Coll.) came into force in July 1991. Originally the subsistence minimum served two important functions. First, it served as a threshold for assessing a person’s entitlement to social benefits. This function of the subsistence level has remained unchanged. Secondly, it served as a guaranteed minimum income threshold for those who were without any other income or their income did not reach the subsistence minimum. Income lower than the subsistence minimum was considered insufficient to ensure the livelihood and other basic needs of the person. The progressive nature of this legislation is evident when one considers the fact that it had been drawn up one year before the Recommendation 92/441 /EEC on common criteria concerning sufficient resources and social assistance in social protection systems.

After the split of Czechoslovakia the law on the subsistence level remained a key component of the social security system in the Slovak Republic. During the 90s a series of amendments to this law has been adopted. The aim of these amendments was to valorize the subsistence minimum to reflect inflation.

The new Act no. 125/1998 Coll. on the subsistence minimum and on fixing of the amounts for the purpose of state social benefits, as amended, was the result of a comprehensive policy and research efforts encouraged by the Concept of social sphere transformation. This law defined the subsistence minimum in the same way as the previous one (a socially recognized minimum level of personal income below which a person is considered to be in material need) the subsistence minimum continued to function as a reference point of the social security system. Act no. 195/1998 Coll. on social assistance which was adopted concurrently with the Act on the subsistence minimum served as a basis for the implementation of the minimum income guarantee system. This law thus made the first steps towards the division between the subsistence minimum and social assistance (minimum income schemes) and disrupted the function of the subsistence minimum guarantee as socially recognized minimum income.

The Ministry of Labour, Social Affairs and Family of the Slovak Republic is entitled to take steps governing the subsistence minimum on July 1 of each calendar year based on the growth rate of net cash income per capita or the growth rate or the cost of living of low-income households for the decisive period. The decisive period in which the growth of the cost of living of low-income households is being ascertained is: the period from April of the previous calendar year to April of the current calendar year (Horváthová, 2016a). The data are provided by the Statistical Office of the

---

1 University of Prešov, Faculty of Management, Konštantínova 16, Prešov, Slovakia, alzbeta.suhanyiova@unipo.sk
2 University of Prešov, Faculty of Management, Konštantínova 16, Prešov, Slovakia, ladislav.suhanyi@unipo.sk
Slovak Republic. The subsistence minimum according to Art. 5 par. 2 of Act no. 601/2003 shall be adjusted by multiplying the subsistence minimum with the following:

- growth rates of net cash income per capita published by the Statistical Office of the Slovak Republic - if the growth rate of net cash income per capita resulting from the comparison of the first quarter of the current calendar year and the first quarter of the previous calendar year is lower than the growth rate of the cost of living of low-income households for the decisive period, or
- the growth rate of the cost of living of low-income households published by the Statistical Office of the Slovak Republic - if the growth rate of the cost of living of low-income households for the decisive period is lower than the growth rate of net cash income per capita published by the Statistical Office of the Slovak Republic for the period of the first quarter of the current calendar year in comparison with the first quarter of the previous calendar year.

The amount of the subsistence minimum is not amended if one of the above-mentioned coefficients is lower than one or equal to one. This measure prevents the reduction of the subsistence minimum and the benefits associated with it.

The analysis of the development of the subsistence minimum

The subsistence minimum is therefore a socially recognized minimum level of personal income below which a person is considered to be in material need. Its level is adjusted annually, usually on July 1 of the calendar year. The following section examines the development of the monthly subsistence minimum amounts in Slovakia. The reference period is nineteen years, starting with the date on which Act no. 125/1998 Coll. came into force to the present (2016).

</table>
Since 1998, the subsistence minimum of one adult person increased by 98.49 EUR (nearly 98.89 %), of another jointly assessed adult person by 68.48 EUR (98.24%) and of independent minor child and dependent child by 45.61 EUR (101.79 %).

The highest increase of the subsistence minimum was recorded on July 1 2004. In the case of an adult person the increase of the subsistence minimum amounted to 12.28 EUR (8.79%), in case of another jointly assessed adult person the increase of the subsistence minimum amounted to 8.62 EUR (8.62%) and in case of independent minor child and dependent child the increase of the subsistence minimum amounted to 5.64 EUR (8.90 %).

In recent years, the coefficients for the valorization assessment of the subsistence minimum are below one (Horváthová, 2016b). We can therefore conclude that given the negative development of the growth rate of the cost of living of low-income households (now 0.994), the subsistence minimum level has remained "frozen" in the past years. Therefore, the Ministry did not issue any regulation that would alter the subsistence minimum level, and according to available information the Ministry does not plan to do so in 2017 either.

The currently valid amount of the subsistence minimum per household is specified in the table below.

Source: Author³

As already mentioned above, the subsistence minimum remains unchanged for the third year in a row: one adult person 198.09 EUR per month, for another jointly assessed adult person in the household 138.19 EUR per month, the independent minor child or dependent child 90.42 EUR per month. The subsistence minimum is calculated according to the following formula: 100% for the first adult in the household, 70% for each another jointly assessed adult person in the household, and 45% for each child.

³ The table was prepared by own processing based on data from Measures of the MoLSAF (from 1999 to 2016).

⁴ The table was prepared by own processing based on the Regulation by MoLSAF no. 186/2013.
The analysis of the impact of the subsistence minimum on the selected social benefits and taxes on personal income

The economic indicator "subsistence minimum" has an impact on social benefits (Palíderová, 2016), the amount of which depends on the subsistence minimum. It influences, for example, parental allowance, child allowance, the supplement to the child allowance, minimum maintenance, maintenance payments, allowances to support substitute care for a child, repeated financial contributions to compensate severe disability, early retirement or the amount of the minimum pension. The subsistence minimum has an impact on the level of the tax bonus, the amount of tax allowances, the amount of the tax base above which an individual is a subject to a higher rate of income tax (25%).

The following section analyzes the impact of the subsistence minimum on the amount of selected social benefits and the amount of income tax.

Early retirement pension – according to paragraph 2 of the Act no. 461/2003 Coll. the entitlement to early retirement pension arises, in addition to other factors, only to an insured person whose early retirement pension is greater than 1.2 times the subsistence minimum for an adult person as of the date a person requested such an allowance. The minimum amount of early retirement pension is therefore 237.80 EUR per month.

Minimum pension – the amount of the minimum pension is affected by, among other factors, the subsistence minimum in force on January 1 of the current calendar year. The minimum pension is at the level of the subsistence minimum 198.09 EUR and increases depending on the number of years worked. For example, for 30 years worked, the minimum pension is 269.50 EUR (1.36 times the subsistence minimum), for 40 years worked the minimum pension is 311.10 EUR (1.57 times the subsistence minimum), for 50 years worked the minimum pension is 370.50 EUR (1.87 times the subsistence minimum).

Income execution – the levy on an income execution (wage deductions or pension deductions) shall not withhold basic amount, which is 100% of the subsistence minimum. At present, this amount is 198.09 EUR.

Child maintenance – minimal maintenance under Art. 62 paragraph. 3 of Act no. 36/2005 Coll. is 30% of the subsistence minimum of a dependent child, which currently amounts to the 27.13 EUR for 1 child.

Tax bonus – tax bonus is a form of tax relief for a dependent child living with a taxpayer in a shared household, which reduces the income tax paid by a taxpayer. A taxpayer is entitled to the tax bonus provided he had a taxable income in the calendar year:
- from employment of at least 6 times the minimum wage (2 430 EUR),
- from business or other self-employed activity at least equal to 6 times the minimum wage and reported the tax base from these activities.

Tax bonus increases on January 1 of the tax year on the basis of the same coefficient as the subsistence minimum. The amount of monthly tax bonus for a dependent child is 21.41 EUR. The annual amount of the tax bonus that a taxpayer could claim per 2016 is 256.92 EUR. In 2017, this amount remains unchanged since the living wage in 2016 has not increased.

Nontaxable part of a base tax – the taxpayer may annually apply the nontaxable part of the tax for a dependent spouse or himself.

<table>
<thead>
<tr>
<th>The tax base for the taxpayer in EUR</th>
<th>Nontaxable part of a base tax in EUR</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤ 19 809 (100-times the subsistence minimum)</td>
<td>3 803.33 (19.2-times the subsistence minimum)</td>
</tr>
<tr>
<td>&gt; 19 809</td>
<td>8 755.578 (44.2 times the subsistence minimum) - 1/4 of the tax base</td>
</tr>
<tr>
<td>≤ 35 022.31 (176.8-times the subsistence minimum)</td>
<td>0</td>
</tr>
</tbody>
</table>

Source: Author³

³ The table was prepared by own processing in accordance with the Act no. 595/2003 Coll. on Income Tax, as amended.
The taxpayer may annually apply the nontaxable part of the tax if the tax base is less than 100-times the subsistence minimum – 3,803.33 EUR per year, which is equivalent to 19.2 times the current amount of the subsistence minimum. Monthly nontaxable part of the tax is 316.94 EUR (3,803.33 : 12 = 316.94 EUR). If the tax base exceeds 100-times the subsistence minimum, then the tax allowance is calculated as the difference between 44.2 times the subsistence minimum and 1/4 tax base. If the result is equal to or less than zero, the tax allowance on the taxpayer will be zero.

The taxpayer is entitled to apply the nontaxable part of the tax for the spouse who lives with the taxpayer in the shared household and meets at least one of the following conditions: takes care of a dependent minor child, receives a financial allowance for nursing a member of family, or has been registered with the Labour office, or is considered a disabled person. The amount of the nontaxable part of the tax for the spouse showed in the table below depends not only on the amount of the taxpayer’s tax base, but also on the amount of spouse’s income.

Table 4: Determination the nontaxable part of a base tax for spouse

It follows that the subsistence minimum has a significant impact on personal income taxes. Specifically, the subsistence minimum influences the amount of nontaxable part of a base tax for a taxpayer and spouse (see Tables 3 and 4), as well as the obligation to file a tax return, minimum tax, and the use of the appropriate tax rate. Due to the limited extent of the paper we will not research this issue any further.

**Conclusion**

The subsistence minimum can be easily described as the sum necessary for one’s survival. It should be sufficient for basic needs, namely one hot meal a day, necessary clothing and shelter. The highest increase in the subsistence minimum was recorded in 2004, almost 9%. Since 2013, the growth rate of the cost of living of low-income households (≤ 1) has been developing negatively, therefore the subsistence minimum is also stagnating. If the subsistence minimum does not increase, the contributions that state pays parents, students, families in need, etc. also do not increase.

We see the current form and function of the subsistence minimum in a very negative light since the subsistence minimum stopped serving its original purpose – to protect those in need. Since the subsistence minimum should cover the basic human needs, its current form needs a serious revision. The subsistence minimum should reflect the actual needs and purchases of low-income families. We expect the subsistence minimum to become much more meaningful.

According to Kusá (2010), too low income makes it impossible for the household to “behave as it should.” The minimum income (the subsistence minimum, however, has no longer the character of a minimum income) in other civilized societies saves households from bad decisions (hunger, not paying bills, absenteeism in schools, etc.) and prevents households from getting into poverty.

This paper is an outcome of the projects VEGA no. 1/0909/16 and KEGA no. 058PU-4/2015.

COLLABORATIVE ECONOMY AS AN INDICATION OF SUSTAINABLE CONSUMPTION IN RESULTS OF EXAMINED PEOPLE

Agnieszka Tłuczak,1 Sabina Kaufl

Abstract: Sustainable consumption takes inspiration from the newest trends in economics which is a collaborative economy. This type of economy changes the model of organization and distribution based on sharing, using and creating together. The basic aim of this study is pointing out a purpose of a collaborating economy in the accomplishment of sustained consumption rules and in a conscious and self-motivated limit of personal consumption to the purpose of co-sharing. This task is going to be achieved with empirical verification of consumers behavior based on answers to a questionnaire. Research has confirmed the suggested hypothesis. People want to attend in collaborative consumption, which is positively correlated with the level of self-satisfaction from life and income. The results presented in this paper shouldn't be treated as final, because it was pilot research.

Keywords: collaborative, consumption, co-sharing, sustainable.

Introduction

The last two decades of 21st century mark themselves in the growth of the meaning of consumption described as sustainable and being the answer of consumers to the growing social and environmental issues. It is said that it has its source in a report from Bruntland which sketched directions of development of the modern economy systems (Our 1987, p. 16).

Sustainable consumption is in the center of concern of the economy, studies about rational managing limited resources and alternative ways of using it (Sowell 2000; p. 66, Mont, Plepys 2008, p. 532). It is an alternative for consumerism, spare consumption that crosses a level which is necessary to appease people’s needs (Baudrillard 2005). It means that optimal, conscious and responsible use of available natural resources, goods and services according to rules of sustainable development. We are able to see it in the reorientation of behaviors, change of egocentric basis in an egocentric direction and purchasing decisions which include the needs of others and the environment. Sustainable consumption is also a conscious limit of consumption – anti-consumption which doesn’t mean quitting from satisfying your needs but making it more rational, responsible and ethical (Binkley & Littler, 2011; Iyer & Muney, 2009; Chatzidakis & Lee, 2013, Hogg et al., 2009; Shaw & Newholm, 2002).

Sustainable consumption takes inspiration from the newest trends in economics which is a collaborative economy which changes the model of organization and distribution based on sharing, using and creating together (Botsman & Rogers, 2010, Pearson, 2014; Ozanne & Ballantyne, 2010). The basic aim of this study is pointing out a purpose of a collaborating economy in the accomplishment of sustained consumption rules and in a conscious and self-motivated limit of personal consumption to the purpose of co-sharing. This task is going to be achieved with empirical verification of consumers behavior based on answers in a questionnaire.

Collaborative economy as an element of sustainable consumption – literature review

The problem of sustainable consumption gets more and more attention. Its main idea is increasing the disequilibrium between using resources and their availability on earth and the big differentiation of the standard of living among people who live in regions with different rates of growth (Evans 2011; Lorek & Fuchs, 2014). This is evident in gained behaviors which support using products that consummate basic needs and minimize the abortion of natural resources. The increased prevalence of sustainable consumption opens up wide abilities to creating new business models based on rules of the collaborative economy. This has been started in the new technology era with easy access to the internet. It is defined as sharing, bartering, lending and ranting of products and technology (Botsman & Rogers 2010; Schor & Thompson 2014b, pp. 4 – 6). It is opposite to the usual business economy which leads to having and getting, the expression of my own “me” and identification with objects (Kleine et al., 1995, p. 328). Schor names the collaborative economy a social, sustainable innovation with the ability to improve and develop new technologies for communication and informatics and web

1 Opole University, atluczak@uni.opole.pl
2 Opole University, skauf@uni.opole.pl
communities (Schor, 2011). A Collaborative (or sharing) economy is meant to get relationships with strangers through cyber platforms (Schor, 2015).

The author of “sharing economy” is M. Weltzman, the economist who used it in 1984 for the first time in the book named “The share economy.” This saying means “collaborative consumption made by the activities of sharing, exchanging and rental of resources without owning the goods (Lessing, 2008). Collaborative consumption shows the tendencies of consumers to involve themselves into systems and consumption webs, which gives them access to products and services without paying obligatory fees that come from property of law (Botsman & Roger, 2010; Gansky, 2010). It is a symptom of common digitization and actualize era of prosumers (Ritzer & Jurgenson, 2010; Toffler, 1980). Nowadays almost every consumer has an ability to become a producer by only using commonly available web platforms, which give the consumers a variety of opportunities to express their identities (Belk 2013a, Belk 2013b). It means the subject of a sharing economy are resources, services and transport (BlaBlaCar, Turo, Uber) accommodation and space (Airbnb, Landshare, JustPark), abilities and time (Killshare, Skilltrade, Khan Academy) and other resources like for example tools.

The Internet and social media do not guarantee the sense of independence. Web connections have contributed to creating a new form of community where property doesn’t have any economic value. What is very important is affiliation, trust, and devotion. In an economical context collaborative consumption is an economical model sustained by the common use of products (ex. physical good or service) in webs C2C and B2C (Hamari et al., 2015, p.1). In the first case those webs have been coordinated through social websites which help in social interaction (Liand & Turban, 2011), in the second case through an agent. In every single one of them, the main condition is specific information about the reputation on the social website of people from the exchange. R. Bosman and R. Rogers highlight that social websites (Facebook, Twitter, Freecycle) increase the ability of consumers to exchange and cooperate and not see any risk (Botsman & Rogers, 2010).

Collaborative consumption is social movement against isolation, separation and grouping, which keeps getting more and more popular among consumers, especially young, because it precisely gives them their basic needs: low prices, individualism, comfort. It is possible thanks to the effective collaboration free sources (ex. car, flat, abilities). Even though collaboration isn’t based on sharing properties, it needs transaction mechanisms C2C, like for example: making bookings (of a bike, car) or payments. The sharing economy is not always only kindness and charity, it’s also profit that matters and the need of saving and confrontation with ability to get profits is the thing that makes it work. It will be possible according to decreasing costs of transactions made with the help of the Internet. Just like Rifkin said: in the future, there will be community of zero final cost, in which the costs of using a certain good through next subjects will be very low (Rifkin, 2015). Through Internet platforms it will be possible to widen a size of users of a goods and Internet services will earn on advertisements or payments for help. Even though in the literature of the subject there is highlighted the positive role of consumption in promoting “positive” materialism which means connection to the meaning of quality of goods, their background, kind of used sources and extend a cycle of using a product (Schor, Thompson 2014b, p.14) it is hard today to describe how collaboration is really promoting the matter of sustainable consumption. As Schor said widely shared beliefs about the good influence of the sharing economy and anti-consumption show the basis of consumers against sustainable consumption.

**Methodology and results of studies**

The main subject of study is the collaborative economy, which makes up an integral element of sustainable development. Authors of this theory think that collaboration is shown in resignation, reduction and reuse of goods shows sustainable style of living. It was established additional that consumers using sharing are more pleased from their life and they spent their money more rationally. Those assumptions make us enunciate two hypothesis:

H1: Collaborative consumption is positively connected to happiness in life

H2: Sharing economy is positively connected with how much we have.

Verification of the hypothesis was made based on a questionnaire made by group of professors I. Balderjahn from University of Potsdam. The research was conducted during spring 2016 in Poland, in opolskie voivodeship, on 250 randomly chosen and connected people. According to age, sex, and
income, the research was compatible to the structure of the general population (tab 1.). This research was a kind of pilot. These were pilot studies, the location was chosen deliberately.

Source: Author.

The gained results supported the made hypothesis. Collaborative consumption is correlated to the level of self-happiness from living of the studied people. Additionally, what’s worth more attention is a fact that it is a positive correlation, so as the will to share a good of stabile use is bigger, the more self-happy is the studied person.

As the analysis have shown, answers according to characteristics of studied people are differentiations between attending in the sharing economy and the level of self-happiness between male and female. Male mark their level of self-happiness higher than female, but their will to share is smaller. Among the described items which the studied people pointed as those that they are able to share, in the first place was a drill, then snow skis, then a washing machine and finally a camera.

Income that divides polish community is also positively correlated with will to share. Often having more income lead to buying additional, not necessarily useful products. Among the studied people there is bigger will to leave their money in single use in the share economy. Those people think that rather than having something, they would like to have a free access to some other goods. Even though if they already have something they are not necessarily connected to it, but they can share it with other people.

As a main reason of being part of sharing economy, the studied people say it’s their saving (32%), ability to meet other people (26%) and a will to help others. Their attitude to property changes and approval of services and applications which are based on sharing rule. More and more people see how important is access to goods and not actually having it. Some part of them is doing it because of economic reasons, but some are fully into the idea of sharing it (goods).

**Summary**

There is a new trend in Western Europe countries, it is a continued new idea in the Polish country. The consciousness of limit of natural resources should incline consumers to share certain goods of permanent use (and not only those). The sharing economy should make consumers feel positive and they show this with a connection to certain motivations. More of the studied people agree that it is more affordable to use someone else’s goods than having it for themselves. Consumers see real advantages from someone’s resources in place of actually having it for example savings, feeling comfortable and elasticity: empowering social connections, positive influence to the environment, and a bigger satisfaction from interaction. Research has confirmed the made hypothesis. The will to participate in collaborative consumption is positively correlated with a level of self-satisfaction from life and income. Our theoretical and empirical assumptions give basic ideas to making a study directed
to Polish consumers. The results presented in our work should be treated as final because the research we made was only a pilot and in the future authors are going to widen the presented topics.

**Final Comments**

Sustainable consumption takes inspiration from the newest trends in economics which is a collaborative economy. It is a new trend in Western Europe countries. The main reason of being part of sharing economy, the studied people say it’s their saving (32%), ability to meet other people (26%) and a will to help others.

A NEW SIMPLIFIED DECISION MAKING SYSTEM FOR SMALL PROJECTS

Secărea Tudorel¹

Abstract: Making decisions on funding or not funding projects is the most difficult process in management, especially for the state services that have a limited budget. The aim of this study is to establish a new simplified system for evaluating small projects based on translating all values into economic terms. The new system tries to simplify the Cost-Benefit Analysis (on which it is based) to the bare minimum and still keep a high degree of relevance to the decision-making process. The conclusions were somewhat remarkable, mostly because the system gives accurate and relevant data for comparing projects despite its simplicity. The other big benefit of this system is its simple nature and ease of understanding even for people with no economic studies.

The applied part of this paper involves an analysis of real projects in Brasov County – Romania and the results of applying Cost-Benefit Analysis and the new method for evaluating projects.

The paper concludes proposing a new, modern and simple system for improving decision making on small projects.

JEL Classification Numbers: D61, D70; DOI: http://dx.doi.org/10.12955/cbup.v5.970

Keywords: decision making, efficiency, project

Introduction

Investment decisions represent the main problem of any development strategy. They pose a great obstacle for any management structure, especially in the public sector. A decision has to be made after research results to determine the costs and returns for each option. When an investment decision has to be taken to implement a small project (usually with local impact), one form or another of weighing costs against benefits is involved. The current system used to calculate future benefits versus cost is the Cost-Benefit Analysis. This analysis is best used for big projects that have impacts measurable in monetary terms. In a real-world application, this analysis is too complex for small projects so the aim of this study is to create a new simplified system for evaluating the impact projects will have. The new system will incorporate the core components of the Cost-Benefit Analysis.

The Financial Analysis of a project

The most used system for analyzing the opportunity of an investment that can be financed by grants consist of six steps (Florio, 2008):

- A presentation and discussion of the socio-economic context and the objectives;
- The clear identification of the project;
- The study of the feasibility of the project and of alternative options;
- Financial Analysis;
- Economic Analysis;
- Risk Assessment.

Our research is based on the Financial Analysis – that is the core of the Cost-Benefit Analysis and which dictates the value of the project in the long term (Dinwiddy, 1996). The financial Analysis is based on the discounted cash flow approach. A system of accounting tables should show cash inflows and outflows related to (Florio, 2008):

- total investment costs;
- total operating costs and revenues;
- financial return on the investment costs: FNPV and FRR;
- sources of finance;
- financial sustainability;
- the latter takes into account the impact of the grant on national (public and private) investors.

For the projects to be funded the Cost-Benefit Analysis must generate results that respect the indicators provided in the Guides for the European Union Programs. This analysis responds to the question: What will be the impact of the project on the target groups in society? (Belli, 2001)

The main purpose of the financial analysis is to use the project cash flow forecasts to calculate suitable net return indicators (Drèze, 1987). In the European Union Guides, a particular emphasis is placed on

¹ Transilvania University, Brasov, Romania, e-mail: secarea_t@yahoo.com
two financial indicators: The Financial Net Present Value (FNPV) and the Financial Internal Rate of Return (FRR) (Florio, 2008).

Investment analysis

For our study, we took 12 real projects that have been implemented in the Brasov County – Romania with funding from the European Union. The projects range from constructions to services and provide the communities with different benefits.

The majority of the guides, especially those in rural area (The Agency for Financing Rural Investment, 2017) state that the Cost-Benefit Analysis results influence the project selection and funding. In the case of construction projects, the Cost-Benefit Analysis is mandatory, but in the service area this analysis is not used. For services the project is scored on the quality of the proposition and on the estimated impact.

The project performance indicators are the basis for the investment analysis. According to the guidelines the analysis is based on the total investment (which is form from European Grant and local/national contribution), the operating costs and revenues. These inputs are used to calculate the financial net present value (FNPV) and financial internal rate of return (FRR).

The financial net present value is defined as the sum that occurs when the expected investment and operating costs of the project (suitably discounted) are deducted from the discounted value of the expected revenues:

\[ \text{FNPV} = \sum_{t=0}^{n} a_t S_t = \frac{S_0}{(1+i)^0} + \frac{S_1}{(1+i)^1} + ... + \frac{S_n}{(1+i)^n} \]

Where \( S_t \) is the balance of cash flow at time \( t \) (net cash flow) and \( a_t \) is the financial discount factor chosen for discounting at time \( t \).

The financial internal rate of return is defined as the discount rate that produces a zero FNPV:

\[ \text{FNPV} = \sum [S_t / (1+FRR)^t] = 0 \]

More specifically, the financial net present value (FNPV), and the financial rate of return (FRR), on the total investment cost, measure the performance of the investment independently of the sources or methods of financing.

The European Guidelines state that for a project to be funded by grant the FNPV must be negative and FRR be smaller than 5% (Florio, 2008).

In Table 1 below there are the results of the financial analysis for the projects studied.

From this financial analysis of all 12 projects we immediately see that all the FNPV are negative and FRR are smaller than 5% so is clear that all the projects need European Grant funding. But the problem occurs when we try to differentiate between them. Let’s say that we could only finance 6 out of the 12 projects proposed. The financial analysis is a very complex tool from which result are very complex. For a trained economist, these result can be very helpful, but for ordinary people to understand and make decisions based on this numbers is hard, harder still is the possibility to re-calculate these indicators if we tweak the variables that generated them – especially the total investment and the revenues and/or costs.

Also we must take into account that the Cost-Benefit Analysis is used and effective especially for large scale projects. Its complexity is fully justified on massive projects (Pearce, 2006), but for smaller projects with local implication this analysis with all the financial and economic indicators seems too complex. We consider that investments that impact only local communities, smaller than 30,000 people and with simple to estimate costs and benefits need a new type of efficiency measure unit.

Investment opportunity number

The investment opportunity number is a financial indicator proposed by the author that resulted from the research and analyses of projects and their efficiency - the usage of European Grants – that are a limited resource. This indicator factors in the most important numbers for calculating efficiency of using the funds, but relays on a very simple equation.

The process of calculating this indicator has two stages:
Stage 1 – calculating the basic indicators from the data that is generated by the project:

A = \frac{(\text{Revenues on 5 Years that includes indirect revenues})}{(\text{EU Grant})}

B = \frac{(\text{Revenues on 5 Years that includes indirect revenues})}{(\text{Operating costs on 5 Years})}

C = \frac{(\text{Revenues on 5 Years that includes indirect revenues})}{(\text{Local / national contribution})}

### Table 1: Results of the financial analysis of the studied projects.

Source: Author

This first stage takes into account the revenues (the most important indicator) that also contain the indirect revenues (for example for a sewer system the revenues from the taxes and also generated from the improving the health of the community – indirect revenue). The revenues are divided by the Grant the Operating costs and the Local / national contribution to justify the funding better.
This system of comparing the direct revenues over the main cost indicators has a natural logic, but these 3 numbers can’t generate a decision. The three numbers must be united in a simple to understand equation:

\[ A \times 35\% + B \times 45\% + C \times 20\% = ION \] (Investment opportunity number)

Table 2: The Investment opportunity number calculated for the 12 projects

The percentage for the importance of the individual indicator has been chosen by the author for the local environment. The local / national contribution is smaller in size for this program, so the impact in the bigger picture is diminished to 20% from the indicator. By contrast the revenues versus operating cost has a bigger importance because the financial support from the EU stops after the initial investment and the local entities must finance the operating of the structure / services.

This percentage could be changed to be adequate for the local environments where they are calculated. For projects where the local / national contribution is greater, the percentage can be adequately changed.
The period of 5 years had been chosen for this analysis because all the EU Grants stipulate a 5-year period of sustainability for the projects. This period is the minimum in which the project structures must operate according to the initial purpose of the project. Also, this period is best suited for small local projects that usually have a smaller lifespan.

From the Table 2 above we can see that the ION indicator is calculated for all the projects, regarding if they are construction or services based.

Also, this system is easy to transform into a formula in a spreadsheet that can be calculated automatically based on the inputs made. This ease of use and the ability to be understood and calculated by almost everyone regardless of their education, makes this indicator a powerful tool for understanding a project value and comparing it to other projects or even other options of the same project.

The projects can be arranged according to this indicator:

![Figure 1: Project type, description and Investment opportunity number](source: author)

We can observe that the service based projects took the first 3 positions due to the small costs of the projects and the big indirect revenues. All the projects are in direct relation to the economic impact that they had in the local region. We can clearly see that the promotion of tourism and close by, the sewer systems, are investments that have proved the most viable. At the bottom is the Multifunctional Social Building from the Vulcan village that has been proved to be a very minor improvement in the local social and economic sector.

**Conclusion**

This indicator is the first step in simplifying the process of decision making for local projects. This analysis, like its more complex counterpart – the Cost-Benefit Analysis – doesn’t give the full answer to the viability and economic/social impact of a project. But it does put the basis for reversing the trend in which the whole economic system goes – from simple to complex and even more complex.

It is true that in this simple analysis we didn’t take into account all the economic factors and uncertainties, but on local projects, especially ones with lifespans of around 5 years, these externalities could, at least in theory, have a less of an effect on the overall percentage – about 1 – 5%. So, in the bigger picture these external factors will not affect the final result. Also, the model could be modified to take into account more complex factors if needed.

In conclusion, this tool is created as a response to the growing complexity of decision making, especially for project funding. It is a tool that can be used and customized to the need of the entity that finances or want to implement a project. Its purpose is to make project analysis easier and accessible for everybody. This method is intended for use especially in developing countries to order a large number of alternatives and/or projects in a rapid manner and with a high degree of confidence. We must mention that this indicator is only a part of the decision-making process and it must be used with the other steps in analyzing a project (socio-economic context, the analysis of objectives, study of the
feasibility, risk assessment). Its importance comes from simplifying the financial analysis and providing a fast, easy to calculate, and dependable indicator for total value over total costs for a project.

Acknowledgment
All the data from the projects come from 8 years of analyzing and implementing projects for the Brasov County – Romania. Special thanks to the Administrations of: Bran, Cincu, Cristian, Drăguș, Feldioara, Fundata, Râșnov, Rucăr, Sânpetru, Voila, Vulcan.

INCREASING THE SOCIAL EFFECTIVENESS OF PUBLIC TRANSPORT

Svetla Tzvetkova

Abstract: The functioning of public transport as a primarily social phenomenon leads to the realization of a significant social effect. The more deployed and high-quality the level of transportations is, the larger the social effect is. This also elevates the culture of passenger service and the use of modern environmentally friendly means of transport. The social effect has a multilateral manifestation, but the most significant one is its manifestation in the following trends: satisfying the population’s various travel needs; reducing travel time and increasing free time, thus increasing the time for rest, relaxation, entertainment, educational and sport activities. The social effect is also achieved through the use of modern and environmentally friendly means of transport with reduced harmful emissions and noise impact on the population’s health. The primary goal of socially effective public transport is to be accessible to everyone, to provide comfort, awareness, safety and security during passenger travel by incorporating efficient and stable urban intelligent transport systems and modern integrated environmentally friendly public transport with better emission indicators. The present report is dedicated to the main trends of increasing the social effectiveness of public transport in cities.

JEL Classification Numbers: R41; DOI: http://dx.doi.org/10.12955/cbup.v5.971

Keywords: public transport, social effectiveness, quality transport, stable urban transport systems

Introduction
Increasing the social effectiveness of public transport has a defining role in the social and economic development of major cities. Quality transport contributes to the improvement of cultural and economic relations between separate regions, the trouble-free transportation of passengers for production needs and personal needs, and it becomes a basis for enhancing citizens’ living conditions and standard. The issue of the social effectiveness of public transport and the quality of freights has become particularly topical in recent years. Because the dynamic of urban traffic and the growing number of personal vehicles are the main reasons for traffic jams in European metropolises and environmental pollution with about 40% of CO₂ emissions and 70% of other air pollutant emissions, the European Commission has unsurprisingly focused on these problems, compiling the Green Book of Urban Mobility. It is a global strategy that defines the challenges that European cities face in their drive to provide stable mobility and social effectiveness by facilitating traffic in cities, reducing environmental pollution and noise and improving the organization, accessibility, security and safety of public transport.

The primary objectives of public transport in major European cities have to be: increasing social effectiveness through the use of higher-quality and more environmentally friendly transport; convincing citizens to use their personal cars less and aim at using public transport more frequently; fully satisfying their needs and covering their criteria for high-quality transport services.

Social effectiveness and quality of public transport
The social effectiveness of public transport is shown in the results of expenses for achieving a certain social effect. The results related to the degree of satisfying citizens’ needs for public transport are regarded as social effects. The higher the quality of public transport, the higher its social effectiveness (Vasilev, 1997).

It is especially important that firms dealing with transport services strive to fully satisfy users’ needs and, ideally, attempt to offer them such quality that best suits their needs. Therefore, the target quality of the service has to be as close to customers’ marketing criteria and their ideas of higher-quality transport services as possible. The literature does not provide a uniform standpoint on the hierarchy of individual indicators measuring the quality of public transport due to the subjective nature of satisfying travel needs, which means that it not always accurately defined or simple. People from different cities and states can have different habits, traditions and expectations regarding quality. The hierarchy of consumer criteria in regards to satisfying needs is a variable because customer expectations are not consistent and they can become larger, depending on the advancement in other sectors (for example, by

---

1 UNWE – Sofia, svetlatzvetkova@abv.bg
introducing new technology, air conditioning and increasing comfort standards).

However, there is a uniform opinion in transport literature about the degree of importance of the “time” indicator, or the quantity of time spent on traveling with public transport is accepted as defining the quality of the service. Another important indicator directly linked to time is the “availability” indicator, which defines the degree of regularity of vehicle movement on preliminarily defined routes, which is determined by the available and planned in the schedule number of vehicles, especially in the peak periods of the day. Transport operators have to keep a constant eye on the percentage of trains traveling on time; the threshold of delay has to be between 2.5 to 5 minutes. The percentage of freight regularity has to be 97-98% in order to achieve the necessary quality of urban population service. This is especially important due to the circumstance that irregularity in public transport vehicle traffic is linked to a number of negative consequences.

In order for urban passenger traffic to be appealing, it has to be both regular and easily accessible to all passengers; 96% of the passengers cannot waste a lot of time and they need to have easy access to vehicles. Accessibility concerns primarily people with impeded mobility, disabled people, elderly people, families with small children who need to have easy access to the infrastructure of public transport as well as to automatic ticket machines.

The “comfort during trips” indicator is defining for the quality of public transport in Europe’s larger capitals. Comfort while traveling usually means the number of people per square meter. According to the standard in peak urban transport moments, the number of passengers per square meter cannot exceed four people (Mutafchiev, 2000). Creating conditions for a comfortable and pleasant travel experience also suggests that the temperatures and the level of cleanliness in vehicles have to be in accordance with the preliminarily defined standards.

The “awareness” indicator is also vital to quality customer service. Traveling citizens have to be kept updated on current information about the vehicle schedules at stations, stops and the vehicles themselves, as well as receive timely and immediate information about impending delays or irregularity of vehicles in case an operator’s performance is impaired.

Caring about customers’ satisfaction with transport services has to be a priority of transport operators carrying out passenger freights, which is another important indicator regarding the level of the provided transport service. The company has to keep an eye out for incoming citizen complaints and adopt quick and appropriate measures to remove the problems that arise during or in relation to freights.

The “traffic safety and security” indicator also determines a large portion of citizens’ decisions to use one mode of transportation or another. Safe and accident-free travel, as well as maintaining the security and peace of citizens during trips is one of the most important indicators regarding the degree of quality of public transport.

**Directions for increasing social effectiveness**

In order to increase the social effectiveness of public transport, public transporters have to adopt effective measures for increasing the quality of the transport services they offer. Public transport enterprises have to successfully convince citizens to use public transport through the high-quality transport services they offer and make them aware of its social effects. In order to achieve this, they have to reduce the travel time and provide comfortable, secure and environmentally friendly public transport. This can be achieved through introducing modern high-speed vehicles into service, increasing the number of public transport routes and the availability, regularity and rhythm of vehicles, especially in the peak and most bearing periods of the day.

The necessity to modernize urban infrastructure so it corresponds with the city’s needs is crucial to increasing the quality of public transport freights. Modern stops equipped with information panels need to be built. It is necessary for the city to be equipped with available parking lots near subway stations, next to which there need to be parking spaces for bicycles. Access to bus or tram transport has to be provided next to each subway station. Trams are preferable because of their high environmental friendliness and passenger capacity. Overall, in order to increase the quality of public transport and reduce travel time, it is necessary to improve intermodal connections and create more comfort during the whole trip. However, one of the most important issues related to the effective functioning of urban passenger transport is coordinating the work of its separate types. The good integration of the work of different urban passenger transport types is a good prerequisite for improving the transport service of
the population, which simultaneously creates an opportunity for the most rational use of transport vehicles possible.

The safety and security of stations, stops and vehicles has to be at the necessary level for both passengers and vehicle drivers, i.e. by introducing a security strategy through equipping stops and vehicles with cameras and creating better safety conditions for stations and the surrounding territories. Regular security and safety training also have to be organized, as well as increasing vigilance.

Traffic safety has primary significance for secure passenger trips with public transport. The main trends of increasing vehicle reliability and traffic safety are aimed at updating vehicles and increasing drivers’ qualification. A typical trait of transport manufacturing activity is that its nature is too cyclic and it is directly related to the specifics of transport and the probability for the occurrence of risky situations and traffic accidents. Its employees are required to have more specific qualities and skills which are necessary during the sometime extreme situations that arise during work. Transport workers have to be able to react quickly and appropriately; sometimes, within a very limited time frame, they have to make important and responsible decisions upon which people’s lives depend. In addition to high qualification and professionalism, it is necessary for transport employees to possess other qualities such as high psychological stability.

In addition, the rolling stock within the public transport system has to be modernized constantly. The rolling stock has to be renewed gradually, with vehicles with modern technical characteristics and high parameters of comfort and environmental friendliness, which will increase comfort and safety during travel and will remove even the smallest prerequisites for the occurrence of traffic accidents. By introducing modern, environmentally friendly and energy-saving vehicles into service, better environmental parameters will be reached, such as air quality and harmful emissions, reduction of pollution, greenhouse effect and energy consumption; noise reduction and climate change are necessary for improving the population’s health status and reducing healthcare expenses.

It is necessary to implement intelligent transport systems which will aid public transport management and organization in major cities. Their implementation can improve cities overall vision and image. These are innovative and modern decisions that guarantee bigger safety and security for citizens and can improve their living standards as a whole. They can improve significantly traffic situation in cities, make various urban zones more accessible and secure access to workplaces and services for all citizens. The appeal and quality of the urban environment can be improved as a whole.

Based on operational experience, some of the benefits of implementing intelligent transport systems are measured quantitatively, with regard to the following key aspects of exploitation concerning the city of Sofia: management of the network and road safety.

Source: Author
The incorporation of such systems can reduce travel time by about 20%, greenhouse gas emissions from cars by about 15%, improve public transport traffic observation by 40% and reduce traffic accidents by about 35% (Strategy for ITS development for Sofia, 2010).

Increasing the social effectiveness and partially the quality of urban passenger transport has to be aimed at current and potential users, with the primary beneficiaries being passengers with impeded mobility, elderly people and families with children. Safety and security measures also have to be introduced for the protection of public transport drivers. It is advisable to analyze the current situation of supply and demand in public transport and to identify the zones that are inaccessible or are sparsely visited through public transport. Preliminary marketing studies are also necessary to determine the specific demands and needs of target groups as well as the political support and willingness of local decision-making authorities to change the way that public transport is perceived and supported in order to stimulate different target groups to use this form of transportation.

**Conclusion**

The development of socially effective and integrated public transport is in accordance with the EU’s transport policy for achieving urban mobility of citizens. It involves encouraging the use of environmentally friendly transport, providing accessibility and mobility for citizens and reducing the use of their personal vehicles. International experience shows that in regards to company management in the field of urban bus transport, the measures for improving electronic billing, car pool management, providing passengers with information, right of way at intersections with traffic light regulation, etc. can lead to significant results when it comes to increasing the number of travels (passengers) by public transport (Gatovski, 2016). This will guarantee successful economic and social development for cities, high quality of life for their citizens, traffic jam reduction and environmental protection. Special attention is given to the provision of higher-quality and more accessible public transport for disadvantaged people, people with impeded mobility, disabled people, elderly people, families and small children.

THE PROGRAM “FAMILY 500 PLUS” – IMPLICATIONS FOR HOUSEHOLD FINANCE IN POLAND

Agnieszka Wiśniewska, Marta Musiał, Beata Świecka

Abstract: Household finance is heavily dependent on the phase of a family’s development. As the family grows, the household’s financial needs change. Young Poles choose not to create families, mostly because of their financial situations. In order to increase the number of births, the “Family 500+” program was introduced in Poland, where parents can receive a benefit of 500,00 PLN (about 120 euros) per month for a second and every further child. It is indicated that the effects of the 500+ program are both positive and negative. Some effects of the program are already visible, although many forecasts have not yet been confirmed in the statistics due to the short duration of the program. The purpose of the article is to identify the impact of the government’s family policy program: “Family 500+,” introduced in April 2016. This article describes the assumptions and instruments of family policy in Poland, a description of the assumptions of the “Family 500+” program and the implications for household finances in Poland in terms of consumption, income, debt, the labor market or poverty.

JEL Classification Numbers: H D14; G21; J13; DOI: http://dx.doi.org/10.12955/cbup.v5.972

Keywords: household finance; family policy; family benefits

Introduction

Most authors equate the concept of household finance with personal finance (Campbell 2006; Korenik and Korenik 2004; Bywalc 2009; Taijuga 2007; Waliszewski 2010; Bogacka-Kisiel (ed.) 2012). For the purposes of this article, the author adopts the definition of personal finance sensu largo by Świecka (2014): „Personal finance sensu largo is a sub-discipline of finance related to funds management by household members. In other words, personal finance on the one hand are related to collecting funds, on the other hand, to spending, saving, and investing them by members of households. In this case, the concept of personal finance sensu largo can be synonymous with the concept of household finances”. Household finance is heavily dependent on the phase of a family’s development. As the family grows, the household’s financial needs change. In Poland, the phenomenon of an aging society is observed, due to e.g. low birth rate. Young Poles choose not to create families, mostly because of their financial situations. In order to increase the number of births, the “Family 500+” program was introduced in Poland, where parents can receive a benefit of 500,00 PLN (120 euros) per month for a second and every further child. According to many reports, the program ”Family 500+” affects both the finances of households as well as the whole economy. It is indicated that the effects of the 500+ program are to be both positive and negative. Some effects of the program are already visible, although many forecasts have not yet been confirmed in the statistics due to the short duration of the program. The purpose of the article is to identify the impact of the government’s family policy program: "Family 500+" introduced in April 2016. This article describes the assumptions and instruments of family policy in Poland, a description of the assumptions of the "Family 500+" program, and the implications for household finances in Poland in terms of consumption, income, debt, the labour market or poverty.

Family politics in Poland

Family policy is very important in the workings of the state as part of its social policy. The concept of “family policy” was used for the first time in the 1940s, during debates on social policy which took place at that time in Europe. The first activities addressed towards families were taken in France and Sweden at the turn of the nineteenth and twentieth century’s (Myrdal 1941). “Family policy” is defined as all means, actions, and legal norms which are carried out by the state and whose aim is to create acceptable living conditions for all aspects of family existence - its beginnings, appropriate functioning and its fulfilment of all socially important roles (Kamerman 1994). In the literature, two types of family policy are distinguished: indirect policy (implicit) and direct policy addressed to families (explicit). There are activities taken within implicit policy which are not aimed directly at households but have consequences on family functioning - such as in the case of preventing unemployment, or tax policy. Explicit family policy comprises clearly defined actions, programs and benefits addressed to families as such or family members (Balcerzak-Paradowska 2004).

1 Faculty of Management and Economics of Services, University of Szczecin, agnieszka.wisniewska@wzieu.pl
2 Faculty of Management and Economics of Services, University of Szczecin, mart.a.musial@wzieu.pl
3 Faculty of Management and Economics of Services, University of Szczecin, beata.swiecka@wzieu.pl
Family policy in Poland has been evaluated and changed many times over the years. From 1989 to 2015 three most important periods may be distinguished: transformational (1989-1997), transitive (1997-2005), mature (2005-2015). The first of these periods (transformational) was characterized by a limited family policy with the state’s efforts addressed mostly to the unemployed. The first, transformational, phase lacked mostly explicit programs and strategies addressed to families, with a decline in the number of places in nurseries and kindergartens. In the following period, starting in 1997, family policy took a different form – addressed directly to family functioning. It was characterized by activities such as: extending maternity leave, the introduction of a child tax credit and a single payment at child birth (the so called “becikowe”), and a gradual increase in the number of places in nurseries and kindergartens. In the last period, the mature period, family policy takes the form of improvement of the previously introduced solutions and aims at reimbursing families for the expenditure they have to make in keeping a household and balancing professional life and looking after children (Sobociński 2016).

State family policy is implemented through instruments in the form of legal means (these comprise all legal norms, which regulate the relationships of a family with the state and other institutions), financial benefits (all kinds of benefits and allowances), in-kind benefits (comprising material aid given to families) as well as benefits in the form of services (services provided by different kinds of institutions with the aim of supporting families in their basic functions – for example: nurseries, kindergartens, after-school clubs). Table no. 1 shows selected instruments of the Polish family policy.

Program “Family 500+”

Particular attention should be drawn to the “Family 500+” program, which has been operating in Poland since 1 April, 2016. According to its assumptions, the program is aimed at supporting families in a broad, long-term perspective. The program aims to provide assistance in raising children and money paid under it is supposed to reimburse at least partially the cost of satisfying living needs and raising a child. Furthermore, apart from improving the material conditions of Polish families, it is also aimed at improving the birth rate in Poland (currently, the fertility rate in Poland is approximately 1.3 children per woman). This benefit is available to every Polish family - parents (carers) of children until they reach the age of majority (18 years). A benefit under the “Family 500+” program is PLN 500 (120 euros) paid to families every month. A family with two minor children receives this benefit for the second and subsequent child irrespective of the family’s income in a given month and year. In the case of families whose income per capita in a given household is below PLN 800 net, this benefit is also granted for the first (or an only) child. In the case of families with a disabled child, the income criterion is PLN 1200 net per capita. This benefit is also granted to foster parents and children’s homes.

A benefit under the “Family 500+” program is paid by local authorities, welfare centers or social benefits centers. To be granted the “Family 500+” program benefit, a family has to file an appropriate application with one of the above mentioned institutions. Upon being granted the benefit, one should
apply for it in every given year. In the case of applying for a benefit for the second and every subsequent child, a family (an applicant) is not required to file a statement on income. The exception is applying for financial means for the first (or an only) child. The payment of benefit commences in the month in which the parents applied for it. Noticeably, the award of the benefit of PLN 500 and above is not included in the family’s income for the purpose of establishing its rights to other benefits (for example from the maintenance fund, family benefits or various housing allowances). Furthermore, a benefit under “Family 500+” program is not taxed, so parents of the children who have been awarded this benefit receive PLN 500 per child and do not have to pay any tax or contributions on this amount – this rule applies also to parents who conduct economic activity. The benefit cannot be claimed by a family which receives financial means of a similar character abroad (http://www.program500plus.pl/).

**Implications of Program “Family 500+” for household finance in Poland**

The “Family 500+” program has already covered more than 3.82 million children up to the age of 18 by the end of February 2017. More than 2.57 million families have received almost 21 billion zlotys. Throughout Poland, the "Family 500+" program covers 55% of all children under 18 years old. In the country, this percentage is 63 percent. In municipalities it is 49%, and in urban – rural areas 58%. The highest number of supported children are in Mazovia (almost 554,000), Silesia (over 383,800) and Greater Poland (over 379,600) (MPiPS 2017). According to GUS data, the "Family 500+" program has a positive effect on the number of births. In November and December 2016 and January 2017 there has been as much as 13-15 percent increase in childbirth in relation to the same period of previous years. The most frequently mentioned phenomena influenced by the "family 500+" program, along with the number of births, are an increase in consumption and savings while simultaneously reducing household debt, as well as lowering professional activity (especially among women) and reducing poverty among families and children.

Consumption, savings, and debt of households

The ING Financial Barometer (2017) shows that due to the program, parents could purchase clothes (31%), shoes (29%) and family holidays (22%). An important element is education: 22% of the respondents spent resources on books and aids, and 20% on extra activities for children. As many as 17% of the participants financed holiday and school trips for children through the program.

The study shows that 21% of people receiving resources from the 500+ program have started saving for the first time, and another 36% are putting off more than before. In total, only 32% of program beneficiaries admit that they spend all 500+ funds on a regular basis.

According to BIG InfoMonitor data, over 12 months, from the end of February 2016 to the end of February 2017, the number of people with overdue payments for amounts up to 2 thousand PLN grew at a slower rate than all debtors. In the case of unreliable debtors listed in the BIG InfoMonitor, their share fell during the year from almost 40% to less than 35%.

Those that earned less have resigned from high-speed consumer loans (data show that the least-paid 20 percent of households spend more than they earn and are financed by such loans), so the 500+ program has reduced debt rather than significantly increased consumption.

The NBP (2016c) suggests that the 500+ beneficiaries are not willing to save for future due to their greater optimism. While in households that do not benefit from this subsidy, the assessment of the current and future situation is negative, the people with government support positively see both the present and the future. The state of mind, as claimed by the central bank, has a significant impact on the financial attitudes of Poles, for whom a significant motive for saving is a sense of threat. This is also confirmed by research done by Deutsche Bank (2016), which shows that the proportion of people saving for a rainy day has increased in relation to 2015. This is due to the increased uncertainty among people not receiving additional family benefits from the budget, which is fully consistent with the NBP's observations. The percentage of rainy-day savers among those that do not use 500+ is as much as 51 percent, while only 26 percent are beneficiaries of the program.

Labour market

More and more reports show the impact of the "Family 500+" program on the labor market’s situation in Poland. For a few years, Poland has been experiencing the effects of an aging society. According to the NBP report (2006) on the labour market, due to the recently introduced institutional changes -
particularly the reduction of the retirement age and the introduction of the "Family 500+" program, there is a great risk of lowering professional activity and thus diminishing the labour supply.

The "Family 500+" program provides non-work-related income, which does not give incentives for the professional activation of women taking care over children. As a result, it may even encourage the deactivation of a person (mostly women) who have been unsuccessfully seeking employment or working in poorly paid jobs. Data for the first full quarter in which the Family 500+ funds have been paid show that the activity rate has decreased, but the number of inactive people has also declined. This is primarily due to demographic changes affecting the sources of inactivity in the form of an ever-lower number of young people who are not professionally active due to learning. On the other hand, the number of economically inactive people due to retirement is increasing systematically (NBP 2016a). There are also negative effects, i.e.: the fall of actively engaged parents, which affects mainly women. 235,000 people are said to resign from work, mainly women in families where both parents work (over 200,000) and single parents (25,000). To summarize, the program will discourage the active participation of parents in families 3+ and those with one and two children (Szarfenberg 2016).

Right at the beginning of 2016, information on transfers of 500 PLN to the second and every subsequent child in the family reduced the threshold wage of non-working family members that receive them by about 6%, i.e.: 120 PLN. It is unclear what effect this change has on the willingness to provide work. The declared threshold wage of inactive persons is relatively low - it remains at about 200 PLN below the minimum wage applicable from 1 January 2017 (NBP 2016b).

Poverty

The introduction of the Family 500+ program significantly affects the reduction of poverty among children and their parents, according to a report by the European Network for the Prevention of Poverty. Positive factors include a huge decrease in poverty. Extreme poverty is reduced by 48 percent and extreme poverty among children by 94 percent (Szarfenberg 2016). The program has also significantly improved the material conditions of families. We are seeing fewer and fewer people benefiting from social assistance and nutritional support - a 10% decrease compared to the previous year. It is about periodic, targeted, child-raise benefits. With the program, total poverty has declined by 48 percent and extreme poverty by 98 percent.

Conclusion

The theoretical framework of family policy is that the state can support families both indirectly and directly, and instruments supporting family units can take financial or non-financial forms. Introduced in Poland in April 2016, the "Family 500+" program aims to support families and pay them an allowance of 500 PLN per month for their second and each subsequent child (also for the first one if the income per family member is lower than 800 PLN). The "500+ Family" program is designed to help the poorest families on one hand, and on the other hand to increase births in Poland (this indicator is gradually increasing). Many forecasts have been made regarding the consequences of the program, but due to its short duration, not all of them have been confirmed. According to a partial study, consumption is rising, debt is reduced, households are giving up on short-term loans, and the scale of poverty is limited. On the other hand, there is a decrease in the professional activity of women, and savings are gradually increasing but rather for those people who do not benefit from the program and not those who receive benefits.

RESEARCH ON THE IMPACT OF THE CORPORATE IMAGE ON THE COMPETITIVENESS OF INTERIOR DESIGN ENTERPRISES

Vyara Kyurova, Dilyana Yaneva

Abstract: In striving to secure a competitive advantage in the market, companies endeavor to create a high level of trust and attachment of customers to the company. Building a positive image is a prerequisite for businesses to enhance their competitiveness. In this regard, the main objective of this paper is to identify measures of corporate image, competitiveness of enterprises, and the relationship between them. This paper uses statistical methods (variance, regression, and correlation analysis) to study the influence of corporate image on the competitiveness of enterprises in the field of interior design. A questionnaire method is used to gather the primary data. Examined indicators are assessed using a 7-point Likert scale. The results of the survey indicate a strong correlation between the level of corporate image and that of competitiveness of enterprises. The conclusion includes a summary concerning the use of the corporate image as an important tool for a sustainable market presence and achieving a strong competitive edge.

JEL Classification Numbers: M31, M20; DOI: http://dx.doi.org/10.12955/cbup.v5.973

Keywords: corporate image, competitiveness, interior design enterprises, indicators

Introduction

In a highly dynamic business environment of ever increasing competition and globalization, a business’ main task is to search for new ways of enhancing their competitiveness. A successful implementation of market objectives requires enterprises to build positive attitudes, trust, and loyalty to their product, brand, and the company itself. This, in turn, lays the foundations of forming a corporate identity and achieving organizational objectives.

Building a positive corporate image is key to expanding influence and leadership in the market for any company. It is a major factor in forming consumer opinion and achieving the competitive advantage of enterprises.

In a highly competitive environment, only companies that implement effective marketing tools become successful. In this respect, the corporate image plays a crucial role as a strategic marketing tool. It allows the company to influence the consumer’s purchasing decision, helps in attracting new clients and forming loyal customers, and these outcomes inevitably lead to an increase in sales and profit and foster the development and competitiveness of the company (Yaneva, 2016).

In this context, a study examining the value of the corporate image would benefit management decisions with respect to improving the competitiveness of an enterprise based on its competitive advantages.

Literature Review

The corporate image is associated with the behavior and profile of a company (Olins, 2003). It defines the financial relations of the company, as well as the relations between stakeholders and consumers (Brun, 2002). In this respect, Jones and Sasser (1995) emphasized that consumer behavior correlates with loyalty to the company. Moreover, the image relates to the way stakeholders, not only perceive, but also interpret their experience, beliefs, values, and experiences of the organization (Wood, 2001). Thus, corporate image plays a prominent role in customer satisfaction and in influencing customer’s willingness to lay trust in the company (Andreasen & Linestad, 1998).

The main goal in building the corporate image is the effectiveness of communication. According to Kim and Lee (2010) with the help of the corporate image, social responsibility and capability of the company are formed. A set of tools and instruments are used, such as ideas, symbols, and events (Schultz, 2007). Another way to achieve competitiveness is through advertising because it contributes to a better understanding of the corporate image. In this regard, Kiryakova-Dineva (2016, p. 217) particularly comments on “the relationship of symbols, images, and company names.”

The corporate image is a targeted communication strategy and is a direct consequence of interpreting information (Venelinova, 2012). It consists of planned and unplanned verbal and visual elements that

1 Faculty of Economics, South-West University “Nefot Rilski”, Blagoevgrad, Bulgaria, verivasileva@abv.bg
2 Faculty of Economics, South-West University “Nefot Rilski”, Blagoevgrad, Bulgaria, d_janeva@swu.bg
are conveyed by the corporation and are aimed at creating an impression on the viewer (Abratt, 1989). In this regard, Afanasiev (2003) views the corporate image as containing descriptive and evaluative components.

It should be recognized that the impact of the attractiveness of the offered products reflects the competitiveness of the enterprise, which can be considered a result of the specific behavior of the company. Gorbashko (2015) defines this competitiveness as the potential for efficient operation in the market to achieve certain competitive advantages. The Great Britain Department of Trade (1994) defined competitiveness as “the ability to produce the right goods and services of the right quality, at the right price, at the right time. It means meeting customers’ needs more efficiently and more effectively than other firms” (cited in Edmonds, 2000, p. 20). The Dictionary of Business and Management (Law, 2009) views competitiveness as the ability of an organization to compete successfully with its commercial rivals. Therefore, the analysis and evaluation of competitors are ongoing conditions, allowing the company to achieve the best market position and to meet the needs of consumers fully.

Filipova (2004) contended that today, among the main competitive factors that determine competitiveness, such as price, quality, technology, innovation, and time, corporate image is gaining increasing importance.

Building a corporate image is a fundamental tool of management for marketing enterprises in the field of interior design. This activity is crucial for boosting up consumer loyalty and evolving the corporate’s competitive advantage and competitiveness.

Revealing the importance of a corporate image for the competitiveness of an enterprise requires appropriate measuring methods. The scientific literature suggested several approaches.

For example, Islam (2010) offered an evaluation based on the business name, architecture, and products or services. Kim and Lee (2010) emphasized service quality, satisfaction, and customer loyalty. Certain authors considered the corporate image as part of communication, and on this basis, they offered an assessment based on strategic intent, mission, vision, goals, and identity (Leuthesser & Kohli, 1997; Van Riel & Balmer, 1997).

Regarding competitiveness, certain authors offered an evaluation based on corporate flexibility (Galbraith, 1990; Rumelt, 1982; Bruning & Lockshin, 2000; Pettigrew, 1987), product quality (Kumar, Motwani & Stecke, 1999a; 1999b; Swan & Targhavi, 1992), and return on assets (Besanko, 1996; Goddard & Wilson, 1996; Mueller, 1990; Waring, 1996). Others referred to the level of resource productivity (Porter, 1998; Allen, 1996), level of quality, price, service, and return on assets (Skinner, 1996), as well as marketing experience (Pratten, 1991). A comprehensive and accurate system of indicators was offered by Velev (2004) in relation to enterprises: product competitiveness; labor productivity; financial performance; innovation; change in the production volume; production and marketing flexibility; and adaptability to the market.

**Data and Methodology**

The study used data from a questionnaire-based survey, conducted in November to December 2016, of 28 enterprises in the field of interior design in Bulgaria. This research instrument was used because of its adequacy regarding the specifics of both the study topic and the data being sought. A qualitative assessment of the corporate image and competitiveness of enterprises in the field of interior design followed.

Each indicator characterizing the corporate image and competitiveness of enterprises in the field of interior design was assessed by respondents using a 7-point Likert scale, including estimates of 1 (very poor) to 7 (exceptional). Averages for each indicator were calculated and used in analyses.

For assessing the competitiveness of enterprises, the study used the indicators suggested by Velev (2004), since these were considered the most comprehensive and accurate system for the study.

Dispersion (Fisher Distribution), linear regression, and correlation analyses were used to explore the relationship between corporate image and competitiveness of enterprises.

The presence or absence of correlation between corporate image and competitiveness of enterprises was established using an analysis of variance (ANOVA). The test was based on the following hypotheses:
- \( H_0 \) – there is no statistically significant difference between the level of corporate image and competitiveness of enterprises;
- \( H_1 \) – differences in the level of value of the corporate image substantially affect the competitiveness of the surveyed enterprises.

A single factor regression analysis was conducted to test the relationship between the corporate image of enterprises in the field of interior design, the factor (\( X_i \)), and their competitiveness, the result (\( Y_i \)).

A correlation analysis (coefficient of Pearson) was used to determine the strength of the relationship between the variables of corporate image and competitiveness of enterprises. To define what part of the overall changes in (y) was due to variations in the studied factors, the coefficient of determination was calculated.

**Results and Discussion**

The survey results regarding the level of value of the corporate image showed that a relatively low share of businesses defined their image as poor (14.3%). In particular, 25.0% of businesses rated it as fair, and 28.6%–32.1% as good to very good. It should be noted that none of the surveyed enterprises indicated an excellent level of value of the corporate image.

The dispersion analysis assessed the effect of the corporate image on competitiveness. The estimated value of the empirical feature was 16.70 (F – Fisher criterion) with a theoretical value of 3.07 at the level of significance \( \alpha = 0.05 \). Thus the null hypothesis was rejected, and the alternative hypothesis confirmed. Hence, differences in the level of significance of the corporate image substantially affect the competitiveness of the surveyed enterprises, i.e., in the field of interior design, based on the assessments given by the respondents.

The regression analysis results (\( b = 0.74 \)) revealed a positive relationship between the assessments of corporate image and competitiveness of the surveyed enterprises, in the field of interior design. Thus, the increase in the average evaluation of the corporate image by a unit resulted in an average increase in the grade of the competitiveness of enterprises in the field of interior design by 0.74.

The estimated value of the correlation coefficient of Pearson (\( r = 0.84 \)) showed a strong correlation between corporate image and competitiveness of enterprises in the said field.

The resulting coefficient of determination (0.7056) indicated a substantial part (70.56%) of the total change in the result, ‘competitiveness,’ was due to variations in the factor, ‘corporate image.’

**Conclusion**

The study results suggest that the corporate image has a significant impact on the competitiveness of the surveyed enterprises in the field of interior design. The increase in the assessment of corporate image by one unit led to an increase in the assessment of the competitiveness of enterprises in the field of interior design by 0.74. The presence of a strong correlation between the level of corporate image and competitiveness of enterprises was observed. It was found out that the majority (70.56%) of the total change in the competitiveness was due to change in the corporate image. Hence, the importance of corporate image for the competitiveness of enterprises in the field of interior design requires continuous, targeted management actions, aimed at optimizing marketing activities and developing and implementing an effective, adequate, and innovative strategy to deal with the dynamic changes in the competitive environment. Possibly, enterprises in the field of interior design need to embrace innovation as a strategic priority with the aim of effective use of a corporate image as a prerequisite for further gaining competitive advantage, as well as to preserve and increase market share.

TRANSITION AND AGRICULTURAL COOPERATIVES IN BULGARIA

Darina Zaimova,1 Julia Doitchinova,2 George Zheliazkov3

Abstract: One general characteristic of Eastern European countries (EEC) countries is that at the early stage of transition from a central-planned to a market economy the majority of land was returned to the rural population, which resulted in large numbers of relatively small and dispersed land plots. Geographical proximity and the similar institutional model of these countries identify common development constraints: generally small farm sizes, unclear cooperative legislation or inappropriate taxation policies, individualism and general unwillingness by the farmers to collaborate, absence of value chain activities and entrepreneurial spirit. This paper is purposed towards identifying, analyzing and evaluating the causes of economic and social changes in the development of agricultural cooperatives in Bulgaria in the past two decades.

JEL Classification Numbers: Q13, Q18; DOI: http://dx.doi.org/10.12955/cbup.v5.974

UDC Classification: 334, 338

Keywords: Bulgaria, agriculture, cooperative model, development

Introduction

One general characteristic of Eastern European countries (EEC) is that at the early stage of transition from a central-planned to a market economy the majority of land was returned to the rural population, which resulted in large numbers of relatively small and dispersed land plots. Geographical proximity and the similar institutional model of these countries identify common development constraints: generally small farm sizes, unclear cooperative legislation or inappropriate taxation policies, individualism and general unwillingness by the farmers to collaborate, absence of value chain activities and entrepreneurial spirit. Political and cultural environments may be barriers to the adoption of collective action, as well as a perceived complication in setting up cooperative channels. The lack of knowledge of how cooperatives function also plays a role, as does the consequences of historical and political events, financial and land reform and fragmentation.

Cooperative concept from perspective of the transition process

Hillborn (1998) addressed cooperatives as schools of democracy being acknowledged for their significant role and impact over the turbulent process of transformation of the European map. Several authors recognized cooperativism as a process of shaping community culture and economic growth, especially in rural areas (Chloupková, 2002). Still it was also recognized as a core element of building a new model of society urged by the discrepancies within social classes, and inspired by the socialist ideology. Being part of the planned economy, cooperatives grew in scale to structure the state production and working system (Schilthuis et al., 2000). Cooperative relationships were imposed, instead of being built as a credible commitment based on the principles of mutualism and social economy. Their natural feature of being primarily economic enterprises driven by the market principles was also violated, which prevented cooperatives in certain Eastern European countries to develop and contribute as a steady mechanism for economic and social development.

Offe (1991) argues for a triple transition of the post-communist regimes: the transition to statehood, the transition to a capitalist economy, and the transition to a democratic political regime (Jan Steijn, 2007). According to Bryant and Mokrzycki (1994) we have witnessed the exhaustion of the development potential of the state socialist mode of production and the inability of communist party-states to resist demands for transformative change. Even more, there is neither model nor precedent for the transition from real socialism to democracy and capitalism. Kornai (1986) also states that the limits of reforming socialist economy were reached. The “gradualist” or evolutionary” approach of changing the system by partial and phased reforms was to keep lower social costs and also to deliver sustainable standards of life.

Political change in Bulgaria and the radical shift of control over production from state to private entities was considered as an essential step, which automatically would lead to market improvement;

1 Darina Zaimova, Trakia University, Bulgaria, dzaimova@gmail.com
2 Julia Doitchinova, Trakia University, Bulgaria, julia.doj@abv.bg
3 George Zheliazkov, Trakia University, Bulgaria, george-zh@mbox.digsys.bg
economic criteria application, and irreversibility of the reforms under way. Nevertheless, the results were far from the expected optimistic ones instead leading to institutional instability, declining economic sectors, insufficient level of domestic demand, restricted export.

High physical fragmentation of land imposed significant constraints to farming and the development of the agricultural sector. This brings forward three key factors, which Swinnen (1997) hypothesizes to have constrained or influenced governments in their choice of land reform strategy: the precollectivization concentration of land ownership together with postcollectivization ownership status; the ethnicity of precollectivization owners; and the equality of postcollectivization asset distribution. This refers to the more recent interpretations, specific to Eastern European theorists, who draw on the sociopolitical reasons for avoiding cooperatives as organizational form in certain economic sectors. Burawoy and Verdery (1999) suggest a property analysis that evokes the total system of social, cultural and political relationships. Sabates-Wheeler (2005) acknowledges that while the evidence against the existence of economies of scale are robust, and empirical research indeed shows that free-riding and labor incentive problems do plague large collective farms.

**Logic framework and context analysis**

A step-wise approach is employed to build a conceptual framework for comprehending and analyzing cooperativism and its institutional environment specific factors for Bulgaria; and to also share the knowledge about the role of the various actors involved in stimulating and promoting cooperative movement (Table 1).

The analytical framework involves the following key elements: the role of the institutional framework and policy instruments; cooperative development within agricultural sector versus alternative business models, incl. single farming; and expected outcomes and positive co-relation.

In 1998 as a result from the restitution process 75% of the agricultural lands in Bulgaria were restored to their previous owners. The strong polarization in the size of the land farms was confirmed by the results from the Census of agricultural farms in 2003. Statistics signify for a prevailing number of small-scale farms (0.1-0.3 ha) and a small number of farms with over 50 ha utilized agricultural land. By this period the EU was still concerned about the progress in the agricultural sector, where considerable efforts will be needed (European Commission, 1998). During the pre-accession period through the SAPARD program were allocated 52 million euro with the aim to improve agricultural production and the food-processing sector, and promote sustainable rural development. Over the period 2005 – 2007 the process of reduction in all types of holdings, while increasing the average size of farms continued. According to the economic size of holdings, the largest group is the group of small farms i.e. farms having a size up to 4 economic units (more than 96% of total number of farm). 77.9% of the total number of holdings were up to 1 economic size unit, primarily subsistence farms; followed by farms having an economic size of 1 – 4 economic size units, considered to be semi-subistence farms. Results of the agricultural census in 2007 on the structure of the agricultural sector showed that
the numbers of holdings in Bulgaria continued to decrease. Until 2007, the total number of holdings declined by 26.4 % as the average size of farms increased by more than 42 %. The most substantial is the decline in number of cooperatives (41.4 %) followed by associations and others (39.7 %). A substantial re-distribution of land among the different legal type is observed as the area cultivated by cooperatives declined by nearly 38 % as the land used by all other types of farms increased as the most substantial increase is observed in land used by companies.

**Structural analysis of the post-accession period**

Data Envelopment Analysis (DEA) is applied both to rate efficiency and to estimate sources and amounts of the inefficiency components for two consequent years – 2007 and 2008 – when significant institutional and economic stimuli have been provided to level up the organizational rate in the agricultural sector (Table 2).

Only for one year the number of cooperatives operating under CRS increases more than twice, positively influenced by the membership in producer organizations (cooperatives and limited liability company), which led to an adjustment and positive change in production, the pricing process and marketing (Graph 1).

In 2007 the average efficiency result under constant returns to scale is 0.90; and as it has been expected under variable returns to scale the efficiency coefficient is higher amounting to 0.93 (Table 3). Of the total number of producers, under assumption for constant returns to scale 44 % belong to the efficient production frontier or they are estimated as benchmarks with an efficiency coefficient of unity. This percentage increases slightly under variable returns to scale, when 56 % of producers are estimated with unity efficiency coefficient.
In 2008 the average efficiency coefficient estimated under constant returns to scale is 0.91; and under variable returns to scale the estimated coefficient is expectedly higher – 0.94. Almost 60% of decision-making units under variable returns to scale belong to the efficient frontier. Input optimization and the lower and the upper bounds of the stability region are calculated with the sensitivity analysis of both CRS and VRS (Table 4).

The presented hypothetical frontier points of the minimum and maximum points of this increase are given in the percentage values of the lower and upper bounds in the following Graph 2 and Graph 3.

The calculated results reveal by how much the inputs could be increased, without influencing estimated efficiency levels. For producers with no calculated input slacks, it is expected that any increase in the input or decrease of the output will cause less efficiency. The relationship between input utilization, the efficiency coefficients and the size of utilized area is presented on Table 5.
As previously estimated members of cooperatives have managed to gain higher efficiency and to improve it during the period. The presented results show that the most efficient seem to be the large-scale producers, who obtain significantly higher efficiency levels and achieve better economic performance. For 2007 the in-proportional change of used production inputs discloses that the optimization of the both costs categories – production and operational costs is close to 3.3 % (Table 6). This change on average increases their efficiency results by 3.6 %. The most inefficiently utilized production resource appears to be the salary costs category – for 2007 the overall change in data set of this input on average is 23 % and expectedly would improve efficiency by 25 %. Optimization of land input is in terms of redistribution of cultivated area and the average change among decision-making units in data set is 17.4 % with expected efficiency improvement on average by 18.9 %. The percentage change in its redistribution is estimated to 11 %.

In 2008 there has been a change and redistribution in production and operational costs, which is estimated to 14 % among the total decision-making units (Table 7). The optimization of the costs is estimated to 14 % and it resulted in 1.5 % increase of efficiency results. The estimated overall change in labour expenses is 16.3 % and 14.29 % of the costs have been decreased or redistributed to other budget items. The same conclusion is applicable to the utilized area input – 14.2 percent of producers have redistributed on average 6.48 % of their land input. This resulted in a 15.4 % increase of the efficiency coefficients.

Source: Author

By the end of the studied period it is reasonable to look for a relationship between specialization of production and the obtained efficiency levels. Such supposition is consistent with the estimated significant relationship between the increased re-distribution of the agricultural area and the two cost categories – production and operational.

A Malmquist index comparative methodology is also applied to the present data set in order to measure the change of efficiency over time and the change in the efficient frontier (Appendix 1).
Efficiency coefficients are decomposed into pure and scale efficiency. The calculated “catch up” effect does not signify for an increase in the relative efficiency, as the average coefficient of efficiency change is less than unity, estimated to 0.986. This result could be interpreted as a regress or no change in the efficiency frontier. Therefore, a more detailed conclusion is provided by the calculated individual results. According to these, 19.8% of decision-making units have achieved catch-up effects with estimates more than 1, which infers that they have managed to improve their efficiency. Producers who have experienced no change during the period represent 46.9% of the total evaluated units. The rest 33.3% have experienced regress in their efficiency. According to the type of registration – natural or legal person, there is significant improvement of producers who are registered as single persons and are members in a cooperative. This category of producers is among the estimated percentage for increase and no change in the efficiency frontier.

The last estimated coefficient “frontier shift” signifies whether efficiency change is due to improvement in production technology. The calculated frontier-shift effect signifies for slight progress in the frontier technology, as its value is 1.005. Of the total number of producers 67.7% have indicated for progress in production technology and 30.2% experienced regress in production technology. Only 2 producers remained with no change in their efficiency level – positive or negative in their production technology.

The average value of the Malmquist index is 0.991; which is close to unity, but still according to the theoretical explanations signifies for the deterioration in the total factor productivity. This result is mostly justified by the small percentage of producers that have managed to improve their efficiency.

One of the most hopeful prospects derived from the performed analysis is that cooperatives have managed to prove their competitiveness along with the company not only in terms of achieved efficiency results, but also considering their sustainability during the studied period (Graph 4).

Graph 4: Total factor productivity (2007-2008)

The decision-making process is revealed as a permanent process and consequences from each decision-making phase have particular impact not only over the individual producer, but also over the organization once he decides to become a member. Taking into account that the majority of problems, which an agricultural producer faces stem from inefficient organizational structures, collective organization of production is assumed to be a sufficient choice.

Several reasons could be pointed in favor of the assumption that cooperatives promote efficiency, such as: increase in optimal scale; reduction of transaction costs; engagement in different but complementary activities and thus releasing scale economies; and improvement of management and internal organizational coordination and control as well.

Results and achievements during the first programme period (2007-2013) and priorities for the second programme period (2014-2020)
During the first programming period, there have been substantial structural changes, resulting in the increased importance of commercial companies and holdings of sole traders, while at the same time limited role of the agricultural cooperatives. In 2010, the largest amount of land is managed by farms owned by individuals (34% of UAA) followed by commercial companies (31.6% of UAA). Compared to 1998 only 27.5% of the cooperatives are functioning, even more in some regions the land cultivated by cooperatives has declined by more than 10 times. At the end of the first programming period, cooperatives handle less than 15% of the total agricultural land. In 2014 the number of registered agricultural producers has almost reached statistics at the beginning of the period (Graph 5).

Graph 5: Agricultural producers in Bulgaria (2006-2014)

Source: Department “Agro statistics” Ministry of Agriculture and Food in Bulgaria

Increasing awareness of the role of agricultural cooperatives in reducing poverty and improving food security; facilitating the formation of agricultural cooperatives’ networks, and supporting the development of enabling environments and better governance frameworks for agricultural cooperatives is perceived as a mission to create sustainable rural employment through business models that are more resilient to economic, social and environmental problems.

The rural development program for the program period 2014-2020 is built therefore upon six thematic priorities and fifteen priority areas aimed at program interventions, innovations and transfer of knowledge, etc. (Table 8).

Conclusion

Collective organization of production is assumed to be a sufficient choice taking into a consideration several reasons why mergers of existing farms promote efficiency: increase in optimal scale: combining farms may reduce duplication or otherwise benefit from an increased size; reduce transaction costs: an important source or transaction costs is opportunistic behavior. When farms agree to a future transaction, each farm may try to interpret the terms of a contract to its advantage. Similarly, a farmer that has more information than another – asymmetric information – may take
advantage of the relatively ignorant farmer; synergies: farms that engage in different by complementary activities may benefit from mergers because of the economies of scope, where it is less costly for one farm to perform two activities than for two farms to perform them separately; and the improvement of management and coordination.

GLOBAL SUPPLY CHAINS AND THE SUSTAINABLE DEVELOPMENT
Bistra Nikolova Boeva,1 Stela Georgieva Zhivkova,2 Ivan Stoyanov Stoychev3

Abstract: Sustainable development issues are considerably popular subjects within the international research community. On the other hand the importance of the issues related to global supply chains has also increased significantly. This paper will also mention a change in one of the main economic paradigms: from international exchange between countries and individual companies there is a transition to exchange between the participants along the global supply chains. The interest in global supply chains and their management is provoked by the fact that they are a major source of competitive advantage on global markets. Nowadays, global supply chains are an integral part of the activities of a number of companies operating abroad. Every business operation finds its place in one or more supply chains. Within the contemporary context of scarce resources and the widely spread sustainable development idea, the companies compete on a global economic scale where the main business unit is the world as a whole, not an individual country or region. All these trends and global developments provoked our scientific interest and with the project “Corporate governance and the global supply chains” we tried to find out how the global supply chains are actually influenced by the issues of sustainable development. Within the course of the project we have reviewed and analyzed quite a lot of scientific literature, we studied the publicly available information of the big international corporations related to their social corporate responsibility and sustainable development issues. In addition, we have made empirical research among local suppliers of big international companies as well as a number of international NGOs dealing with sustainable development and social policy issues. Some of the findings from our project are presented in the current paper.

JEL Classification Numbers: F23, M14, Q01; DOI: http://dx.doi.org/10.12955/cbup.v5.975

Keywords: corporate governance, sustainable development, global supply chains

Introduction
The interest on global supply chains (GSC) and their management has been provoked by the fact that they are a major source of competitive advantage on the global market. Nowadays, global supply chains are an integral part of the business of a number of companies operating abroad. Every business sphere finds its place in one or more supply chains. The companies compete in the global economy where the business unit of analysis is the world as a whole, not the individual country or region. Kotler (1997) states that "when companies go global, they realize that regardless of their size they lack the necessary resources and tools to achieve success. Looking at the entire supply chain as a chain that creates value they realize the need for partnership with other organizations". That is why today there is an increasing interest both from academia and from the business community, to the specificities of the global supply chains’ management as a new way of doing business, in order to increase the competitiveness of companies involved in the international business. On the other hand, sustainable development is another aspect of the global economic environment. The sustainable development concept enters into every detail of the production process and the way the companies are doing business worldwide. Therefore, it also inevitably influences the global supply chains. All these trends and global developments provoked our scientific interest and with the project “Corporate governance and the global supply chains” we tried to find out how the global supply chains are actually influenced by sustainable development issues on one hand and on other hand how they reflect on the corporate governance. The methods used in the project are the review and analysis of academic literature and different projects papers, study of the publicly available information on the big international corporations’ websites as well as empirical research among local suppliers of big international companies as well as a number of international NGOs dealing with sustainable development and social policy issues. Some of the findings related to the global supply chains are presented below.

Sustainable development and the supply chains
Sustainable development is the most discussed issue nowadays. There is a variety of definitions for sustainable development and its characteristics.

Sustainable development is not a modern concept but in our century it gains a lot of popularity. It is seen as the development that ensures the well-being of the present generation without threatening the

3 University for National and World Economy, Sofia, Bulgaria; i_stoytchev@yahoo.com
survival and the normal living of future generations (Brundtland, 1987). Sustainability stands on the most important bases of the life of every society - economic development, social equity and environmental protection. These characteristic of sustainable development will be taken as a base for determining the main changes in the supply change management.

On the other hand the Global supply chains connect businesses all over the world (Boeva, 2015). The supply chains usually are related to the activities of the business and the public entities in respect to their production and economic activities. Supply chain can be described as an assembly of organizations and processes whose main aim is to develop products or services and to provide them to the end users (Dimitrov and Tolev, 2010). The supply chain leads to the transformation of the production materials and streams and encompasses the whole range of processes and activities related to manufacturing and supply.

“Greening” the supply chains

Management of the supply chains is becoming more and more popular. The supply chain is a dynamic process that involves continuous flow of materials, funds and information in several functional areas within and between participants in the chain (Jain et al., 2009). Given the fact that the supply chain covers the entire product life cycle from the processing of raw materials to delivery of finished products to the end user the focus on supply chains is a step towards the wider acceptance and development of sustainability (Ashby et al., 2012).

By focusing attention towards the environmental protection, the behavior of the deliverers in respect to the environment becomes more and more important. The suppliers are expected to cover specific criteria defined by their partners and employers for environmental protection. This leads to the establishment of environmentally friendly deliveries and products. Thus, the supply chain is ‘getting greener.’

Sustainable supply chains

Sustainable management of processes is defined as a set of skills and levers that allow the company to structure its business processes in such a way as to achieve sustainable results (Gimenez et al., 2012). A sustainable supply chain is defined as an integral part of the traditional supply chain, integrating economic, social and environmental performance. In this supply chain the social indicators (i.e. non-environmental) refer to the stakeholders along the supply chain, including customers, shareholders and employees, etc…; economic performance is related to the financial profitability of the chain; and environmental indicators are associated to those activities that are not directly related to the production of a good, but result more from the policy imposed by the countries where different actors in the chain are located and function (Ji et al, 2014).

The sustainable development topic in the context of the supply chain management is discussed in the literature using a number of terms. The two concepts that most clearly connect sustainability and supply chain management are green supply chains and sustainable supply chain management.

An idea about the supply’s sustainable management concerns the plans and activities of the company that integrate environmental and social issues in the supply chain in order to improve the environmental and social behaviour of not only the company itself but also its suppliers and customers, without compromising economic efficiency (Gimenez et al., 2012). This definition implies that companies adopt programs to improve the environmental and social consequences of their internal processes (eg. manufacturing processes in their plants) as well as initiatives to improve the impact of their suppliers and customers’ activities.

Another definition of supply chains’ sustainable management is given by Ahi and Searcy (2013). Based on a thorough review of the theoretical literature in the field of supply chains and sustainable development, they develop the following definition of supply chains’ sustainable management:

“The creation of coordinated supply chains through the voluntary integration of economic, environmental, and social considerations with key inter-organizational business systems designed to efficiently and effectively manage the material, information, and capital flows associated with the procurement, production, and distribution of products or services in order to meet stakeholder requirements and improve the profitability, competitiveness, and resilience of the organization over the short- and long-term” (Ahi and Searcy, 2013).
On the other hand, green management of supply chains occurs as an organizational philosophy that helps companies and their partners to achieve profit and market share by reducing the risk and impact on the environment while improving environmental efficiency (Rao and Holt, 2005). The increased pressure from the public and consumers have led to the imposition of strict environmental regulations such as the EU Directive on waste electrical and electronic equipment. These regulations force the manufacturers to incorporate the environmental considerations into their management practices (Azevedo et al., 2011). In addition, the participants in the global supply chains of any company can be held responsible for the environmental and social performance of its suppliers.

Management of the green supply chain is defined as “the integration of environmental concerns in the management of the supply chain, including product design, choice of materials, production process, delivery of the final product to the customer and product management after the end of its life” (Boeva et al., 2012). A study on the methods for the relationship between environment and trade even concludes that the supply chain is "embedded" in nature as all human actions depend on the resources that nature provides such as the necessary raw materials and the energy for the production processes (Faße et al., 2009).

**Sustainable supply chains in terms of strengthened regulations to protect the environment**

Deepening the problems with the natural resources protection, forces the legislators in the different countries to continuously develop and implement a range of policies for environmental protection, covering the various stages of production, distribution, use and disposal of the produced products. The greatest attention by regulatory authorities is paid to the environmental components related to climate change mitigation and the increasingly worsening quality of the soil. In this sense, new regulations and policies have been developed that are related to more than one sector of the environment (eg. concerning soil and atmosphere), and which the companies should comply with simultaneously. In this way "double" regulations for environmental protection appear (Ji et al., 2014). For instance the EU Directive on Waste Electrical and Electronic Equipment (WEEE) requires discarded electronic products to be suitable for recycling, while the Directive on end-of-life vehicles (ELVs) adopted by the EU in 2006 requiring vehicle manufacturers to ensure that 85% of the raw materials used in the cars production will be recycled. Both can be considered as regulations concerning soil protection, as discarding obsolete electrical and electronic equipment to the landfill might result in leakage of dangerous (harmful) substances in the soil. These regulations and a number of similar ones are based on the "producer responsibility" concept, prompting producers to internalize external factors in their production and turn the open chain of direct production and distribution into a closed system that encourages all participants in the chain to recycle, recover and improve product design (Ji et al, 2014).

Another practice – the one of the United States, applies the concept of product liability (product stewardship). This concept is similar to the European "producer responsibility", whose importance grows mostly on the development of waste management strategies. China in 2009 also adopted a regulation for the administration of the recovery and disposal of waste electrical and electronic equipment, which is also based on the re-buy and processing of products. All these regulations in different countries are focused on the effect of solid waste disposal on the environment and aim to force manufacturers throughout the supply chain to actively take measures to reduce their environmental impact in such a way as to achieve improvements in both their economic and environmental performance. On the other hand, during various conferences and summits on climate change it was agreed that carbon emissions are the major source leading to global warming. Thus, more and more countries and governments adopt measures aimed at protecting the atmosphere by imposing a policy to reduce emissions by introducing a carbon tax or creating different market mechanisms such as emissions trading.

All these activities result in a kind of double regulations that aim to achieve the same result - environmental protection – by affecting separate elements and the companies are forced to take action (voluntary or under specific regulation) to reduce their environmental impacts within the scope of all these elements. It should be noted that the influence of companies on the environment is mostly a result of the different stages of the product life cycle. Moreover, there is a close relation between the phases of the product life cycle and stages in the supply chain, so that the impact on the environment should be directed to the interaction between all partners in the supply chain (Diabata and Govindanb, 2011).
Conclusion
Sustainability is part of our life nowadays and this is an undoubted fact. The activities in this area have started back in the 70s but in the last decade they have become inseparable from the economic life of every society. Business operations do not make an exception from this trend. Within the academic project “Corporate governance and the global supply chains” we have tried to find out how this trend influences one of the major parts of the contemporary international business namely global supply chains. It turned out that these chains have been modified by sustainable development as well. The requirements of the suppliers along the global supply chains have significantly changed and they are expected to work in an environmentally friendly manner thus “greening” the supply chains themselves. Also, a new type of supply chain occurs namely the sustainable supply chain, which integrates economic, social and environmental performance. These are only a small part of the project’s findings but they are quite demonstrative for the influence sustainability has on international business activities.

EVALUATION OF MANAGERIAL COMPETENCES THROUGH SELF-REFLECTION

Eva Živčicová¹, Monika Gullerová,²

Abstract: This qualitative research paper examines managerial competences through self-reflection. The main purpose of the evaluation is to identify strategic goals for developing and educating managers. Managerial competences are perceived as intellectual potential, through which the functions and roles of managers are performed. In the paper, managerial competences are evaluated through the self-reflection of middle managers. Due to the recommended extent of the paper, self-reflection results were presented as a case study using a SWOT analysis. The results were incorporated into the development strategy of managers. The study represents an atypical example of defensive development strategy of managers, i.e. the strategy of strong managers in adverse working environment. The main purpose of the study is to highlight the possibilities of applying SWOT analysis for self-reflection of managers and subsequent incorporation of results into development and education programs.

Introduction
No uniform standards regarding managerial competences have been developed in the European Union due to different opinions on the mission, roles and functions of managerial work. The efforts on defining managerial competences have progressed mostly in France, Germany and the UK. The French standards fully focus on the personality of managers, while applying a psychological approach to the assessment of managerial competencies. While, on the other hand, much less attention is paid to the personality of managers, and technocracy is dominant in the German standards. The British standards prefer a multi-layer orientation, placing importance on the expertise as well as personality traits of managers, both social and psychological ones. Currently, we have been witnessing attempts to elaborate a universal model of managerial competences for the European Union. Efforts to develop European standards of managerial competences have been made by the Institute of Management in Great Britain.

Current views on managerial competencies
The need for managerial competences is displayed at a workplace by the need to demonstrate one’s soft skills and hard skills. The term of a competency was first used by Boyatzis (1982) in his work “The Competent Manager” which stated that a "person’s capability or talent is consistent with the needs of the job demands and the organizational environment.” In 1982, he elaborated a model for effective performance with twelve competencies applicable to different organizations. The model was based on results gained from a large-scale study with 2,000 managers holding different jobs in organizations (Hronik and Vedralová, 2008).

There are two basic approaches to defining managerial competencies, i.e. performance-based and personality-based ones. The performance-based approach established a link between a competency and performance. Woodruffe (2000) referred competency to the dimensions of behavior leading to competent performance. Advocates of the personality-based theory look at managerial competencies from the personality point of view. Spencer et al. (1990) perceived competency as any measurable characteristic of an individual that can be used to distinguish between effective and non-effective performance markedly. Another approach under the personality-based theory identified the key characteristics and competencies of managers needed for effective performance. They were specialized knowledge, intellectual maturity, entrepreneurial maturity, interpersonal maturity and professional maturity. The above two approaches were combined to develop standards of managerial competencies. As a result, the Management Charter Initiative (HLavenka, 2000) delineates competencies as inputs and outputs of behavioral patterns of managers. The Management Charter Initiative distinguished between personal and functional competencies. "Personal competencies refer to the inputs for work performance, such as knowledge, skills, abilities, attitudes, values and

¹ Faculty of Social and Economic Relations, A. Dubček University in Trencín, eva.zivcicova@tnuni.sk
² Faculty of Social and Economic Relations, A. Dubček University in Trencín, monika.gullerova@tnuni.sk
personality traits” (Hlavenka, 2000). These, however, are only the prerequisites for and not the direct indicators of real performance of managers. The outputs refer to the functional competencies that are employed to measure the performance of managerial work. We believe that the systematic approach to managerial competencies is the most complex one for highlighting readiness of managers to perform their roles as well as their actual performance in management positions. The argument is also supported by Petříková (2007) who said that a competency includes two elements – the potential for performance and the actual performance.

**Managerial competencies and self-reflection**

Mastering management functions and roles is as important as self-management. We maintain that self-management is a part of personal competencies covered by managerial competences. The importance of personal competencies was underscored by Porvazník (2013) who distinguished the following activities under personal competences: self-acceptance; self-actualization (incl. self-planning, self-organization, self-control); self-development or self-learning. Personal competencies go hand in hand with a personal paradigm, i.e. the way a person perceives and understands oneself (Sojka, 2007). This is an important starting point for the assessment of managerial competencies through self-reflection. Self-perception is a starting point for self-knowing oneself. There are several techniques of self-knowledge and self-perception, such as metacognition and self-reflection. While changes and mental processes are only registered under introspection, in the process of self-reflection they are analyzed and explained. Self-reflection refers to “thinking about one’s past actions, ideas, attitudes, feelings, summarizing a particular portion of one’s life and decision-making in critical situations” (Průcha et al., 2003). A personal SWOT analysis technique can be used to perform self-reflection in managerial competencies.

**Case study with SWOT analysis**

In the presented case study, the following questions were formulated:

1. What are the key internal and/or external factors related to failures of the manager?
2. What are the right development strategies for the manager?

In analyzing the given case, a personal SWOT analysis was conducted.

**Problem description:**

Mr. M., aged 37, is a middle manager working in a department store. He supervises 32 subordinates – sales assistants, section heads and shift supervisors. He was appointed manager after a new owner took over the store and after cutbacks in personnel were made. New objectives were set in order to restore the organization. The main goal was to meet the sales goals set. He devoted most of his time running meetings, delegating and checking task completion. Employee performance improved, but the pressure by the owner was increasing. The manager tried to motivate his employees with bonuses and fringe benefits. Employee performance increased slightly, but the owner was still not satisfied. The manager conducted customer satisfaction surveys and communicated the survey results to his employees. Continuous customer dissatisfaction made him tetchy. His attitude towards employees changed, he was critical, kept reassigning employees and those working not perfectly were punished. Interpersonal relations worsened, employees started competing with one another, and there was no cooperation among employees. Group performance was decreasing. Mr. M. fell ill more frequently and was criticized by the owner for failing to fulfill the tasks.

**Analysis:**

The respondent was given an inventory of managerial competencies, which were ranked using a 7-point Likert scale (1=strongly disagree, 7=strongly agree). The results were used to perform a SWOT analysis. The outcomes are given in Tables 1 and 2.

Table 1 shows the manager’s strengths and weaknesses. His strengths outnumbered his weaknesses. It was found that the difference between strengths and weaknesses was 19.

In Table 2, opportunities and threats, being external factors affecting managerial work, were compared. It was established that the difference between opportunities and threats equalled to -6. Threats were found to be the most critical. The respondent is under constant pressure. Having performed the SWOT analysis (Figure 1), the strategy of the manager was found to be defensive.

Results and Discussion

Assessment and prognosis:

The analysis given is an example of a strong manager working under unfavorable working conditions. The research questions can be answered as follows:
1. The external factors (threats) are the key reasons for failures of the manager.
2. A defensive strategy is an appropriate way for the development of the manager.

<table>

</tr>
<tr>
<td>Source: Authors</td>
</tr>
</tbody>
</table>

It is advisable to make use of the strengths in order to eliminate external threats, which are, in this case, demands for higher performance. It is also recommended to make the position of a manager stable and protect it. Setting strategic goals means making goals, actual performances and employer demands stable.

**Conclusion**

There is no consistent theoretical framework and there are too many perspectives on managerial competencies. There is not only no consensus on defining competencies but also in describing their components. The structure and hierarchy of managerial competencies are critical for making the theoretical basic research on the issue. In addition to inconsistencies in the theoretical background, competency identification and measurement are of key importance in applied research. The purpose of the paper was to point to the possibility of using a SWOT analysis in assessing managerial competencies and setting manager development priorities. There are two fundamental problems associated with the issue, such as the selection of competency components and measurement of the factors. An effective employment of a SWOT analysis needs factors to be correctly identified. It is in the identification phase when some weaknesses may be misinterpreted as threats or strengths may be misinterpreted as opportunities. As a result, the final assessment may be biased and may lead to mistakes in setting the right strategy. In order to reduce mistakes, the inventory of competence components was developed and the respondent assigned numerical values to the statements given. Results obtained from more than one respondent can be compared, and thus the strategy can be set more precisely. Moreover, a SWOT analysis can be used to identify ways for further manager development, such as improving their strengths through education, training, changing, modifying or adapting business external factors or competitive environment. A personal SWOT analysis can be employed in interviewing candidates for middle management, and can be used as a starting point for career development as well as initial career consultations.

EXPLORING ENTREPRENEURSHIP EDUCATION IN THE PRIVATE HIGHER EDUCATION INSTITUTIONS (HEIs) IN SOUTH AFRICA (SA)

Robert Walter Dumisani Zondo

Abstract: The role of educators in education is indispensable. Hence, students continuously search for a business education that can equip them with the necessary entrepreneurial knowledge and skills to succeed in running businesses. Consequently, this study evaluates the perception of Academic Managers in the private Higher Education Institutions (HEI) of South Africa (SA) on the significance of entrepreneurship education. It explores the reasons for offering such an education in the private HEIs in SA. There were 78 private Higher Education Institutions (HEIs) in SA that were identified for participation in this study. These institutions are registered in terms section 54 (1) (c) of the South African Act (SAQA, 2012). For the study to achieve its objectives, the South African Qualification Authority (SAQA) provided a sample frame of all the private HEIs in SA. From the 78 HEIs identified, 22 offered the pastoral courses and were excluded from the study. As a result, a target population of 56 HEIs participated in the study. This research has two objectives. That is, examining the perception of Academic Managers on entrepreneurship education, and the reasons for offering such education in the private HEIs in SA. This study uncovers the need for entrepreneurship education in private HEIs of SA. The results present the value of entrepreneurship education as a practice that develops students into cross-functional innovative thinkers. It provides valuable data relating to the significance of entrepreneurship education for developing students into business-minded individuals.

Keywords – entrepreneurship education, entrepreneurs, opportunities, skills, students

Introduction

It has been noted that a significant number of entrepreneurship courses have been introduced worldwide as a result of an emergence of entrepreneurship as an academic field. In SA, the trend is exacerbated by the inevitably limited job opportunities where one must compete to secure a job (Nicholaides, 2011). Based on the South African population of 54.9 million, the total number of unemployed people (as in March 2016) was 5.6 million and the not economically active population was 15.05 million (Trading Economics, 2016). Hence, many graduates are unable to get a job upon graduation. Therefore, students continuously search for a business education that can equip them with the necessary entrepreneurial knowledge and skills to succeed in running businesses or to create a job from seizing existing entrepreneurial opportunities (Henry, 2003). As a reaction to such the situation, there has been a growing diversity in the courses offered by the HEI in terms of content and depth (Matlay, 2008). An assessment of the trend reveals that most entrepreneurship courses were offered in business schools but now there is a growing trend of offering them in non-business schools (Gerba, 2012) and such courses are included in the curriculum for teachers (European Commission (EU), 2011). This study aims to determine the perception of Academic Managers on the need for entrepreneurship education in the private HEIs of SA. Generally, entrepreneurship education is needed to address a growing range of contemporary socio-economic and political challenges (Henry, Hill and Litch, 2005) and is therefore relevant for students in all disciplines. Studies on entrepreneurship education have focused on progress in entrepreneurship education (Vesper and Gartner, 1998), the status of entrepreneurship being taught to business students in the UK and USA, respectively (McKeown, Mullman and Sursani, 2006; Solomon, 2007), indicating the diversity of courses in terms of content and methods. Studies in the African context, including those by Co and Mitchell (2006), Kabongo and Okpara (2010) and Gerba (2012) show that entrepreneurship education in Africa is at the development stage and is offered in business schools, and with a few initiatives in non-business courses. Consequently, this research aims to evaluate the significance of entrepreneurship education in the private HEIs of SA. It seeks to determine if entrepreneurship education can positively motivate students towards an entrepreneurial career choice. Furthermore, it establishes the reasons for offering entrepreneurship education in private HEIs in SA.

Attitude towards Entrepreneurship Education

Entrepreneurship is a process that happens over a period of time, and its first phase is an entrepreneurial attitude (Asenjo and Barberá, 2013). This attitude is the result of a way of thinking and

1 Durban University of Technology (DUT), Faculty of Management Sciences, Durban, South Africa. E-mail: dumisaniz@dut.ac.za
behaving (personality), together with external variables (situational and social) and these form the basis of models to predict entrepreneurial behavior (Krueger, Reilly and Carsrud, 2000). In recent years, curiosity on the subject has given rise to a rapid growth in research on the introduction of business creation as a specific area of study, as well as the concern that entrepreneurial competence be taught systematically on degree courses, influencing the entrepreneurial attitude of university students (Sánchez, 2011; Fenton and Barry, 2014; Hattab, 2014). As a result, this study examines the attitude of Academic Managers in private HEIs on the influence of entrepreneurship education in SA.

The concept of entrepreneurship in education is not solely established in the academia partially because of the variety of research paradigms applied to it that resisted a clear definition (Davidsson, 2004). The interest of this study lies in entrepreneurship as a mindset and is understood to be a fundamental human feature. It is an aptitude that can be developed by anyone (Senges, 2007). Thus, this paper explores if entrepreneurship education can positively motivate students towards an entrepreneurial career choice. Whilst entrepreneurship is an intrinsically motivated practice (Senges, 2007), and entrepreneurship education is a breed of innovative system whose characteristics and activities leads to transformation of the education system; this study examines the significance of such education.

**SA's perspective on Higher Education discourse in Entrepreneurship**

It is apparent that the apartheid economic dispensation in SA provided higher education offerings which served the then needs of the industry well, in that they made available a workforce that would be trapped, in a comfort zone, working for a ‘boss’ (Nicholaides, 2011). The offshoot of such education was to instill within future university students the notion that one should graduate and then seek employment in large corporations or other such formal sector settings rather than opt for something innovative and creative as a work option. Today, SMMEs in SA are accounting for a sizeable chunk of the economic activity (Nicholaides, 2011). However, education is seen as one of the most significant barriers to entrepreneurial activity (Nieman and Nieuwenhuizen, 2014). The result is that, HEIs are increasingly obliged to redefine their role in the SA economy. The primary function of HEIs should thus seek to instill a greater entrepreneurial character among students. HEIs should strive to carefully consider local development needs and support the promotion of entrepreneurial education initiatives, and this should not only be at the tertiary level but as early as the primary school level. This research attempts to establish the perception of Academic Managers in private HEIs if entrepreneurship education should be taught at both school and Higher Education levels. The role of Higher Education is clearly to meet the socio-economic needs of the country whilst safeguarding social justice and democratic values. In addition, HEIs have an important role to play in regional innovation systems and, in what are termed as, the learning areas (Morgan, 1997). Training and development programmes should include views on and encourage entrepreneurship (Nieman and Nieuwenhuizen, 2014). More faculties are required to offer entrepreneurship as a course or at least make it a greater part of existing courses where it does indeed exist (Nicholaides, 2011).

The relationship between university education in general and entrepreneurship in specific, is not so strong and contested (Nabi and Liňán, 2011). Most of these studies have been carried out in developed countries. Few studies have been done on developing countries and these include studies by Jones, Jones, Packham and Miller (2008); Schwalb, Grosse and Simpson (1988), and Wu and Wu (2008). These studies have a common focus on analysing the role of higher education in helping develop new entrepreneurs. However, attempts to promote and implement entrepreneurship education in universities and other HEIs in developing countries have been considerable delayed, in comparison to developed countries. Consequently, SA needs to revamp its human capital strategies if it is to begin to meet the challenges of the global marketplace (Nicholaides, 2011). An effective investment in national higher education initiatives concerning entrepreneurship which will meet the needs of the population, will underpin the international standing of SA’s higher education institutions. Only by recognising the great value and importance of entrepreneurship, and by expanding education about it, can SA hope to obtain a pre-eminent position in the world of education and become truly competitive economically (Nicholaides, 2011).

**Methodology**

The target population for this study is 78 private HEIs that were registered by the Department of Higher Education of SA. Twenty two private HEIs that focus on pastoral courses were excluded from
the study. As a result, only 56 private HEIs participated in the study. Recruitment of respondents was undertaken with the aim of ensuring that all the 56 private HEIs participate in the study. As a result, the questionnaires were forwarded to the Academic Managers who represented their institutions in this study through electronic mail. Similarly, the completed questionnaires were sent back to the author via electronic mail. Forty one questionnaires were returned representing a 73.2 per cent response rate, which is considered high compared with the norm for survey responses (Baruch and Holtom, 2008). The main reason for this high response rate was due to the invitation letters sent to all the private HEIs and consistently following up on the questionnaires through telephone calls. The data collected were analyzed using the Statistical Package for the Social Sciences (SPSS) version 22.0. The descriptive statistics were used to analyze the study objectives.

**Findings**

**Perception of Academic Managers on entrepreneurship education in SA**

The following Table 1 shows results on the perceptions of Academic Managers in entrepreneurship education in the private HEIs in SA.

Source: Author

The Academic Managers in private HEIs strongly believe in entrepreneurship education for SA. Critical factors as presented in Table 1 include issues relating to: entrepreneurship should be taught at both school and higher education levels; entrepreneurship education inspires students to be innovative; and entrepreneurial education can positively motivate students towards an entrepreneurial career choice. These factors have bigger percentage ranges from 80 to 90 per cent. Academic Managers have also indicated that: the lack of skills is the biggest barrier to entrepreneurial success; entrepreneurship education inspires individual students to become entrepreneurs, and entrepreneurship education is suitable to those individuals with high self-efficacy.

**Reasons for offering entrepreneurship education in private HEIs in SA**

The following Table 2 presents results relating to the reasons for offering entrepreneurship education in the private HEIs in SA.

Table 2 provided high percentage response rates from Academic Managers in private HEIs on the reasons to offer entrepreneurship education in SA. The highest reasons that range from 80 to 95.5 percent include: to help reduce poverty; to enhance innate entrepreneurial qualities in students; to assist students exploit business opportunities; to engage students in business start-ups; to develop entrepreneurial culture among young people; to promote innovative thinking; and to contribute to job creation.

Conclusion

This study began by reviewing the global aspect of entrepreneurship education. Minimum research has been carried out on the significance of entrepreneurship education in the private HEIs in SA. Hence, the study examines its significance. Entrepreneurship education gives students a new way of looking at the world, irrespective of whether or not they opt to start or develop their own enterprises. This paradigm should continue to receive increased attention in SA and be vigorously researched. For entrepreneurship to be successful, entrepreneurship education is paramount. The HEIs in SA should provide extra entrepreneurial capacity and this should be especially aimed at creating intention and aspiration in students towards entrepreneurship (Chenube, Saidu, Omumu and Omomoyesan, 2011). Students with high intentions in entrepreneurship will ultimately be more successful (Hirsch, Peters and Shepherd, 2008) and be able to employ others, thus alleviating the huge levels of unemployment in the South African society.

Therefore, students must be taught to identify opportunities in the marketplace and assisted to innovate and create something different in establishing a new venture (Nieman and Nieuwenhuizen, 2014). Hence, entrepreneurship education should encourage students to think and then to do (Neck and Greene, 2011).

INTRODUCTION

The provision of superior customer services is an important strategic objective of all companies seeking to achieve and retain their competitive advantage (Weng, 2011). Hence, the improvements in service performance have become critical to survival within the retail industry (McGregor, 2009). The retail industry functions under extreme competition in a technologically dominated environment. For a business to adapt under these external conditions, it has to undergo internal changes to respond to the external changes. During this transition, financial performance drops, quality of the service rendered declines, customer volumes decrease, and employee morale is affected (Fisher, 2005). The inability of the business to adapt to change and make use of the latest information technology systems and equipment hinders it from rendering satisfactory products and services. This ultimately results in customer dissatisfaction. According to Wang (2006), customer dissatisfaction due to the lack of retail businesses providing desired products and services is one of the factors that lead to reduced repurchase intentions in customers. On the other hand, a business transformation process that is not well communicated with the employees causes uncertainty and confusion within the workforce and results in decreased employee morale and motivation. This practice impacts negatively on employee productivity. According to Higuera (2010), unmotivated employees develop a lack of interest in their work and performance suffers, resulting in lower productivity. As a result, the overall financial performance suffers. Hence, this study investigates the impact of transformation on the provision of products and services in operational-level retail businesses, thereby improving their financial performance in KZN. It will also examine the influence of transformation in employee motivation.

THE IMPACT OF BUSINESS TRANSFORMATION ON THE PROVISION OF PRODUCTS AND SERVICES IN OPERATIONAL-LEVEL RETAIL BUSINESSES: CASE STUDY

Xolani Protus Simamane,¹ Robert Walter Dumisani Zondo²

Abstract: The retail industry is arguably one of the most prosperous sectors in the global economy. It serves as an intermediary between producers and consumers. Given its significance in the everyday lives of people in communities, and its role in national economies, the industry operates under extensive competition driven by growth in Information Technology which has dramatically changed the consumption patterns and buying behavior of consumers today. This study investigates the impact of transformation on the provision of products and services in operational-level retail businesses of KwaZulu-Natal (KZN). This is a case study and the South African Post Office (SAPO) in KwaZulu-Natal (KZN) participated in the study. Of the 101 branch managers of SAPO, 72 participated in the study, representing a 71 percent response rate. The sample frame was obtained from both the Human Capital and the Infrastructure Management departments of SAPO in KZN. Descriptive statistics and chi-square tests were used to analyze the two objectives. That is, to establish if the change brought about by business transformation activities improves the provision of products and services in retail businesses and thereby improves the financial performance. It also determines if retail businesses undergoing transformation inspire confidence amongst employees, and thereby achieving their financial goals. The findings revealed that business transformation has the ability to improve the provision of products and services of retail businesses. Continuous communication with regards to transformation inspires confidence among employees, thereby leading to productivity improvements and the achievement of the organizational goals. Productive employees contribute positively to the financial performance of the business. The original value of this study is its approach in uncovering strengths and weaknesses of business transformation in the operational-level retail businesses.

needed across the organization to deliver and exceed customer expectations in order to continue the privilege of an extended, profitable relationship with the customers. McGregor (2009) states that when the need for the provision of superior service performance is communicated as an important element of the company’s vision, and one which is advocated by the leader as an important organizational goal, members of the organization are likely to pursue it with vigor. According to Liao and Chuang (2007), when transformation leaders succeed in implanting such visions, values and beliefs into their employees, such employees will feel far more motivated to produce high-level commitment, and make positive changes in their attitude towards their work. This intensifies the employees’ efforts to improve overall service performance. Nadiri and Tümer (2009) indicate that superior service quality has become a major differentiator in producing customer satisfaction and successful quality management is recognized as the most powerful competitive weapon that many leading service organizations possess. The following section discusses the importance of retail transformation in rendering of products and services.

**Importance of Transformation in Rendering Products and Services**

Retailers spend a lot of money each year to design, build, and furnish their establishments. Extensive competition prompts them to employ the store environment as a source of differential advantage (Brüggen, Foubert and Glemler, 2011). Brüggen *et al.* (2011) add that McDonald’s began redesigning its 30,000 stores in a makeover of unprecedented scale to provide the stores with a contemporary, welcoming image. Kentucky Fried Chicken (KFC) also responded to a changing environment by transforming their stores. The model store was intended to provide the optimal dining experience for a KFC customer and had to include the hottest, freshest food served daily; unparalleled hospitality and service; exciting new products; consumer choice and a variety of menu items; and a clean and comfortable dining experience. The model store would also help to promote the financial performance such as sales growth; the increased average spends and improved profitability. Furthermore, Brüggen *et al.* (2011) state that, despite the pervasiveness of store transformation, research to date does not provide sufficient understanding of customer responses to store makeovers. However, most research has revealed that customer response is influenced by individual servicescape parameters such as color, lighting as well as store characteristics such as store design and ambience. The relevant literature only focuses exclusively on store response to the servicescape. However, a complete evaluation of the transformation impact on the store performance also requires an understanding of whether transformation brings more people into a store in the first place. Dagger and Danaher (2014) state that shopping is an everyday element in most people’s lives because the in-store experience continues to have high relevance and retailers must keep their servicescape modern, fresh and in line with competitors. The look, feel and mood of a retail store or service environment are unique and constructed purposefully to contribute to the persona of the brand and ultimately its profitability. Simon, Gomez, McLaughlin and Wittink (2009) explain that, in a buying decision, the place where the product or service is purchased or consumed is often more influential than the product itself. Most retailers have created not just a retail store but a place that customers will love. Creating a place to satisfy a customer is critical to a company’s success. Simon, *et al.* (2009) indicates that, the satisfied customers may be the most consequential of all economic assets. Indeed they may be proxies for all other economic assets combined. Companies that are unable to satisfy their customers can expect to lose their market share to rivals that are offering better products and services at lower prices.

**The Role of Transformation in inspiring Confidence among Employees**

Motivation is the psychological process that gives behavior a purpose and a direction, a predisposition to behave in a positive manner to achieve specific unmet needs (Mishra and Gupta, 2009). Thus, work motivation is a key mechanism for maximizing the use of human capital for organizational success (Kanfer, Chen & Pritchard, 2008). Motivated employees are highly involved in their work; they take initiative and make extra effort to help their organizations achieve goals (Parfvonova, 2009). Hence, the self-determination theory of motivation (SDT) posits that the employee job performance and well-being depends on the satisfaction of employee needs for autonomy, competence and relatedness at work (Parfvonova, 2009). For management to be successful, managers need to be true leaders who can understand what motivates their team and enroll employee participation in a way that combines their personal needs with group goals (Sidikova, 2011). According to Thurlow, Helms and Mills (2009), employee motivation during change can be affected by fear of failing in new tasks or not being
able to adapt to change. Researchers proved that employee motivation and their performance are closely linked (Sidikova, 2011). Mishra and Gupta (2009) state that the success of retail companies is reliant on a motivated workforce. Companies use a variety of job motivators to retain employees’ motivation and satisfaction. The most important motivators used by retail stores are working conditions, skills development, recognition, role clarity, career growth and support from management. Vlad (2012) identifies human capital in all service sector organizations, like retailing, as one of the pillars of success. Proper personnel planning, recruitment, motivation and retention are crucial to maintaining operational smoothness and consistent service to customers. As the retail industry continues to mature, employee satisfaction and retention is likely to persist as a challenge. Therefore, adequate steps must be taken by the retail industry in terms of recruiting, training, retaining, motivating, and engaging employees for enhanced productivity (Mishra and Gupta, 2009). According to Kumar (2011), motivating the workforce is not just a means to get people to pursue the organization’s goal. Rather, it is an attempt to get people to buy in and take ownership of the organization’s need as well as their own. Strategies such as appreciation of achievements, individual attention, empowerment and providing opportunity for leadership roles can be a powerful means of motivating knowledge workers who are satisfied with their package. Mishra and Gupta (2009) outline that the work patterns of the retail industry require employees to put in long hours of work which generally cause fatigue and lower motivation of the employees. Huddleston and Good (1999) agree that the success of retail companies is dependent on a motivated workforce. Motivation is vital in the work environment as it influences work performance and productivity. This study is designed around the following questions.

- Does the change brought by business transformation activities improve the provision of products and services in the retail business and thereby improve their financial performance?
- Do the retail businesses undergoing transformation inspire confidence to employees, thereby achieving their financial goals?

**Methodology**

The target population for this study consists of 101 middle-level branch managers of SAPO in KZN. Of the 101 middle-level branch managers of SAPO, 72 participated in the study, representing a 71 percent response rate. Data was collected using structured questionnaires that had 8 questions. The sample frame was obtained from both the Human Capital and the Infrastructure Management departments of SAPO. Both the descriptive and chi-square analysis were used to test the study objectives. The data collected was analyzed using the Statistical Package for the Social Sciences (SPSS) version 22.0.

**Findings**

**Influence of Transformation on provision of Product and Services**

The following Table 1 presents results on the influence of transformation on the products and services in the business.

Table 1 provides high percentage response rates on the influence of transformation on the provision of products and services. The percentages range from 83.1 to 91.7 per cent on the influence of transformation to the rendering of services and 83.3 to 90.3 per cent on product offerings. The analysis is in line with the study objective that establishes if the changes brought by transformation improve the provision of products and services in retail businesses and thereby improve the financial performance.

**Employee motivation during the Transformation Process**

The following Table 2 presents results on the motivation of the workforce during the transformation process.

Findings on Table 2 show high percentage response rates on the influence of the transformation process to improve employee motivation. The percentages range from 83.3 to 93.1. The analysis indicates businesses undergoing transformation inspire confidence amongst employees, thereby achieving their financial goals. The chi-square test per each variable was also done. Hence, Table 3 presents test results for determining whether the scoring patterns across the different statements were similar.

Source: Authors

The p-values for all the variables in Table 3 are less than 0.05 level of significance. This implies a significant relationship of the variables of the transformation process to employee motivation.

Discussion

Retailers must create a place that customers will love to be. Hence, the retail companies must build quality service information that will help to align them with the ever-changing environment and improve the provision of products and services. Whilst business transformation improves the provision of products and services, the process must not affect employees negatively. According to Mishra and Gupta (2009), motivation is the psychological process that gives behavior a purpose and direction, a predisposition to behave in a positive manner to achieve specific unmet needs. Work motivation is a key mechanism for maximising the use of human capital for organizational success (Kanfer, Chen and Pritchard, 2008). The success of a retail business is dependent on a motivated workforce. This is equally true in the business that is involved in the transformation process.

Conclusion

It is crucial for the retail sector to ensure an effective flow of the transformation process and the creation of retail business that will remain relevant and be profitable in the future. This highlights the importance of the retail businesses on continuously scanning the environment, thus determining the
opportunities that the market is presenting and, at the same time, identifying the threats it might face. The external environment that pose threats to retail business are economic conditions, changing consumer consumption patterns, competition and the IT. These market forces compel the retail business to change their internal environment to respond to the external environment and to adapt to the change by appropriately transforming their businesses.

MANAGEMENT OF STAFF FLUCTUATION IN TRANSPORT ENTERPRISES

Asya Grigorova Tsonkova

Abstract: The dynamic transport business and the ever-growing competition on the market for transport services increase the significance not just of staff management but of effective staff management as well. The staff is an inseparable part of both resources and enterprise structure however, it should be underlined that it is the most complex and most difficult one to manage, plan, organize and control. The main key factor for the success of a transport enterprise is its employees and workers. Given the ever-growing supply of transport services, customer criteria regarding their quality grow as well. European transport firms constantly strive to implement special approaches, principles and methods in the management of human resources with the purpose of improving the quality of the services they offer. However, one of the primary and an especially serious issue related to staff management in transport firms remains staff fluctuation. It is an essential part of financial relations and an indispensable component of the complex PR system. The present report studies the issues related to staff management and fluctuation within transport firms.

JEL Classification Number: R49; DOI: http://dx.doi.org/10.12955/cbup.v5.979

Keywords: transport enterprise, transport services, competitiveness, staff management, staff fluctuation

Introduction

Human resources in a transport enterprise are a structured aggregate of people who possess specific knowledge and skills and respective practical experience through which the enterprise’s normal function and the successful execution of tasks is ensured. According to Armstrong (2006), human resources are the most valuable assets that an organization owns and their effective management is the key to its success. Staff management is viewed as a primary part of the management of transport firms, but it is also a relatively independent one, differing from the management of other production resources. The challenge that the successful development of transport organizations faces in terms of strong competition and globalization is the people. The human factor plays an increasingly significant and defining role in regard to the development and success of every modern enterprise. In order to achieve success in an organization, it is essential to take into account the factors that motivate employees to do their best and work more efficiently.

The ability to aim the staff towards successfully achieving preliminarily set goals plays a leading role in staff management. The primary goal of the management is to achieve a sense of community and to ensure harmony between the needs of the transport organization and the necessities of its employees. Staff management is characterized by a series of specific traits, presented in two directions: motivation and defining the worth of human resources (Tzvetkova, 2015).

The mechanisms for increasing transport effectiveness are aimed towards increasing competitiveness, economic growth and creating more and better work places, which is set annually in the yearly plans of major European firms, primarily the ones from Western Europe. In recent years, business in Bulgaria has also strived towards improving the management and optimizing the fluctuation in transport enterprises. Every transport enterprise builds a concept about its goals, plans and its results. Mostly with the experience of European and global management systems having influence to this concept. For the Bulgarian transport market the strategy for human resource management in the transport sector plays a defining role in its correspondence to the challenge that the Bulgarian government faces – namely, Bulgaria’s successful integration in the European Union. Each transport company determines the need for workers by planning and integrating them in the process of production and economic activities. The determination of the need for workers is influenced by various factors, amongst which are: incorporating automated systems for information processing, the seasonal nature of transport activity, as well as the uneven performance of freights during the different periods of the year. These factors suggest the necessity for recruiting extra personnel.

Trends in Western Europe: trial & training days and recruitment via business networks

Staff recruitment for transport organizations is primarily carried out through higher education institutions, industrial schools and specialized schools. In recent years, however, it has been carried...
out primarily through the “LinkedIn” online platform for Europe and through “Xing” just for Western Europe. Private companies supplying and demanding employees have also become popular in recent years. There is a tendency for multiple firms and enterprises from Western Europe to turn to mediator firms with the purpose of finding the best suited candidate for the respective job.

In Germany for example more than 50% of all companies use new internet platforms and social career networks for recruiting (ICR Recruiting Trends, 2017).

Transport enterprises use primarily psychological tests and interviews in their staff recruitment; for Western Europe this is “Trial Day,” which has become a commonly accepted practice. All potentially new employees have to spend 1 to 3 trial days in the company or enterprise, where they observe how the work day goes and they are usually given a task, followed by an evaluation of both the candidate’s performance as well as their ability to adapt in the collective and work atmosphere typical of the job specifics and the respective position. During their work, each employee receives a certain amount of training, seminars and specialization; in Western Europe there is also a practice of providing 5 extra days of leave for this type of training, financed by the employer.

It should also be noted that in recent years transport company managers, in addition to traditional methods (lectures, seminars and practice), have employed other modern active methods such as organizing various business role-playing games, managerial situations and tests. The preferred method of managerial training staff is staff rotation. It involves temporary switching of managerial places horizontally in the transport firm’s structure, without changing rewards and occupations for a certain period of time. This provides an opportunity for gaining knowledge and experience in the company’s various fields, as well as for interacting with other sections and the people working there (Tzvetkova, 2016a).

The main task of the experts from the human resources department in the transport enterprise is the constant improvement and development of staff qualification and skills. For this purpose, a “Personal Development Plan for Employees” is drawn for every new employee during their first year of assuming office. Through this plan, the respective workers are given an opportunity to grow and increase their qualification, which leads to achieving better results as well as capability for taking additional tasks. This can have a positive influence on staff fluctuation and preserve transport companies’ professional potential.
A primary issue in transport activity is the “physical” and “moral” aging of workers. With “moral” aging individual experts and managers cannot use the new methods and innovations in management processes in their work. This also reduces the professional qualities of these managers, which in turn has a negative impact on the effectiveness of the managerial decisions they make (Tzvetkova, 2016b). There are also other reasons for staff fluctuation in transport enterprises, such as motivation for work or shortage of qualified workers. It is often observed that well trained and capable experts lose their motivation to work due to inadequate pay and lack of a clear strategy for their professional and personal growth. The lack of motivation among workers can also lead to an unsatisfactory level of the quality of transport services.

A large portion of transport firms from Western Europe strive to compensate this type of situation in daily routines by providing employees with other types of stimuli such as: free public transport cards, food coupons, office cars, office phones, tablets, fitness cards, organizing field trips for employees or training employees to acquire specific knowledge and increase their qualification.

**Brand management and working conditions influence the level of satisfaction**

Recently, the “Brand Management” position has also been opened in the management of medium and larger European transport firms that have over 500 employees. The primary task of these experts is to focus their efforts on improving the company’s image, attract new workers and monitor the level of their satisfaction (PricewaterhouseCoopers, 2012). They have to hold regular polls and conversations with workers and analyse their attitudes regarding the work specifics and atmosphere, acknowledge their desires and level of satisfaction, and make offers for optimizing their work process and improving working conditions and breaks – i.e. flexible work time, “home office”, potential for creating commodities at the work place, etc. The function of brand managers is to initiate various campaigns for employees in order to strengthen their mental and physical health.

Source: Kerneder (2016)

It should be mentioned that, aside from having a negative influence on the transport enterprise, staff fluctuation can also be a criterion for effectiveness that can improve the quality of human resources because it selects a large number of candidates for the respective period, thus displaying new experience and knowledge. Fluctuation is the cost of replacing leaving employees, but it is also a loss of productivity due to the lack of work force that can take over the increased work load. The reduced productivity, for its part, can reflect on corporate revenues (Tzvetkova, 2016b).

Employers often assume that the employees they have already trained will prefer at any time to work in another company because of a more attractive position or better pay, which often causes tension and discontent in the company. At the same time, however, providing an opportunity for additional training or specialization reduces the risk of staff dissatisfaction and discontent. Based on analyses carried out in Great Britain, it has been determined that employees that have had 5 or more days for training and specialization during the previous year are significantly more loyal to their employers than the ones who have been trained for less than five days. In other words, training provided by employers has a positive effect on staff motivation and improves the working climate based on the
employees’ psychological assumption that their employers understand and care about the people working for them.

Staff fluctuation has economic and social functions. The economic function is represented through the redistribution of the work force between companies and the national economy’s branches, the state’s regions, the professional and qualification groups in production and managerial personnel. As for the social function, changing the place of employment allows people to satisfy certain needs, to increase their pay, to improve their working conditions, to use social privileges and additional opportunities for professional growth (Tzvetkova, 2016b).

When fluctuation varies between 3-5% of the company’s staff, it is natural and no specific or special measures by the company’s management need are necessary. It is important to stress that it is possible to have additional fluctuation that creates production, organization, staff and technical obstacles for the firm’s normal functioning.

Staff management plays a leading role in the development of every country because it influences the growth of public production. From the preceding analysis, it can be concluded that staff management in transport enterprises is a combination of principles and requirements for forming and using human resources in the organization in accordance to its interests and goals. Staff fluctuation itself is part of staff management and a primary criterion for evaluating the effectiveness of human resources management. Staff fluctuation is a real indicator for the quality of work life in transport enterprises. In the modern conditions of active market competition and dynamically changing markets where employers compete among themselves for recruiting and keeping better workers, the real risk of fluctuation is an indispensable part of the work process.

**Quality staff management plays a role in the national economy**

Management itself constantly develops and stimulates workers’ creative initiatives and creates conditions for provoking their activity. The primary goal of every transport enterprise should be the creation of a successful and functioning monitoring and active control over fluctuation. The transport sector, as an attractive and dynamic sector, starts to experience an increasingly stronger shortage of highly qualified experts in the field of transport and logistics who are fluent in several languages and work with the new and optimized programs of the so-called “cloud technology.” It is necessary to specify a strategy for the development of human resources, since it will help form a new vision for the development of the transport sector and it will be able to read the specific differences of each subsector.

Modern transport firms in Bulgaria face numerous difficulties and challenges on a daily basis. Quality staff management plays a key role both for the transport firm itself and national economy. For every successful production activity, the management and use of human resources has primary significance, thus creating new value in the production process. Through human resources, the effective activity of transport enterprises is increased substantially, which is why staff management has its leading position.

The state of the labour market also influences staff management. This influence is shown primarily through market mechanisms – supply and demand of work force and intensifying competition. Larger supply and smaller demand for a work force stimulates the motivation for work and improves discipline. Although the size of the companies influences staff management primarily through the mechanisms for carrying out managerial activities, the state also plays a key role in management through national legislation and the adopted international norms. However, the effective management of human resources is what plays a key role in the successful development, prosperity and increased competitiveness of every transport enterprise.

**Conclusion**

The human factor plays an increasingly significant and defining role in regard to the development and success of every modern company. Hire the right people and motivate them to do their best and work more efficiently is a key factor of success.

Business in Bulgaria has improved the personal management in recent years to reduce fluctuation. Coming from Western Europe there is a trend to hire high qualified people via business networks like LinkedIn and install trial & training days for new employees. Also, a “Personal Development Plan for
Employees” in combination with giving them a chance to increase their qualification (sponsored by the company) helps to improve moral motivation and to be more loyal. This helps to reduce fluctuation.

To keep well trained employees motivated, payment and company strategy are important. Quality brand management and working conditions influences level of satisfaction. Quality staff management plays a role not only in the transport companies itself but also in national economy.

DEMOGRAPHIC RISK AND SOCIAL SUSTAINABILITY OF THE PENSION SYSTEM

Alexander Nepp,1 James Okrah2

Abstract: In the framework of this study, we have obtained a mathematical model for maintaining the financial sustainability of PAYG pension systems. We introduce the term financial soundness, by which we understand the maintenance of a balance between the contributions to the pension system and the costs of pension payments. We have proved that the financial sustainability of PAYG systems depends on the growth rates of wages, the growth rate of contribution rates. And demographic factors such as the ratio of the number of pensioners and the working population. However, in the context of countries' competition for investment and the impossibility of increasing the rates of contributions to the pension system, as well as the limited business opportunities to increase wages, the financial sustainability of PAYG systems is determined only by demographic factors. Financial stability in such conditions is violated in case of excess of the rate of increase in pension payments over the rates of Support Ratio (ratio of working population and pensioners) determined by the number of employable people; 2) influence is tenacious by the following factors: 1) demographic risk on central indicators of the pension system.

JEL Classification Numbers: D53 G28; DOI: http://dx.doi.org/10.12955/cbup.v5.s.980

UDC Classification: 336

Keywords: Demographic risks, retirement age, PAYG, Pension payment, Support Ratio, Finance sustainability, Social sustainability

Introduction

The effect of demographic uncertainty on the pension system is strenuous to overestimate. Demographic uncertainty has consequences on the financial sustainability of the pension system by means of the earning and expenditure system. The basis of such effect is the age of entry, period work and the time of retirement, time span of saving, the number of employable citizens, number of retired citizens and the life expectancy.

Demographic Risk and its effect on the pension system has been discussed by many economists such as Wills (2010) and Cossette (2007). Fehr (2009) studied the effect of macro-economic uncertainty on the financial sustainability of the pension systems. His study showed that financial stability is based on two factors, the balance of income and expenditure in pension funds with acknowledgment to macro-economic risk. Gurvich (2011) and Gurvich (2012), these two studies were focused on the impact of demographic risk on central indicators of the pension system.

The unique aspect of the work presented in this paper is the is the discussion of the way demographic uncertainty affect financial and social sustainability of the funded system and distribution.

Financial sustainability of pension systems is defined as a balance between contributions to a pension system and pension payments. Apart from financial sustainability, this research also focused on the maintenance of social sustainability, which implies preservation of the core indicators of a pension system in the current conditions. Replacement rate is understood as the ratio of an average pension in a given time period and the average. It is considered to be the main indicator of the social sustainability of a pension system. This indicator was put forward by the International Labour Organization as the key characteristic of social sustainability (effectiveness) of pension systems.3

1. Impact of demographic risks on financial and gregarious sustainability of distribution pension systems

Demographic risks are important for distribution pension systems because they affect the amount of contributions through the number of payers, or the employed populations see Gurvich (2011). In his study, Volkov (2010) took into account such demographic risks as the number of employed people and that of retired people in the economy, as well as the number of people who enjoy certain benefits, when assessing Russia's implicit pension debt for the non-contributory part of the pension. This influence is tenacious by the following factors: 1) the amount of pension contributions depends on the number of employable people; 2) the amount of pension payments and the replacement rate are determined by the number of pensioners.

1 Ural Federal University, Ekaterinburg, Russia, anepp@inbox.ru
2 Ural Federal University, Ekaterinburg, Russia, jokrah6@gmail.com
The impact of demographic risks on a distribution pension system can be presented mathematically as their impact on the core indicators of pension systems, the amount of pension payments (PV) and the replacement rate (PZ).

\[ PV = \frac{P}{n} \]  

(1)

where:

P is the amount of contributions to the pension system;

n is the number of pensioners.

The amount of funds transferred to the distribution pension system from pension contributions can be presented the following way:

\[ P = Zpl \ast (1 + r)^i \ast s \ast k \]  

(2)

Where:

Zpl is an average salary;

r is the average wage indexation rate;

i is the wage indexation period;

s stands for the pension contribution rates transferred to the distribution system;

k is a number of employed people who pay contributions.

Thus, if we plug the amount of pension contributions (formula (2)) into the formula (1), we get:

\[ PV = \frac{Zpl \ast (1 + r)^i \ast s \ast k}{n} \]  

(3)

The replacement rate, which shows the share of the pension (P) from the salary (Zpl) with regard to (3), will be calculated according to the following formula:

\[ PZ = \frac{Zpl \ast (1 + r)^i \ast s \ast k}{n} \times \frac{1}{Zpl \ast (1 + r)^i} \ast \frac{s \ast k}{Zpl \ast (1 + r)^i} = \frac{s \ast k}{n} \]  

(4)

The dynamic impact of demographic risks on a distribution pension system is revealed through the changes of demographic parameters, such as the employed population and retired people, within a certain period of time: from year ‘j’ to year ‘i.’ It is crucial to point out that actuarial models making allowance for the impact of demographic risks on pension systems were developed by economists Kwon (2008), Debon (2008), who analyzed the impact of specific demographic factors on pension payments. However, their research does not consider the financial and social sustainability of pension systems. To analyze this factor, let us make the following transformations (4). The dynamics of pension payments, that is, the ratio of the pension payments in the year ‘j’ to the pension payments in the year ‘i,’ is expressed with regard to (3) and (4) the following way:

\[ \frac{PV_j}{PV_i} = \frac{Zpl_j \ast (1 + r)^{i-j} \ast s \ast k_j \ast n_j}{n_i \ast Zpl_j \ast s \ast k_j \ast n_j} = \frac{(1 + r)^{i-j} \ast S_j \ast k_j \ast n_j}{S_j \ast k_j \ast n_j} \]  

(5)

The expression (5) shows that the change of pension payments in distribution systems from the year ‘j’ to the year ‘i’ will be determined by the average rate of wage indexation (r), the rate of insurance contributions (s), and the two demographic factors: the number of employed people (k) and the number of pensioners (n). In the conditions of economic stagnation and/or lack of increase in wages, we get the following formula by using the expression (5):
The expression (6) demonstrates that when faced with demographic risks, that is, when the number of pensioners is growing ($n_i > n_j$) and the number of employed people is falling ($k_j > k_i$), the only way to maintain the level of pension payments is to provide the proportional growth of pension contribution rates ($S_i > S_j$). Otherwise, pension payments will decrease.

In case of wages stagnation, however, or if it is infeasible or undesirable to increase the tax burden on enterprises due to the growth of pension contribution rates ($S_i = S_j$), pension payments in distribution pension systems and their dynamics will be determined only by demographic factors, that is, the number of retired ($n$) and the number of employed people ($k$):

\[
\begin{align*}
\frac{PV_i}{PV_j} &= \frac{k_i \times n_i}{k_j \times n_j} \\
r \to 0
\end{align*}
\]

(7)

The systems (5) and (7) show that in a distribution pension system, an increase (or decrease) in pension payments used to maintain financial sustainability should not exceed the growth in the number of employed population and the fall in the number of pensioners provided that the insurance contribution rates and the wages remain the same. There is another option to be considered, though: if the number of the employed and retired remains the same (it is possible for short time periods), in order to maintain financial sustainability the growth in pension payments should not exceed the wages indexation provided that there is no growth in insurance contribution rates.

The formulas (5) and (7) include the ratio of the number of the employed population and the number of pensioners, which is another demographic indicator of the support ratio ($K_p$). Studies in economic demography consider it as one of the indicators of demographic risks. Thus, the support ratio is calculated according to the formula:

\[
K_p = \frac{k}{n}
\]

(8)

If we take into consideration the formula (8), the system (5) will look like this:

\[
\begin{align*}
\frac{PV_i}{PV_j} &= (1 + r)^{j-i} \frac{S_i}{S_j} \frac{K_p_i}{K_p_j} \\
r \to 0
\end{align*}
\]

(9)

If we plug (8) into the system (7), we will get the following:

\[
\begin{align*}
\frac{PV_i}{PV_j} &= \frac{K_p_i}{K_p_j} \\
r \to 0 \\
S_i = S_j
\end{align*}
\]

(10)

Judging by the system (10), the dynamics of pension payments in distribution systems is determined only by the correlation of support ratios, if there is no increase in wages and the tax burden remains constant.

The second target indicator of pension systems, as it has been noted before, is the replacement rate. To find out the impact of demographic risks on the replacement rate, let us plug (8) into the equation (4) and calculate the balance of the replacement rate in the year ‘j’ and the year ‘i.’ The expression will then look the following way:

\[
\begin{align*}
\frac{PZ_j}{PZ_i} &= (1 - r) \times \frac{I_i}{I_j} \times \frac{K_i}{K_j} \times \frac{R_j}{R_i} = (1 - r) \times \frac{I_i}{I_j} \times \frac{K_p_i}{K_p_j}
\end{align*}
\]

(11)
Thus, the pension contribution rate \((s)\), the number of employed people \((k)\), and the number of pensioners \((n)\), that is will determine the dynamics of the replacement rate, by the support ratio \((Kp)\). It is evident that for the replacement rate two out of the three major factors are demographic ones as distinct from the amount of pension payments \((PV)\), which have two demographic factors out of the four influential ones. As a result, it can be concluded that in case of negative dynamics of demographic indicators, the only factor which makes it possible to maintain the support ratio will be the pension contribution rate, that is, the tax burden on enterprises, which is proven by the following expression (12):

\[
    \begin{align*}
        \frac{PZ_i}{PZ_j} &= \frac{Kp_i}{Kp_j} \\
        S_i &= S_j
    \end{align*}
\]

2. Impact of demographic risks on the financial and social sustainability of funded pension systems. Theoretical framework

The impact of demographic risks on funded pension systems is resolute by the following factors: 1) the amount of accumulated pension capital (pension savings) is tenacious inter alia by the accumulation period, that is, the age of starting working life and the retirement age; 2) the value of pension benefits depends on the endowment period, that is, the retirement age and the age.

The impact of demographic risks on the funded pension system can be represented by a mathematical formula through their influence on the fundamental parameters of pension systems: the value of pension payments \((PV)\) and the replacement rate \((PZ)\).

\[
    PV = \frac{Pn}{d} \quad (13)
\]

where:
- \(Pn\) is the sum of pension savings;
- \(d\) is the endowment period

The amount of pension savings can be expressed in terms of wages, the rate of indemnification contributions, and the accumulation period:

\[
    Pn = \sum_{q=1}^{w-1} sn \times Zpl \times ((1 + r) \times (1 + a))^q = s \times Zpl \times \sum_{i=1}^{w-n} ((1 + r) \times (1 + a))^q \quad (14)
\]

where:
- \(Zpl\) - the average wage;
- \(r\) - an average rate of wage indexation;
- \(q\) - a period of wage indexation and investment period;
- \(sn\) - the rate of indemnification contributions directed to the funded system;
- \(a\) - rate of investment income (in shares) received from the investment of pension savings;
- \(w\) - retirement age;
- \(v\) - age of ingress into working life. In turn, the endowment period is determined by the age of retirement (retirement age) \((w)\) and the expected life span \((z)\):

\[
    d = z - w \quad (15)
\]

Thus, by substituting (14) and (15) into (13), we obtain the following formula

\[
    PV = \frac{s \times Zpl \times \sum_{q=1}^{w-1} ((1 + r) \times (1 + a))^q}{z - w} \quad (16)
\]

characterizing the share of lost earnings replaced by pension payments. The replacement rate will be calculated accordingly:
As it is demonstrated by the obtained formulae for the main indicators of the pension systems, pension payments (16), the impact of demographic risks in a funded pension system will be largely offset by the investment income, the effect of which is amplified by a function exponent.

The dynamic impact of demographic risks is defined through pension benefits under a funded pension system for the years ‘i’ and ‘j’ and the coefficient of the main indicators of a funded pension system:

\[
\frac{PV_i}{PV_j} = \frac{s \times Zpl_i \times \sum_{q=1}^{w_i-v_i} (1 + r_j) \times (1 + a_j)^q}{z_i - w_i} \times \frac{z_j - w_j}{s_j \times Zpl_j \times \sum_{q=1}^{w_j-v_j} (1 + r_j) \times (1 + a_j)^q} \]

(17)

As it can be optically discerned from the formula (18), the impact of demographic risks on pension payments, namely the age of ingress into the labor market, the retirement age, and life expectancy, will be largely constrained by the investment income, the effect of which is amplified by the function exponent.

If there is no magnification in wages, the dynamics of pension payments in a funded pension system depends on the rate of indemnification contributions (s), rates of investment income (a) and certain demographic parameters: the retirement age (w), the age of ingress into working life (v), and life expectancy (z). However, utilizing the rate of indemnification contributions as a factor to increment pension payments to a funded pension system would authentically mean an incrementation in the tax burden on enterprises. Consequently, when it is infeasible or undesirable to increment the tax burden, the investment income and demographic factors will only influence pension payments:

\[
PZ = \frac{PV}{Zpl \times (1 + r)^w} = \frac{s \times Zpl \times \sum_{q=1}^{w} (1 + r) \times (1 + a)^q}{z - w} \times \frac{1}{z - w} = \frac{s \times \sum_{q=1}^{w} (1 + r)^q \times \sum_{q=1}^{w} (1 + a)^q}{z - w} \]

(19)

It should be noted that this issue has been described, for example by Gontmakher (2012). In the formula (7), the difference in life expectancy (z) and the retirement age (w) is the duration of pension payments (tv); while the difference of retirement age (w) and the age of ingress into working life (v) is the period of pension savings (tn). Retirement payments under a funded pension system are less susceptible to demographic risks compared with pension payments within the distribution system, as under the funded pension system the function exponent of the investment income can handle them. If there is a task of constructing a financially sustainable funded pension system, it does not require eliminating the impact of demographic risks by the investment income (a = 0), we achieve financial sustainability of a funded pension system under the influence of demographic risks the following way:

\[
\begin{align*}
\frac{PV_i}{PV_j} &= \frac{t_n}{t_j} \times \frac{t_v}{t_{v_j}} \quad &\text{or} & \quad \frac{PV_i}{PV_j} &= \frac{t_n}{t_j} \times \frac{t_v}{t_{v_j}} \\
\frac{PV_i}{PV_j} &\geq PV \\
\frac{t_n}{t_j} &\geq \frac{t_v}{t_{v_j}} \\
\Delta t_n &\geq \Delta t_v
\end{align*}
\]

(20)
Maintenance of pension payments at the current level and at the same time dealing with demographic risks, provided there is no growth of wages and investment income, is possible if the increase in the duration of pension savings exceeds that of pension distributions. It is also possible in the following situation: while the duration of the pension savings period and that of the pension distribution period are both becoming shorter, the rates of the former process should be going at a slower pace than the latter.

However, the advantage of funded pension systems as compared with the distribution ones lies in the fact that the impact of demographic risks on the former can be offset by the investment income, but not only due to the growing tax burden through incremented indemnification payments. Hence, there is a second option available to maintain the stability of a funded pension system. If the system experiences a negative impact of demographic jeopardies, for instance, in the situation of more expeditious magnification in the duration of the retirement period as compared to the duration of the working life, then pension payments will still remain identically tantamount, provided that the impact of investment income through the function exponent is more vigorous or if there is an incrementation in the rates of indemnification payments.

Thus, the compulsory precondition for the conservation of the supersession rate as well as pension payments in funded pension systems is primarily the transmutation in the duration of pension savings rather than in that of pension payments.

Growing demographic risks affect not only the Russian pension system: they make one of the major challenges faced by OECD countries’ pension systems (optically discern MacInnes, 2003).

**Conclusion**

1. In a distribution pension system, an increase (or reduction) in pension payments to maintain financial sustainability should not exceed the growth in the number of working population and the decrease in the number of pensioners (provided that the rate of insurance contributions remains the same). If the number of working population and that of retired citizens remains the same (which is possible for short time periods), then the growth (reduction) in pension payments should not exceed the indexation of wages.

2. Funded pension systems are under the influence of demographic risks to a lesser degree than the alternative distribution systems;

3. The following precondition for financial sustainability of funded pension systems is proposed: the dynamics of pension payments and the supersession rate should not exceed the dynamics of indemnification payment rates, the rates of the investment income, duration of savings and payments.

THE EU – CHINA COOPERATION IN THE FIELD OF RESEARCH, DEVELOPMENT, AND INNOVATION

Loredana Jitaru,1 Lorena Florentina Popescul2

Abstract: The EU and China enjoy one of the most fruitful relationships of cooperation in the world. In time, this cooperation has evolved into a strategic partnership created in 2003. A central part of the development and consolidation of the Strategic Partnership was that of the cooperation between these two actors in the field of research, development, and innovation. This paper intends, on the one hand, to analyze the cooperative relationships between the EU and China in the field of research, development, and innovation, and on the other hand to offer a bigger picture of the present day relationships in the field. This paper uses methods of quality research, more precisely document analysis.

Keywords: RDI, EU – China cooperation, global challenges

Introduction
Considering that nowadays the world faces deep, complex changes, the states of the world have started to pay more attention to the international cooperation in the field of research, development, and innovation (RDI). That is because “by international cooperation, the financial and human resources in the field of RDI that exist in the developed and developing states can be allotted more effectively to subfields which are very important for humanity. Moreover, international cooperation is an important factor that gives states or groups of states easier access to the information and knowledge needed for solving the problems that exist on the planet” (Stanculescu, 2016).

The EU promotes the enhancement of the relationships of cooperation in the field of RDI, stating that the challenges of the third millennium affect both the developed and the developing countries and that the access to information in the “Century of Speed” is much easier and faster, thus contributing to the fight against such challenges. Furthermore, the European Commission underlines the fact that “the international relationships of cooperation promote the production of new knowledge, increase scientific quality and improve the competitiveness of the research and innovation systems” (the European Commission, 2016). To that effect, the EU has international cooperation activities in the field of RDI with the US, Russia, China, Brazil, South Africa, Canada, Israel, Turkey, etc. In this context, this paper intends to offer a complex image of the cooperative relationships between the EU and China in the field of research, development, and innovation. Considering this, the paper has the following structure: section 1- Introduction; section 2 – The positions of the EU and China in the field of research, development and innovation – where we will briefly present the positions of the two actors in the field of RDI; section 3 – Bilateral cooperation relationships in the field of research, development and innovation – it is meant to analyse the EU – China relationships in the field of RDI; section 4 – conclusions.

The positions of the European Union and China in the field of research and development
It has been 42 years since the EU established cooperation relationships with China. In time, these relationships have developed into a strategic partnership whose main pillar is the RDI cooperation. During the past few years, the EU has increased its relationships with China in the field of RDI, thus becoming one of the most important partners in the field at an international level. The two actors promote a relationship based on mutual interest and common benefits. Right now, China holds the third place in the top of international partners in research, development, and innovation, after the US and Russia. Before analyzing the RDI cooperation between the EU and China, we will study the positions of the two actors in this field.

“Europe is one of the most important areas of the world in the field of research, development, and innovation. Even though the population of the EU is only 7% of the population of the world, the EU is

1 Alexandru Ioan Cuza University of Iași, Doctoral School of Economics and Business Administration, jitaru_loredana10@yahoo.com
2 Alexandru Ioan Cuza University of Iași, Doctoral School of Economics and Business Administration, lorena.popescul@student.uaic.ro
now the main center of knowledge production worldwide, yielding almost one third of the production of science and technology on the planet. At the same time, the European Union is responsible for 24% of the world’s expenses for research, 32% of the publications with great impact and 32% of the invention patent requests”. (Delegation of the EU to China, 2016a).

Moreover, right now, the EU has one of the greatest research programmes – Horizon 2020 (H 2020). This programme takes place between 2014 and 2020, with a budget of approximately 80 billion Euros. The Horizon 2020 programme is a “financial instrument stimulating the process of innovation inside the EU and beyond, having the role of increasing the global competitiveness of Europe” (UEFISCDI, 2017).

According to the political elites of the EU and the European Parliament, “research is an investment in our future and is essential for us to have an intelligent, lasting growth that favors inclusion and the creation of jobs” (European Commission, 2015a). To that effect, the EU has the objective of increasing the proportion of the RDI expenses to 3% of the Gross Domestic Product – this objective is stipulated in the Europe 2020 Strategy. According to certain estimates, the consequence of this objective could be “the creation of 3.7 million jobs in the EU and an economic growth of the EU by approximately 800 billion Euros by 2025” (Brauner, 2011).

As for China, during the recent years, it has made great progress in research and development, becoming one of the greatest global investors in the field. Thus, we can see in the figure below that the proportion of the research and development expenses in the Gross Domestic Product increased by 81.54% between 2003 and 2014, whereas, in the EU, it has only increased by 13.19% in the same interval.

![Figure 1: The proportion of the research and development expenses in the Gross Domestic Product in the EU and China between 2003 and 2014 (%)](source: World Bank)

Moreover, China has set the objective of increasing its R&D expenses to 2.5% of the GDP by 2020. Also, “in 2015, China held the first place with regard to the research and development staff – 2.5 million researchers” (European Commission, 2015b), and, as far as the number of scientific articles is concerned, in 2013, China held the third place with 401,435 articles, following the EU with 605,536 articles and the US with 412,542 articles.

Considering all this, we can conclude that the EU and China are the main actors in the field of RDI. In this context, in the next section, we will analyze the RDI cooperation relationships between the EU and China.

**Bilateral relationships of cooperation in the field of research, development, and innovation**

The RDI cooperation between the two actors started in the 1980s, but its importance was recognized only during the 16th EU – China Summit in 2013. Moreover, during the second high-level dialogue...
regarding the cooperation in the field of innovation, the European Commissioner for research, science and innovation, Carlos Moedas, “underlined the importance of the EU – China cooperation in RDI as equal partners in strategic fields of common interest, in order to approach the global challenges and to promote a sustainable growth. He stated that the People’s Republic of China had become a great power in science and technology. Europe needs to engage with China in the context of open science, open innovation and an open world policy” (European Commission, 2015c). Another document showing the importance of the international cooperation in RDI is the EU strategy in the field of research and development. According to this strategy, the European Union needs to pay special attention to the international cooperation in RDI because: “(1) it offers Europe access to the best talent, knowledge and resources, no matter where they are; (2) the EU can approach the global societal challenges in an effective way, that is in a partnership approach; (3) it offers the EU the possibility to establish new opportunities for the high technology European industries, by participating in the global chains of value and by the access to new, emerging markets; (4) it offers the EU the chance to have a leading voice in the debates and evolutions at a global level” (European Commission, 2015d).

The cooperation between China and the EU in RDI was achieved by the Framework Programme 7 (FP 7) and by Horizon 2020 (H 2020). If we take into account FP 7, the cooperation between the two actors covers approximately all the fields of interest, such as space, ICT, health, transportation, environment, energy, etc. (see Figure 2). According to the statistics, the FP 7 (2007-2013) enjoyed the participation of “383 Chinese organizations in 274 collaboration projects, with a cumulative contribution of the EU of 35.24 million Euros. Moreover, the Marie Skłodowska-Curie programme had over 880 Chinese participations” (Delegation of the European Union to China, 2016b).

The cooperation between China and the EU in RDI was achieved by the Framework Programme 7 (FP 7) and by Horizon 2020 (H 2020). If we take into account FP 7, the cooperation between the two actors covers approximately all the fields of interest, such as space, ICT, health, transportation, environment, energy, etc. (see Figure 2). According to the statistics, the FP 7 (2007-2013) enjoyed the participation of “383 Chinese organizations in 274 collaboration projects, with a cumulative contribution of the EU of 35.24 million Euros. Moreover, the Marie Skłodowska-Curie programme had over 880 Chinese participations” (Delegation of the European Union to China, 2016b).

Figure 2: The main fields of collaboration between the EU and China within FP 7 (% of the total amount that the Chinese organizations benefited from)

China also remains an important partner in the Horizon 2020 programme, as well. According to the statistics, by February 2016, 116 Chinese entities had participated in 49 projects in this programme. The cooperation between the EU and China in RDI offers the two actors both benefits and challenges. The benefits coming from the consolidation of the bilateral cooperation in RDI are economic and more. In the case of the European partners, the main benefits of the cooperation enhancement are: (1) “the access of European companies on the Chinese market” (Brauner, 2011, Stumbaum et al., 2010); (2) the effective facing “of the common global and societal challenges, such as pollution and the fact that the population is growing old” (Fan et al., 2014); (3) “the interest in accessing the specialized Chinese staff that is growing from the viewpoint of both quality and quantity; (4) adjusting the European products to the Chinese market; (5) the European researchers are interested in benefiting from the increase in the Chinese R&D expenses” (Brauner, 2011). For the Chinese partners, the main motive has been and will be getting high technology that is essential for the economic, social and military development of China.
But, unfortunately, the RDI cooperation between the EU and China also involves challenges; these pertain to the copyright which is often breached by China, to the introduction of “indigenous innovation policies” by this actor and to the fact that the Chinese entities practice unfair competition.

Synthesizing what we have said, we can conclude that, in order to remain a leader in the field of science and technology, the EU needs to consolidate its RDI cooperation with the main international partners, including China.

**Conclusions**

At the present moment, the EU and China are the greatest global investors in the field of research and development. During the recent years, the EU has increased its RDI cooperation with China, an aspect that is shown by the number of participations of the Chinese entities in the Framework Programme 7 and in the Horizon 2020 programme. According to the statistics, the number of participations of Chinese entities in the H 2020 programme has been 116 in 49 projects.

The EU–China RDI cooperation relationships contribute greatly to finding pertinent solutions to global challenges such as climate change, terrorism, migration, food safety, etc. In this context, the EU sets the objective of increasing its R&D expenses to 3% of the GDP by 2020. In order to reach that objective, there is a need for greater transparency in the cooperative relationships between China and the EU Member States and for a decrease in the difference between the Member States with regard to the proportion of the R&D expenses of the GDP. For instance, there is a great difference between Finland (3.17% of the GDP in 2014) and Romania (0.38% of the GDP the same year).

Considering what we have said, the increase in the cooperative relationships between the EU and China is recommended. But, at the same time, the EU should pay greater attention to the challenges coming from this cooperation.

DESIGN OF THE RESEARCH BASED TRAINING IN TECHNOLOGIES AND ENTREPRENEURSHIP IN THE SECONDARY EDUCATION

Maia Angelova Stoeva,1 Sashko Plachkov,2 Diana Mitova,3 Lyubima Zoneva4

Abstract: The article presents the nature of the research approach and its application in the framework of the studied disciplines of the cycle of technological training. Presented are the results of monitoring study of the skills of 11-14 year old students for research. The design of research-oriented training in technology and entrepreneurship predisposes the increase of the interest in the learning process and the learning motivation in parallel with the implementation of basic educational goals. The suggested tools aim to diagnose the skills of the students in the research training. Described are the basic levels of administration of the research approach in the training and its influence on building skills on a high level (at meta-level) in the students. The idea is similar to Bloom’s taxonomy according to which levels that follow the logical transition from easy to difficult act in the cognitive sphere. Knowledge and basic intellectual skills formed during are explored, with an emphasis on problem-solving cognitive and practical tasks. The creative technical abilities of the students are being studied through case studies and situations, and an algorithm for key research projects has been developed. The focus is on the interdisciplinary research training project which requires a broad general culture and knowledge from various scientific fields. A critical analysis of the results and conclusions about changes in teaching practice takes a special place in the article.

UDC Classification: 37.01/.09, 37.02; DOI: http://dx.doi.org/10.12955/cbup.v5.981

Key words: Educational design, competent approach, research-based learning, research project, technological education

Introduction

The quality education is based on the use of progressive strategies for teaching and learning, among which an important place is assigned to the research training. Modern educational transformations imply a subject-subjective pedagogical interaction and transition from the reproductive to the creative type teaching and learning. In the activity-oriented model, education is targeted at students, stimulating their productive thinking and creativity. The current educational trends help to move the focus from receiving just knowledge to independent learning through personal experience and impressions, through solving real life problems and active research.

One of the directions for upgrading the technological training and entrepreneurship in the Bulgarian educational system is to strengthen the research activity of students through direct participation in research.

Scientific research as a method of thinking and solving problems in the school environment

Each scientific research has specific characteristics which distinguish it from other research methods. Depending on the scientific method, research is described as theoretical, empirical, fundamental, and applied. It can be performed in nature or in a laboratory environment, or real objects or test models or samples. (Dimitrov, 2013)

The ability of students to think is developed using modern methods of teaching and learning as problem-based learning or training based on research approach. In the process of scientific inquiry, learners discover and solve research tasks and problems of different nature. Their ability to comprehend the learning material and its application to achieve certain scientific goals is evaluated through solving research tasks. The tasks are directly related to the skills of students to formulate objective, tasks, object, subject, and hypothesis, to select and present the methodology of his research (phases and methods of study) to seek, analyze, summarize and present scientific information, conduct scientific monitoring to model (in the course of experimental work), and to present results.

Solving problems in the process of teaching – research goes through different stages: exploration sources of information, analysis, synthesis, comparison, systematization, classification, typing, monitoring, research, experiment, and others. The process of experimentation is associated with

establishing causal connections and relationships, taking into account the variables and interactions in solving practical problems.

The ability to solve problems is one of the key competencies of the 21st century, and its formation in the school environment is of critical importance.

Competence to solve problems is related to the mobilization of cognitive and practical skills of the student, his creative abilities, values, and motivations. Solving problems is associated with the capacity of students to use the knowledge acquired in school to cope with the challenges of real life. At the core of solving the problem is the analysis of the reasons that cause it. It requires the ability to understand its nature and necessity problem to be recognized, considered and properly defined. The process includes the definition of the specific problem, the planning to find solution and choice of action strategies, performance, control and evaluation of the outcome. The problem represents a problematic situation on a smaller scale or a part of it. The formulation of the problematic situation requires creative and analytical thinking. The process of solving the problem represents specific research activity which begins with the study of the unfamiliar situation to determine the obstacles and the possibilities for the further steps. (Petrova, 2012)

The problematic situation is a state of intellectual disability, of which the student is looking for answers. It occurs when the knowledge and the experience, gained by the instant, are not sufficient for the solution of the problem. Learning how to solve problems is based on the creative abilities and comprehensive independence of the students. The Learning problem is a practical or a theoretical difficulty to which the solution is a result of the research activity of the student. It suggests a combination of knowledge from various scientific areas, giving the opportunity to the learners to independently apply the already acquired knowledge in a new situation.

We can mention the following requirements in formulating educational problem: it should be related to the already studied educational discipline and should have a logical connection with the achieved skills and knowledge; the formulation of the problem should contain both known and new terms; should contain cognitive difficulties; should be optimally difficult; should reflect contradictory information; the content of the problem should point to finding solutions; and finally it should cause cognitive interest for students.

Problematic situations require from the student's complex mental activities, oriented to alternately rising and checking of different hypothesis, self-absorption of new knowledge and experience, and reaching logically reasoned findings and conclusions. Independent work of students to solve problems is often closer to the actual research. Each problematic task provokes deductive, inductive and combinatorial thinking, thinking through analogies, and creative thinking of students.

This study focuses on the following cognitive competencies and forms of mental activity:

- Formation of terms that place the base of the abstract knowledge;
- Planning a series of activities to achieve a particular result;
- Decision-making through choice between alternative strategies;
- Problem-solving through a series of actions (steps);
- Opportunity for reflection by exposing the evidence to support these conclusions and reaching conclusions;
- Manifestation of creative imagination and create new images and objects through participation in research activities.

Research skills suggest the targeted use of scientific and technical concepts and basic scientific theories that are characteristic of the research. In particular, these are the skills the student use to identify logically justified questions: to make observations and to ask questions; to collect, analyze and present information; to compare decisions, experiences or hypotheses; to forecast and to reach conclusions with different levels of complexity; and to make objective conclusions and to assess the strengths and weaknesses of the conducted research. Research skills stimulate the scientific and technical thinking, supporting the objective interpretation of the information obtained and respectively the preparation of conclusions and predictions about future initiatives and career development in science and modern technologies.

Great attention is paid to the interrelation between these competencies here with three key competencies set out in the European Reference Framework - the digital competence, technological
competence and competence called "initiative and entrepreneurship" (Plachkov, 2013). These competencies are the foundation of building a competency profile of both teachers and students on the subject "Technology and Entrepreneurship," which in turn determines the quality and direction of formation and expression of their research skills.

**The specifics of learning and research activities of students in the course "Technology and Entrepreneurship"**

The specific objectives of training in general subjects "Technology and Entrepreneurship" in Bulgarian schools have been limited to the establishment of basic technological competence of students, launching of formation of key competence ‘initiative and entrepreneurship, formation of attitude towards a healthy and safe lifestyle and work to create conditions for conscious choice of education and profession.

Technological competence is associated with the use of the equipment for manual and machine processing of materials, self-development projects through the application of available software and digital communication and control. To manifest initiative and entrepreneurship, it is planned to enter in the real economic environment, exploring the best entrepreneurial practices and examples of entrepreneurial initiative. Considerable emphasis is placed on the key competencies and learning skills, critical thinking, problem solving, decision making, initiative, creativity, responsibility, and teamwork. (Ministry of Education and Science of the Republic of Bulgaria, 2015).

Educational and research activities of the students in the process of technological learning is a form of active learning and use of theoretical and empirical methods of scientific research. This activity is organized by the teacher who plans, creates and directs the process of learning. Content determination of training suggests opportunities to address diverse learning tasks, having the features of the research process. Educational activities have a research nature related to solving various design, technology, and organizational tasks. Structures will be analyzed, tools and technological operations – selected, the value and cost of products will be calculated, technical and technological objects will be evaluated as well as social phenomena and processes, and choice, based on certain criteria will receive argumentation. Organization of training in technology and entrepreneurship involves conducting integrated lessons, laboratory work and the development of projects that are leading teamwork and learning through search.

The laboratory training as one of the organizational forms of technological education provides the following opportunities for educational research:

- Research of physico-mechanical and technological characteristics of the materials;
- Measuring physical quantities with digital equipment and basic electrical parameters (power, voltage, resistance, size of the electric current, etc.).
- Identifying any changes in parts and products subjected to mechanical and thermal effects;
- Establishing a compliance between working process and working environment for a given profession;
- Establishing major motivational features and determining interest in a profession.

The educational content provides an opportunity for individual and team development of ideas and implementation of projects on topic, where the techniques of manual and machine processing of materials and products are used, and affordable digital software and digital means of communication and control are applied. Activities, related to entering the real economic environment, exploring the best entrepreneurial practices and platform for the entrepreneurial initiative, are stimulated. The ideas for project work are oriented to: constructive modifications to objects, design of structural assignment, development of options for family budget, research and development of ideas for entrepreneurial activity, realization of models of automatic electromagnetic and photo relay, performing market research and production of promotional materials for the company performance, the development of virtual design of a small firm, computer-aided design, engineering products from environmentally friendly materials, research and evaluation of the organizational structure of the educational company and others.

The educational research project in the content framework of technological training represents a specific learning task, related to the implementation of planned activities and aims to achieve concrete pragmatically oriented results for a set time. The project has specific objectives oriented toward
solving specific technical/technological problems. The specific objective of creative (research) project is based on research with a focus on a specific topic of the educational content of technological training. Students are required to have skills for planning, organization and time management during the implementation of the planned educational tasks. Criteria for evaluation of the project can be: the selection and formulation of the theme of the project; concretization of tasks; selection of appropriate methods for accomplishing the design research task; the presentation of the collected information; the selection of participants, resources, sites for the project, meeting deadlines, etc. (Mitova, 2011)

Methodology and research approach

The used research methodology is based on the methods of qualitative research - meaningful analysis of school records in technological training and testing (with problematic issues and practical tasks). The proposed tools aim to diagnose the interests of students to research training in the subjects of the cycle of technological training. With a view to implementing the research methodology, the following are identified:

- A complex of tasks and the respective criteria for analysis and evaluation of the level of preparation of children for research training in selected topics of the discipline “Technologies and Entrepreneurship”
- Criteria for the analysis of responses to tasks
- Measuring instruments - tests with questions and tasks tailored to specific technological training

Assessing the preparation of children for research training and skills for research is carried out through tasks for the detection and selection of certain information, questions and tasks with optional answer, questions with free and independently constructed response, and creative technical tasks in accordance with the set criteria.

The criteria for the analysis of results are reduced to: the mean scores of students; distribution of results in levels of achievement and performance, according to the measured cognitive processes and content areas.

We used the following criteria to evaluate the student responses (they match respectively low, medium and high level): completely true are the answers where the students give a correct answer or proper explanation (algorithm steps to solve the problem, creative interpretations); partially true - the answers are incomplete (partially true) without the necessary explanations; and wrong answers. In structuring the diagnostic technology assessment for the preparation of students for research training, the focus on the following components:

- Study of basic knowledge and intellectual skills formed in the process of learning, focusing on problem solving, cognitive and practical tasks from the content framework of technological training;
- Exploring the creative technical abilities of students through case studies and situations and developing conceptual algorithm designs with themes from the content of the subject "Technology and Entrepreneurship."

For a starting point in designing the diagnostic techniques are used the components of knowledge and skills of Bloom’s taxonomy.

Assessments of the study

The survey results are quantitatively processed and are correlated to levels of research training. Included are tasks for the detection and selection of certain information, questions and tasks with multiple choice answers, questions with free and independently structured answer, and creative technical tasks. The solution of the tasks for the assessment of the research abilities is consistent with the cognitive levels of Bloom: knowledge, comprehension, application, analysis, synthesis, and evaluation.

The relevance of the results obtained for the 6th and 8th grades are clearly seen from the graph of Fig. 1. The analysis of quantitative data strongly suggests that in answering questions and solving problems, the students from 6th grade there is a dominating performance average in ascending plan and high level of bearish run. There is an uneven distribution of the results at a low level, but the
trend, clearly shown in the chart with the line going upward, allows us to relate these results to the reproductive-adaptive level of expression of research skills.

It was found that tasks requiring expression skills of the highest cognitive level - evaluation, cause considerable difficulties in students from 8th grade. In tasks that require thinking through comparison of causalities and relations, abstraction, generalization of a match, and critical thinking related to the discretion of a situation, the results are the lowest regarding the levels of Bloom’s taxonomy.

Figure 1: Comparison of the results of 6th and 8th grades regarding the level of performance of research skills

Detected bottlenecks in the transfer of competence in the third and fourth tasks occur progressively at the fifth and sixth task, too. The correct answers to task 5 are 12.50% less than the correct ones in regards with the correlation “knowledge, synthesis, application.” The downward trend is clearly manifested in the sixth task in expression levels “synthesis and assessment,” where only 26.79 percent of the students give correct answers. The incorrect answers dominate with 73.21% (Fig.2).

Figure 2: Correlation between "true-false” answers at high cognitive level

Conclusion

The conducted pedagogical study provides results that at this stage do not allow outlining the contours of an optimistic picture of the research skills in technology and entrepreneurship of students in the lower secondary level of the Bulgarian school. The main problem consists in continuing adherence of the teachers to methodical schemes adhering students to express reproductive thinking.
The expected change in the standards of the educational environment, including the training in technologies and entrepreneurship will enable teachers to more easily switch to the application of modern method-based approaches of Edward de Bono (1994) to develop "lateral thinking" approaches, “learning by doing”, “learning by experience”, “project-based learning”, and so on.

ON MORAL IDEAL BETWEEN PHILOSOPHY AND RELIGION
IN THE GLOBALIZING CONTEXT

Eronim-Celestin Blaj¹

Abstract: Nowadays, humanity is continuously challenged by globalization at all levels: technological, economic, political, ecological, and social-cultural. The axiological crisis we face makes us find and develop viable values – by priority, ethical values - for the present time. More than ever, man needs to look for and to reconstruct his moral ideal by discovering new points of reference concerning the choices to be done. This paper focuses on the necessity of an ethical perspective open to principles rich in philosophy and religion. The purpose is to highlight the question of the moral ideal of human life in a globalizing context by accounting the offer of these two major cultural domains.

UDC Classification: 172; DOI: http://dx.doi.org/10.12955/cbup.v5.982
Keywords: Moral ideal, philosophy, religion, ethics, globalization

Introduction
Lately the phenomenon of globalization generated more and more challenges for humanity, from technological, economic, and political challenges to socio-cultural challenges. Because of this phenomenon we find ourselves in a value crisis which invites us to create new values that apply to our times. Now more than ever, people need a restriction on their moral ideals and new role models in decision making. The starting point is the reconstruction of the fundamental global humanity, reconstruction of the profound ethics, based on philosophy and theology. From this point of view, a factor to consider is the perspective offered by contemporary philosophy and also the way theology faces globalization trends today.

Thus, the globalization phenomenon even from the beginning, from 1870, when international formalization and implementation in social environment of the new ideas took shape, was described by the fight for power- at a global scale. Another important globalization characteristic is the development of communication systems and of global systems of production and exchange. Specific to this economical process, and from a social-cultural point of view, this phenomenon must be seen as way of changing the world, with the goal to overtake the borders of the old order.

An important role in developing this level of global culture is held by the ethical aspect of the globalization process, which implies the exchange of different cultural values from one part of the globe to another. Thus, we find strong communities of European citizens in other continents of the globe, and vice versa, for example, communities of the Far East in European countries each of them keeping their own individual cultural characteristics.

Globalization as a unifying process
Starting with the globalization, we face a progressive process of world unification toward one big market dominated by more and more competitive relationships and marked by serious tension. As I mentioned before, this process was developed from before the first industrial revolution and, in the last few years, had developed in a very intense and unexpected way. At its base, this development has financial, economical, informatics and political phenomenon. What takes shape, is in actual fact a type of fight between nations’ global classes, where a safe place doesn’t exist anymore, there aren’t any borders: “In this world, it is difficult to hide and, in many cases, it is almost impossible. All economies are intertwined in a competitive market and, unfortunately, in this cruel game, which takes place on this stage, the whole society has integrated; to back out this game impossible” (Dahrendorf, 2009).

From this international, national, political and cultural aspect, it is important to reflect on the person who, by importance, is above state and even above international realities involved in the globalization process. Now our considerations are becoming more of philosophical, theological and of a Christian nature. The traditional scale of values, theoretical behavioral and practical are questioned, or even ignored or disputed in many of their parts. We think about the fact that the Christian religion is isolated in the intimate sphere of the person, and it is driven out more and more in the public space, in

¹ Alexandru Ioan Cuza” University of Iași, Romania, celestinblaj@yahoo.com
the state. Today’s crises of values and profound principles create a mist in front of the view, leaving man prey to his or her uncertainties and anguish.

The value and importance of Christian diversity can disturb some; it is to notice that there is an attempt to create a new human being, without roots, lacking transcendence, adapted to new technology and economic interests. From a historical and cultural European point of view, today globalization represents the last phase to secularization of thinking and of life, which started at the end of the Middle Ages. The process is long and complex and it cannot be defined through sentences or comprehensive definitions.

Therefore, we consider that globalization is not a new phenomenon, but a present phase to a process, to a confrontation between sacred and layman, between theology and natural science, between the Church and the European states, everything evolving over many centuries. In the process, especially in the current time, we can see that the human being is not seen in their transcendent dimension. Although the fundamental human rights are respected, the right to life, to freedom of religion, or to have no religion, the human being is only a citizen on Earth and is living in a desacralized space, in an immanency spirituality, without having any superior benchmarks, always cropping the new, always reconsidering, reinventing everything, including their own nature (Gatti, 2001).

The history of the model of the contemporary human being, marked by this phenomenon, is a horizontal one, without references to the transcendent, who lives in polis which he build for himself- the global state. His identification is without an exact outline, and his routes are uncertain and in a constant change; from this uncertainty rise existential anguish and fears. It is obviously that as humans have more as material goods, the more they discover themselves being frail and needing more attention and protection. In this context rise values and constraint crises, one way, the human being at fundamentally questions the meaning of life and history, the rate between reason and faith, why does evil exist, etc...

Starting with the experience of an interior call for doing the good, human being understands that he is in a fundamental way a moral being, no matter what the contingent circumstance he is on. This call for good “corresponds the profound wish of the human being- as any being- aims in a spontaneous, natural way at what completes it fully, at what enables it to reach perfection, which is his own happiness” (Commissione Teologica Internazionale, 2009).

**On moral ideal between philosophy and religion**

According to a document of the International Theological Commission about the search for a universal ethics related to the natural law, human being -as a spiritual and rational one living in society- is not merely able to engage a conscious and mutual dialogue with others, but he also can look for the communion with God. Thus, human being is to be led by the imperative of justice within the social relations, which claims the recognition of equal dignity and mutual respect for each individual (Commissione Teologica Internazionale, 2009).

On the same tone, in his book *Psychologie Consonantiste*, Ștefan Odobleja argues that: “the moral ideal is the perfect balance between self and the others, between individual and society” (Odobleja, 1982).

Each person assumes for himself an ideal model in accordance to which the person is projecting, unwinding and appreciating his behavior. The moral ideal doesn’t reflect what is at a certain time or in a certain condition, as human reality, but what it must be; there is a need for change and self-improvement. Through this takes shape a state in which the human being desires to be, because it’s a better one than the present one, in the light of fulfilled personality (Albulescu, 2008).

In different cultures, people had elaborated and developed in a progressive way tradition of wisdom through which they express and pass on their vision about the world, so, their perception reflects the place human being hold in society and the universe. Before becoming any existential theory, these wisdoms, which are of a religious nature, send an experience which shows what favors or blocks the full manifestation of the personal life and the good function of the social life. They constitute for a kind of “cultural capital” available for the search of a general wisdom, necessary for answering the challenges of today’s ethics.
According to the Christian faith, the wisdom traditions in spite of their limits and, sometimes, even their errors, show a reflection of the divine wisdom which works in humans’ heart. Nevertheless, they constitute the testimony of the existence of values patrimony common to all people, regardless the way these values are justify in the interior of a particular vision about the world. For example, we can find in one form or another “the golden rule” in most of the sapiential traditions.

It is dharma, in Hindu traditions, which defines the social and religious obligation for human being: “The human who is practicing his religion (dharma) to not harm (ahimsa) universally he will obtain the greatest Good. [...] This human being who considers all the creatures as himself and treats them as he treats himself, laying down the punitive rood and totally controlling his anger, this will ensure his happiness” (Augustinus, 1962, III, XIV, 22).

Deep selflessness of Buddhist tradition, which translates itself by a deliberate attitude of non-violence, through friendly good will and compassion goes with the golden rule. Chinese civilization is profoundly marked by the Taoism of Lao-Tze and after, of Confucius, who was named “Kong Master”, tends to, in the context of a profound crisis of the period, restores the order by respecting the rites, based on filial piety that has to be the core of any social life.

In fact, social relationships take over the model of family relationships. Harmony is obtained by an ethic of the right measure, in which the ritual relationship (Li), that inserts the human being in the natural order, is the measure of all things. The ideal that needs to be touched is REN, the perfect virtue of humanity, formed by self control and good will for others. According to Confucius, “Is in it kindness the keyword? What you don’t want others to do to you, don’t do to them” (Entretiens de Confucius, 1981, 15, 23).

In African traditions, the fundamental reality is life itself. It constitutes the greatest good, and individual’s goal is, not only to live happily ever after, but to stay, first of all, even after death, a vital force, always reinforced and vitalized. An anthropological and vital ethics is unfolded by favouring life, keeping, protecting and developing it, especially growing the potential of community life, which goes to the good. Consequently, anything might harm the individual or community life represents the evil.

Muslim ethic is one of listening. Doing good means obeying the rules; to not obey rules leads to the evil. Human reason has to recognize the relevant character of the Law and get from it the concrete juridical implications (Commissione Teologica Internazionale, 2009).

In Christianity, more exactly in the Holy Scripture, the “Ten Words” constitute the centre; they are the essential elements of the religious experience of Israel. This Law of the Alliance contains precepts of the fundamental ethics. Alongside the texts referring to the history of salvation, with the major theological themes of choice, of promise and of the Alliance, the Bible contains a literature of wisdom which doesn’t handle first-hand the national history of Israel, but who takes interest on the place of human being in the world. There is the belief that there is a fair and wise way to do things and to plan life. In the New Testament, in a sort of moral teachings, Jesus renews on his side the golden rule: “Therefore, whatever you want men to do to you, do also to them, for this is the Law and the Prophets” (Mathew 7, 12). This positive precept completes and somehow overcomes the negative wording of the same rule from the Old Testament: “What thou (thyself) hatest, do to no man.” In its negative expression, the Golden Rule is to be found stated “in various forms by Confucius, Hillel, the Stoics, and others” (Calhoun, 2013, p.186).

Through the examination of the great traditions of moral wisdom, I wanted to highlight that some types of human behaviour are recognized, in most of the cultures as expressions of a certain excellence in the way a human being lives and accomplish his own humanity through: acts of courage, of patience in the face of challenges and difficulties of life, compassion for the weak, moderation in using materials goods, responsible attitude for the common good. These ethic elements define the great lines of the moral ideal of life “in accordance with the nature”; this is in accordance with the deep being of human subject. On the other hand, certain elements are universally perceived as being reprehensible: murder, theft, lie, anger, etc... They appear as negative attempts at the dignity of the human being and at the right precepts of life in society. There is a consensus beyond the cultural diversity, enlightening us as regards “the natural law” of St. Thomas Aquinas (I-II, a 2). The term of natural law refers to that complex of moral concepts which a human being is capable to know using reason, without the
intervention of the revelation or from God. The doctrine of natural law has a fundamental importance for two reasons: first, it stays at the base of moral, universal order and constitutes the spring of moral wisdom which Christians share with all humanity, because it is founded on that common reality of all, and second, natural law is the only protection against the political and legislative power-and constitutes the ultimate High Court against the unfair laws given by human authorities (Peschke, 1988).

Human beings accede only in a progressive way at the moral experience and become capable to give themselves rules to guide their actions. It supposes that they are part of the human relationships network from the birth moment within the family, gaining step by step self-consciousness as part of the entire world.

These are some pivotal ideas we find in a synthetic scientific theory – which since 1936 has announced a generalized cybernetics – belonging to Ștefan Odobleja. In his Psychologie Consonantiste, first published in two volumes in Paris (1938-1939), the Romanian thinker stressed the importance of understanding man – among other particularities – as an ethical being, self-fulfilling in the social relations framework, because “the moral ideal is the most perfect balance between self and others, between individual and society” (Odobleja, 1982).

Conclusion

Considering the great traditions of moral wisdom, I tried to highlight that some types of human behaviour are recognized in most of cultures as expressions of a certain excellence in the way a human being lives and accomplishes his own humanity through courage and patience dealing with challenges and difficulties of life, no less compassion, moderation and responsibility for the common good. These ethical elements define the great lines of the moral ideal of life in accordance with the law of nature and of God, supporting man to experience harmony as much as possible in a globalizing world.

The social and cultural circumstances play an important role in educating moral values. It seems that, in the context of globalization, communities and cultures must practice an honest dialogue and right exchange grounded on co-responsibility of all for the common good on the planet; before anything else, we need reach the moral values and rules, comprehending the authentic call of our very own human status in this world.

Abstract: The 200 year old Bánffy Castle exists as architectural evidence of the Hungarian nobility with significant importance in the garden history of Romania. The Renaissance style, late Baroque influence, and Neoclassic accents characterize the landmark, which has surpassed, through restoration, the test of time, and has since revitalized the social life in the nearby village. A cultural and physical message has already been highlighted by reconverting the ruin into a functional space, but a current approach to support the landscape as a local patrimony is lacking. This article discusses a reconstruction study of a green area within the historic garden, by analyzing another example of a Bánffy domain in Transylvania. The need for patrimonial protection of architecture, and landscape has great value in sustaining a local memory. This paper concludes with a discussion on the impact of garden rehabilitation in Modern Age.

Keywords: Renaissance, Baroque, reconstruction, historical garden, Transylvania

Introduction

In Romania, until the last century, the region of Transylvania has benefited from the Hungarian elite, who enriched the local culture and left a unique mark on the landscape with their architecture. The local secular gardens have suffered in time transformations from one architectural style to another, being closely connected with a fortress, castle, mansion, curia, or any other form of noble or cleric settlement. Particularly relevant at this point are the Habsburg historic maps, which capture the plans of the Bánffy domains from the 18th century, both Sâncrai, and Bonțida, and help to identify certain characteristics. This theme has been studied from a historical, cultural, and architectural point of view in maintaining a local patrimony, but the gardens, in both cases, have been lost over time, creating a gap between the past and the present. From Renaissance to Baroque, from ruin to the cultural center, today, the castle from Sâncrai has been restored to its former glory. However, regarding the historical garden, much more can be done. Being the most fragile among works of art, with drought withering the plants, wars destroying their architecture, weeds invading the ornamental plantings, and the hostile nature resuming what was once lost through art (Constantinescu, 1992), restoration is often considered among specialists, stating these matters as architectural and horticultural composition of public interest that should be treated as a monument (Florența Chart, 1982).

The main purpose of this paper is to stress the importance of a green area as part of a complex restoration. Without setting boundaries between the building and the landscape, it is imperative to be aware of the essence of this relationship. Hortus conclusus, as gardens are referred to in literature, has lost its origins. There are only assumptions, from comparing historical data, that a particular affinity for this type of art first appeared in Asia (Iliescu, 2008), where the utilitas component emerged first, and the evolution of society generated sacred, funeral, imperial, public, and private gardens with changing individual needs. A fundamental aspect of this study is to reveal the history of the Sâncrai garden in connection with Bánffy Castle. The study aims to analyze 20th-century postcards and compare the castle with another Bánffy domain to determine a landscape rehabilitation of the main castle entrance that could be extended to a larger part of the settlement.

Geographical Landmark

Bánffy Castle, placed in Sâncrai village, is part of Alba county, a central region of Transylvania (Romania). Situated seven kilometers from Aiud, a famous historic city in the county, it is accessible via the Ciumbrud-Meșecreaç Road (Socaciu & Takács, 2010). Mureș River is present on the west side of the holding, creating a natural and friendly microclimate with characteristic flora disposed as a barrier (Figure 1), in which Salix (weeping willow) has been identified. In the cold season, the formation of fog is a meteorological effect often seen here.

The deciduous vegetation and the agricultural land are an essential presence of the local landscape. On the north side, a group of modern buildings stands, while in the southeast, a rural road and a paved

street delimit the 17,850 m² settlement. At first sight in the historic garden, only a few old trees remain, such as *Fraxinus sp.* (ash), *Platanus sp.* (plane tree), *Juglans sp.* (walnut tree), and *Picea sp.* (spruce). Young trees, such as *Acer sp.* (maple) and *Rosa sp.* (roses), form part of the eco-farm, near the ornamental pond, while other representative vegetation near the castle have disappeared during restoration. The rose culture is popular among locals, especially in Ciumbrud, Romania, where each year an exhibition is held during summer.

**Figure 1: Aerial view of Sâncrai Castle**

![Aerial view of Sâncrai Castle](image)

### Historical Settlement

Few historically documented facts remain in writings about the castle from Sâncrai, except for the mention of it as belonging to the Kémeny (Fekete, 2007) and the Bânffy families (Iliescu, 2014), while the first mention of Sâncrai was in the 13th century. The First Military Survey (Figure 2) shows the Renaissance settlement and the central symmetry of the building. From 1890, the Baroque castle with Neoclassical elements was extended, due to the Bânffy family (Băscă, 2016), in two different phases. The manner of the passage from a family to another is not entirely clear. Suppositions claiming the transfer from one owner to another involves three hypotheses: lost at gambling, through marriage, or inheritance. The last one is the most plausible and is associated with Jeno Bânffy, the baron who assigned Pâkei Lajos to direct the works, although in the architect’s biography there is no such mention (Bordás, 2013). However, Lajos’ representative artistic creations from Cluj-Napoca show a certain resemblance to the assembly from Sâncrai.

A mystery engulfs the historical context of this subject. In the 20th century, Sâncrai Castle, like many other noble mansions, has had its function dramatically changed to a school for disabled children, and was even at one point abandoned. The damage caused by these actions was permanent until the local authorities decided to recover a valuable treasure of the past through restoration. An inventory from 1953 presents details of the castle’s garden as having various floral species, and fruit and deciduous trees (Bordás, 2013). This aspect reinforces the authenticity of a postcard view from the same century, presented in the subchapter, Landscape Rehabilitation. Since 2013, the building once known as a castle had its glory successfully restored and hosted many cultural and educational activities that now enrich the local social life, but still with minimum intervention in the perimeter of the garden. A culture of roses was established as part of the eco-farm and some young *Acer sp.* (maple) were planted. The only built element in the garden that still stands is an ornamental pond that is out-of-use, almost lost in the spread of vegetation (Milea, 2011). This is the landscape that welcomes the visitors of the Cultural Center of Sâncrai in 2017, which is administrated by the local council (Moga & Rustoiu, 2013).
Bánffy Domain, Bonțida (Cluj)

Many noble families preferred the Transylvania region (e.g. families of Wessényi, Bethlen, Kendeffy, Ugron, Mikes, Haller, and Brukenthal). Its picturesque scenery, rich soils, and proximity to a water source were probably the main reasons to build their large and luxurious castles in this area (Narcis, 2002). The Bánffy name occurs in the history of Cluj county from the 14th century. At 30 km from Cluj-Napoca, one can observe the imposing castle at Bonțida, which is a remarkable example of a complex architectural ensemble, with Renaissance, Baroque, Neoclassical, and Neogothic features, comparable with Versailles or Schönbrunn (Hegedűs et al., 2015). The building is primarily said to have had curtain walls disposed in a U-shape, which can easily be confirmed by comparison with the First Military Survey of the Habsburg maps (Figure 2).

Generally, the noble families have shown a particular interest towards art being transposed into their gardens as the driving force to transform and adapt the landscape according to the brilliant minds of the landscape architects of those times. An occidental Baroque influence emerged through the personality of Dénes Bánffy VI (Jurnalul Național, 2015), a descendant who inherited the castle in the 18th century. Educated at the Imperial Austrian court, he transformed the landmark into a French parkland making of Bonțida a Transylvanian Versailles (Hegedűs et al., 2015). Iosif Biro describes in his writings three long narrow paths measuring almost one kilometre each, adorned with Linden trees that converged to the north side and united into a fourth path. The park had all the main features of the mentioned style: floral beds, obelisks, fountains, and sculptures (Marcus, 1958). Although these characteristics were transformed in the 19th century into a romantic garden, according to the plans from 1831 of Lazlo Iañoş and the works of Herman Samuel (Marcus, 1958), some large old trees from the avenues remain today, with severe pruning interventions, but as proof of an extraordinary landscape settlement created by artists, such as Johann Kristian Erras.

War World II had negative effects on the settlement, not only were works of art within the building destroyed but valuable documents were stolen during this period (Scholten, 2010). In the following years, one by one the famous trees were cut down, based on the information presented in Castle Break (2016). The garden silently disappeared, becoming only grassland and a local memory. In the 20th century, degradation became such a problem that the monument was included on the List of the Most Damaged Historical Monuments of the World, with funds being directed for the conservation of the castle, since 1999. Today, through the hard work of the Transylvania Trust (1996–2017), the cultural and social spirit is being rebuilt. For a few years now, a pioneering project, the Electric Castle music festival, has attracted many tourists during summer and the income from this event helps achieve the restoration, due to be completed by 2026, as estimated by the trust. A recent study visit, in March 2017, at Bonțida, helped acknowledge the connection between the past and the present between castle and garden (Figure 3). With many examples of similar monuments from Europe, the future is promising for restoring the green area as it was intended for the built environment.

**Landscape Rehabilitation**

A possible landscape proposal of a small area within the restored castle from Sâncrai, accompanies the *in-situ* study of the landmark in 2015 and 2016, to acknowledge the true potential of the Cultural Center, which has been operating since 2013. The method used in this case study of a historical rehabilitation (more so than a landscape one), started with retrospective 20th century postcards that showed the castle’s surrounds. This involved comparing etchings illustrating the Bânffy domain (Bonțida), as seen in the 19th and 20th centuries (Figure 4).

These remarkable drawings showed a preference for floral beds, groups of shrubs, individual plantings, and a rose culture. The species that could be identified, conclusive for Sâncrai, was the *Agave sp.* (century plant), which is considered an exotic species that needs protection indoors during winter due to the meteorological conditions of Romania. Climbing plants observed on the building’s main façade were associated with wine species or ivy but without any certainty. On the lawn area, conifers such as *Abies sp.* (fir) adorned the garden and roses on the opposite side made the lateral path visually pleasant. Near the entrance, two pots stood symmetrically, as a reminder of the Renaissance age.

On the opposite side, the Mureș river creates a microclimate for specific water vegetation. This information gathered from the aesthetic analysis of the past is considered fundamental for the future landscape proposal. Although documented historical facts of the castle outnumber those of the garden, the concluding images provide a glimpse of the past for more tangible evidence.
The landmark of Bonțida is by far a landscape architecture that deserves to be among Transylvania’s most outstanding works of art. The etchings (Figure 4-b) show luxurious vegetation and an accurate sense of proportion, rhythm, and harmony, creating an extraordinary composition. From the drawings, corresponding to the garden’s romantic period, the study established there was a particular preference for deciduous species, possibly Fraxinus sp. (ash), Populus sp. (aspen), and Quercus sp. (oak), with a narrow upright form.

Near the western wing of the castle a small wooden bridge connected the rustic paths, while, in front of the main building, the lawn was enriched in its design with floral species. These aspects revealed an attentive perception and organization of space. Analyzing and comparing the photos of the two Bánffy domains helps one understand not only the history but the essence of the topos (place). The proposal for a hypothetical landscape intervention had a simple pattern, imitating the style in the etchings (Figure 5).

It was considered appropriate to propose a pleasant area in front of the main entrance due to the many cultural and educational activities that were likely to be held throughout the year (conferences, workshops, competitions, expositions, and concerts). The portrayal included an option for enlargement, with future studies. The historical background, strengthened by accurate documentation and relevant illustration formed the base of conceptualizing the idea into a visual graphic.

The conceptualization included an open space that would allow the visitors to admire the architecture of the building without vegetal obstruction. Considering the 20th-century image of the landmark and the Bánffy's possible affinity for plants, a couple of Baroque look-alike pots with roses were chosen to define the vertical lines in the composition at a smaller scale from that of the historic building.

An exotic accent was established with the central piece of an Agave sp. (century plant), and variety was shown with a simple mosaic made of Senecio cineraria (dusty miller) and Petunia sp. It formed a natural passing from vertical lines to horizontal ones, which are not that easily perceived by the human eye unless viewed at the correct angle. This minimal intervention presents a great opportunity for continuous development in the historical landscape field and completing the final level of restoration, uniting the castle and garden in the 21st century.
Conclusion

The past cannot be changed, but the present is an opportunity for a 19th-century garden rehabilitation to stand as a testimony of Hungarian culture and society into the future with positive implications for Transylvania. This study highlights the natural evolution of world heritage and provides an impression of Romanian historical landscape. By understanding Sâncrai Castle’s settlement from an analytical point of view and comparing it with the domain from Bonțida, a simple landscape rehabilitation proposal was developed.

The connection between the building and the garden has a history of its own, adapting and transforming into different styles. Overall, specialists in the 21st century still have much to learn from the forgotten monuments. Only acknowledging the true spirit of a landmark, can it be restored to its former glory. A first step has been made for the Bánffy Castle; the same should be done for the landmark garden closely related to the castle, and from which could emerge a unique work of art. Landscape architecture is designed to be contemplated and protected in time.

DIDACTIC PARAMETER OF LANGUAGE LITERACY IN THE BULGARIAN SECONDARY SCHOOL

Tanya Borisova

Abstract: This article summarizes the main conclusions about the state of reading literacy of students in the same class in a Bulgarian school and the correspondence between the international criteria for establishing reading literacy of the students. A study, based on the longitudinal method, outlining the didactic parameters of reading literacy in the Bulgarian school was conducted. Emphasis is placed on the needed changes regarding overcoming the problems in the education in reading literacy of Bulgarian students, its limits and variety in its improvement; the correlations which exist between the results of the national external assessment (NEA) of the students in the subject of Bulgarian language and literature of the fourth, seventh and twelfth grade.

UDC Classification: 373; DOI: http://dx.doi.org/10.12955/cbup.v5.984

Keywords: Reading literacy, external State assessment, education in Bulgarian language and literature, level of reading literacy and language competency

Introduction

The use of the longitudinal method to establish reading literacy levels of students of the 4th, 7th, 9th and 12th grades, of the same class (enrolled in first grade in 2004) in the Burgas district, enabled the analysis of the reading literacy of the same class in the 4th, 7th, 9th and 12th grade with national and international means and traces the dynamics of the reading literacy of the students in all stages and grades of secondary school. The comparative analysis of the results obtained through the Bulgarian and international methods of research of the reading literacy shows reading literacy levels as a summary of the requirements of the new Bulgarian normative documents for studying Bulgarian language and the international standards for reading literacy;

The didactic parameters of reading literacy in the Bulgarian school outline the following trends:

Purpose, object, subject and aim of the study

The proposed dissertation work fulfilled the purpose and the tasks set in its concept and thus the following conclusions can be made:

1. The didactic parameters of the reading literacy, related to its formulation by UNESCO (UNESCO, 2006) read in the context of the state educational requirements for Bulgarian language and literature education in secondary school and compared to the PISA criteria should be basic in reading literacy education - from initial literacy education to reading comprehension and finding, retrieving and interpreting information from the text on the basis of established correspondences between the didactic parameters of the reading literacy in the Bulgarian secondary school and the international systems of work for raising the levels of its understanding.

2. The external evaluation in the fourth grade and the thorough analysis of its results in the Burgas district showed that the correct answers rates from 2007 to 2013 are still going downwards. In 2007 (with the first introduction of the fourth-graders test), the percentage of true answers was 81.01%. The percentage in 2008 (the year of the evaluation) it was already 80.50%. In 2013 it was only 68%. Without further calculation, it can be said that the decline is significant, even on the basis of the overall results of the test, which is solved by the students. The difference of more than 13% can lead in several directions: - the achievements of the students have significantly dropped, i.e. their knowledge in Bulgarian language and literature marked a serious decline. In just six years something difficult to explain has happened in their education in Bulgarian language and literature The comparison of the 4th grade test of the 2007/2008 school year with the PISA criteria found the following: the text for dictation and reading is the same but is without subject; it is missing a title and it should be entitled by the students; only five of all 15 questions are to find and retrieve information from the text. They are standardized, i.e. the students choose a response from 3 possible options that are given to them. Moreover, the PISA criteria and their presence in the test lead to the conclusion that the state test for external evaluation can hardly be related to the global dimensions of reading literacy. The reference to the requirement for

1 Trakia University, Faculty of Education, Stara Zagora, Bulgaria, borisova.t@abv.bg
reading and writing education go hand in hand (as two branches of literacy) and this immediately reveals that more than 17% of the students did not master the so-called elementary initial literacy after the 4th grade.

2.1. According to the sex of the students, girls showed higher results. Their average score for girls is 17.29 points and for boys is 16.86 points. The difference is less than half a point. At the same time, 28.1% of the girls have reached the maximum test score, while the percentage of the boys is 17% according to data received from mean square deviation, there is significant difference.

2.2. More serious is the problem with the results obtained according to the students' mother tongue. The study shows that students whose mother tongue is Bulgarian have the highest score in the test and the dictation (average score 17.7 points). Students from Turkish ethnicity, who are predominant in the Burgas district in Ruen, Aytos, Pomorie, Malko Tarnovo, make more mistakes in observing the grammatical rules of the language and their score drops to 15.05 points. Statistically significant is the difference in the ball of the Roma ethnicity students - an average of 13.74 points. In the Burgas district they are predominant in the Kamen and Sungurlare regions. A difference of nearly 5 points in 20 max points of the students with Bulgarian as their mother tongue is enough to conclude that the Roma pupils show a significant lag in the covering of the state educational minimum standards still at the external evaluation in fourth grade. It is only emphasized on this part of the competences that are set out in the SER, for the purpose of applying knowledge rather than improving skills.

3. The external assessment of the same pupils in the seventh grade, consisting of two modules (with the first, compulsory for all students), which measured the pupils' achievements according to SER and the educational minimum, contains the following information for measuring the reading literacy of seventh grade students: 18% of the points provide information on student literacy; 18,46% - bring information about students' achievements when editing text; the remaining 63.54% measure students' knowledge of grammar and literary comment only elementary literature forms. According to the PISA criteria, these percentages clearly show what and how is reading literacy being assessed according to the educational minimum. In this way of assessment, it turns out that only 51.23% of the seventh-grade students in the Burgas district have dealt with the tasks of the first module.

4. When compared to the average success rate of the same students from the external evaluation in 4th grade - 80.5% measured according to the average statistical dimensions of the Ministry of Education and Science (State educational standard). Referring to MES statements that these two tests - after the fourth and seventh grade measure how much and how many students have covered the SER in Bulgarian language and literature subject, without looking for a high level of difficulty, then the success of the same students marks a decrease of 29.97% for only three years.

5. The results of the study of the reading literacy of the seventh grade students show that the successful solving of the specific tasks within the depicted problem areas should be interpreted as a consequence of the change of the profile of the Bulgarian language teaching as the first language in the secondary school – from grammatically oriented towards communicative oriented Bulgarian language education; and not only to be talked about communication, but to make sense of it as a communication with a text, i.e. acquiring reading literacy and such skills that help the individual's social realization.

6. The study conducted and tested how and in what direction the reading literacy of the students of the same class in the fourth, seventh and ninth grade is moving. If in the fourth grade 81.1% of the students in the Burgas region are successful, according to the SER, in the same test in seventh grade 51% of them have managed to cope with the educational minimum. Somewhere between the fifth and the seventh grade, nearly 30% of the students "self-isolated" themselves from reading, and most of them have dropped out of school. The tendency for girls to do a little better than boys keeps up. These figures are very similar to the national statistics, because the Burgas region has always been somewhere in the middle with its achievements. In this case, this data should have been noticed by the MES long ago. But the results are reported year by year, and it has not occurred to them that they can already see the competencies of whole classes. And the competencies are decreasing. This is confirmed by the PISA criteria in a sample of 204 students from a grade, divided into different types of schools in the Burgas region. Still another 10%, of the students are dropping beyond the critical level of reading literacy. So, from the fourth to the ninth grade, the succeeding students are reduced by half. This tendency is preserved till the twelfth grade and is confirmed by the results of the grade shown in the June 2016
session of the Bulgarian matriculation exam in Bulgarian language and literature subject: - a large number of poor grades that were predicted from the study of reading literacy in the ninth grade; the lack of reading skills directly influences the acquisition of knowledge, so the students have limited themselves to working only on issues bearing 1 point for a correct answer (da Costa et al., 2013).

7. Research shows that the decreasing reading literacy in Bulgarian schools is a fact. Therefore, more correlations need to be sought to suggest to researchers and experts where they should direct their efforts if they want to get out of the enchanted circle. State schools most clearly indicate the tendencies in the achievement of the graduating students. They are the most, and in them the success gives an idea of the real level of literacy. In the Burgas region - 4, 33 / 4, 08, in the country 4,54 / 4,27. In these schools more than 89% of 12th graders study. Most of the graduating students who have not worked on the creation of an interpretive text study at state schools. Most students also study there, also have not received higher scores from the range of 3,49 to 4,00. This is Grade Point Average of the students from the municipality schools compared with the same value achieved in the State and the private schools in Bulgaria. As a conclusion to their reading literacy, it can be argued that the differences are in contrast between profiled and un-profiled classes in the same school.

8. The decline in the dynamics of reading literacy is categorical and confirmed by the study.

Results
To overcome it, it is necessary:
- To take into consideration the level of the reading literacy of the students in the secondary school and to compare it with the requirements of the state educational standards for educational content (syllabus) through independent assessment methodology - threshold values, illustrative material (Bench mark), etc. It is especially important to integrate the skills that are a subject of evaluation in the international research;
- To understand why reading and reading skills are given such great attention in international studies of achievements in education. And if today our education system encourages the best students to acquire reading literacy, why do they continue their studies abroad and are realized in the societies there, while the labour market in Bulgaria remains with those that are below the critical values of the reading literacy;
- To respond to the broad public needs with reliable information on how our educated system prepares students for the Bulgarian public reality. The PISA's results can be the basis for public dialogue and political will, and for collaborating in defining and implementing educational goals with innovative methods that reflect the understanding of the skills necessary for the lives of mature people. The recognition of the literacy as understanding, use and comprehension for writing texts to achieve goals and meet the needs of deepening knowledge is essential for PISA. They see the literacy as a development of the intellectual potential of the person for his active participation in public life. Reading seeks to extract information, to interpret texts and to broaden their common understanding as well as to reflect on the text and to evaluate its content, form and characteristics (OECD, 2010).
- To process the educational context of a unified Europe the SER for learning content on the BLL in secondary school. These new standards should be applied in the practice of learning, as well as in the evaluation and measurement of students' achievements in Bulgarian language as the first and the national language in Bulgaria. A step in the right direction is the introduced external evaluation, but it waits for its improvements in the direction of validity and reliability (Mullis et al., 2004).
- To pay special attention to the thresholds for assessment of the BLL training between grades 4 and 5 as well as between 7 and 12 grade. There is also a need to define the BLL (mandatory, optional and facultative) levels of training, and why not to provide a specific discipline to develop the pupils' reading skills and reading literacy skills. Moreover, such experience exists in many European countries.

Conclusions
Among the key issues awaiting their decision are the following:
1. Establishing a link between the results of international researches in order to improve the Bulgarian language and literature education and the whole cultural and educational area, in order to build reading literacy among the students.

560
2. Again, the problem of what to assess the external sight of the system is highlighted - the educational minimum or the achievements and weaknesses of the students in their reading literacy.

3. Where will the system of assessing students' achievements in Bulgarian language and literature go - to some Bulgarian idea or to the global system measuring a set of skills, including reading and writing, perception in their social context. (Rayner, K., & Reichle, E.D., 2010)

4. The published PISA reading literacy thresholds, tailored, compared and implemented through the normative documents for studying Bulgarian language and literature under the new School and Preschool Education Act, can be used as a basis for discussions on whether the FUNCTIONAL EDUCATION of Bulgarian students should be as a KEY COMPETENCY in the Bulgarian school (Lundberg & Hoien, 1991).

5. The study of "reading literacy" also raises the question of how students should be trained in it to be validly assessed and prepared for social realization. Qualitative assessment, such as structuring evaluation standards, selecting an educational evaluation philosophy, and identifying key objectives, leads to the reconsideration of curricula in the Bulgarian language and literature and their focus on developing students' reading literacy.

Abstract: Raising the environmental awareness of architectural students becomes increasingly important given today’s global environmental challenges. As a prominent player in urban development, an architect needs to be concerned with the alternative ways for achieving environmental sustainability. Subsequently, environmental issues constitute an important part of the curriculum in architectural education. The scope of this study covers an elective course in an architectural graduate program of Turkey with the main aim of making fresh architects aware of their vital role in environmental objectives. In this course, the students are asked to visit and examine the vernacular architecture at a rural Turkey settlement. In this assignment, the students use a series of architectural as well as social science research methods. They present their findings visually and offer their proposals as a conclusion. Their proposals involve ways, not only, to achieve sustainability for this rural settlement but, also, to adapt the traditional design methods and materials examined within the course into contemporary design techniques. Given the acquisitions of the graduate students, this paper concludes with a recommendation for improving architectural course content by integrating applied learning.

UDC Classification: 378; DOI: http://dx.doi.org/10.12955/cbup.v5.985

Keywords: education, architecture, sustainability, environmental awareness

Introduction

Professor Viktor Papanek, an international design expert recognized by United Nations Educational, Scientific and Cultural Organization (UNESCO) and design teacher of several renowned design schools of the world, defined ecologically responsible and socially responsive design as revolutionary and radical (Papanek, 1985). His ideas included consuming less, using things longer, and recycling materials (Papanek, 1985). When considered in the context of architectural design, it is about ecologically responsible and socially responsive architectural design offering a sustainable lifestyle and future. It is clear that buildings of the future need to provide suitable environmental conditions for dwellers. At the same time, building design should create a lighter impact on the wider environment. Being conscious of such vital importance of architectural education, the authors have emphasized the need for ecologically responsible architectural design in their undergraduate and graduate courses. One of the related graduate courses held at Uludag University, Architectural Program of Institute of Science and Technology, will be presented in the context of this study.

Literature Review

Environmental Education in Architectural Programs

As ecological awareness has grown globally in recent years, the role of architectural education in Turkey has gained increasing importance, with the construction industry recognized as one of the most answerable sectors in the fight against the current climate crisis. According to the International Energy Outlook of 2016 (IEO, 2016), 20.1% of the total energy delivered worldwide is consumed by the building sector. This truth places the need to introduce sustainable architectural design to new generations of architects at the apex of their agenda for many years. The descriptives qualifying desirable architecture, namely, ‘sustainable,’ ‘ecological,’ ‘green,’ and ‘environmental,’ appear more often in related media. The architectural programs now prefer to enhance their curriculums with theoretical and practical courses that include sustainable design. Furthermore, this preference has become a ‘must have’ for accreditation and qualification boards in many countries.

Altonome (2009) indicates that there is a great need to discuss environmental issues such as climatic design, choice of materials, construction techniques, resource efficiency, and similar options throughout the architectural teaching because current curriculums of the programs are insufficient in integrating sustainability issues methodically.

In fact, the roots of architecture, or otherwise, the traditional ways of building, should be the main guide for sustainable architecture.

2 Uludağ University, Bursa, Turkey, renginb@hotmail.com
Analyzing examples of vernacular architecture is a particularly fruitful approach for developing a guidance tool.

Vernacular Architecture as a Tool for Environmental Awareness

Defining ‘ vernacular architecture’ and clarifying its importance for improving environmental consciousness needs priority consideration. Oliver (1997) defined vernacular architecture as the most widely used term to denote indigenous, tribal, folk, peasant, and traditional construction. He points out the distinctions that can be made between formal architect-designed and vernacular architecture, and between these and what can be termed as popular architecture. He is a renowned researcher who works for recognition and understanding of the meaning and importance of vernacular architectural traditions, worldwide. Oliver (2006, p. 267) argues that vernacular architecture will be necessary for the future to “ensure sustainability in both cultural and economic terms beyond the short term.” Another eminent researcher, Rapoport (1969), defined and described the vernacular design as a part of a typology that comprises primitive, vernacular, and high-style settings, with modern architecture a special case of the latter. In one of his studies, he described vernacular design as both a process and a product with the resulting environment having certain characteristics. Concentrating on the process, he argued that the main point is not that it is created directly by the users without architects but rather that the vernacular design is achieved through applying shared rules. Asquith and Vellinga (2006) indicated that contemporary studies about vernacular architecture mainly focus on the applicability of lessons learned from traditional building styles for that applied in the twenty-first century. The emphasis is mostly on vernacular traditions having much to contribute to contemporary practice through offering economic and culturally sustainable solutions for global housing problems. The common aim is to foster an architectural perspective that integrates vernacular and modern knowledge, to create “a truly sustainable future built environment” (Asquith & Vellinga, 2006, p). Recognizing the importance of vernacular architecture and in sharing the ideas of Yannis (2005), who considered sound theoretical background to be supported by empirical knowledge and evidence-based learning, the authors realized the value of vernacular in both undergraduate and graduate courses.

Methods

This study uses proceedings from a graduate course held at Uludag University for the Architectural Program of the Institute of Science and Technology. A Graduate Course: Sustainability and Materials in ArchitectureThe course’s main aim is to determine the sustainability of an architectural design and its implementation including the role of building materials in this sustainability. In achieving this aim, it is envisaged that fresh architects will have a greater awareness of their vital role in environmental objectives. The proposed learning outcomes are 1) an understanding of the relationship of sustainability and architectural design and 2) knowledge of the characteristics of building materials and the roles these play in architectural design. The concept of sustainability is considered in three main components: ecologic, economic, and socio-cultural. The students were invited to visit a vernacular village, Tongurlar, located in Bilecik City, in the northwest of Turkey (Figure 1), to analyze and identify the reasons for its unique architectural characteristics. Few families live in this village today since most have immigrated to urban centers because of lack of income sources in the village. Furthermore, poor economic conditions have resulted in unhealthy living environments, and the traditional buildings are now degraded to near inexistence. Agriculture and cattle breeding are the main sources of income for the villagers, but because of the insufficient policies of the government, it has become difficult to earn a living in the area. For revitalizing the village, there was little doubt that socio-cultural and physical sustainability of Tongurlar village should be achieved. Having this aim, the academicians with varying professions, such as architects, textile artists, sculptures, and painters, in different universities of Turkey, developed a research project supported by the universities’ foundations. They organized summer workshops together with their students. The architecture students from varying universities attended these workshops and together restored the primary school building and one house in the village. Today, these buildings comprise the hub for workshops organized at varying times over the year.
Results and Discussion

In the scope of their research, graduate students of the Uludag University Architecture Program combined a series of architectural approaches with social science research methods. They presented their findings using visual applications and offered their proposals as conclusions. They prepared analysis charts for the vernacular houses in the village, including physical and material properties, and calculated the energy efficiency of the houses (Figure 2).

At the end of the term, the graduate students developed a set of strategies for sustainability of all aspects of this vernacular site. These proposed strategies were as follows:

- Organize events similar to the summer workshops of the universities in the village to vitalize the everyday life of the villagers; arrange these to include festivals, bazaars, and themed education activities.
- Teach the villagers the value of their lifestyle and living environments for a sustainable future. This awareness could be developed through students spending more time with the villagers and experiencing their lifestyle, while explaining the adaptability of their everyday practices and ways of building for modern living.
Investigate ways of using vernacular building materials and techniques in the maintenance of the traditional houses and consider both the local people and practitioners.

**Conclusion**

This experimental study, undertaken in a traditional village of south-western Anatolia, aimed to increase awareness in student architects of the basic vernacular ways of living and building that are the basis of sustainable architecture. The students recognized that to understand the basic principles of sustainability, a designer needs practical experience in the vernacular ways of living and the traditional modes of architecture. Furthermore, it was accepted that by analyzing the traditional building materials and techniques one can propose new sustainable materials and technology for composing contemporary spaces for modern living.

The outcomes of this practical study undertaken by the graduate students of the architectural master program indicate that this type of applied learning has many advantages in architectural education. The necessity for this type of learning specifies the importance of architecture being a multidimensional and applied discipline. These conclusions indicate the merit of applied learning, integrated with theoretical coursework, in providing a more innovative and up-to-date architectural education system.

LEGAL ADJUSTMENT OF ILLEGAL EMPLOYMENT OF CHILDREN IN SLOVAK REPUBLIC

Peter Čonka

Abstract: Illegal employment of children deserves our specific attention because the healthy development of children is one of the most important factors of an advanced society. The aim of this contribution is to provide a preview of a theme, especially in a branch of the Criminal law. The contribution deals with the definition of child labor and analyses the legal adjustment of illegal employment of children included in Criminal Code of the Slovak Republic while also pointing out international sources of this legal adjustment. The Criminal code of the Slovak Republic, the Convention on the Rights of the Child, and other relevant literature and documents about child labor are the main sources of this survey. We can consider this legal adjustment as suitable, but it is important to focus on its adherence. An important benefit of this particular analogy is a general overview on the theme of illegal child labour by analysis of relevant legal adjustment.

UDC Classification: 343.3/.7; DOI: http://dx.doi.org/10.12955/cbup.v5.986

Keywords: children, labor, employment, illegal, convention.

Introduction

Child labor is an issue that needs to be handled very carefully because incorrect procedure might cause huge damage to the children’s development. Illegal employment of children might cause damage to their moral development, physical health, and it also has significant impact on truancy. Premature termination of education and truancy make it harder to find a stable job with good salary. According to the World Report on child labour (2015) some 168 million children remain trapped in child labour while at the same time there are 75 million young persons aged 15 to 24 years of age who are unemployed and many more who must settle for jobs that fail to offer a fair income, security in the workplace, social protection or other basic decent work attributes.

Child labor is typical for developing countries, but we need to focus on this issue also in Europe, because development of this unwanted phenomenon might be very dangerous. We need to take control over truancy and premature termination of education to prevent illegal child labor, because children which are not under control and which are not educated are more susceptible to be abused.

It is very positive that in the most of the European countries there is protection of children secured by Criminal law. This fact might discourage potential perpetrators and also serves as expression of the highest importance of resolving this issue.

Contribution Legal adjustment of illegal employment of children in the Slovak Republic presents legal adjustment of this issue expressed in the Criminal code with focus on international conventions as sources of this legal adjustment. The contribution also pays attention to the definition of key concepts and also focuses on connection between child labor and truancy.

Illegal employment of children

Society pays extraordinary attention to protection of children by its system of laws, and this is expressed by the fact that children are protected not only by the norms of civil law, but also by the norms of criminal law. Criminal law protects only the most important values of society so we can conclude that life, health and healthy development of children belong to the top of human interest.

Employment of children is a very specific theme which is regulated by strict rules. These rules can be found in Labour law and also in Criminal law.

The Criminal law of Slovak republic provides protection of children by the Criminal code (number 300/2005), which includes following legal adjustment in § 211:

1) Any person who, even by negligence, exposes a person under eighteen years of age to the risk of debauchery by
a) enticing such person to leading lewd or immoral life,
b) enabling such person to lead lewd or immoral life,
c) enabling such person to perform actions which are considered as criminal offenses under this Act or,

d) preventing such person from compulsory school attendance, shall be liable to a term of imprisonment of up to two years.

(2) The same sentence as referred in paragraph 1 shall be imposed on the offender, who as a contrary to a generally binding legal regulation, employs a child under fifteen years of age, and thus prevents him from compulsory school attendance.

We can conclude that the cited paragraph of the Criminal Code contains two different facts. The paragraph number one contains general protection of children to prevent the risk of their debauchery. Objective of paragraph number two is to protect the healthy physical and mental development of children younger than fifteen years of age. This provision implements the Convention on the Rights of the Child which has been approved on 20-th of November. The Convention on the Rights of the Child describes a child as every human being below the age of eighteen years, unless under the law applicable to the child, maturity is attained earlier. State Parties shall secure life and development of children at the most possible level. According to article 19 of the Convention, state Parties shall take all appropriate legislative, administrative, social and educational measures to protect the child from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse, while in the care of parent(s), legal guardian(s) or any other person who has the care over the child.

According to article 27 of the Convention, state Parties recognize the right of every child to a standard of living adequate for the child's physical, mental, spiritual, moral and social development. According to article 31 of the Convention, state Parties recognize the right of the child to rest and leisure, to engage in play and recreational activities appropriate to the age of the child and to participate freely in cultural life and the arts. State Parties shall respect and promote the right of the child to participate fully in cultural and artistic life and shall encourage the provision of appropriate and equal opportunities for cultural, artistic, recreational and leisure activity. From the mentioned article, it is possible to conclude that its objective is the protection of children against illegal employment, because it guarantees the right to rest, leisure time, and versatile development.

Article 32 of the Convention explicitly protects children against illegal employment and against truancy. According to this article, state Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development.

State Parties shall take legislative, administrative, social and educational measures to ensure the implementation of the present article. State Parties shall in particular:

(a) establish the minimum age or minimum ages for admission to employment;

(b) determine the appropriate regulation of hours and conditions of employment;

(c) enact the appropriate penalties or other sanctions to ensure the effective enforcement with respect to the present article.

Article 36 of this Convention also refers that state Parties shall protect the child against all other forms of exploitation prejudicial to any aspects of the child's welfare.

The capability of citizens to rights and obligations in labour relations and capacity to acquire these rights and take on such obligations by one's own legal actions (labour-law capacity) comes to existence, if the Labour code do not enact different ways, by reaching 15 years of age, but the employer is not allowed to arrange a day to start work before a citizen has completed a compulsory education. The mentioned legal adjustment contributes to the protection of children against illegal employment and especially against truancy.

It is very important to protect children from early termination of education or truancy, because according to the World report on child labor (2015) it is more difficult for early school leavers to secure stable jobs, also it takes more time to do so than better-educated youth. The World report on child labor (2015) points out that these results run counter to the common perception that better-
educated school-leavers with more specialized skill sets have relatively greater difficulty in gaining an initial foothold in the labor market.

Criminal offense - Corrupting morals of youth is committed by its subject when by contrary to the law (Labour code) employs child younger than fifteen years of age and thus prevents him from a compulsory school attendance.

The consequence of this kind of employing is that the child does not attend a school; however the law requires that the child is prevented from fulfilling this obligation. Lichá Valicová (2014) points out that when we are talking about preventing school attendance, if a person is prevented from attending a school physically or by persuading, both cases pose the potential danger and threat. The criminal offense of corrupting morals of youth is committed only if a perpetrator acts willfully. This means that a perpetrator has his own specific intent and he knows that if he will employ a child who is less than fifteen years of age, than this child can be prevented from attending a school. It is required by law that the perpetrator has knowledge about the age of the child. Criminal liability cannot arise without fulfillment of these particular elements.

It is very important to recognize the first signs of truancy by parents of truants, but sometimes even parents support their children in this behavior, because they expect money from their children’s work or they think this also helps the children. Reid (2003) writes that this is a totally false and a misguided belief. Regular attendance at school matters and is critically important for a child’s schooling and social and academic development. As Blanco Allais and Hageman (2008) say in countries where child labor is a common phenomenon many children are excluded on a permanent basis from the education system (i.e., high levels of child labor translate into large numbers of out-of-school children). This, of course, puts a downward pressure on overall school attendance rates.

According to a survey made by the International Labour Organization on child labor and education, there is an inverse correlation between the number of working hours and the capacity of children to attend school.

Illegal employment of children is dangerous for their moral development, because this employment has no rules regulated by law and children can sometimes do work which is not suitable for them. According to United Nations’ definition of child labour, it means work that is prohibited for children of certain age groups. It is work performed by children who are under the minimum age legally specified for that kind of work, or work which because of its detrimental nature or conditions, is considered unacceptable for children and is prohibited.

However according to the International Labour Office (Making progress against child labor) children worldwide are usually illegally employed in the field of agriculture, industry or household chores. It is possible to suppose that children in Europe do similar work. Muižnieks (2013) says that many of the children working across Europe have extremely hazardous occupations in agriculture, construction, small factories, or on the street. This has been reported for example in Albania, Bulgaria, Georgia, Moldova, Montenegro, Romania, Serbia, Turkey and Ukraine.

According to the International Labour Office, agriculture is by far the most prevalent sector, representing 59% of all those of child labor and over 98 million children as a final number. Child labor in agriculture consists primarily of work on smallholder family farms, although it also extends to activities such as livestock production, fishing and aquaculture.

According to International Labour Office 54 million children around the world can be found in the services sector and 12 million in industry. These numbers are very alarming, because work in industry can be dangerous for children’s organisms and it also causes truancy. The International Labour Office also declares children who are working in the services sector primarily work in hotels, restaurants, street selling, car repair shops etc.

According to a survey made by the International Labour Organization – Child labor and education: Evidence from the surveys, boys and girls often do different jobs, where girls are usually overrepresented in non-economic activities such as work in the “own household.” As Blanco Allais and Hageman (2008) say they also often bear the double burden of work outside and inside the house, with little time left for schooling.
It is possible that the situation about child labor is much better in Europe than in Africa or Asia, but for many European countries there are no available data, so it would be proper to make a survey about child labor in the states of the European Union in order to get updated statistics. Authorities should focus on prevention by greater inspection in this field to protect the correct development of children and to prevent truancy, which is related to the illegal employment of children.

**Conclusion**

It is possible to conclude that the protection of children needs to be secured by international conventions in order to point out the high importance of this issue by state parties. However, inclinations of these norms to the Criminal code of the state have the greatest importance, because it makes these norms directly enforceable. Legal adjustment of this issue in the Criminal code of the Slovak Republic can be considered as an advancement to the international standards, because it implements the Convention on the Rights of the Child which has been approved on November 20. The legal frame provided by the Convention is sufficient, but we need to focus on its adherence and enforcement.

We need to gain updated statistics of illegal child labor all around the European Union to work with relevant data and to be able to adopt suitable action. It is also very important to prevent truancy, because this phenomenon helps illegal child labor to develop. Truants are often out of control and this can lead to the development of drug abuse or gambling addictions which then forces them to look for particular source of income. One of the possible ways to gain money is to make truancy more intensive and get a job. These jobs are usually not well-paid so these young truants are actually abused. We can suppose that this kind of child labor which is motivated by the need for money is present also in Europe.

IDENTIFICATION OF CULTURAL DIFFERENCES IN MANAGEMENT IN MULTINATIONAL COMPANIES BASED IN SLOVAKIA

Elena Delgadová,¹ Monika Gullerová²

Abstract: In 2004, Slovakia became a full-fledged member of the European Union. Since then, Slovakia has been one of the attractive investment locations for multinational companies in the region of Central Europe for its skilled and educated labor force. Managers who want to succeed in running multinational companies in culturally diverse settings must have the intercultural competence, i.e. the capability of thinking and acting in interculturally appropriate ways. The lack of intercultural competence skills in managers may result not only in miscommunication but can also be detrimental to the financial and economic success of organizations. The purpose of the paper was to identify cultural differences in management in German, Korean and French multinational companies operating in Slovakia. In the paper, the methods of questionnaire, literature research, analysis, synthesis were utilized. 160 respondents participated in the research on establishing cultural differences in management based on Hofstede’s model of cultural dimensions.

Introduction

In May 2004, Slovakia became a member of the European Union. Some EU countries applied transitional periods before fully opening their labor markets to citizens of the new Member State, while others opened up their labor markets immediately. Recently, Slovakia has become one of the attractive investment locations for multinational corporations, especially automobile manufacturing companies, for its highly skilled and qualified labor force. Multinational corporations, operating across borders in diverse cultural settings, need to be run by managers, having among others, an intercultural competence.

Culture and Models of Culture

The first modern scientific definition of ethnological and anthropological concept of culture was formulated by the English anthropologist Edward Burnett Tylor in 1871. Tylor looked at culture from the point of view of evolutionism, i.e. the theoretical approach that attempts to objectively depict and explain processes of cultural changes in the long-run, viewed as a configuration of learned behaviors and results of behavior whose component elements are shared by the members of a particular society. This new theory of culture was distinct from the previously recognized individualistic and restrictive concepts of culture. American anthropologists Kroeber and Kluckhohn (1952) compiled a list of 164 definitions of culture and put forward the following definition “Culture consists of patterns, explicit and implicit, of and for behaviour acquired and transmitted by symbols, constituting the distinctive achievements of human groups, including their embodiments in artefacts; the essential core of culture consists of traditional (i.e. historically derived and selected) ideas and especially their attached values; culture systems may, on the one hand, be considered as products of action, and on the other as conditioning elements of further action”. Zorkócióvá (2007) maintains that culture should never be viewed as good or bad, there are only distinct cultures: distinct in shared values or hierarchy of needs. Needs of diverse cultures can encompass different defining characteristics. Culture of society reflects the interaction of attitudes, traditions, beliefs and other values that are recognized by the members of a culture. A set of values, not individual items, can be viewed as culture. A set of values are the principles respected by and adapted to members of a group. The theory by Zorkócióvá, however, is opposed by those who use the example of cannibalism in some societies to say that clear boundaries between good and evil cultures should be distinguished.

The conclusions of the World Conference on Cultural Policies (MONDIACULT, 1982) say: “…culture should be regarded as the set of distinctive spiritual and material features of society or a social group and that it encompasses, in addition to art and literature, lifestyles, ways of living together, value systems, traditions and beliefs…” According to this point of view, culture refers to a

² Faculty of Social and Economic Relations, A. Dubček University in Trenčín, monika.gullerova@tnuni.sk
system of values, social norms and rules, which are typical for society and which are passed from generation to generation through cultural elements, such as language, symbols, history, ceremonies, rituals, values, norms, etc. Values that underpin the social and cultural system of society are learned in the process of socialization. The scientific model of "the structure of culture" draws attention to the relations and ties between the essential subsystems of culture: the system of education, science, art, mythology, morality, politics, and religion. Sociologists argue that culture is an integral part, property, and attribute of society. Culture arises from society and society evolves thanks to culture, and the collapse of society means the end of culture. Culture refers to everything shared by all members of a group and passed on from older to younger generations. It is the central element in interpersonal relations, guiding people’s behavior and interaction. Culture is our self-expression, composed of values, beliefs, attitudes, norms, and assumptions which make it unique and distinct from other cultures. Actually, each culture refers to the ways we classify or denote objective reality and view the world, which is reflected in our thinking, feeling and doing. Moreover, culture relates to the way humans sense, perceive and organize everything that surrounds them and which is apparent in the way they communicate. They are the patterns of meaning that are passed on from generation to generation through symbols, communication schemes or models. Thus, culture is understood as a way of being, thinking, feeling and acting that humans have acquired in a particular social and linguistic environment. Thus, intercultural competence is seen as the “ability to communicate effectively and appropriately in intercultural situations” (Deardorff, 2006). It goes without saying that “individuals capable of effective cross-cultural communication can limit potential misunderstandings, minimize social barriers, and reduce ethnocentrism” (Lauring, 2011). In order to identify differences across cultures, several models of culture have been developed. Kluckhohn and Strodtbeck (1961) proposed a model of culture that was based on value orientations. They argued that cultures can be distinguished by the way they address five common human concerns, such as man-nature relationship (attitudes towards the need or responsibility to control nature or live in harmony with nature), time sense (attitudes towards past, present and future), human nature (attitudes towards the basic nature of people), human activity (being, becoming or learning mode of activity) and social relations (hierarchical, collateral or individual form of organization). Trompenaars and Hampden-Turner (1998) regarded culture as “a dynamic process of solving human problems/dilemmas in the areas of human relationships, time, nature.” He developed the onion model of culture as he believed that the levels of culture can be compared to the layers of an onion. There are a number of interpretations of this model but the simplest one consists of three or five layers. The outer, explicit or visible layers, represent cultural artifacts and symbols such as flags, architecture, hairstyles, jewelry or traditional clothing and all the material things that the culture has ever made. The next layer is represented by language, common rituals, customs and traditions. This could include how people greet each other, how they eat meals, get married or practice their religion. Next layers, noticeable but more implicit or invisible ones, represent norms, rules, values, beliefs and attitudes that are much harder to recognize, get to know and understand. In the centre of the onion, there is the most implicit, most invisible layer of the culture that hides the underlying values, cultural assumptions and the worldview of the culture which influence all of the other layers. Trompenaars and Hampden-Turner (1998) classified cultures along a mix of patterns related to behaviour and values, and developed a cultural model composed of seven dimensions/dilemmas: universalism versus particularism, individualism versus communitarianism, achievement versus ascription, neutral versus emotional, specific versus diffuse, sequential versus synchronous time, internal direction versus outer direction. The Dutch cultural researcher, Geert Hofstede (Lustig and Koester, 2009) identified the following five dimensions of culture: Individualism/collectivism – describing the strength of the relation between an individual and other individuals in the society. In cultures that are high in individualism, people tend to think and act as individuals rather than as members of a group. In cultures that are high in collectivism, people think of themselves mainly as group members. Power distance concerns the way the culture deals with unequal distribution of power and defines the amount of inequality that is normal. In countries with large power distances, the culture defines it as normal to maintain large differences in power. In countries with small power distances, people try to eliminate inequalities. Uncertainty avoidance describes how cultures handle the fact that the future is unpredictable. High uncertainty avoidance refers to a strong cultural preference for structured situations. In countries with high uncertainty avoidance, people tend to rely heavily on religion, law, and technology to give them a degree of security and clear rules about
how to behave. In countries with low uncertainty avoidance, people seem to take each day as it comes. Masculinity/femininity is the emphasis a culture places on practices or qualities that have traditionally been considered masculine or feminine. A masculine culture is a culture that values achievement, money making, assertiveness, and competition. A feminine culture is one that places a high value on relationships, service, care for the week, and preserving the environment. Long-term/short-term orientation suggests whether the focus of cultural values is the future (long-term) or the past and present (short term). Cultures with a long-term orientation value saving and persistence, which tend to pay off in the future. The dimension related to indulgence versus restraint juxtaposes hedonism with self-discipline. Thus, high-indulgence cultures encourage pleasure, enjoyment, consumption and spending, whereas high-restraint cultures encourage the control of such hedonistic gratifications, and the pleasures and enjoyment that go hand in hand with leisure-time activities. Hall (1996) distinguishes high-context and low-context cultures. High-context cultures place more emphasis on the context than the words even though words play a decisive role and less legal documents are used in such cultures. Low-context cultures that messages rather by words than non-verbal means. Verbal messages are clear and direct. Hall (1996) also categorized cultures according to their attitude towards time. Thus, cultures were divided into strongly monochronic, slightly monochronic and polychronic ones. Monochronic cultures do one thing at a time, they like to concentrate on the job at hand, respect privacy, and adhere to plans and deadlines. Polychronic cultures like to do multiple things simultaneously, tend to change plans often and easily, and their main concern are people, mainly those closely related to them. In addition to the above models of culture, there have also been other scholars researching cultural models and cultural differences. The main purpose of the paper was to identify cultural differences in management in a German, Korean and French multinational companies operating in Slovakia. In addition, the research intended to identify the values of corporate culture in multinationals and to find what style of management is used by middle managers and what management style is preferred by Slovak employees. In the paper, the methods of questionnaire, literature research, analysis, synthesis were utilized. 160 respondents participated in the research on establishing cultural differences in management based on Hofstede’s model of cultural dimensions. Due to the recommended extent of the paper, two dimensions of culture were examined, such as power distance, and femininity vs masculinity.

Regarding the style of management, it was found that managers in the German multinational used democratic style of management (78%), managers in the French multinational used authoritative style and, similarly, managers in the Korean multinational use authoritative style of management (80%) – compare Table 1.

Table 2 lists the preferred styles of management by respondents – employees of the German, French and Korean multinationals based in Slovakia. As shown, employees in all multinationals surveyed prefer democratic or participative style of management, mainly due to the shared-decision making process and employee recognition by managers.

The following question was to find the power distance in multinational corporations. Hofstede’s power distance indexes for the three countries are the following PDI Germany – 35, PDI France – 68, PDI Korea – 60. The lowest level of power distance was found in the German company where employees are not afraid to express their opinions and disagreements to their managers or supervisors. On the contrary, more obedient and passive employee attitude was found in the French and Korean companies. The responses by respondents found in other questionnaire items also revealed that employees working in the French and Korean companies do not question decisions by their managers, expect to be told what to do and do not participate in decision-making.

The following question was to identify whether the companies under research display feminine or masculine traits. Hofstede’s masculinity vs femininity indexes for the three countries are the following Germany – 66, France – 43, Korea – 39. The research findings indicate that, given the manufacturing nature of companies, management positions are filled by men.

Competition among employees was found to be encouraged in the German company. In addition, employees in the German company were expected to come up with their own ideas whereas Korean and French companies valued harmonious relationships among employees.

**Conclusion**

The purpose of the paper was to examine cultural differences in management in three multinational corporations operating in Slovakia. The research attempted to identify the values of corporate culture in a German, French and Korean multinational and to find what style of management is used by managers / preferred by Slovak employees. The findings show that German middle managers mostly use democratic management style whereas authoritative style is common in Korean and French companies. Authoritative style of management can imply fast decision-making process, and high demands placed on employees. Democratic or participative style of management is, however, preferred by employees working in the French and Korean companies. It can be inferred that employees value collaborative decision-making process and recognition by managers. With respect to the power-distance, the lowest level of power distance was found in the German company where employees are not afraid to express their opinions and disagreements to their managers or supervisors. On the contrary, more obedient and passive employee attitude was found in the French and Korean companies. High power distance in French and Korean companies indicate hierarchical structure in management, big salary range from top to bottom and employees expecting their superiors to tell them what to do. The responses by respondents found in other questionnaire items also revealed that employees working in the French and Korean companies do not question decisions by their managers, expect to be told what to do and do not participate in decision-making. Thus, the outcomes of the research on cultural differences in management in multinational companies are clearly attributable to dimensions of culture developed by cultural theorists.

THE POWER OF PROJECT BASED LEARNING: EXPERIENTIAL EDUCATION TO DEVELOP CRITICAL THINKING SKILLS FOR UNIVERSITY STUDENTS

Nicholas Dimmitt

Abstract: Can a project based learning (PBL) pedagogy improve critical thinking skills in first-year university students? This was the research question that drove this action research investigation. The purpose of this study was to find the best practice pedagogy to improve critical thinking skills for college students. A literature review examined the themes of PBL best practices, millennial student learning styles, and critical thinking pedagogy. Methodology included a student survey to better understand the needs for university level, critical thinking skills. The potential effectiveness of a PBL approach to improve the critical thinking needs and challenges of these students was analyzed. The results indicate that a PBL method can provide students with effective techniques for improving self-reliant, critical thinking skills. The paper concludes with recommendations for best PBL practices and strategies for developing independent, critical thinking abilities which are essential for students to be successful in their academic endeavors.
