First-year university students need critical thinking skills more than ever in the current college environment. This is particularly true for freshmen engineering students in the United Arab Emirates. This paper investigates student needs for developing critical thinking skills in first-year students at the Petroleum Institute; a university and research center in Abu Dhabi, UAE, and suggests pedagogical approaches to support student needs in this area. Specifically examining how constructivist learning approaches and understanding preferred learning styles of millennial learners can support students to be more successful in their university studies and future careers.

The Research Context

The Petroleum Institute’s intention is to be a world-class university providing outstanding educational opportunities in engineering and applied sciences to prepare students for engineering careers and to support research in the energy industry. The Institute’s mission is to develop students as professionals in their fields of expertise in the UAE and worldwide.

In the freshmen year, students take core courses that need to be completed by everyone regardless of a student’s major. One of core courses is communication and this research study was conducted with freshmen students in the first and second semesters of the communication course.

Student Needs in Developing Critical Thinking Skills

In today’s multi-media, digital overload of information, where access is everywhere and content is available instantaneously and in overwhelming amounts, it is more important than ever that educators continue to develop strategies to help new university students handle the challenges of processing and thinking critically (Connor-Greene & Greene, 2002; Halpern, 2009).

Millennial Freshmen University Students

Millennial generation students, also known as Net Generation and Gen Y (Bracy et al., 2010) have been identified as those born between 1982 & about 2003 (Nicoletti & Merriman, 2007). These students are Digital Natives, who “are native speakers of the digital language of computers, video games and the internet” (Prensky, 2010), they have always been around computers, keyboards, and digital devices. In 2013 a survey in the USA showed that 84% of 14-23-year-olds use laptops and smart phones regularly (McCoy, 2013). Research shows that this generation of students is more oriented towards multi-tasking, autonomous information gathering, and with shorter attention spans (Nicholas, 2008; Worley, 2011). This has challenges and consequences for curriculum delivery and classroom interaction.

Literature Review

Three areas of previous research are particularly useful to inform this study; (1) Critical Thinking Pedagogy, (2) Learning Styles of Millennials Students, and (3) Teaching Implications. In this section,

---

1 College of Arts and Science, The Petroleum Institute University, Abu Dhabi, UAE, ndimmitt@pi.ac.ae
we will discuss key aspects of these three issues.

Critical Thinking Pedagogy

Although the term critical thinking is discussed widely and used constantly in pedagogical approaches today, it is not a new concept. Centuries ago, Socrates used a method of probing questions focused on examining ideas believed to be true but had dubious logical value. Much later, the name ‘critical thinking’ was introduced as a method for discerning the truthfulness of the information. Paul & Elder (2006) further defined critical thinking by adding in the concepts of problem-solving and metacognition. Progressively, these critical thinking concepts continued to develop to include assessing and analyzing various points of view and challenging the beliefs and theories supporting those perceptions (Brookfield, 2005; Ennis, 1985).

Of the many definitions of critical thinking that have been suggested over the years - most have similar fundamental concepts, such as the definition by Halpern (1999) below;

“Critical thinking refers to the use of cognitive skills or strategies that increase the probability of a desirable outcome. Critical thinking is purposeful, reasoned, and goal-oriented. It is the kind of thinking involved in solving problems, formulating inferences, calculating likelihoods, and making decisions. Critical thinkers use these skills appropriately, without prompting, and usually with conscious intent, in a variety of settings. When we think critically, we are evaluating the outcomes of our thought processes – how good a decision is or how well a problem is solved.”

Critical thinking skills in university study are essential because they allow students “to deal effectively with social, scientific, and practical problems” (Shakirova, 2007).

Learning Styles of Millennial Students

The digital society in which millennial students have grown up has had an impact on their preferences and skills in reference to education. Prensky (2007) claims “… students are clamoring for these [new] technologies to be used as part of their education, in part because they are things that the students have already mastered and use in their daily lives, and in part because they realize just how useful they can be”.

As the students in this study are in the millennial generation, it is important to understand and teach with their learning styles and preferences. According to Sweeney (2006):

“the millennial student prefers to learn under the following conditions;

- In a collaborative learning environment. They exhibit a preference for teamwork incorporating cooperative learning and constructivist principles.
- In a challenging environment that has as its purpose a ‘life plan’ that is goal orientated and directed toward their future plans.
- In a flexible, personalized and customized program.
- In an environment that makes learning interesting. Fun and humor are important additions to instructional components without compromising learning and classroom management.
- In a structured environment. They prefer structured activity in the learning process.
- In an environment that uses technology to enable them to be more productive and connected.
- In an environment in which individuals are respected and all members of the group are supported.
- In an environment that is goal and achievement orientated.”

Another challenge of the digital culture in which millennial learners find themselves is the variety of literacies they need to master (Gurr, 2015):

Literacies in the 21st Century

- Computer Literacy
- Information Literacy
- Technological Literacy
- Social Network Literacy
Media Literacy
Visual Literacy
Aural Literacy

Central to this concept of literacies is the significance of critical thinking as the key variable to mastering these skills. Larmar & Lodge (2014) put forward that millennial learners need support and development of metacognitive skills (critical thinking) to be successful in university study. They have developed an approach for doing this, that provides students with “opportunities to develop a deeper understanding of their own learning, [where] students are able to engage in university curriculum in a way that integrates positive study skills and supportive learning strategies that provide scaffolded support.”

A major characteristic of the millennial generation is their understanding of and fluency in using technology. This is not always the case with instructors in higher education. Prensky (2010) not only labelled students of the millennial generation ‘Digital Natives’ but also referred to the often less fluent educators as ‘Digital Immigrants’ - suggesting they were foreigners in the technological territory of the Net Generation. He believed the gap between the immigrants and the natives to be “the biggest single problem facing education today.” Researchers recommend that due to this disparity teachers need to modify and enhance their pedagogical approaches and classroom activities to address the needs and interests of this different type of learner (Prensky, 2010; Frand, 2000). A key recommendation which motivates this study.

Wade (1995) suggests the following “eight skills that students need to become critical thinkers:
(a) ask questions and be willing to wonder,
(b) define problems clearly,
(c) examine evidence,
(d) analyse assumptions and biases,
(e) avoid emotional reasoning,
(f) avoid oversimplification,
(g) consider alternative interpretations, and
(h) tolerate uncertainty”

From this literature review I applied many of these concepts to enhance the pedagogical approach to the course curriculum to address the students’ challenges and requirements for the improvement of their critical thinking abilities in their freshman year academic needs.

Methodology

Needs Analysis

For a number of years now, my colleagues and I have conducted surveys, interviews and observational studies on the Petroleum Institute freshmen students in the communication courses, to identify what needs and challenges they have during their first year of college. The data clearly demonstrates that our students belong to the profile of the millennial student and possess similar learning styles and preferences as mentioned above.

Action Research Curriculum Applications

After analyzing this data, teaching techniques and learning approaches were modified to focus on the specific critical thinking needs of these students. I have additionally added teaching and learning strategies discussed in this study to test out what works best with these students.

Evaluation

Student surveys, observational analysis and exit interviews all were used to assess the increase in critical thinking skills of the students.

Results

I would now like to describe how the action research applications suggested in this study have informed practice with my students. I have tried to adopt a cognitive apprenticeship model in my classroom, that is, learning by observing and providing an ‘expert’ model (Svinicki, 1999).
Constructivist approaches to learning include a theory of experiential cognitive apprenticeship. This kind of apprenticeship is a procedure by which a master of a skill teaches that proficiency to an apprentice. Experiential cognitive apprenticeships “are designed, among other things, to bring tacit processes into the open, where students can observe, enact, and practice them with help from the teacher” (Collins et al, 1989). This approach is complemented by Bandura’s (1997) theory of modelling, which states that “in order for modelling to be successful, the learner must be attentive, must have access to and retain the information presented, must be motivated to learn, and must be able to accurately reproduce the desired skill.” For example, when asking students to go online or go to the library to find an academic journal article as part of a literature review or source analysis assignment, I first demonstrate how I go online and walk them thru the steps of using a database to find appropriate scholarly journals that can be obtained through the university library or downloaded online. I show them how to determine the factors that will help them decide if the article is credible and reliable, which they then go out and search and evaluate for themselves.

Teaching Suggestions
Other lessons learned from this action research study resulted in teaching applications to increase critical thinking skills and appeal to millennial learners.

- Modelling Critical Thinking Skills

The article search illustration above is a good example of how we can teach by doing. Another way I model critical thinking skills in the classroom is by showing a video of a group wrestling with a contentious problem and then have the students discuss ways to analyze and evaluate solutions presented in the video and in their own discussions. I offer ideas and model critical thinking of my own in the discussion without dominating the interaction.

- Questioning Techniques

Socratic dialog is an excellent method for generating critical thought processes. “The art of Socratic questioning is important for the critical thinker . . . What the word ‘Socratic’ adds is ‘systematicity,’ depth, and a keen interest in assessing the truth or plausibility of things” (Paul & Elder, 2006). I ask questions designed to elicit examination and critique of issues and facts. I dig deep to ask questions that students need to struggle with and become aware of new possibilities and solutions.

- Changing the Technology

Using a variety of media and mixing technology appeals to millennial learners. Even with their zeal for all things digital, these students prefer a moderate amount of IT in the classroom. In fact, according to Oblinger et al. (2005), “the actual use of technology is not as important as the activity the technology allows students to do.”

Therefore, I have increased the variety of technology and media that I use in class (i.e., shorter PowerPoint presentations, streaming video examples, including social media samples where appropriate, conducting on-line team research data searches, podcasts, excerpts from TED talks). Also, assignments for student teams to create multi-media examples of topics covered in class. This addresses the millennials’ preference for variety and diversity in IT delivery forms and keeps them from losing interest with a single (or similar types of) classroom activity.

- Classroom Environment

As these students like to be in an environment that makes learning interesting (Sweeney, 2006), I do my best to keep the classroom atmosphere as relaxed and enjoyable as possible. Humour and fun without compromising learning and classroom management (as Sweeney suggests) is a goal to strive for, and I find this often increases participation and interest in class discussions (and often makes the classroom interaction a joy for the professor).

Conclusion
This action research study was not about changing or reinventing the curriculum but about enhancing and customizing the pedagogical delivery and classroom activities to best suit the needs of the study’s student population. Student exit surveys and interviews show that these enhancements provided our millennial generation students with constructive and practical tools and techniques for learning independent, critical thinking skills which they need to be successful in their university experience and beyond.
Developing critical thinking abilities, to be able to explore and evaluate all kinds of information is an essential skill for first-year university students (Connor-Greene & Greene, 2002; Ellis, 2009). By addressing the way millennials best learn and by adopting best practice techniques, teachers can offer their students the tools to be able to solve problems, make the best decisions and identify solutions in their educational experience and future professional careers.

Acknowledgments

I would like to thank my faculty colleagues of the PI Communication Department, College of Arts and Sciences, who have assisted in conducting course evaluations and assessments which were used in the data collection of this study.

A SURVEY INTO THE SATISFACTION OF NURSING STUDENTS WITH THEIR PRACTICAL TRAINING

Snezhana Dragusheva,1 Biyanka Tornyova,2 Maria Semerdjieva,3 Silviya Novakova4

Abstract: The training nursing students in the Republic of Bulgaria confirms with the contemporary European requirements. The training is theoretical and practical, with the practical training accounting for at least 50% of the total number of hours in the specialty. The practical training includes clinical practice and pre-graduation traineeship, which complies with the Ordinance on the Unified state requirements regarding the training of nurses. The clinical practice and the pre-graduation traineeship involve a total duration of 2740 hours for students majoring in Nursing (Ordinance on the Unified state requirements). The level of satisfaction of these nursing students is an important indicator of the quality of the practical training. The study involved a sociological method of direct group survey involving an original set of questions with one developed specifically for this survey and others adapted from the questionnaire on job satisfaction of the Institute of Psychology at the Bulgarian Academy of Sciences. This questionnaire on satisfaction comprises 36 statements with three subscales: 1) work organization or organization of the practical training; 2) social-psychological conditions; and 3) material. The approach uses a Likert-type scale from 1 to 4 (1 = “no”, 2 = “to a certain extent”, 3 = “very much”, and 4 = “extremely”) to score responses. The opinion of 280 fourth-year nursing students from three universities: the Medical University of Plovdiv, Trakia University of Stara Zagora, and ‘Prof. Dr. Asen Zlatarov’ University of Burgas, is surveyed. The analysis of the results from the conducted empirical survey shows that in their professional activity the surveyed students are primarily motivated by love and care for people (78.8%) followed by the desire to perform an activity that is beneficial to society (63.3%). Then follows the respect on behalf of patients, the team, and society as a whole (52.5%) and subsequently, the emotional attractiveness of the work reflected in the desire to do work that brings pleasure and joy (job satisfaction; 42.4%). The level of student satisfaction with their practical training depends on the organizational-educational, social-psychological, and material and technical conditions of the hospital environment. The analysis of the survey data confirms the significant role of practical training for the professional qualification of these nursing students. However, certain negative trends are also identified. These trends are connected with the satisfaction of the students concerning the procedures they have the opportunity to perform, their relationships with their mentors and medical teams, and that at times they are required to perform inappropriate activities. This calls for increased control on behalf of the tutors.

UDC Classification: 378; DOI: http://dx.doi.org/10.12955/cbup.v5.s98

Keywords: nurses, satisfaction, practical training.

Introduction

The mission of the university level of medical education is to provide students with professional training that not only satisfies the social needs and those of the labor market but also meets student expectations concerning their professional careers and personal development. This mission is the main aim of education and training of nursing students: to prepare specialists who have mastered knowledge and skills, personal qualities, and professional competencies, necessary for providing quality health care.

The training of nursing students in the Republic of Bulgaria conforms with the contemporary European requirements. It is conducted at universities and colleges accredited under the Higher Education Act of Bulgaria. After the accession of Bulgaria to the European Union, significant changes have taken place in the training of nurses. In accordance with the unified state requirements, the required number of academic hours of education and training for nurses is 4600, and the duration of the program is four years (eight semesters) full-time (Ordinance on the Unified state requirements for completing higher education in Nursing and Midwifery and earning a Bachelor’s degree, 2010). The training is theoretical and practical, with practical training accounting for at least 50% of the total hours for the academic major.

The practical training includes clinical practice and pre-graduation traineeship, which complies with the ordinance under the unified state requirements regarding the training of nurses. The clinical practice and the pre-graduation traineeship are with a total duration of 2740 hours for students majoring in Nursing.

1 Nursing Care Department, Medical University, Plovdiv, Bulgaria, sdragusheva68@gmail.com
2 Health Care Management Department, Medical University, Plovdiv, Bulgaria, btornyova@abv.bg
3 Health Care Management Department, Medical University, Plovdiv, Bulgaria, msemerdjeva@abv.bg
4 ‘St. George’ University Hospital, Plovdiv, Bulgaria, novakova66@yahoo.com
Students do practical clinical training from the first semester through to the sixth, and the duration of this training is at least 1140 academic hours.

Pre-graduation traineeships are taken in the seventh and eighth semesters, and their duration involves at least 1600 hours. Thus, young specialists are provided with the opportunity to master the needed professional skills and competencies in a real-life hospital environment. Pre-graduation traineeships provide students with a practical basis of specialized knowledge in various areas of nursing (Ordinance on the Unified state requirements for completing higher education in Nursing and Midwifery and earning a Bachelor’s degree, 2010).

The practical training is conducted at hospitals and outpatient centers, social centers, and institutions approved and accredited to train students, and staffed by highly qualified professionals. Students work under the supervision of a tutor, mentor, or both. According to Andonova (2013, p. 22): “For mentoring to be efficient, it should be based on constructive partnership so that each trainee could be encouraged and assisted to realize their full potential.”

It is during their practical training that the theoretical knowledge, mastered by students, is transformed into skills and competencies, values, and respective qualities, which are expressed in their conduct. The involvement of future registered nurses in various types of activities and manipulations during their training in providing high-quality health care to patients facilitates the development of professional awareness and moral values and forms skills and abilities that demonstrate their developed qualities and competencies. On the other hand, this allows students to become aware that they belong to a social group of nurses and they adapt to the job more easily.

The level of satisfaction of nursing students is an important indicator of their assessment regarding the quality of the practical training. The expression of satisfaction is a subjective way of assessing the training environment. This involves the conditions of work in the respective hospitals and clinics, the organization of the practical training, and the interrelationships in the medical team. Student satisfaction can also be regarded as an expression of personal well-being and not only as satisfaction with the conditions in which they perform the medical activities (Petkova, 2003, p. 192).

The aim of this study is to survey and analyze the satisfaction of nursing students regarding the way in which their practical training is organized and conducted, as a factor in forming their professional competencies.

**Data and Methodology**

The survey was conducted in two consecutive academic years, 2014–2015 and 2015–2016. The respondents were 283 nursing students who were voluntary participants from three universities: Medical University of Plovdiv, Trakia University of Stara Zagora, and ‘Prof. Dr. Asen Zlatarov’ University of Burgas.

The respondents had completed the full course of training, and at the time of the survey were in their pre-graduation traineeship, which was considered a prerequisite for obtaining objective responses for the assessment of practical training.

The structure of the research tools corresponded to the overall concept of the study. A sociological method of direct group survey was used to collect the initial statistical information. A survey card was developed for the study. This survey card included an original set of questions developed for this survey with some questions adapted from a questionnaire on job satisfaction from the Institute of Psychology at the Bulgarian Academy of Sciences. The questionnaire of this current study comprised 36 statements in total, with three subscales: 1) work organization or organization of the practical training, 2) social-psychological conditions, and 3) material. A Likert-type scale from one to four (1 = “no,” 2 = “to a certain extent,” 3 = “very much,” and 4 = “extremely”) was used to score the responses.

Pearson correlations were used to identify relationships in the data. The empirical data was statistically analyzed using the software package for statistical analysis in the field of social sciences (SPSS).

**Results and Discussion**

The analysis of the results showed that most of the respondents (81.6%) were in the 20–25 year age range. Of the respondents, 95.4% were females and only 4.6% were males. The nursing profession has traditionally been dominated by females, although in the past few years there has been a trend towards an increase in the number of males opting for this profession in Bulgaria.
The significance of motivation in the medical profession is directly connected with the quality of the care provided and the level of job satisfaction. The motivation for a professional career stems from internal personal reasons, mostly conscious ones that ensure students strive after gaining knowledge and mastering skills and working habits necessary for the job.

The analysis of the results from the conducted empirical survey showed that in their professional activity, the surveyed students are primarily motivated by love and care for people (78.8%); the desire to perform an activity that is beneficial to society (63.3%); the respect on behalf of patients and the team and society as a whole (52.5%); the emotional attractiveness of the work reflected in the desire to do work that brings pleasure and joy (job satisfaction; 42.4%), with the sum total of the results exceeding 100%, since respondents could give more than one answer.

The level of student satisfaction with their practical training depends on the organizational-educational, social-psychological, and the material and technical conditions in the hospital environment. The ranking of the motives in this study shows that the respondents were strongly driven by humane reasons in choosing their career.

The analysis of the results according to the first subscale regarding the organization of the practical training clearly shows that students highly appreciated the need for high-level knowledge (X_{av} = 3.24) and they were satisfied to a great extent (r = 0.69). In the education of nursing students, theoretical training serves as a basis for acquiring practical skills and competencies. The results show that 76.6% of the surveyed students considered their theoretical training sufficient for the subsequent practical training, 10.5% were not satisfied with the training, and 12.9% were undecided. Students were aware that the knowledge they had mastered was a solid foundation for acquiring practical skills.

The satisfaction of the surveyed students with the quality of tutorials, clinical practice, and pre-graduation traineeship is a significant factor for the professional development of future registered nurses. The results from the distribution of their answers to the components of this question according to the four-level scale are presented as mean values (Table 1).

Source: Author

The respondents expressed the highest level of satisfaction with the quality of the tutorials followed by practical clinical training and then the pre-graduation traineeship. The difference between the perceived quality of the tutorials (X_{av} = 3.62) and that of the pre-graduation traineeship (X_{av} = 3.12), at p =0.00, was statistically significant. Therefore, students had the greatest satisfaction with the quality of the tutorials and were less satisfied with the quality of the clinical practical training and the pre-graduation traineeship.

During their tutorials (practical exercises) students acquire practical skills and master their nursing obligations to a high standard. First, they practice respective manipulations on medical simulation mannequins in special rooms, and then on patients in their clinical practice. It is the practical applicability of the knowledge and skills they acquire during their tutorials that possibly account for the satisfaction of the students from the type of training they receive.

The lower level of satisfaction of the students with their clinical practical training is most probably associated with their anxiety and uncertainty when applying the acquired skills in an actual hospital setting. It might be because some rules are ignored in the course of performing nursing activities, some patients refusing to allow students to perform the prescribed procedures and manipulations, a high number of students in the training, or the shortage of personal protective equipment and other consumables in the university hospitals and clinics. These reasons predetermine the second and third position of practical training forms in the opinion of the students. According to the students (X_{av} =
2.19), their practical training poses a threat to their health (Figure 1), being held in an actual hospital setting. In hospitals, students confront suffering and death and the experience of patients and their families, and this possibly places additional pressure on them. The greater the threat to their health seemingly corresponds to a lower level of satisfaction with their training (r = 0.48).

The level of student satisfaction regarding the statement “I will choose a better-paid job” was relatively high (Figure 1). Their training appears to play a significant role in contributing to the successful professional career and prospects of a better-paid job of those surveyed (X̄av = 2.66). This rationale results in an increased level of satisfaction with the practical training because it is seen that they acquire useful practical skills that endow them with higher competitiveness and employability (r = 0.74).

One of the most important activities of practical training is the mastering of procedures and manipulations to that of the highest level, where the manipulations become automatic. This requires numerous drills and performing certain manipulations many times though creates the impression of monotony for the students (X̄av = 1.91; Figure 1). There is a moderately expressed dependence between student satisfaction and the monotony of the performed activities (r = 0.56). In this regard, tutors and mentors could involve students in various types of activities on a daily basis during their
practical and pre-graduation traineeship.

The survey showed that the majority of students were satisfied with the number of manipulations as a set requirement in the different sectors (81.5%), while 8.0% stated “no”, and 10.5% answered “cannot decide”. Notably, only 72.7% of the trainees coped with the required manipulations, while approximately 27.3% could not. The reasons they quoted varied from the lack of patients on whom to perform certain manipulations or activities, an unwillingness on behalf of the medical staff to include them in administering manipulations, to fear and uncertainty on behalf of the students. This result is somewhat alarming and calls for optimizing the organization of work of students and mentors in the respective units.

The results show that 72.8% of the respondents felt most confident when administering intramuscular injections and over half, 59%, felt the same when administering intravenous infusions (students were allowed to provide more than one answer). The lower percentage of students feeling confident when performing intravenous manipulations – 41%, and infusions (55.1%) is a signal to tutors that as early as during their tutorials, students should be encouraged and motivated to overcome their fear from these manipulations (Table 2).

In the clinical training in the actual hospital environment, the future registered nurses expressed keen interest to master the functional activities and are models of professional conduct and decision-making. In the training of nurses, the main focus is on the patients and their families. The respondents stated they had the opportunity to make decisions independently (Xav = 3.00; Figure 2), which they found satisfying to a great extent (r = 0.74).

The analysis in regard to the second subscale investigated the satisfaction of the students with the material and technical conditions (facilities) in the university hospitals and clinics where they performed their practical training.

During their practical training on clinical matters and their pre-graduation traineeship, in particular, students develop and master professional skills and competencies needed for their future independent work. The opinion of the respondents on the level of their satisfaction with the opportunities and working conditions provided by hospitals and clinics for their practical training can be classified as follows: 48.16% of the surveyed students were fully satisfied, 41.84% were partially satisfied, 7.35% were unable to decide, and 3.14% were dissatisfied. Notably, the level of dissatisfaction was especially low, yet, almost half of the respondents were “partially satisfied” and demonstrated a critical attitude. This may be due to the lengthy duration of the pre-graduation traineeship, held in certain medical establishments that lack the dynamics of medical practice, contrary to what students would prefer, as well as students not being allowed to practice for longer at hospitals and clinics of their choice.

Approximately 11% of the surveyed students were unable to decide or were dissatisfied with the working conditions at the university hospitals and clinics where they performed their practical training. Probably the difficulties encountered in the performance of their nursing tasks in a real-life hospital environment are connected with organizational problems relating to medical supplies and consumables, and that most university hospitals are outdated and not well maintained, resulting in poorer living conditions for the patients in some units. This situation, along with organizing work,
possibly constitute the main reasons for the lower level of student satisfaction with the facilities where they perform their practical training ($X_{n} = 2.62$; Figure 2). There is a clearly expressed dependence between good working conditions and a high level of student satisfaction with their practical training ($r = 0.80$).

In the analysis of the third subscale, student satisfaction with the social and psychological conditions was investigated. The social and psychological environment finds its expression in interpersonal relationships. A supportive educational environment is characterized by a positive and creative atmosphere of trust and partnership among the participants in the process of training, and among the students themselves; support motivation, and active involvement of the students in the process of practical training.

The job of the nurse is likely to be an emotionally tinged. The encounters with human pain, suffering, and problems underpin this profession and coincide with the shortage of funds for their profession. Possibly, the future nurses, facing human suffering on a daily basis cannot but feel a certain disappointment with their choice of a career. At the end of their training, however, they also discover the other side of their profession. They appreciate patients’ gratitude for their work and care, the process of recuperation and recovery, and the satisfaction with their valuable work and hence influence the statement that practical training “is of great importance for my improvement as a professional” ($X_{n} = 3.26$; Figure 2). There is a significant correlation, that is, the better students become in their profession, the higher is their level of their satisfaction with practical training ($r = 0.62$).

Source: Authors

The results of the survey show that 69.0% of the respondents were exceptionally satisfied with the atmosphere in their team or working group ($r = 0.85$). This was directly connected with the opportunity for students to practice ($r = 0.74$) and develop their skills and abilities ($r = 0.72$).
Pearson correlations were strongly expressed. The better the psychological atmosphere in a group of students of the medical team, the higher the level of satisfaction of the respondents. In the process of their practical training, students master the skill to communicate with patients and their families, as well as with the medical team; they adopt models of professional conduct. Hence, the members of the medical teams are of great importance as role models.

The mentor plays a key role in the practical training of nurses. The majority of the surveyed students, 81.5%, were satisfied with the assistance they received from their mentors. It is the mentors who exercise direct control and supervision of the activities of the nursing students in the respective unit. According to most students, their mentor acknowledges their achievements (Xav = 3.24) in coping well with the assigned tasks and consider their opinion (Xcp = 3.00). The analysis of the results showed significant correlations, r = 0.63 and r = 0.85, respectively, in these areas. The friendlier and more supportive is the attitude of the mentor, the more satisfied are the students. The answers to the other question concerning their satisfaction with the assistance they received from the medical staff were similar. Some surveyed students (25%) were dissatisfied with the attitude of the medical staff in the university, hospitals, and clinics. They attributed this attitude to the lack of time and unwillingness of mentors to communicate and provide students with independent activities. The attitude of the staff in the university hospitals and clinics affected the level of student satisfaction. Improving the connection between tutors and their colleagues in the university hospitals and clinics along with resolving the need for control in the practical training may help overcome negative trends in communication.

Conclusion
The conducted survey established the organizational, educational, technical, and social-psychological conditions for optimizing practical training in the context of student satisfaction. The analysis of the collected data confirmed the significant role of practical training for the professional development of students majoring in Nursing. Certain negative trends were also identified, mostly connected with student satisfaction with the manipulations they access, their relationships with mentors and medical staff, and that sometimes students have to perform unusual activities. All these trends call for greater control on behalf of tutors.

THE IMPACT OF GLOBALIZATION FOR NEED OF SOCIAL PEDAGOGUES IN SCHOOLS

Pavol Durana,¹ Darina Chlebikova²

Abstract: The aim of this paper is to highlight the changes that have occurred in society due to globalization. There has been a change in the social environment, economic security of family and social security of pupils. The result is the change of behavior and socialization in school, leading to undesirable practices in primary schools, such as bullying, truancy, drugs, rebellion, violence, emotional abuse and so forth. Social pedagogues are the experts in schools that can help in these areas and can help to harmonize the school environment. The questionnaire survey made in 18 primary schools in Žilina tries to find out the existence of social pedagogues and their activities in primary schools.

JEL Classification Numbers: H75, I21, J14; DOI: http://dx.doi.org/10.12955/cbup.v5.990

Keywords: social pedagogy, social pedagogue, behavioral failures, globalization, hypothesis.

Introduction
It is not possible to exactly determine when the development of social pedagogy began. However, it is demonstrable that it has evolved with the development of socio-pedagogical ideas and ideas that education has to take into account and implement social interests. Education was established and developed, and its development was influenced and determined by society.

Theoretical background
Social pedagogy is one of the theoretical disciplines whose role is to assist. The growth of social problems connected with globalization highlights the need to deal with them, in theory as well as on the basis of empiricism, and prepare solutions for practice. Gogolova (2016), Ponisciakova (2015) and Sukalova & Ceniga (2016) discuss possible and potential impacts and problems linked to the globalization.

The term “social pedagogy” started to be used in Germany around 1850. The author of this concept is considered to be a German teacher A. Disterweg, whose definition is not known. Here are just some famous authors who have dealt with this issue.

Natrop considered the leading role and duties of social pedagogy as providing education to everyone according to the measure of its ability, all sections of the nation (Bakosova, 2008).

Ryszard Wroczynski discussed that social pedagogy contains in addition to the complex problems of education in the society, two separate sections of educational theory and practice as well. These sections are: the pedagogy of social care and after-school education with cultural and educational work among adults (Hroncova & Emmerova, 2004).

Kraus Mollenhauer regarded social pedagogy as a theory of help to socialization problems which aim is to change individual, and raise extending cognitive skills, emotional skills, psychomotor skills and also eliminate the reasons which give rise to or which cause conflict (Bakosova 2008).

Bakosova (2008) asserts that social pedagogy is part of the science of man and belongs to the complex of pedagogical sciences. It is a scientific discipline which aim is transforming the people in the system of comprehensive care, provides services for children, young people and adults in different types of environments, through finding optimum forms of assistance and compensating for weaknesses.

Polackova (1999) discourses social pedagogy is an interdisciplinary science. It integrates and develops the knowledge of human sciences and society in educational, preventive and re-educational action.

Kraus & Polackova (2001) understand social pedagogy in the broader sense. This discipline focuses not only on the problems of the pathological character, marginal groups, and vulnerable sections of the population in their development and potentially deviant acting, but above all the whole population in terms of creating harmony between the needs of individuals and society to shape the optimal way of life in a given society.

Balaz (1991) focused on defining the subject of social pedagogy and relationship to other sciences and so on. Social pedagogy is understood as the science of social aspects of education. Gogolova et al.

¹ University of Žilina, The Faculty of Operation and Economics, pavol.durana@fpedas.uniza.sk
² University of Žilina, The Faculty of Operation and Economics, darina.chlebikova@fpedas.uniza.sk
(2015) adds that it examines the educational aspects of the socialization process and contributes to the formation and development of personality in the educational process in the family, at school and in their free time, also in leisure and work activities.

Social pedagogy and its methods and principles are implemented by social educators in practice (Schwedler & Stofkova, 2011). The definition of a social teacher is not easy. Create a fixed, universal model of social educator is not easy or straightforward. Shots of his work are very broad and sometimes it seems that it is approaching to the teaching profession, ever the educator or psychologist, but what is important, social pedagogy never replace these professions.

Wroczyński, one of the first to write about the social educator. Social educators are targeting their interest in the issue of the role of the environment in the process of purposeful educational activities and environmental education organization, therefore the planned release of stimuli and influences in the environment that act in the same direction as an educational activity (Hroncova & Emmerova 2004).

Klima characterize the social pedagogue as dedicated professionals equipped theoretically, practically and conceptually for deliberate action on individuals and social groups in particular where the way of the life and life experience of these individuals or social groups is characterized by a destructive or uncreative way of satisfying the needs and creating one’s own identity (Hroncova & Emmerova 2004). Kraus (2000) defines social pedagogue as an expert who is theoretically, practically and conceptually equipped to educational activity where it contributes to the formation of healthy lifestyles of individual and groups.

Bakosova (2008) defines social educator as a professional, whose general competence is to help and support children, young people, adults, parents, socializing and finding ways to improve the quality of life through education, training, prevention and counseling.

Abroad social activity at school has a long tradition. In the USA, the concept of a social worker at the school was introduced 100 years ago. Positive experiences were transferred to Europe. The profession of social pedagogy ranks between assisting and the development of recommended OECD in transition countries in 1994 for a sharp increase in socially undesirable and socio-pathological phenomena (Hroncova, 2009).

**Definition of social in Slovak Republic**

The legislative definition of the status of the social educator in schools occurred in 2008 in the Law no. 245/2008 on education and training, where §130, paragraph (3) letter e) ranks the social educator among the components of educational counseling and prevention. Law no. 317/2009 teaching staff and specialists and change and addition to certain laws, § 24, making the social educator in the system of educational counseling and prevention as a professional employee of schools, school, special education and counseling centers.

**Social pedagogue at school**

Sukalova et al. (2015) show that the importance of social pedagogues in schools is increasing with the growing problems of students. The origins of problems can be in the family or in the environment in which the child grew up as well as in the integration of pupil into the school environment. Given the specific approach of social educators that they have to use to solving these problems of pupils, it is not possible to transfer the competencies of social educators to the teachers.

Polackova (1999) sees the possibility of applying of the social educator at schools in the following areas:

- social education (extracurricular activities, support for social learning with an emphasis on the formation of pro-social personality characteristics),
- social counseling,
- multicultural education.

Learning disabilities are a modern phenomenon, Ponisciakova & Gogolova (2015) think that affect the lives of not only individual students, but also entire families. It seems as that learning disorders are constantly increasing, respectively, of students with learning disabilities. This is due to the fact that today a lot of time is devoted to diagnose children if their school results are bad. Bencsik et al., (2016)
remind us that children are usually placed in schools with normal teaching and is needed to adapt not only the teaching process but also the environment (climate) in classes to other pupils learned to accept their classmates with special needs and problems, therefore, those who they are. On the other hand, it is somehow disturbing element for the other children who have to adapt to these children or to such an environment. Withstand this situation in schools is on the shoulders of the teachers. To have in the classroom, at school, students with learning disabilities means to cope with the situations outside of the classroom as well, in leisure activities, communication with parents, other school staff and the solution of these problems are social educators.

**Results and discussion**

The social educator expertly helps pupils with learning disabilities. What is the experience from practice and what are their activities in primary schools? Authors and Chlebikova (2016) found out by using a questionnaire survey in the fourth largest city in Slovakia in Žilina which had a population of 83578 in 2016. There are 18 primary schools in the city, the number of students attending primary school in 2015/2016 was 6735.

The aim was to determine the number of social teachers in primary schools in this city, to analyze their job description and specify how they help or can help students with learning disabilities.

Hypotheses, we set ourselves:

**H1**: The main problem of employment of the social educator in primary schools in the Žilina is financial reason of schools.

**H2**: More than 50% of primary schools in Žilina have a social educator.

**H3**: In every primary school in Žilina there is diagnosed at least 1 pupil with a learning disability.

**Figure 1: Primary schools in Žilina according to the number of pupils**

From 18 primary schools in Žilina, there was only 1 school social pedagogue and it was in a church primary school. The social pedagogue operates at this school mainly in:

- the educational process,
- leisure activities,
- in social counseling.

The total pupils with learning disabilities in schools in Žilina were 347, which is a little over 5%.
Figure 2: The structure of the primary schools according to the founder

The structure of the primary schools according to the founder

Figure 3: Primary schools in Žilina with social pedagogues

Primary schools in Žilina with social pedagogues

- Primary school without social pedagogues: 17
- Primary school with social pedagogues: 1

Source: Authors

Figure 4: The reasons of no social pedagogues in primary schools in Žilina

The reasons of no social pedagogues in primary schools in Žilina

- Financial reasons: 41%
- They do not need them: 41%
- They do not know the job: 6%
- Nature of the job: 12%

Source: Authors
Collecting data on primary schools was a good experience because it showed the true image of knowledge about social pedagogues. Very often at the first mention there was a misunderstanding and earlier resonated special education teacher as a social pedagogue. After refinement, the reactions were varied: from “I do not know what a social pedagogue should do at school” to “we do not have money to pay a social pedagogue” or “we do not need a social pedagogue.”

**Testing of hypotheses**

**H1**: The main problem of employment of social educator in primary schools in the Žilina is financial reasons of the schools.

Test of hypothesis H1: To verify the hypothesis, we used a chi-square test whether it is the choice of uniform distribution. 17 schools have no social educator, in seven schools there is problem of financial nature, 7 schools do not know the job description of social pedagogue and 3 schools were other reasons. Based on the research, the assumption has not confirmed that the main problem of employment of social educator in primary schools in Žilina is the financial reason of the schools.

**Table 1: Testing of hypothesis H1**

</tr>
<tr>
<td><strong>The test statistics</strong></td>
</tr>
<tr>
<td><strong>Critical field</strong></td>
</tr>
<tr>
<td><strong>Result of the test</strong></td>
</tr>
</tbody>
</table>

**H2**: More than 50% of primary schools in Žilina has social educator.

Test of hypothesis H2: From 18 primary schools in Žilina have only 1 school social pedagogue (Primary school of Romualda Zaymusa). It means that only 5.56% of primary schools in Žilina have a
social pedagogue. The hypothesis that more than 50% of primary schools in Žilina has social educator has not been confirmed, therefore, it can be rejected. We could use only this test because he was a research of the whole file.

H3: In every primary school in Žilina is diagnosed at least 1 pupil with a learning disability. Test the hypothesis H3: Based on the survey on primary schools in Žilina we know that at every school in Žilina is at least one student with a learning disability (the least were 4 pupils in the Primary school Javorku, the most were then 36 students at Primary school Karpatská). We can accept H3 because the hypothesis was not disproven.

Conclusion
Social pedagogy and its issue come to the forefront in our country in recent years by the growing social problems of the families of the students, by the growing differences in social status in society, and by the growing problems in schools, such as drugs, bullying, physical and psychological abuse and so forth. Justification of social pedagogues in primary schools is more than necessary. The results of the survey conducted in primary schools in Žilina are unsatisfactory and we see them as a challenge towards to universities bringing up social educators as well as primary and secondary schools, where their help is justified, and the ministry of education should clearly define by the law the work of social educators, not just refer to them as the support staff in schools.

INNOVATION OF THE STUDY COURSE USING PEARSON HIGHER EDUCATION TOOLS

Kateřina Dvoroková,1 Lumír Kulhánek2

Abstract: In the Czech Republic, there is historically a wealth of experience with eLearning. In recent years, however, new platforms were developed that have escaped the attention of the academic sphere. The purpose of this article is to evaluate experience with the platform of Pearson Company within the innovation of the course Monetary Theory and Policy at the Faculty of Economics, Technical University of Ostrava. In the Czech Republic, the history of eLearning has been dating since the year 2000. Among the best-known eLearning projects within universities belonged the project "Virtual University" or the online training system WebCT. The most widely used eLearning tools in the Czech Republic today are LMS Moodle, Articulate, Adobe Captivate, eDoceo, etc. Surprisingly eLearning platforms built within the renowned book publisher – e.g., Pearson or Oxford, are less known in the Czech Republic. In this article, we will, therefore, discuss the possibilities that Pearson platform for eLearning offers for universities, and we will conclude with our further experience with its practical use.

JEL Classification Numbers: A23, E52; DOI: http://dx.doi.org/10.12955/cbup.v5.991

Keywords: higher education, LMS Moodle, online courses, test generator.

Introduction

The IEA's international study center TIMSS (the Trends in International Mathematics and Science Study) conducts international comparative assessments of student achievement in mathematics and science. Libich, J. (2014) highlighted their international survey which reveals that the Czech students in comparison with foreign spend fewer hours with experiments, discussions or presentations of their project, however, much more time to listen to the teacher's monologue. The teaching should not be limited to transmitting information, especially in today's era of modern technology where any information is available within seconds. The teacher should be mainly moderator who asks questions and seeks discussion of students in the right direction. Rose & Goll (1992) demonstrated that after 48 hours on average, students remember only ten percent of what they read, twenty percent of what they hear and 30 percent what they saw. This finding is in contrast to 70 percent of what they discuss with others, 80 percent of what they use in life, and 95 percent of what they tried to teach someone else. Certainly, there are many factors behind that teaching methods are little effective. Worth noticing is the fact that with the development of technology during the teacher's monologue students take their mobile phones, tablets, laptops. Students naturally redirect their attention from the monologue full of what they can learn on the internet easily to something more interesting at that moment. Is there any possibility to link modern technology in teaching with the learning process to make it more efficient, funnier and more attractive for students?

Theoretical Discussion about new Methods of Learning

Nowadays, in various fields and different industries, we can find the technological development. It facilitates work; make it easier and more efficient, in many instances. The evolution of computer technology supported such development. Nowadays practically, we cannot find a field in which computer technology or components thereof is not used. Technical development is also very familiar with the area of education and training, in which advanced tutorials and technical equipment that facilitates the work of the teacher on its interpretation is applied. Thanks to modern technology, it is possible to engage students in interactive teaching, which may be not only with the spoken word but on cooperation between teacher and student as well. Claims for educational methods increase, which, in turn, not only facilitates teachers' work, but also provides students with an opportunity to learn how to work with new technologies and thus acquire work experience for the future.

The most popular term for alternative ways of teaching using new methods is an eLearning. It is a concept that indicates the method of learning using interactive environment, electronic materials that run through modern computer technology using the worldwide web, which is not always needed. The forms of eLearning are very diverse. On the other hand, understanding the eLearning is quite simple. eLearning is a different kind of education, in which electronic information and communication technologies are used. Most often, it can be a desktop, tablet or mobile phones also connected to the

1 Faculty of Economics, VŠB-Technical University of Ostrava. Czech Republic. katerina.dvorokova@vsb.cz
2 Faculty of Economics, VŠB – Technical University of Ostrava. Czech Republic. mojmire.kulhanek@vsb.cz
Internet. The student realizes training or testing of knowledge through eLearning software or online application directly on their devices, e.g. computers. The history of eLearning dates back to the early 19th century, in 1840 Sir Isaac Pitman laid its roots. Since then the first educational tools and software began to emerge. At the end of the 20th century, eLearning has been progressively implemented into schools. Singh, G., & Hardaker, G. (2014) draw attention to the potential and importance of learning technologies in higher education. They stressed among other things on the reduction of costs to students (McMillin et al., 2010) and the more flexible learning (Haughey, 2006). eLearning may have some disadvantages also. Rymanova et al. (2015) discussed the lack of social contact between a teacher and students; poor understanding of the content: no opportunity to express knowledge in oral form; requirements for computer and Internet access; requirements for strict self-discipline.

Moodle Software Package

The vast majority of Czech universities use LMS Moodle software package designed mainly to create supporting educational programs for distance learning. Moodle can be freely downloaded from the internet because its license is the GNU General Public License. This is useful for universities because not only they can save much money, but there is no need to pay extras for administration as well. As regards the content, various components added to the Moodle can facilitate work in this system. Currently, there is an interconnection between standard (full-time, face-to-face) teaching and eLearning. Students use Moodle to log on to the topics of seminar papers or to submit the correspondence tasks. On the other hand, teachers can post materials needed for discussion in lessons there.

Veletiansos and Navarrete (2012) conceded that LMS serves as static repositories of content, failing to provide the robust social experience found on platforms that have garnered societal interest and appeal, such as Facebook. Also, our practical experience led to the realization that LMS Moodle is an excellent tool in the classroom, but it became the repository of learning materials without broader use rather.

Innovation of the Subject Monetary Theory and Policy

The course Monetary Theory and Policy (MTP) focuses on the key areas of contemporary monetary economics and monetary policy. It presents and compares different theories of money demand and money supply, including their implications for various monetary policy strategies, explains the approaches to the influence of money and financial processes on price levels, inflation, product and other macroeconomic variables, including the creation expectations of economic agents. The course analyzes in detail the process of monetary policy, objectives, instruments and transmission mechanisms of monetary policy conducted by the central bank. It serves well as an overview of monetary policy in the Czech Republic and the world, with an emphasis on the trends of the nineties of the 20th century and necessary perspective adaptations.

The subject MTP is part of a master study program Economic Policy and Administration at the Faculty of Economics, Technical University of Ostrava. In the academic year, 2015/2016 it was decided to change the extent of teaching, which was increased by introducing seminars. Given the current trends in education, the innovation of the subject aims to promote modern teaching methods to lectures and seminars. Its objective is the update of present lectures to reflect the evolution of contemporary monetary theory and practice of monetary policy, and updating the content of special seminars after evaluating experience with the introduction of this form of teaching. According to the absence of electronic support for this study course, we will make the study materials for seminars as well. The innovation of the subject will enable students more in-depth understanding of the topics covered. Contents of the subjects, materials, and tools used in teaching will focus more on practicing set themes so that passing the course at the master’s level significantly increases the level of financial literacy in both professional and personal level of the graduates of the course. Benefits of course innovation are to support progressive forms and new methods of education. New materials enable a better understanding of the studied problem based on applied practicing of the subject matter.
Pearson Higher Education – possibilities and practical use of the study course

One of the world’s companies offering services in the field of education is Pearson PLC. Samuel Pearson founded the company in 1844. The company’s headquarters are placed in London (United Kingdom of Great Britain and Northern Ireland). Besides services in the field of education, the company offers services in strategic business information, international television production, and consumer publishing. Pearson as a learning company specializes in educational courseware and assessment, and a range of teaching and learning services powered by technology. With 35,000 employees across 70 countries, the company can rightly be considered as a transnational corporation.

One of the company’s slogans perfectly captures this fact:

“Whether it is through new digital learning products in the US, developing qualifications and Assessments in the UK, training school leaders in the Middle East, teaching English in China, or Educating professionals, we are helping people make progress in their lives through learning,” (Who We Are, 2017).

The company in the field of education for the higher education sector offers many products and services. These include Course development, Customisable resources, and technology, MyLab & Mastering, Online program management, Printed textbooks and eBooks, Learning Catalytics, Simulations, etc. Educators can browse by discipline the catalog on the website https://uk.pearson.com/higher-education-educators.html as well as choose the required scientific discipline.

Course Management with Textbook

Without the need to register Pearson offers for their own published books supporting resources. For the requirements of our subject, we select Economics, Money, and Banking, MTP. Through such exactly predefined task, each teacher can choose from the list of books published by the company, and for each of them he can use such tools, the company offers for the book. In the case of the subject MTP, we work with the book The Economics of Money, Banking and Financial Markets with MyEconLab, Global Edition, 11/E by Frederic S. Mishkin, Columbia University. On the website, http://catalogue.pearsoned.co.uk/educator/product/The-Economics-of-Money-Banking-and-Financial-Markets-with-MyEconLab-Global-Edition/9781292094304.page downloadable resources and other resources are available.

Downloadable instructor resources are as follows:

- Instructor’s Resource Manual;
- PowerPoint Presentation - contains lecture notes and all the textbook’s figures and tables;
- TestGen Computerized Test Bank - contains over 2,500 multiple-choice questions that are appropriate for use as a quiz or test questions. These forms provide us alternative methods to make up exams. The Pearson TestGen program offers us a computerized test generator that lets us construct tests by choosing questions from the Test Bank that was prepared specifically for this textbook. The Test Bank includes four types of questions: multiple choice, true/false, short answer, and essay.

Other resources are as follows:

- Companion Website including web chapters and appendices in PDF format.

In the book itself at the end of each chapter, End-of-Chapter Problems (Questions, Applied Problems, and Web Exercises) are placed. Some of these questions require students to look up current data. We use them mainly for homework assignments.

Course Management with MyEconLab

Within the innovation of the study course MTP, we use MyLab & Mastering at most. The tool consists of online homework, tutorial and assessment products such as Learning Catalytics; Adaptive Learning; Econ Experiments; Assign real-time data analysis exercises that use real-time data; Multimedia assets assist students’ learning. MyLab courses are available on mobile devices as well, and there is a possibility to integrate them into LMS. Those instruments can only be used to paying the license fee. Without having to pay, Pearson offers an option for instructors to register into the system and enroll in an existing course related to some of the Pearson’s published books.
MyLab & Mastering has adapted to the needs of the individual disciplines also. We can find support for anatomy and physiology, biology and microbiology, mathematics, etc. For economics, the platform MyEconLab serves. Unlike the service Learning Catalytics, it is possible to use this product partially without paying a license fee.

MyEconLab delivers online content and innovative learning tools to our classroom. To use the basic tools of MyEconLab, it was required to register first. After validation of the instructors by Pearson, we got access to existing courses. If the school had paid for the licenses, then each teacher can create his/her course with particular content. Since the Faculty of Economics does not offer such possibility, we took the approach without a license. In this case, we searched for the already existing course by Frederic S. Mishkin, formed to his book The Economics of Money, Banking, and Financial Markets Global Edition. (2017). Following the enrollment in the course instructor can use particular resources, which include supporting materials for lectures and seminars of all kinds. It is possible to customize the existing content and add our own as well. We can manage, create, and assign tests to students, choosing from the exercises in the Study Plan as well as from the Test Banks.

We considered Chapter Resources to be the most valuable. For each chapter in the book materials of different media types were created:

- Animation;
- Appendix;
- online Textbook;
- Reading - Pearson publishes an annual Readings book online, aimed to enhance the text. The Readings collection is unique in that it is updated over the life of current edition of the textbook. More than that, it includes summaries of the articles, provides suggestions for which textbook chapter(s) the reading might be assigned, and contains discussion questions that follow each reading to encourage students to think about how the reading relates to material in the text;
- Study Guide – includes Chapter Review to summarize the chapter, Helpful Hints to provide additional examples, Terms and Definitions to match key terms to their definitions, Problems and Short-Answer Questions, Critical Thinking to provide a single multi-step problem as an application of the major issue, Self-Test to provide true/false and multiple-choice questions, Solutions to provide solutions for all problems and questions;
- Video;
- web Chapter;
- web Links.

Students and MyEconLab

MyEconLab delivers students access to a variety of study and practice tools that put them in control of their learning. Students can use practice tests to check their understanding and identify areas in which they need to do further work. For each student, a personalized study plan is based on test results will show students where further study is required. Students can choose from many interactive exercises based on specific end-of-chapter questions and select from Readings in Money, Banking, and Financial Markets, regularly updated by Frederic S. Mishkin and James W. Eaton of Bridgewater College. Sample quizzes are also available to give students a chance to double-check their understanding and application of the main topics in each test chapter.

Learning Catalytics

In the context of products and services listed above, probably the most interesting of them seems to be Learning Catalytics. We believe that this instrument can grab the attention of students during classroom instruction and connect the latest technology while teaching at the same time. Learning Catalytics was founded by Gary King, Brian Lukoff, and Eric Mazur, of Harvard University. It is an advanced, cloud-based learning analytics and assessment response system that helps instructors evaluate student understanding in real-time. It is one of the most interesting tools to attract student’s attention known as "bring your own device" student engagement and classroom intelligence system. Thanks to it, the teacher can engage students in real time, using open-ended tasks to probe student understanding, see Figure 1. Students can use any smart web-enabled device they already have — laptop, smartphone, or tablet. The teacher creates open-ended questions that ask for a broad range of
responses. Question types include word clouds, graphing, short answer, matching, multiple choice, highlighting, image upload, etc.

Utilization of this tool is a chargeable service. The license price depends on the length of the period and the number of students with access to the system. Although we could find a use for it (for example, to solve arithmetic problems), this tool has not been used within the innovation of the study course MTP, therefore.

**Figure 1: Learning Catalytics™**

**Conclusion**

The innovation of MTP course was motivated by an effort to modernize teaching using current methods and tools in education. Presently, there are several platforms for eLearning available at the market learning tools. At Czech universities, the most used are probably LMS Moodle. Although it brings much innovation to modern education, its major disadvantage is that it places high time and technical demands on instructors. At present, the pressure on teachers to engage in research and publish professional publications is enormous. It remains, therefore, a lack of time to focus on the quality of teaching process. Thus, we consider beneficial to take advantage of opportunities that are offered by professional companies. Pearson PLC is such firm that has for years devoted to the field of education. During the course innovation, we have seen only a fraction of the tools that Pearson offers nevertheless we can say that all of them are handled professionally about the reflection of modern methods in teaching. Therefore, it is worth for Czech universities to consider professional service firms to be more applied in higher education.

**Acknowledgements**

The innovation of the study course Monetary Theory and Policy and presentation of this paper is supported by so-called Institutional development projects FRVŠ 2017 (Institucionální rozvojové projekty FRVŠ 2017), the number of the project is RPP/2017/171, and the project is implemented at VŠB-Technical University of Ostrava, Faculty of Economics.

AN ANALYTICAL APPROACH OF SOURCES OF CONFLICT AMONG STUDENTS
Luiza Enachi-Vasluiianu,1 Flavia Mălureanu2

Abstract: In a broad sense, conflict is an interactive process displayed through incompatibility, disagreement or dissension among social entities such as individuals, groups, organizations, etc. In a society in a changing, based on competitiveness, conflict is an integral part of human relationships, as it is a natural component of everyday life. New perspectives on conflict agree that its presence is natural and inherent in the human activity. The educational context is, inevitably, a space of conflicts. According to the actors involved, there has been established the following typology of conflicts: (a) conflicts among students, (b) conflicts among students and teachers, (c) conflicts among teachers and parents, and (d) conflicts among teachers. This paper aims to study the sources of conflict between students at the gymnasium and high school levels to lay emphasis on the aspects that could generate situations of risk or even educational crisis. The starting point in the research was specific literature, the observations and the experiences in the classroom. The items identified were a competitive atmosphere, intolerance, deficient communication as a result of linguistic ambiguity, inappropriate expressions of emotions, aggressiveness, lack of skills in solving conflicts, abuse of teacher’s authority, etc. A questionnaire-based survey was developed, and the respondents were instructed to answer depending on how often they met the situations described by the indicators in the questionnaire. The results obtained were processed using the SPSS analysis. Further studies on conflicts between teachers and students/parents, teachers/peers can complete the research.

Keywords: conflict, sources of conflict, school tensions, competitiveness

Introduction
Conflict in education has been under scrutiny in the recent years. Perceived as a significant feature of human development, conflict represents the quintessence and the premise of the personal and social change. Inherently, the school space is conflictual, with tensions in several aspects such as knowledge, social and political. Current studies of pedagogy have classified conflict in school according to various and multiple criteria. Our paper will limit the research to the analyses of some selected sources of conflict among students belonging to two different school levels, taking into consideration the specifics of the present Romanian educational context.

Literature review
Competition in education is a tough fight, most of the times, irrelevant, for a place in the top of the school hierarchy. Traditionally, teachers consider that competition is efficient as a source of increasing motivation for learning. However, this competitive system generates the marginalization of students with low intellectual skills, even if these students are skilled in other different fields, such as art, sports, etc. The competition becomes destructive only when it is exaggerated and becomes a goal. In this case, it cancels cooperation (Bocoș et al., 2008) and may generate conflicts and aggressive behaviors within the group (Neculau, 1996) as it creates rivalries, envy, selfishness, etc.

The type of relationship among the students of a classroom, as well as the quality of interpersonal communication, depending upon the attitudes of each of the agents involved (Abric, 2002). Intolerance is about hostility, negative judgment, superior attitude, negative feedback. Intolerance is present in all aspects of society, ethnic, racial, cultural, economic, educational. The inequalities within the groups, in which people are exposed to discrimination, marginalization as manifestations of intolerance can lead to conflicts or even exclusion (Nedelcu, 2007). As such, students must learn to accept one another, to develop tolerant attitudes and behaviors because they often get to conflicts as they are convinced that the others do not accept or like them (Olsen, Nielsen, 2009).

The way emotions are expressed significant for social interactions as it contributes to their maintenance or degradation and triggers the appearance of conflicts (Șâlăvăstru, 2004). Children’s inadequate expression of negative emotions (fury, fear, sadness) through physical or verbal aggression determines the appearance of similar behavior or isolation. Children who behave aggressively have difficulties in recognizing and understanding the emotions expressed by the others in a given situation, thus initiating conflicts. On the other hand, some children express their emotions through exaggerated

2 Faculty of Psychology and Educational Sciences, University of Bucharest, Romania, flaviamalureanu@yahoo.com
manifestations such as outpouring laughter, ample, theatrical gestures or physical aggressiveness when they like somebody so as to draw attention to themselves, etc. As children grow up, their emotional expression is affected by cultural values, gender stereotypes, etc.

Ambiguity in communication is based on insufficient, untrue information, inadequate channels of communication or lack of open communication among colleagues (Bocos et al., 2008). Alongside these, research demonstrated that ambiguity in communication is also triggered by linguistic elements such as polysemy, intensifiers of negation, modality, indefiniteness, anaphora, modifiers, gradability, figures of speech (Malureanu, Enachi-Vasluianu, 2015). Children have a tendency to make extensive use of such linguistic elements and, sometimes, their inappropriate or erroneous use may lead to misunderstandings which develop into conflicts.

Children aged 11-18 lack abilities to solve conflicts. They may know some of the strategies described in the specialized literature, compromise, retreat of one of the conflictual sides, consensus, negotiation, mediation (Păun, 1999), but they do not possess the necessary experience, tact or will to put them into practice, especially in the case of gymnasium children. As a matter of fact, with gymnasium children, the use of hierarchic authority (teacher, parent, elder brothers) leads to conflict attenuation or even elimination. With high school students, there is a tendency to avoid outside involvement and try to solve different conflicts by themselves.

Reboul (1971) states authority indicates the supremacy of the one that practices it, so it establishes a vertical relationship. The authoritative teacher can impose certain decisions that may be contrary to students’ desires, may favor some students in others’ detriment, may discriminate students with low results through criticism, may evaluate students in negative terms, may humiliate publically. Some students may easily assume these behaviors to obtain supremacy in front of their colleagues, which may determine significant interpersonal tensions. The relationships between the groups led authoritatively evolve from great interpersonal tensions, manifestations of irritability and hostility towards team colleagues to the collective aggressiveness of more subjects against one of them who becomes an “escape goat” (Sălăvăstru, 2004).

Specialists in social psychology state that aggressiveness is the tendency to answer hostilely to unpleasant interactions. Aggressive children can orientate their aggressiveness on a colleague by hitting, insulting, mocking him or indirectly by speaking ill behind his back or laying traps for him (Eibl-Eibesfeldt, 1995). On the other hand, the students included in our study talked about another form of aggressiveness, stubbornness identified as passive aggressiveness, defined as refusal to do what is necessary or what is requested. The two ways of aggressiveness, active and passive, create pressure, a tension which may eventually lead to conflicts.

**Methodology of Research**

**Objectives**

The research objectives are a) to identify the sources of conflict among students at gymnasium and high school levels in order to lay emphasis on the aspects that could generate situations of risk or even educational crisis, b) to realize descriptive analyses of the selected elements to determine a hierarchy of two school levels, gymnasium and high school.

**Participants**

The sample used for research was made of 100 students from Vrancea County, Romania, split evenly in number: 50 from gymnasium students (ages 11-14) and 50 high schools (ages 14-18). The students volunteered to take part in the research.

**Research instrument**

The main method used in our research was the questionnaire-based investigation. The questionnaire was built based on specific literature and focus-group discussions with students from the two school levels. This method allowed the identification of a series of sources of conflict among students transposed into the following items: competitive atmosphere, intolerance, deficient communication as a result of linguistic ambiguity, inappropriate expressions of emotions, aggressiveness, lack of skills in solving conflicts, abuse of teacher’s authority that can generate into envy.
The respondents chose one of the following variants of a five-step scale: (1) to a very low extent, (2) to a low extent, (3) to an average extent, (4) to a large extent, (5) to a very large extent. These steps are showing the relevance of each item as a source of conflict.

Results and Discussion

For the descriptive analyses, we used SPSS software, the t-test for the independent samples.

The means in Table 1 were used to realize a hierarchy of sources of conflict among students for the two school levels. Thus, the indicator ranked one was considered the source with major impact in triggering conflicts, whereas the indicator ranked seven was less appreciated as a source of conflict among students.

According to the hierarchy resulted from the investigation, competitive atmosphere (m = 4.70) registered the highest means for gymnasium students, while inappropriate use of emotions (m = 4.60) rated highest for high school students. Placing competitive atmosphere as the main source of conflict for gymnasium students is explained on the one hand, through the importance of the final grade for all four gymnasium years, as it represents a certain percentage of high school entrance grades. On the other hand, students declared in focus-group discussions that the competitive atmosphere is supported by teachers who encourage this form of educational progress. As for the inappropriate use of emotions with high school students, the age of adolescence is characterized through emotional exaltation which may lead to the amplification, the exaggeration of emotional-expressive behaviors (Crețu, 2005). Deficient communication (m = 3.52) for gymnasium students and abuse of teacher’s authority (m = 3.72) for high school students registered the lowest means.

Gymnasium responses registered means above 4 for five items: competitive atmosphere (m = 4.70), inappropriate expressions of emotions (m = 4.38), aggressiveness (m = 4.36), lack of skills in solving conflicts (m = 4.20), intolerance (m = 4.18). High school responses registered means above 4 for six items: inappropriate expressions of emotions (m = 4.60), lack of skills in solving conflicts (m = 4.44),...
deficient communication as a result of linguistic ambiguity (m = 4.32), aggressiveness (m = 4.30), intolerance (m = 4.22), competitive atmosphere (m = 4.10). These means show that students in both school levels consider these items as sources with major impact in triggering conflicts. Even the lowest means are above 3.5, which demonstrate the importance students pay to these items as significant sources of conflict among students.

The T test was used for the independent groups to determine the differences of the opinions regarding the sources of conflict among students. The significance level was set to 0.05. Starting from the significant differences from a statistical point of view among students’ appreciations, we could state the relevance of the sources of conflict. Thus, the analysis of the appreciations of the students from the gymnasium and high school brought to significant light differences for two items (deficient communication and competitive atmosphere, p<0.05). The divergence of opinions regarding the two elements is reflected on the hierarchy in Table 2. Thus, deficient communication ranked 7 (m=3.52) at gymnasium level and 3 (m=4.32) at high school level. The comparative analysis of the two means shows higher appreciation with high school responses. This demonstrates that deficient communication has a greater relevance as a source of conflict for high school students. The second item which registered statistically significant differences is a competitive atmosphere. According to Table 2, it ranked 1 (m = 4.70) at gymnasium level and 6 (m = 4.10) at high school level. The higher mean is registered with the gymnasium responses. Statistically insignificant differences were registered for five items, indicating convergence of opinions of the students from the two school levels.

Conclusion

Although conflicts are not desired in the educational communication, they exist. Specific literature underlines that a solved conflict may be seen as a source of learning, as previous experience for others to come and thus the participants will know how to react to diminish the impact of the phenomenon or even solve it. The existence of conflicts helps to discover personal values and beliefs, contributes to developing proper conflict management skills.

Our study demonstrated that students pay attention to conflict as an important issue in education by giving high scores to the sources identified in the research. We also appreciated their involvement in focus-groups discussions as they provided examples or drew attention upon different conflictual situations. The selection of the sources of conflict for this research was made according to the specifics of the present Romanian educational context. Although they were analyzed individually, the sources of conflict can act separately or in combinations determined by the situation in case. Mention must be made that there is a much richer range of sources of conflict that generate particular aspects, strategies of preventing and solving, which could be dwelled upon in further studies.

STUDENTS’ PERCEPTIONS OF EXTRA-CURRICULAR ACTIVITIES IN FOREIGN LANGUAGES AS VALUE FOR THEIR PROFESSIONAL COMPETENCIES DEVELOPMENT AND FUTURE EMPLOYABILITY

Elena Gavrilova, Kira Trostina

Abstract: The rationale behind this research is based on the claim that the students actively involved in university-geared extra-curricular activities (ECAs) in foreign languages gain higher employability than their uninvolved peers. With the recruitment market toughening and the universities’ budgets tightening, the role of ECAs in increasing a student’s profile needs revisiting. This paper examines the correlation between participation in free-of-charge and fee-paying ECAs in foreign languages and greater opportunities for better employment. In recognizing the value of extra-curricular input in their future, student’s views of themselves are reshaped. This outcome results in an increase in the number of student-led versus teacher-initiated activities, thus developing students’ autonomy, critical thinking, and cognitive skills. This article reports on the review and findings of the benefits of ECAs in a Russian economic university. The survey shows that employer-focused ECAs in foreign languages unfailingly provide university graduates with an added edge. The paper concludes with a proposal that inexperienced job-hunters have more confidence to seek better employment when armed with a portfolio of achievements in ECAs and non-degree courses.

Introduction
Possessing a single diploma in tertiary education is no longer adequate for seeking jobs since the global recruitment market now requires graduates to diversify in their job search. Narrowing the pathways to work paradoxically necessitates a great deal of versatility from those searching for their first career opportunity. Prospective employers are longing to see potential applicants’ flexible approach and seek adaptable staff that does not fear new challenges and change. Recruiters worldwide are, to a less extent, convinced of an applicant’s ability to work effectively, judging solely by his or her diploma, and demand ‘ready for work’ graduates with clear evidence of specific job competencies. The contemporary knowledge-driven economy is witnessing a downturn in the number of employers offering induction courses or training programs for novice graduates and a secure career ladder. Fry (2009) claims that there are increasingly more qualified people available for most jobs than has been in recent memory and adds that what has changed is the level of competition and the need, more than ever, to set the applicant apart from all other contenders. Moreover, IT-powered modern society has completely reshaped the job application process. Job seekers now forward their curriculum vitae (CV) through email or complete applications on-line for screening by special corporate filters that automatically reject those that fail to conform to basic specifications and requirements.

A major commitment of modern universities is to equip their graduates, not only with standardized academic qualifications but also with an array of ‘extra-curricular skills’ to allow them to stand out in the crowd and boost their employability. It is a topmost concern for a business that students leave university with a wide range of employable skill sets (BIS, 2010, p. 8).

Employability, in contrast to employment, is a term increasingly used, especially in describing students and graduates. According to Fancourt and James (2005, p. 5), “employment refers to having a job, while employability, or being employable, refers to the qualities needed to maintain employment and progress in the workplace.” As interpreted by Hillage and Pollard (1998), employability is the capability of gaining initial employment, maintaining jobs, and obtaining employment where required. Some universities are especially active in promoting their extra-curricular component and additional educational services and narrow the definition of employability to that applicable specifically to their graduates. For example, the University of St Mark & St John, in their Marjon Employability Strategy 2013–2015, declared that their Marjon Plus program would act as a vehicle for acknowledging extra-curricular achievements. The University spells out employability as the set of accomplishments, understandings, and personal attributes that make their “graduates more likely to gain employment and

1 Plekhanov Russian University of Economics, Russia, helena0517@mail.ru
2 Plekhanov Russian University of Economics, Russia, kiratrostina@mail.ru
be successful in their chosen occupations” as stated by Kalei (2016, p. 1).

During the development stage, researchers had difficulty defining extra-curricular activities (ECA). For some time, different names for ECA co-existed, e.g., after-school activities, co-curricular activities, out-of-school activities, and extra-classroom activities causing some confusion in terminology worldwide. Today the complications are so many and varied that, in the authors’ view, it remains difficult to provide an unequivocal definition of ECAs. Generally, ECAs are attributed to those activities that are not the components of the academic curriculum but are an integral part of the education environment, comprising sports, singing, music, debate, dance, drama, and social services. Co-curricular activities (CCAs) are defined in The International Dictionary of Education as follows:

Activities sponsored or recognized by a school or college which are not part of the academic curriculum but are acknowledged to be an essential part of the life of an educational institution, such as sports, school bands, student newspaper etc. They may also be classed as ‘extracurricular’ i.e. activities carried on outside of the regular course of study; activities outside the usual duties of a job, as extra class activities. (Page, Terry, Thomas, & Marshall, 1977)

However, although all authors accept that ECAs take place outside of curriculum hours, there is no unanimity as to whether these activities include activities practiced within a university setting exclusively or whether they should include those conducted externally as well. Including the latter expands the definition of ECAs to an exorbitant range of activities, from all types of sports and youth associations to non-degree (L2) courses.

This paper summarizes the experiences from more than 20 years of voluntary ECAs, which have been university-focused and professionally-focused, and of the supplementary educational service in foreign languages at the Plekhanov Russian University of Economics (PRUE). It also presents the manner in which these programs not only support students’ linguistic competence but also enhance their employment opportunities.

**Literature Review**

The first studies summarizing extra-curricular experiences in colleges and universities appeared as early as the 1920s. These recognized the value of ECAs and administering, guiding, and promoting the ECAs, and thus demonstrated that such activities could and, often worthily, contribute towards achieving educational aims and goals. Some educators were inclined to set the same values for curriculum and extra-curricular programs (Koos, 1926). An early philosophy behind ECAs was that they should “grow out of curricular activities and return to curricular activities to enrich them” (Millard, 1930, p. 12, cited in Broh, 2002, p. 71).

Recent researchers in ECAs diverge to embrace a whole array of topics and outcomes. Stuart, Raht, and Smith (2011) attempted to re-vision the teacher-learner roles through ECAs. Chan (2010) suggested that the locus of control and ECAs influence the learning approaches of full-time and part-time sub-degree finance students and concludes that the deep approach is positively associated with academic achievement. Holloway (2002) studied ECAs and student motivation in educational leadership, while Clegg, Stevenson, and Willott (2010, p. 1) place considerable focus on the “blurring of boundaries in conceptions of the curricular and extra-curricular” in regards to the United Kingdom (UK) higher education.

Many researchers highlight the correlation between ECAs and academic achievement. Seow and Pan (2014) prepared a literature review on how participating in ECAs affected the academic performance of accounting students and offered three major theoretical frameworks, zero-sum, developmental, and threshold, in explaining such. Wilner (2005) studied the role of ECAs in helping students choose an appropriate career path and a support network to thrive. Yorke and Knight (2006) stated that ‘employability’ is a more complex construct than that of ‘core’ or ‘key’ skills, suggesting that employability becomes part of the curriculum. According to Yorke and Knight (2006, p. 2), “employability can be enhanced through personal development planning, but success will depend upon the extent to which students see a ‘pay-off’ for the effort that they put in.” When the students know that ECAs are included in their profile, their participation becomes more fervent. Thompson, Clark, Walker, and Whyatt (2013) admitted that although an excessively active ECA engagement can
be detrimental to academic study where it is framed in structured institutional schemes, it would enable students to increase their employability.

In Russia, research in university ECAs in foreign languages, as well as their effect on graduates’ employability, is in its infancy, and corresponding publications are infrequent. Though many colleges and universities persistently organize a supplementary educational service and a variety of forms of ECAs in foreign languages, the information about these is fragmented with no serious attempts to systematize and publicize evident to date. Publications of Russian researchers’ studies in ECAs in foreign languages relating to universities are second to none. However, these studies only highlight individual aspects of ECAs in foreign languages (Kuimova & Gaberling, 2014; Pashkova & Solodovnikova, 2013) and no studies connect ECAs with employability.

**Data and Methodology**

This study was a desk research that included theoretical literature and empirical studies on the topic of ECAs and employability. The literature included scientific periodicals, companies’ and universities’ websites, publications on employment, application forms, recruiters’ blogs and posts from world’s largest professional networks. This approach aimed to elicit information on ECAs in foreign languages that would be advisable to include in university graduates’ CVs in response to likely questions during job interviews. This information would reflect their experience gained from ECAs in foreign languages, and account for the contribution of ECAs in successful job-hunting. The field research component involved collecting first-hand information from a series of interviews with human resources (HR) managers from different companies, lecturers from PRUE’s Human Resources Management Department, administrative staff of PRUE’s foreign languages non-degree courses, foreign language teachers from PRUE, and bachelor and master’s undergraduates and alumni.

Interviews with the companies’ HR practitioners and PRUE’s HR for teaching staff with the knowledge and expertise in this area of research focused on the evaluation of ECAs achievements for the employment decisions. There were two questions asked: 1) Is there any benefit of ECAs in foreign languages for a graduate in the initial job-hunting? 2) If yes, then which ECAs are especially valuable for the work in the economic sector?

Interviews and panel discussions with 28 foreign language teachers provided details of their experiences in organizing various L2 teacher-gaered ECAs at PRUE and conducting non-degree courses. This activity elicited ideas for further development and improvement. To be more objective and to monitor the dynamics of the students’ lifecycle in ECAs, the study used data collected from only those teachers who had worked at the Chair of Foreign Languages for more than four years.

Statistical data about students’ participation in non-degree courses of foreign languages were collected from the administration of the courses, at the chairs of Foreign Languages, to analyze the breakdown of students’ interests in fee-paying foreign language activities at PRUE during 2014–2016.

One-to-one interviews and communication with the undergraduates using on-line social and professional networks provided the means of collecting feedback of their positive and negative reflections from participating in ECAs in foreign languages. One-to-one interviews with former graduates working in multinational companies sought to collect their perceptions on the relevance of these activities for their current job practices and experiences.

**Results and Discussion**

**Language Training in an Employability Context**

Established in 1907, PRUE currently has over 17 000 enrolled students in bachelor, specialist, and master’s degrees and supports over 100 educational programs. The university holds a practical approach towards students’ instruction, thus, highlighting the entrepreneurial traditions as an essential social value. Many PRUE graduates with a decent command of L2 seek employment where the office operates in the English language. The feedback collected from our alumni indicated that among the main objectives of English language studies there should be more emphasis on training students in cross-cultural issues as well as immediacy and clarity of communication.

Undergraduates directly linked their future employability with their English language advancement, thus voicing exaggerated expectations of the curricular L2 courses. Having to act within the rigid syllabus boundaries and being well aware of the inherent limitations of both obligatory and elective L2
courses, teachers in PRUE were increasingly encouraging their students to engage in both teacher-directed and self-initiated ECAs. Additionally, to compensate for the lack of traditional classroom language practice, the enrollment for foreign language non-degree courses was promoted.

Teacher-led activities in foreign languages were on an ad hoc voluntary basis, but students were aware that participation in these could help them outscore their more academically gifted peers, raise their rating, and accessorize their CVs for the future. Achievements in most activities were documented by way of certificates, screenshots from the University website, photos of events, and publications, which provided students with credibility. Hence, by graduating, students can accumulate a diversified portfolio of extra-curricular achievements, demonstrate to prospective employers their language abilities, and strive for self-development and self-actualization in a recognized manner.

Most HR specialists who were questioned agreed that involvement in ECAs in foreign languages enhanced the former students’ employment chances. As Julia Kosareva, the Head of PRUE’s Career Development Centre wrote: “generally, the employers from economics graduates’ target companies prioritize three core requirements for the successful applicant, computer literacy, advanced knowledge of English, and team-working skills.” Inna Shirko, Director for Academic Activities Coordination, PRUE, contemplated that principally there are two sets of questions that can be tackled with the applicants’ recollections about their participation in ECAs in foreign languages: 1) What do you consider most important for the interviewer to know? and 2) Are you able to relate the story back to the job? Petr Karasev, Vice-Rector for Education and Methodology Work, PRUE, outlined that to prove the graduates were valuable candidates there were two recommended answers. One was to tell the interviewer a story about their awards, non-degree course enrollment, interests, or hobbies, and thus, relate their success to examples that reflected well on their character (e.g., their excellent people skills). The second was to share a personal story of being involved in or initiating some project in the ECAs.

The rise of the electronic job market in recent years has accentuated the wider implementation of electronic portfolios in the recruitment process. Unlike a paper-based portfolio, which is a collection of an applicant’s certificates and diplomas, an e-portfolio presents various electronic samples, such as videos, audios, as well as posts on the blogs or websites. Dudeney and Hockly (2007) believe that modern recruiters consider an e-portfolio to be a richer way of assessing a job-seeker, as it provides a much clearer idea of their achievements and personality than formal grades and test scores. E-portfolios are also becoming increasingly common in tertiary education because university graduates can include the most relevant information about themselves and highlight their interests and needs, streamlining their e-portfolios in line with the aims of their career objectives.

University-Geared Employer-Focused ECAs in Foreign Languages

Being focused on the academic outcomes rather than their personal development, students did not always recognize the employability enhancement that their participation in ECAs could bring to them. Thus, the mission of the chair of Foreign Languages was to expose PRUE students to a better understanding of the value of ECAs. The framework of teacher-directed professionally-focused ECAs in foreign languages has been evolving in PRUE for at least 20 years. Now the chair of foreign languages has a well-established system of extra-curricular activities and additional educational service embracing bachelor, master’s, and post-graduate students of all ages with different linguistic abilities. Apart from foreign language non-degree courses, organized by the chairs of foreign languages, and taking international certificate exams, which are fee-paying, all other activities are free of charge, while none are obligatory.

A traditional Week of Foreign Languages (WFL) held in November each year, which lasts up to three weeks, is the initial go-ahead impetus for involving first-year students into ECAs. The WFL’s program includes such activities as drama contests when participants perform chosen episodes from books of their home reading lists, a newspaper contest to try themselves in writing articles in English, and various English-speaking countries’ quizzes. All events are photographed and displayed on the faculties’ pages on the PRUE website. More experienced second-year students participate in additional professionally-focused events within the WFL, which may include roundtables, workshops, and individual business presentations. The awards, ranging from certificates to two-week courses in a language school in Great Britain, encourage a plethora of students to participate eagerly. As far as
participation data were concerned, 93% of first-year full-time students typically join the events of WFL. However, this number generally decreases to approximately two-thirds of the total in the second year. This decrease occurs for two reasons: 1) students become less interested in General English activities, and 2) some students start working part-time and have less extra-curricular time.

A permanent and functional Functioning on a permanent basis a student-led English club organizes such activities as roundtables, watching and discussing movies, celebrating dates and holidays, playing language games, and questing into English speaking countries’ culture. The English Club involves 9% of the first- and second-year students. Such ECAs provide an excellent opportunity to practice the language in informal situations within a circle of friends and partners and show students how to work together in teams. Thus, students learn to communicate and broaden their social network.

Numerous interdisciplinary and inter-university presentation and case-study contests attract a broad participation of undergraduates. Both individual and group presentation contests aim to improve student’s public-speaking skills, help overcome the fear of the stage, and advance their computer skills; benchmark the best practices; provide knowledge transfer from senior to junior students; and offer impetus for passive listeners from the audience to try themselves next year. For example, some ambitious students participate in presentation contests for 2–3 years running until they finally win. In fact, these presentation and case-study contests are viewed by potential employers as the showroom of the brightest PRUE students. In these, students’ predominant choice of topics is mostly career-focused, as they anticipate the links on the event’s websites about their participation will enhance their e-portfolios.

Selection for the case-study and presentation contests usually follows a multi-stage procedure. The process restricts the number of second- and third-year students participating in the contests, with only one representative or group allowed per department. This selection results in approximately 15–20 contestants in the interdepartmental final, with every department holding semi-finals to define the representative who will compete on the final contest day.

Another form of ECAs in foreign languages involves guest lectures in English by world-famous scientists and economists. In the case when even the biggest auditorium fails to accommodate the expected number of attendees, as was during the presentation by marketing guru, Philip Kotler, in 2014, these lectures are broadcast through in-house cable television, Plekhanov-TV, for viewing in halls and lecture rooms. During such ECAs, students gradually progress from passive listening to active involvement in organizational support and from seizing unique opportunities to communicate personally with the world’s leading specialists.

International and interdisciplinary research conferences crown the hierarchy of ECAs in foreign languages. These conferences include the International Research Conference Synergy of Accounting, Analysis, and Audit and the Youth Science Week that are annually organized by the chair of Foreign Languages in conjunction with subject-matter departments. Both Russian and foreign undergraduates present interim and final results of their research at the conferences, which have become a platform for regular scientific exchange for interaction of students of economics with scientists, prospective employers, university teaching staff and students from other universities and countries, and other representatives from various academic and non-academic institutions. Most conferences are joint projects of several universities, and therefore, the undergraduates have an opportunity to expand their professional network. Finally, a selection of submitted articles is published in the inter-university research conference proceedings or the internal, domestic, or international periodicals, e.g., the Proceedings of Scientific Conference International Plekhanov’s Readings, or International Conference on Teaching Humanities at Economic University. Such events mostly involve senior bachelor, master’s, and post-graduate students, since the writing stage of the graduation paper is approaching and the students are willing to demonstrate their academic potential.

Notably, the only fee-paying ECA, the non-degree courses of foreign languages, annually attracts 3.0-3.5% of the total number of full-time students, i.e., 250–300 students each year. The breakdown of student interests and enrollments in the non-degree courses of foreign languages at the University in 2014–2016 were as follows: 50% of these student groups were enrolled to study English as a foreign language, and 44% of these were learning English to prepare for an international examination. The international examination certificate would provide them with a competitive edge as well as the
opportunity for selection in overseas student exchange programs. The interest in such overseas studies has increased participation in ECAs organized and promoted by the foreign languages chair. The number of students taking international examinations varies from 107 to 121 according to 2012–2016 data. Another 50% of the students were studying non-English foreign languages. Those studying Spanish comprised a quarter of these, though no ECAs in this language were available for the students. The remaining 25% accounted for students learning a foreign language to diversify their potential employment portfolio. The range of available foreign languages in additional educational programs has resulted in response to student demands. For instance, the launch of Chinese, Swedish, and Italian language studying groups was due to a student-initiated activity resulting from their search for potential employment.

The advantages of active participation in university-geared and student-led ECAs in foreign languages are various, and student perceptions show such advantages have a significant input in overall personal development. The participants of ECAs emphasized that participating in the ECA increases their enthusiasm for both foreign language studies and economic disciplines, as well as enhancing their study and broadening their future professional horizons. As most ECAs have undefined outcomes, students were invited to contribute to thought-provoking and open-ended discussions to develop their critical-thinking and rhetorical abilities. The ECAs in a foreign language undoubtedly improve academic achievements by way of providing expanded language practice and access to more authentic materials. Thus, they foster linguistic competencies and facilitate a practical approach within the course. Such participation would add to the individual scholar rating as extra activities are non-obligatory, and, in no way, degrade the student’s academic record. Rather, such activities would benefit the involved student’s worth in comparison with peers who are uninvolved. Involvement in ECAs teaches students character-building lessons for their future study habits and other aspects of their lives. By participating and persevering in these activities, the students noticed that they gained a sense of self-confidence and self-respect. Students of average abilities often struggle with their self-esteem, and ECAs can help them find where they can stand out, thus giving their self-regard a boost. Closely connected with building character is the development of solid networking and team-building skills. Students involved in ECAs accentuated that they had extra practice on how to act appropriately in different social situations. This, in turn, would affect their overall well-being. Participation in various group projects teaches them how to compromise and work in a group. Knowledge is gained, not only from reading textbooks and listening to lectures, as students obtained an incredible amount of supplementary information and experience from their peers through ECAs. Students involved in ECAs underscored that they acquire better time management skills and learn to prioritize their commitments.

Students learn about long-term pledges because when they join a club or attempt to study another foreign language, they expose themselves to that activity for a long period, thus developing a great sense of responsibility. The supplementary e-portfolios of the ECAs display a range of skills but are not reflected in a test score. As stated by Lunenburg (2010, p. 3): An important objective of the total learning process” and being the amalgamation of knowledge, ECAs are “integrative in nature because they tie together many areas of knowledge and experience. They don’t provide abstract and isolated pieces of learning, but rather synthesize many aspects of real-life situations.” Both students and teaching staff benefit from cross-fertilization of ideas and close working relationships that they develop. As minimal bureaucracy was attached to these projects, a democratic approach rather than an authoritarian style of formal instruction exists. Most activities are undertaken in affiliation with the students’ societies.

Most relevant, the documented extra-curricular achievements in foreign languages provide a prodigious testimony when applying for further studies (master’s or post-graduate) and employment. Joining such programs and attempting to gain employment in one’s own country, let alone abroad, requires a successful candidate to demonstrate abilities beyond the mainstream curriculum. University authorities and HR managers expect students to have completed more than purely theoretical work. The ECAs in which students participate reveal a great deal about them and thus would carry weight for their admission to committees by recruiters.

Conclusion
Graduates armed with a portfolio of ECA rewards presented with greater confidence in regards to gaining worthwhile employment. Achievements in ECAs in foreign languages added value to resumes
and revealed fundamental skills that employers expect in a professional environment. The ECAs in foreign languages develop employable skills, such as communication, organization, and teamwork. In line with requirements of recruiters for boosting a graduate’s employability, the portfolio of undergraduate achievements diversified by the active participation in ECAs in foreign languages in universities is positively associated with success and proves the ambitions to hit the career ladder. The certificates and other forms of the documentary proof show the prospective employer that applicants, rather than graduating from ‘exam factories’, can also demonstrate proficiency in a foreign language and, furthermore, have developed such traits as perseverance, self-motivation, self-control, and resilience. Understanding the value of the extra-curricular input for their future reshapes students’ views about them. At the onset, in most ECAs that are teacher-led there is a marked shift towards increasing the number of student-led activities. Students are invited to submit their own proposals for supplementary education service, e.g., by requesting to introduce another foreign language to the non-degree study offer and ECAs in foreign languages. Student proposals can also involve themes for research conferences. Where the value of the proposal is established after discussion in the student’s group and with the chair staff, language teachers do their utmost to enable the most successful applicants to jump-start their ideas.

A properly organized and administered ECA in foreign languages not only brings increasingly more scores to future graduates but it also in many cases helps graduates out-perform their more academically advanced peers in employability. Further, it raises a university’s profile among other tertiary educational establishments and business schools, both nationally and internationally. Thus, it increases the university’s competitiveness. As well, ECAs in foreign languages foster cross-institutional student interaction, generate a sustainable medium for knowledge transfer, and enhance the credibility of the students’ work. Perkin, Ahearn, and Lamb (2012, p. 2) considered one approach was to “offer employers the opportunity to learn about the students’ activities, meet the students and engage with the institutions”. The participation and attendance rates prove that students perceive ECAs in foreign languages as generating high value for their professional competencies development and future employability, notably shifting to more career-biased ECAs as the graduation is approaching.

USE OF ANTIOPRESSIVE APPROACH IN CZECH SOCIAL WORK WITH HOMELESS PEOPLE

Kateřina Glumbíková,1 Alice Gojová,2 Soňa Vávrová3

Abstract: The article deals with the use of an anti-oppressive approach in Czech social work focused on homeless people. The theoretical part, among others, looks into the intersectionality of oppression with homeless people. This contribution also presents partial results from two research studies focused on the reflection of oppression by homeless people. The results show that oppression is perceived as pervasive and interconnected by homeless people. Intrinsically, it forms a barrier in the process of their reintegration into permanent housing forms and a barrier to their access to health services. The necessity of applying the anti-oppressive approach in Czech social work can be clearly deduced from the obtained outcomes. Specifically, its individual instruments such as the production of counter-narratives to oppressive metanarratives, advocacy, critical reflection, and agency.

UDC Classification: 304; DOI: http://dx.doi.org/10.12955/cbup.v5.994

Keywords: homelessness, intersectionality of oppression, antioppressive social work

Introduction
In the presented study, we first reflect upon three levels determining the applied approaches of Czech social work with homeless people. The expectations of society that social work will primarily be tool of control of clients and individualization of their problems form the first level (Sirovátka & Winkler, 2010). Legislative changes, related to the fact that on March 8, 2017 the Czech Government approved a draft law on social housing and a housing allowance (Government of the Czech Republic, 2017), represent the second level. Other forthcoming legislative changes are the changes in the Social Services Act No. 108/2006 Coll., that will impose a new obligation to provide social and therapeutic service in shelters for homeless people. The third level consists of a persistent negative view of homeless people by the society. In the context of the third level, the fact that the society shares the view that homeless people are weak, lazy, handicapped and prone to psychological and social problems can be pointed out (Swick, 2005). Given the above mentioned facts, in our article we aim to present research-based arguments for the wider use of an anti-oppressive approach in Czech social work with homeless people because in this approach we see an improvement and the uplifting of social work with the target group.

Theoretical basis
Within the theoretical foundations, we proceed from the fact that identity of each individual is constructed socially (through relationships and interactions with the social environment) (Výrost & Slaměník, 2011), both in their interpersonal form (formed by social affiliation, membership of a particular category of people ...) and in their personal form (self-identification, self-image ...). Harré & van Langenhove (2010), who describe the existence of collectively developed "personal constructs" in which each individual is classified, speak about the mechanism of identity construction through sociality. Personal constructs are also described by Becker (1997) in his theory of "identity of outsiders" or Tajfel (1981) in his conception of in-group and out-group. Under the above mentioned situation, (forced) identification occurs, which can be explained by Cooley's theory of "mirror self," which affects the formation of the human "I" through mirroring of others' opinions of ourselves (O'Brien, 2011). In accordance with the above mentioned oppression can be understood as the exercising of power or authority of the majority group on the basis of socially and culturally constructed differences. The result is the birth of social inequality. Oppression is therefore structural in nature (Graham & Schiele, 2010) and an individual identity is produced through it.

Lots of socially constructed forms of oppression are the basis for creation of an individual identity. An example might be the creation of "subjectivity" of single mothers in a shelter constructed mutually by reinforcing vectors of sex (gender and the situation of maternity and single parent status), race (possibly affiliation with the Roma ethnic group), class membership (the situation of homelessness and resulting socio-economic situation) and other axes of social differences or dimensions of life situations.

1 Faculty of Social Studies, University of Ostrava, katerina.glumbikova@osu.cz
2 Faculty of Social Studies, University of Ostrava, alice.gojova@osu.cz
3 Faculty of Social Studies, University of Ostrava, sona.vavrova@osu.cz
(Nash, 2008). Another example might be the creation of "subjectivity" of men in shelters when their subjectivity can be formed again by class membership and race, but also by other axes such as their possible experience with the use of drugs or alcohol; or long-term poor health as a result of staying on the street. Their life situation and lived experience cannot be understood through experience with only one form of oppression, for their understanding, the interaction of all experience with oppression is important; their intersectionality. The anti-oppressive approach in social work, whose overarching principle is critical social work, is focused on intersectionality (interconnection/intersection) of various forms of oppression (Graham & Schiele, 2010). Intersectionality becomes not only a point of interest but also an analytical tool aiming at the crossing and multidimensional power relationships for anti-oppressive social work (Grillo, 2013). In fact, any form of oppression is not and cannot be considered less important in anti-oppressive social work (Graham & Schiele, 2010). The anti-oppressive approach is frequently used in foreign practice with homeless people (Gerson, 2007), while in Czech social work only a minimum of contributions dealing with this approach can be found.

**Research methodology**

The data presented were partial outcomes of two research studies. Our aim was to determine how homeless people reflect oppression in their replies. (1) The first research study was aimed at analyzing the perception of barriers and accelerators of the reintegration process of homeless mothers with experience of staying in a shelter into permanent forms of housing. (2) The second research study focused on understanding the health by the residents of shelters and their perception of access to health services⁴. Both research studies were carried out using qualitative research strategies and techniques of data collection from half-structured interviews with homeless people.

(1) The first research study was a participatory study by its nature. It was carried out with the direct collaboration of two homeless mothers changing stays in shelters that participated in all phases of the research study, from the construction of the half-structured interview, through the collection of data to their analysis. The informants were selected using stratified sampling through the institution of shelters in Ostrava. In total, 33 interviews were carried out with three groups of informants, mothers changing stays in shelters (18), mothers leaving shelters (8) and mothers reintegrated into permanent housing for at least 18 months (5). The data obtained from individual interviews were also validated in this research study using six focus groups (2) The second research study, focused on the perception of health by the residents of shelters. It was attended by 18 informants, including 8 women and 10 men from shelters from several regions of the Czech Republic (the Moravian and Zlín region and the City of Prague). The informants were selected using stratified sampling with the help of the institution of the shelter (according to individual target groups from shelters: men, women, mothers with children). The data from both research studies were recorded with the consent of participants, processed (transcribed) and subsequently analysed using the constructivist approach to the grounded theory, which assumes the existence of multiple possible realities and the construction of a new reality in the process of interaction of the researcher’s reality and the reality of the participants of the research (Charmaz, 2006). Within the realization of both studies we followed the ethical principles for research involving humans (American Psychological Association, 2010).

**Research results and their interpretation⁵**

Ad (1/first research study) Interviewed homeless mothers described their living situation/experience through multiple forms of oppression. Among the most common labels that the informants referred to, were "homeless", "bad mother", "unable to take care" (in this case, for themselves and the baby), "sneak thief", "scum", "gypsy", "the one who needs to live in shelter", "black sheep of the family". In their narratives, the informants regard the oppression, which is characteristic by its ubiquity, as a barrier to the process of reintegration into permanent forms of housing; they meet with it at school: "I seemed to me that our teacher had thought that when a child was from a shelter, he/she was just stupid

---

⁴ It is the project called Health of Occupants of Shelters, that Ostrava University carries out for the Association of Shelters in the Czech Republic, r.a. within the project called Development of Services for Homeless People under the Roof. Project registration number is CZ.03.2.63/0.0/0.0/99_041/0.002.242th.

⁵ In the following text, we denote the authentic statements with letter abbreviations of the informant and the number of the paragraph where they can be found in the transcribed text, both in brackets, to anonymize them.
and would hurt other kids or I don’t know ..." (KP15); at the doctor: "Some doctors, I think, look at me in a bad way because I live in a shelter ... I told it to the nurse and they told each other, I think ... since then they have been looking at me in a weird way... they keep asking what and how I eat ... once even if I have enough food ... I feel like being questioned ... I really wouldn’t go there if I didn’t have to " (PV1); in a shop: "Well, when you go to a shop ... they take a look at you ... and then they follow you all the time, quietly and inconspicuously and check if you don’t shoplift ... they even follow the kids " (KPR30); at authorities: "And I guess that when you go to the authority, they don’t tell you everything purposely ... or they say it in the way that you don’t understand it, and then you don’t want to ask not to be a complete idiot..." (PV2); with flat owners: "I don’t give a damn ... well everyone sees just a gypsy ... even if I had the money, I wouldn’t get a flat ... Well, I’ve dealt with the fact that I spend the rest of my life in a shelter..." (KP7); in a shelter: "It seems to me that we’re like their (ed. authors: social workers at the shelter) subjects that we have to beg for everything ... it’s not possible to talk with them normally, I don’t trust them at all" (KP16). "When I speak with her (ed. authors: a social worker at the shelter), I feel like being incapable ..." (KP15). Within the relationship with social workers at the shelter, the informants describe the need for understanding their life situation: "She can’t even empathize with me, it was my daughter's birthday, I wanted to buy her a present, we have to hand in the money to them, you know, well, so I wanted to draw it out and she told me that she wouldn’t give the money to me, I had to save money, I tried to explain that I needed to buy a present for my daughter ... she didn’t give me anything " (KP1). "They can’t empathize at all, I think they can’t imagine the situation we are in ..." (KP3); the establishment of trust and informal sharing "The setting of the rules here is a crap ... I wonder if they can ever want this stuff from us ... instead of asking you how you are, they just want the bills for everything you’ve bought this month because you’re short of money, it’s not possible not to be short of money and you have asked them for lentils ..." (KP3); and to reduce the social distance in the sense of "us and them": "When we go to see them, they’re locked, we have to knock or ring, we can only be here in the bedroom when we want, the hours in common room are also set..." (KP19). In this context the informants reflected that a social worker is an employee of the shelter and certain work obligations and rules, that they must observe, derive from that fact: "I think that it is sometimes also hard for them ... they have to watch you here, take care and their boss probably assesses them by some tables, or not? ... they perceive that the relationship between us isn’t good, as well and they also don’t know what to do about it ... or the boss forces them to treat us in this way" (PV2). The informants also described the oppression against shelters as facilities for homeless people. "And I was afraid to go there because I had heard it was like a jail" (KP20). "People usually don’t know what a shelter is, they think that it is a punishment, not that it has to help us ... I myself didn’t know that there was something like that ... a lot of people probably don’t know until they begin to stay there ..." (PV2).

Ad (2/second research study) In the second research study, the intersectionality of oppression was perceived as a barrier of the access to medical care by the informants. This barrier was interpreted as very strong, sometimes stronger than the reduced availability of health care in the sense of the absence of its low-threshold in the form of its distance and charges for medical service and medicines. "Well, now we have to treat him, well, someone unshaven, dirty. I believe that they think like that, and I’m not surprised, because when a person is somewhere under the bridge or so, I understand the doctors that they ponder it like that. If they do, but they probably do," (KPM2). "I had an inflammation of testicles, I couldn’t walk. I had the money, so I went to the emergency on Saturday. The doctor even didn’t come out, only the nurse in the door, she asked what I wanted, I told her my problem. She said she would ask the doctor and she came back in 10 minutes and said that the doctor advised me to go to the surgery department " (KPM1). "I have a bad experience, such a strange behavior I don’t like it from them ... it seems to me that they think that you’re O.K. and swing the lead. Mainly at those emergencies... I've been in the hospital a few times, and such a strange behavior. It's not; it's not right" (KPM6). "You see it’s like... I don’t blame the doctors that they look at you in that way" (KPM8). This perceived oppression led the informants to not take advantage of health services, or to use them only in emergency cases, which does not provide the possibility of early intervention in case of health.

6 Shortcuts: KP 1 – 33 – communication partner and number (1 – 33), PV 1 – 2 – peer researcher and number (1 – 2).

problems and it is costly. "I didn’t see the doctors until I ended up in the emergency room because of my stomach ... I didn’t see them because I knew exactly what they would think of me ... that I was a dirt and it’s my fault" (KP9). "To see the doctor only in the worst case, we prefer going to the emergency, we don’t have a doctor ... " (KP3). As KP3 describes, non-use of medical assistance is associated with emergency visits.

Conclusion

The results of the presented research studies clearly show that the life experience of homeless people is associated with the interaction of several forms of oppression that are perceived as pervasive. This shows that the intersectionality of oppression is a very important analytical tool through which we can understand the life experience of homeless people. According to the informants, the intersectionality of oppression is a barrier in the process of reintegration into permanent housing and a barrier to their access to health services. The status of "disadvantaged" / "disenabled" is attributed to homeless people on the basis of oppressive metanarrative, socially shared understanding. Therefore, anti-oppressive social work may be beneficial to the services with homeless people not only because it enables us to understand their life situation, but also because it allows us to change it. Actually, the aim of anti-oppressive social work is to replace oppressive and controlling relationships with new relations based on equality (Dominelli, 2010). Emphasis on differences, diversity and inclusion are getting into the centre of attention (Brown, 2012). The tool of anti-oppressive social work is the production of counter-narratives that are formed to oppressive metanarratives, and that may be the source of empowerment for oppressed groups and through them also for individuals (Baldwin, 2013). Another tool of anti-oppressive social work is Social Advocacy ("advocacy") within the meaning of defence of the rights of beneficiaries of social work, both in the broad sense, thus assertion of the rights of whole groups of disadvantaged to the public, and in the narrower sense as an assertion of the rights of specific people at different system levels (Dominelli, 2010). The right to housing for homeless people, the right to provide clear information at authorities or the right to be treated with dignity in health care facilities can be defended through this tool. In relation to the oppression perceived by social workers, the anti-oppressive approach can contribute to social work with the homeless people with its emphasis on critical reflection, which always asks where our knowledge comes from (Fook & Gardner, 2007). Healy (2000) states that even social workers can contribute to reproductive oppression, and therefore they should permanently reflect not only their presumptions while working with clients, but also their personal construction about the nature of the world (Fook & Gardner, 2007).

Based on the experience with participatory research approach, we can also point to the "action" ("agency"), which is another tool of anti-oppressive social work to achieve social change. The recipients of social work are seen as actors, as possible bearers of change that takes place through their individual and collective actions (Fook & Gardner, 2007).

THE CHALLENGES AND TRENDS IN HIGHER EDUCATION
Adriana Grenčíková,1 Jana Španková,2 Dagmar Petrušová3

Abstract: The aim of this paper is to study the developments and trends in higher education. The mission of universities is to develop harmonious personality, knowledge, wisdom, goodness, and creativity in a person and to contribute to the development of education, science, culture and health for the welfare of the whole society. It is necessary to pay attention to changing trends in the labor market in connection with the introduction of new technologies and the creation of new jobs as well as the changing requirements of employers in order to fulfill this mission. Despite falling unemployment, it is still necessary to pay significant attention to the preparation of the new workforce which enters the labor market and mainly to the education of a highly qualified workforce that is required by the labor market. The authors are dedicated to education itself as well as educational trends, they sought to underpin the theoretical background of education through statistical indicators. The authors used a time series analysis for the identification of trends and changes of the monitored parameters. They used a regression analysis for the prognosis of trends and have been using the index of correlation and determination for the choice of the most probable future development.

It is essential that the training of the workforce for the labor market and the education sector respond to the changes in a flexible manner. The conventional way of education will become substandard over several years, not only the content but also a technological transformation will be required.

Introduction
Globalization processes associated with the development of new communication technologies significantly impact the national labor markets and can result in an even greater problem with employment. In this context, the education system which prepares the workforce for the labor market is changing. The ability of the workforce to adapt to the changing labor market requirements becomes important. The basic structural features of the labor market of the EU countries, as well as the Slovak Republic is the aging population, high levels of long-term unemployment, high unemployment of people with low education, high youth unemployment, and large regional disparities (Fusch, 2016). Employment and productive work are one of the most important factors for economic and social development of society. Employment increases development of a society and the living standards of every citizen. That is the reason why the growth of employment is the most important goal in the majority of countries. A characteristic feature of most developed societies is their high degree of sensitivity to the level of employment. Many societies are based on the fact that the majority of their population that is able to work consists of employees who earn wages. This implies a dependency ratio on the stability of employment, which ensures a regular flow of income.

Employment represents the involvement of the population in the work process. It can be measured by the number of employed and the employment rate. Full employment reflects a level of employment, which corresponds to the natural rate of unemployment and the economy at the level of potential output. (Habánik, 2012). It is necessary to be aware of the preparation of the new workforce which enters into the labor market and in particular the preparation of a highly skilled workforce that is on demand. Such a workforce is prepared especially in higher education. The need for qualified labor force growth in the fourth scientific and technological revolution, particularly the workforce in specific industrial sectors, which are necessary for the growth of new sectors of production. However, unskilled labor or the workforce skills that can not find employment in new sectors are constantly appearing in the labor market. (Krajňáková&Vojtovič, 2012, p. 69). State intervention in the form of measures of active labor market policies but also in measures for more effective education systems helps facilitate the entry of young people into the labor market. The existence of targeted instruments

1 Faculty of Social and Economic Relations, Alexander Dubček University in Trencín, Slovak Republic, adriana.grencikova@tnuni.sk
2 Faculty of Social and Economic Relations, Alexander Dubček University in Trencín, Slovak Republic, jana.spankova@tnuni.sk
3 Faculty of Social and Economic Relations, Alexander Dubček University in Trencín, Slovak Republic, dagmar.petrusova@tnuni.sk
to support and provide help to young people can make a significant contribution to enhancing their competitiveness and integration into working life. Tools eliminating their main handicap, such as a lack of professional experience and practical experiences, generally are standard tools of the active labor market measures which are explicitly targeted towards young people. These schemes provide incorporation, training, and professional experience directly in the workplace by the employer in order to obtain professional competencies. Graduate practice, is for these purposes, in the active labor market measures of Slovakia. This practice gives the opportunity for graduates to acquire vocational skills and practical experience through work placements at the employers.

The issue of higher education is now rightly in the center of attention of experts and the general public due to the fact that many graduates leave Slovak universities every year and they do not have the required skills for the labor market needs. Education is a process that is difficult because of the changing conditions and rapid obsolescence of knowledge nowadays. Knowledge of the graduates can be obsolete already at the end of their study; therefore, the ability to learn and orientate one’s self in the search and acquisition of new knowledge is an important feature of graduates.

**Purpose and methods**

We used the following research methods:

- Quantitative methods, particularly mathematical - statistical methods (time series, relative values, indexes, regression and correlation analysis, the correlation coefficient and determination, prognostication etc.)
- Qualitative methods such as a secondary analysis of documents, laws, research materials, and other factually relevant domestic and foreign documents, etc.

The information sources from the Statistical Office of the Slovak Republic, Ministry of Labour, Social Affairs and Family, Ministry of Education, Science, Research and Sport of the Slovak Republic, Central Office of Labour, Social Affairs and Family have been used to analyze these. Internal materials of relevant institutions and organizations dealing with given issues and other available literature mentioned in the bibliography have been incorporated in the analysis.

Time series analysis for the identification of trends and changes in the examined indicators have also been employed.

Regression analysis for the prognosis of trends have been used and the most probable future development of this indicator and the index of correlation and determination have been chosen. Price index of determination could take values from 0 to 1, the more the value of the index approaches 1, the greater part of the total variability approaches zero, the smaller part of the total variability is explained by the model described by the model and vice versa, if the determination index

**Impacts on the market of higher education in the Slovak Republic**

The decline of a population significantly affects the whole European market of education. The capacity of universities is set to a greater number of students. This means that higher education is becoming more accessible to a greater number of individuals from the population each year. Therefore, training for future employment is extended significantly and the average age of the workforce which enters into the labor market in the European area is the highest in history. The following graph shows the situation of the development of the number of applicants for university study in the Slovak Republic.

Interest of students is focused mainly on social sciences and natural sciences in the Slovak Republic in recent years. In comparison with technical sciences, where interest of students is significantly lower for this type of study. This situation also impacted the labor market and the Most Desirable graduates become graduates with engineering degrees.

Due to the fact that boomers are falling, the employers are more often looking for graduates of technical fields, this results in an unharmonious labor market. Technical studies are generally considered to be very difficult; therefore, only the best students achieve success. The classic form of teaching and subjects that have not changed for at least two decades discourage potential candidates. Many of the subjects seem unnecessary. In Slovakia, there is no possibility for students to choose subjects that are considered more appropriate and that are prescribed as compulsory subjects in the group, from the range of prescribed credits. Flexible learning pathways and the use of more ICT in education will
change routines of higher education differently opposed to those being practiced now. (Jirasko, Hynek, 2016)

Technically and economically oriented faculties clearly dominate in comparison to individual faculties. Conversely, faculty focused on law, education, and agriculture are least in demand.

Despite the mentioned facts, university graduates create a negligible group in the overall unemployment rate in Slovakia. Other circumstances can lead them being registered as unemployed due to the lack of job opportunities. The following table presents an overview of unemployment in the Slovak Republic by educational attainment.

Table 1: Population structure by education

* Vocational education is included in this number to 2013

The increasing trend of an economically active population (EAP) in the Slovak Republic and also the increasing trend in the share of university educated people from EAP during the period of 2008 to 2015 is being shown in Table 2. EAP growth index is 1,018 that represents an increase of 1.8%, and the university educated component of this population increased by 46.7%.

Following on the statistics above, the university educated component of economically active population of Slovakia has increased. It has been noticed that the highest share of population with university education on the EAP is in the Bratislava Region (share was 37.3% in the year, 2015), then in the Trenčín and Košice regions (share was 20.6% in the year, 2015). The lowest share was 5.9% in the Trnava Region in the year 2015 from the regional perspective.

It is expected that further development of the university educated component of the economically active population in Slovakia will continue until 2020 if we take into regard a linear model with the equation y = 25,819x − 51439, which has an index of reliability of 97.95% for this time period. Development prognosis are illustrated in Table 3.

Source: own processing
In summary, given the analysis of the employed in Slovakia by education, the number and thus the share of university educated people have an increasing trend in the monitored period. This group makes up more than one fifth of workers in recent years. The share of university educated workers on the overall number of all workers in the Slovak Republic was approximately 22.8% in 2015. The Bratislava region is for the entire period higher than this value, which can be justified by the concentration of state and private enterprises, companies, organizations and councils, which require highly qualified workforce. Trnava and Nitra regions have long been below the national share of university educated workers on the overall number of all workers, which is likely related to the migration of the highly qualified workforce to the Bratislava Region; for instance, due to the closer proximity to and higher number of better career prospects, higher remuneration, etc.

The analysis about the proportion of the unemployed with university education in the Slovak Republic indicates an increasing trend as seen in Table 4. For example, it was only one person with a university education in twenty unemployed in 2008, but it was approximately one in ten in unemployed in 2015.

Source: ŠÚ SR, own processing

The lowest share of unemployed with university education was found in Banská Bystrica, Trnava and Prešov regions throughout the period. This situation may be caused by the outflow of educated workforce to other regions and also shows that education has a positive impact on success in the labor market in these regions.

It is assumed that there is a correlation between the development of the university educated economically active population and the development of university students in the total number of unemployed. Based on the above further reduction of the share of highly qualified unemployed can be expected in the total number of EAP with university education. Index of correlation of these indicators is the highest in the quadratic model and has a value $r = 0.96$ (statistically very high interdependence of the examined parameters).

To summarise, the share of university educated people could fall below 2-3% till 2020, it is based on the quadratic model $y = - 0.0002x^2 + 0.2081x - 48,886$ with determination index 91.3% and the expected development of EAP with university education (Table 1). Of course, other factors that may affect future development have to be taken into account.

Availability of university education depends on the financial possibilities of families and students. Therefore, the choice of this type of education is particularly influenced by the possibility of studying in the region from which the student comes from, and it is usually associated with the lowest financial burden for the family. The graduates often remain at work in the regions in which they studied, and it is very important in the balancing of disparities in the labor market, which have been mentioned previously.
Figure 1 Quadratic model – dependence on share of university educated unemployed population in the economically active population with a university education in Slovakia in the years 2008 - 2015.

Conclusion
The Industry 4.0 Initiative, introduced in Germany, brings an entirely new model that will connect the production and non-production components of the organization (Lom, Pribyl, Svitk, 2016; Liu, Xu, 2017). This model will put very different requirements for existing employees in place. The creation of new jobs will be accepted with important changes. It will have a major impact on the required qualifications of the labor market in general; and will create a need to think about the social aspects of these impacts to (Pfeiffer, S. 2016). These impacts will not only lead to a new organizing work principle but will also require new skills and knowledge of employees and employers. Even in the 1980s, it was assumed that each vacancy would be replaced by a new one where the higher qualification and the higher salary would be required. However, at present, this looks different. Reproduction of work leads to another level. There is a small group of jobs that are highly specialized with a higher salary, bonuses and all others, and the vast majority of jobs with low intensity of qualification and lower salaries. On the other hand, it is necessary to take into account the low population growth in the EU. In this context, there is a need to change the training of the workforce for the labor market, and hence huge changes are waiting for the education sector. The conventional way of education will become unsatisfactory in a few years. University education will require huge changes in the content of the curriculum as well as technological changes. (Brigui-Chtioui, Caillou, 2016).

New communications technologies will have to be incorporated into the educational process inevitably (Begum, Aruna, Vetrivelan, 2016, Hutto, 2017). Growth in the use of mobile applications is expected and university teachers will work more as mentors of education, differently from what it is now. Requirements for their skills will inevitably change as well. As factories create smart places or smart factories, this trend will also affect higher education. The teacher will communicate more with students through the new communication technologies and applications than its traditional way, face to face. The considerable emphasis will be put on acquiring new knowledge and passing that new knowledge onto other students. It is important to realize how quickly the knowledge becomes outdated. This process will be more dynamic than it is nowadays, and it will affect all areas including scientific fields. It clearly shows that knowledge of ICT will become the foundation of skills for every individual within the society which also means that education in the humanities will require some level of technical knowledge. The question is raised around the student's role in the new model. Their task is to study in a traditional school. This basic task of a student may change significantly, and the process of gathering and sorting information and knowledge will put significant focus on creativity. A student will become more of a partner to their teacher. The students themselves will be the bearers of new creative ideas. A teacher will lead the students to the implementation and verification of knowledge especially in practice in the role of a coach. It will encourage greater integration between new knowledge of science and education and the transformation of knowledge (Ližbetinová, Hitka, 2016).
On the other hand, we must not forget the group of people who will need to be educated as communication experts [SMEs – Subject Matter Experts], whether as traditional or virtual ones. Communication will become the basis for Industry 4.0, but on the platform of elements that are at the same level, it means that even a person finds himself in an interaction with the machine, he becomes an equal partner. Specialists in social communication between people will be required as a result of these changes because this vision will have a negative impact on this sphere of communication. Today, the millennial generation uses a large number of communication applications. It has been seen that the deterioration in their communication with the surrounding world outside of virtual reality. University education will be much more important for society than it is today. These questions have to be addressed, and an action plan has to be produced in order to prepare for these changes. The government will have, as a founder of the educational process, an important role in this process. The measures adopted at the strategic level will affect the next generation of employees, their skill sets and abilities. For this reason, these measures must be very flexible. Measures will have to be changed more frequently than at present. On the other hand, measures will need to be reflected upon and must take into account the impact on the generation. Attention has to be paid to lifelong learning, in which universities should have a primary role in the education market.

HOW TO MEASURE THE SAFETY CULTURE OF ORGANIZATIONS

Martin Halaj¹

Abstract: Every organization has an interest in protecting its assets and increasing its profit. To preserve the integrity, organizations generally ensure their assets are safe. Today, especially in large organizations, asset security is a chief priority in decision-making. A factor affecting the level of an organization’s security is its safety culture. This factor is measured by the level by which the organization and its employees adopt and comply with security rules and principles. The status of a safety culture can have a positive or negative impact on the organization’s security, which directly affects its development. The aim of this article is to describe approaches for assessing the safety culture of different organizations. The study results can be used to compare several organizations, and it is possible to identify differences in the level of safety culture after applying innovative changes.

UDC Classification: 304. DOI: http://dx.doi.org/10.12955/cbup.v5.996

Keywords: safety, safety culture, corporate culture

Introduction

A factor affecting an organization’s security is its safety culture. Organizations and their employees have specific values, traditions, attitudes, and approaches towards security issues. A summary of these characteristics represents the safety culture of organizations and individuals. Components of the safety culture of organizations are human, material, and intellectual resources. Each organization is interested in recognizing the level of its safety (including occupational safety and security of assets). While assessing the complex level of safety, it is necessary to determine the degree to which the safety culture has been implemented within the organization. Therefore, it is important to know the possibility of measuring safety culture, which may be different for each organization. Methods of measuring safety culture are specific and use different input data. Depending on the structure of organizations, methods of measuring safety culture differ and can intervene in various sectors of the organization. This article describes the possibilities of measuring safety culture in different organizations.

Literature Review

Since the existence of human civilization, influencing the safety of national or religious cultures prevails to achieve objectives or obtain domination. Today, this phenomenon persists with the ordinary person starting to realize its importance. In the past, as well as now, conflicts between different cultures ended with the loss of life. The impact of culture on safety is accompanied by power and violence to promote and impose certain values. On the other hand, there is a defense mechanism to protect values, norms, and attitudes (Hofreiter, 2015).

The term safety culture, which combines the concept of safety and culture, was introduced in 1986 by a group of workers of the International Atomic Energy Agency (IAEA) after an accident in a nuclear reactor at Chernobyl (Lardner, 2003). The investigative team that examined the accident stated that the main reason for the overheating reactor were shortcomings in the safety culture of the organization. Since this event, safety culture has become a focus in optimizing corporate culture so that employees are united in their behavior towards safety (Slováková, 2015). Instruction under the Assessment of Safety Culture in Organizations Team (ASCOT), IAEA-TECDOC-860, issued in 1996, suggests a set of key indicators to be taken into account for the different areas of an organization when evaluating its safety culture (Václav & Sivák, 2016).

Over time, the safety culture introduced in nuclear facilities was incorporated into other sectors of industry. Safety culture is not specifically intended for personnel at risk or dangerous objects but refers to individuals, groups, and society as a whole. Safety culture began to be used as a means of reducing or eliminating the impact of adverse events and factors for individuals, social groups, and states (Hofreiter, 2015).

The definitions of the safety culture are unique and differ among authors. Cieslarczyk (2011) considered a safety culture as a way of thinking about safety (what is safety, the possibility of

¹ Faculty of Security Engineering, University of Žilina, Slovakia, martin.halaj@fbi.uniza.sk
expressing safety), the perception of safety, and detection of safety values (how to achieve safety, which techniques and technologies can be used to achieve safety).

Pidgeon (1991) defines the safety culture as “the set of beliefs, norms, attitudes, roles, and social and technical practices that are concerned with minimizing the exposure of employees, managers, customers and members of the public to conditions considered dangerous or injurious” (cited in Guldenmund, 2010, p. 25).

However, a well cited definition from the United Kingdom Health and Safety Commission (HSC, 1993, p. 23) states that “the safety culture of an organization is the product of individual and group values, attitudes, perceptions, competencies, and patterns of behavior that determine the commitment to, and the style and proficiency of, and organization’s health and safety management”.

According to available sources, one can define safety culture as a set of values, traditions, characteristics, and attitudes of organizations and individuals in which the safety of the organizations has top priority and which adequate attention must be given in view of such importance (Kirschstein, 2013).

Safety culture is a part of the internal safety environment of an organization and reflects the perception and assurance of an organization’s safety. The safety issues are often subjective, due to a variety of persistent attitudes, opinions, and values of individual employees. Safety culture acquires many forms, and its existence or effectiveness is influenced by several factors, such as norms, values, symbols, conditions, conduction, and speech.

For an understanding of the safety culture, it is necessary to identify artifacts, values, and assumptions that are part of the safety culture. Artifacts are most easily traceable, but their interpretation is often challenging. The level of artifact acquires understanding after becoming aware of the values and assumptions (SAFETY CULTURE IN NUCLEAR EQUIPMENT: Instructions for use in enhancing safety culture, 2010).

Safety culture can be assessed at levels of the individual, the organization, or the state. Safety culture at the organizational level requires the acceptance of safety to achieve and ensure the safety of the organization. There is a particular emphasis on occupational safety and health, and protecting staff in their activities.

In creating the organization’s security policy, the managers are important, as are the professional competencies of employees, which are necessary for finding results in adverse events of each sector of the organization. The organization’s safety culture is based on the reception and identification of
employees with the organization’s security policy, as well as on safety behavior within the organization (Halaj, 2016).

Hofreiter (2015) states that the organization’s safety culture is influenced by:

- Adoption of security by senior management;
- Allocating sufficient resources to safety;
- Quality safety documentation and safety procedures;
- Strict observance of safety in all sectors of the organization;
- Safety training and educations;
- The readiness of the organization to deal with crisis adverse events assigned forces and means which are permanently accessible;
- Regular checks, obstruction, and continuously improving organization's safety.
- Safety culture affects safety management due to the existence of rules, laws, regulations, and standards in the field of security. The introduction and the presence of safety culture in an organization influences the management of the whole organization and behavior of senior management on issues of security and the adoption of security policy. Organization adopts security policy, which involves an important and basic document confirming an organization’s efforts to address security issues in all sectors of the organization. It contains a description of the organization’s protected interests as well as potential risks. A security policy can be processed comprehensively organization-wide or individually for each sector separately (Halaj, 2016).

Measuring Safety Culture

The measurement of the safety culture of an organization is focused on sustained and long-term improvement of safety and the safety culture within the organization. The outcome of a safety culture can be quantified by its status throughout the organization, and within the various sub-sectors that are part of the safety culture. Based on these measurements one can determine the current level of the organization, and then take appropriate safety strategies or adopt a security policy responsible for its needs.

Quantitative Measurement of an Organization’s Safety Culture

In addition to the quantitative measurement of a safety culture, collecting input data, mostly through questionnaires, is a vital phase of the process. The significance of this phase requires a large number of respondents to the questionnaires. Input data are analyzed to obtain the most objective understanding of the relationship between the organization and its safety culture. This data can be extended with information from an organization’s safety history concerning frequency of accidents, incidents, and other statistical indicators. Concerning the questionnaire, it is appropriate to involve senior management of each organization.

The main focus of quantitative measurements of safety culture should be on the following (Slováčková, 2015):

- Plans and objectives of organization’s safety;
- Organization and regulation of the safety;
- Management of the safety;
- Tools
  - Analysis of accidents and injuries;
  - Safety education;
Safety controlling;
The evaluation of the safety;
The percentage of implementation of the measures; and
other.

Obtained input data in each area are evaluated, and the result of analysis can be presented in a safety culture grid (Figure 2) and as a safety culture coefficient (Kirschstein, 2013).

A safety culture grid is a way of visualizing the measured results (Kirschstein & Werner-Keppner, 2014). It presents the strengths and weaknesses of the organization for each area of the safety culture (Slováčková, 2015). Subsequently, it is possible to measure the safety culture to the required level.

Safety culture coefficient unifies and summarizing the results for each area into one numerical expression that reflects the level of the safety culture in the organization. The safety culture coefficient can be used to compare two or more organizations for safety culture and allocate categories (weak, medium, or strong levels of safety culture) to the organizations.

**Figure 2: Safety culture grid**

Source: Kirschstein (2013)

Safety culture coefficient unifies and summarizing the results for each area into one numerical expression that reflects the level of the safety culture in the organization. The safety culture coefficient can be used to compare two or more organizations for safety culture and allocate categories (weak, medium, or strong levels of safety culture) to the organizations.

Qualitative Measurement of Organization’s Safety CultureIn cases where there is insufficient information to identify and determine the level of safety culture by quantitative means, qualitative methods can be used. In this approach, appropriate data can be collated through controlled interviews of staff based on structured questionnaires. According to Halaj (2016), data can be obtained from two levels of staff:

1. Senior management; and
2. Regular employees.

In both levels, questions addressed to the respondents should involve all areas of safety culture and include the main factors likely to affect the safety culture of the organization. Respective questions regarding the factors influencing the final level of safety culture are especially relevant in manufacturing, where the safety culture is of the highest importance. Responses and reactions of respondents can be recorded by field notes or audio recordings.

The aim of controlled interviews with management and regular employees is to obtain data about safety and safety culture implemented in the organization. Answers on particular issues related to the elements of safety culture may differ. A critical step involves an expert or group of experts responsible for analyzing the collected data. Their purpose is to identify the quality and appropriateness of responses and eliminate any that are flawed.

The final step in the qualitative approach is the verbal evaluation of the researched safety areas. This evaluation may have different scales, such as for observing safety: primary, important, secondary, or...
irrelevant; the reliability of technical equipment: excellent, very good, good, satisfactory, or poor; or compliance with laws, standards, and norms. Experts determine the level of safety culture in each organization from partial qualitative assessments, and determine the final level using a prepared scale (e.g., very weak, weak, not weak, not strong, strong, or very strong), which is the aim of qualitative measurement.

### Potential Problems of Measuring the Safety Culture

One of the most important steps in assessing the safety culture involves choosing the appropriate method. A factor influencing method selection is the type of organization. For example, in manufacturing, safety extends to sectors other than those found in non-manufacturing organizations. Selecting appropriate methods for measuring safety culture also relates to the size of the organization. Large organizations may have complex structures, and during the assessment, it is necessary to investigate all sectors. In these cases, due to time constraints, it is essential to use quantitative methods. It is also important to determine in advance how many respondents will need to participate in the assessment of safety culture using qualitative or quantitative methods.

The candor of respondents involved in the assessment is also crucial. Managers may often hide certain information in an attempt to appear the best in comparison with others. Regular employees may also hide information because they fear reprisal from their superiors if they respond to the detriment of the organization. Therefore, it is necessary to maintain the anonymity of participating respondents.

### Conclusion

Safety culture is one factor that can significantly affect the complex integrity level of organizations. It reflects an organization’s approach to safety and success of introducing in-house safety strategies. Hence, it is important to assess the level of safety culture in organizations. For this purpose, it is necessary to define the methods for assessing safety culture as well as choosing the appropriate method for a particular organization. This choice depends on the type, orientation, and size of the organization. Measuring safety culture involves either a qualitative or quantitative assessment of the level of safety culture. Organizations that are dissatisfied with the level of its safety culture can adopt new strategies. After this adoption, the level of safety culture within the organization may increase and thus enhance its safety status. However, where the organization intends to increase the level of safety, the elements involved should be included in the future assessment of its safety culture as these may influence the organization’s safety status along with the security of active and passive components and assets of the organization. Finally, it is recommended that future research examines the interconnection of the safety culture and security of assets in the organizations.

MODIFICATION OF SCORING SCHEMES USING DECOMPOSITION PROCEDURES ON STATISTICAL DATA

Monika Hanáková,1 Aba Teleki,2 Boris Lacsný3

Abstract: This paper presents a method of modifying original scores to obtain independent random variables. It includes an analysis of the consequences of using such a method. The paper also describes the mathematical background of the method in detail and discusses the possible use of the method in identifying student or participant assessments that are over- or underrated. The method distinguishes performances of students and assesses their written solutions using a scoring scheme. In this study, it is used to analyze the competence of participants in the Physics Olympiad competition. Scoring schemes that are appropriately set by an author for a physics problem present the participant scores as independent random variables. The assessment solutions are analyzed using analytical tools (such as covariant matrix) for the dependence of random variables. The evaluators of the participants’ solutions were highly qualified professionals. Nevertheless, the study found statistical evidence of minor distortion in the evaluations, though this was found to only marginally affected the ranking of participants.

UDC Classification: 37.01/.02; DOI: http://dx.doi.org/10.12955/cbup.v5.s997

Keywords: Physics Olympiad, Assessment, Scoring, Independent Random Variables, Ranking

Introduction

Assessment of students plays an important role in physics education as it provides an essential feedback for all its participants, including instructors and students, as well as participants in various physics competitions. One of the most-often used assessment methods is evaluating written solutions of physics problems and tasks. According to Gaigher (2007), problem-solving is considered a reliable way to demonstrate conceptual understanding in physics for purposes of evaluation.

Physics Olympiad (PhO) is a worldwide competition where PhO participants solve physics problems, and their performance is evaluated according to their written solutions. Its history in Slovakia started in the school year 1958–59 and has been an important part of Slovakia’s education system since then. The main objectives of PhO in Slovakia, as defined by the Committee of PhO, are to develop the problem-solving and experimental skills of primary and secondary school students talented in physics, create competitive environments for them, and encourage them to study physics or a related science (Slovak Committee of Physics Olympiad, 2010).

An assessment of each PhO participant is crucial as it influences the participant’s results. Currently, the PhO participants are rated by points (maximum of 10 for a physics problem), which they achieve according to the scoring scheme proposed by the authors of the physics problems. Each physics problem is divided into tasks that are scored separately. For example, a score for the solution of the j-th task is defined as a random variable $X_j^i$ and scored as either ‘0’ for an incorrect or ‘1’ for the correct answer. In general case, $X_j^i \in [0,1]$ – for example, one can assign the value 0.5 to any partially correct solution which is not absolutely incorrect nor absolutely correct. This scaling is used rather than specific scores because of its universality. This paper describes the basics of a statistical method to quantify participant assessments using data and results of solutions provided by the participants of the competition, PhO.

Data and Methodology

The first step was to analyze a case using a proposed modification to the scoring of a single physics problem. That is, we analyzed the effect on scores and rankings of a particular PhO participant in regard to solving one specific physics problem. The modified overall scores gained for solving all four physics problems in each category were determined as the sum of modified scores gained for particular physics problems.

We defined scores of $X^i$ for solving the j-th task (upper index) from a set of ‘s’ tasks as random (column) vector variable, where the k-th element $X_k^j$ is a random variable for solving the j-th task by

3 Faculty of Natural Sciences, Constantine the Philosopher University in Nitra, Slovakia, blacsny@ukf.sk
the $k$-th participant (lower index). We assumed that the random variables, $X^i_k$, were defined on the same probability space $(\Omega, A, P)$, where $\Omega$ denoted the set of all possible outcomes (containing all possible solutions of the task, including all incorrect, incomplete, and correct solutions). Therefore, it was accepted that $\Omega$ was the same for all tasks and all participants. A set of subsets (events) of $\Omega$ was defined as, $A$, i.e., an event was a particular solution of the task. The measure of probability, $P$, mapping any event into the interval $[0,1]$, i.e., $P(\mathcal{F}) \in [0,1]$ for any $\mathcal{F} \in A$. In practice, the participants were a limited ensemble with their solutions assessed by scores, where $X^i_k$ was $P(\mathcal{F}^i_k)$, where $\mathcal{F}^i_k$ was the event, $P(\mathcal{F}^i_k)$, representing the solution of $j$-th task by the $k$-th participant, and $P$ was the probability measure by the author of the scoring scheme and evaluators. The probability of the measure was distorted by inadequacies of the authors scoring scheme and by unsatisfactory decisions of evaluators. In the case of the PhO, this influence was relatively small due to the professionality of authors and evaluators. Mathematical statistical tools identified strong evidence of the limitations in the author’s scoring scheme, and in some cases, probable anomalies in the assessment of the evaluators (Hanáková, & Teleki, 2017).

The basic concept was that the random vector, $X^i$, as an independent variable provided objective scoring for the PhO participants with the same knowledge or skills. However, Pearson’s correlation coefficients (Evans, 1996; Markečová, Stehlíková, & Tírpačková, 2011; Spiegel, 1998) of random vectors $X^i$ showed that many were dependent variables. Following this, a covariant matrix, $\Sigma$, was created to analyze variables $X^i$ and $X^k$. This method was selected in place of the Pearson’s correlation coefficients to avoid nonlinear equations in the optimization procedure.

In the optimization procedure, the scoring scheme was modified to obtain independent random variables, $\xi^k$.

The modified random variables corresponded to the modified tasks. However, examining these modified tasks in their explicit forms was a highly complex problem and beyond the purpose of this article.

The covariance matrix, $\Sigma$, was defined by matrix elements as follows:

$$\text{cov}(X^i, X^k) = \Sigma^{jk}(X) = E[(X^i - \mu^i)(X^k - \mu^k)], \tag{1}$$

where,

$$E[X^i] \text{ denoted the expected value of } X^i, \text{ and}$$

$$\mu^i = E[X^i]. \tag{2}$$

We estimated $E[X^i]$ by the average of $\frac{1}{N}\sum_{i=1}^{N}X^i_i$ and therefore, the covariance matrix elements were estimated using Equation 3.

$$\Sigma^{jk} = \frac{1}{N} \sum_{i=1}^{N}X^i_jX^i_k - \frac{1}{N^2} \sum_{i=1}^{N}X^i_i \sum_{r=1}^{N}X^r_r, \tag{3}$$

where,

$N$ - number of assessed pupils and students.

The covariance matrix $\Sigma$, is a real and symmetric matrix, i.e., it is a Hermitian matrix (Horn and Johnson, 1985) and therefore $\Sigma$ is diagonalizable by an orthogonal transformation $A$, $(A)_{kj} = a_{kj}$ (Equation 4).

$$\Sigma_d = A\Sigma A^T \tag{4}$$

Covariant matrix diagonalized: $\Sigma^{kk}_d = D^k$, $\Sigma^{jk}_d = 0 \text{ for } j \neq k$.

The transformation, $A$, was not unique in the manner described below and defined the above mentioned new probability vectors, $\xi^k$ (Equation 5a).

$$\xi^k = \sum_{j=1}^{N}a_{kj}X^j \tag{5a}$$

The inverse transformation $B = A^{-1} = A^T$, $(B)_{jk} = b_{jk}$ was

$$X^j = \sum_{k=1}^{N}b_{jk}\xi^k \tag{5b}$$
where,
\[ b_{jk} = a_{kj}, \]
\[ \sum_{j=1}^{N} a_{jk}^2 = \sum_{j=1}^{N} a_{jk}a_{jk} = \sum_{j=1}^{N} a_{jk}a_{kl} = \delta_{jl}, \text{ and} \]
\[ \delta_{jl} = \text{Kronecker-delta (} \delta_{jl} = 1 \text{ and } \delta_{jl} = 0 \text{ for } j \neq l). \]

It was convenient to save a different notation for the matrix \( A \) and its inverse \( B \) and show, that
\[ \text{cov}(\xi_i^j, \xi_k^j) \equiv \Sigma^j_k(\xi) = \sum_{r=1}^{N} a_{kr} \text{cov}(X^r, X^r) = \sum_{r=1}^{N} a_{kr} \Sigma^r(X) = \Sigma^j_k. \]

The diagonalization procedure defined the new random vectors, \( \xi^j \), with a chance that they were statistically independent (\( \Sigma^j_k = 0 \) for all \( j \neq k \)). It was assumed that they were independent random vectors.

The transformation matrix \( A \) was obtained by the Schur decomposition procedure (Horn and Johnson, 1985), which solved the eigenvalue equation:
\[ (\mathbf{S} - \lambda_j \mathbf{I}) \mathbf{a}_j = 0, \quad j = 1, \ldots, s \]
where \( \mathbf{a}_j \) was a normalized eigenvector (\( \|\mathbf{a}_j\| = 1 \)) associated with eigenvalue \( \lambda_j \). The set of eigenvectors \( \mathbf{a}_j \) formed an orthonormal basis in the \( s \)-dimensional vector space. Multiplying Equation 9 by \( \mathbf{a}_k \) provided the matrix elements of the diagonal covariance matrix \( \Sigma_D \) (Equation 10).
\[ \mathbf{a}_k \cdot \Sigma \mathbf{a}_j - \lambda_j \delta_{kj} = 0, \quad \lambda_j = \Sigma^{j/j} \]

The following defined the transformation matrix \( A \):
\[ (A_{jk}) = a_{jk} = (\mathbf{a}_k)_j. \]

The normalized eigenvectors are given up to a multiplicative factor \( \epsilon_j \), (\( \|\epsilon_j\| = 1 \)). Also, the order of the eigenvectors is arbitrary.

In the first step, the eigenvector \( \mathbf{a}_{j_1} \) and the \( k_1 \)-th coordinate, \( a_{k_1j_1} \), is defined with the property:
\[ (\mathbf{a}_{j_1})_{k_1} = |a_{k_1j_1}| = \max_{j,k \in k_1} |a_{jk}| > 0, \text{where } j = \{1, 2, \ldots, s\}. \]

Where \( a_{k_1j_1} < 0 \), the transform \( \mathbf{a}_{j_1} \rightarrow -\mathbf{a}_{j_1} \) is achieved to obtain \( a_{k_1j_1} > 0 \).

In the second step, the new sets of indices were defined (Equation 13a).
\[ J_{2} = J \setminus \{j_1\} \quad \text{and} \quad K_{2} = J \setminus \{k_1\} \]

Also, the eigenvector, \( \mathbf{a}_{j_2} \), and the \( k_2 \)-th coordinate, \( a_{k_2j_2} \), were defined with the property:
\[ (\mathbf{a}_{j_2})_{k_2} = |a_{k_2j_2}| = \max_{j,k \in k_2} |a_{jk}| > 0. \]

Where \( a_{k_2j_2} < 0 \), the transform \( \mathbf{a}_{j_2} \rightarrow -\mathbf{a}_{j_2} \) was achieved to obtain \( a_{k_2j_2} > 0 \).

This procedure was repeated to obtain in the \( r \)-th (\( r > 3 \)) step for a new set of indices (Equation 14a).
\[ J_{r} = J_{r-1} \setminus \{j_{r-1}\} \quad \text{and} \quad K_{r} = K_{r-1} \setminus \{k_{r-1}\} \]

Also, the eigenvector, \( \mathbf{a}_{j_r} \), and the \( k_r \)-th coordinate, \( a_{k_rj_r} \), were defined with the property:
\[ (\mathbf{a}_{j_r})_{k_r} = |a_{k_rj_r}| = \max_{j,k \in k_r} |a_{jk}| > 0. \]

Where \( a_{k_rj_r} < 0 \), the transform \( \mathbf{a}_{j_r} \rightarrow -\mathbf{a}_{j_r} \) was achieved to obtain \( a_{k_rj_r} < 0 \).

Next, the eigenvectors were permuted to obtain Equation 15.
\[ j_1 = 1, j_2 = 2, \ldots, j_s = s. \]

At this point the transformation matrix \( A \) and its inverse \( B \) was unambiguous.

The new score \( \xi^{j/k}_k \) of the \( k \)-th participant gained in the \( j \)-th task was calculated (Equation 16).
\[ \xi^{j/k}_k = \sum_{r \in j} a_{jr}x^r_k \]

The full score, \( \Xi_k \), for the \( k \)-th participant was formed from Equation 17.
\[ \Xi_k = \sum_{j \in j} \xi^{j/k}_k \]
Notably, the probability vectors, $\xi^j$, were scalable in the following meaning: the new probability vectors, as defined by Equation 18, had also diagonal covariant matrix, $\text{cov}(\xi^j, \xi^k)$ and where the $\xi^j$-s represented independent probability variables, $\xi^j$-s, represented independent probability variables too.

\begin{equation}
\xi^j = c_j \xi^j
\end{equation}

This scaling property was critical in the forming the new scoring schemes. A given scoring scheme can motivate participants (or students) by lowering the maximal value of the scoring in tasks, which were excessively difficult for the participant. Another scoring scheme could emphasize the participants with the highest competency.

The above-described tool was tested successfully on participants of PhO in 2016, and the rescaling of $\xi^k$ was defined as follows:

\begin{equation}
\xi^k = \frac{10}{S(\xi)} \xi^k
\end{equation}

In this equation, $10/S(\xi)$ was a scaling factor with 10 the maximum original score for complete and accurate solving of a physics problem. The appropriate choice of the value, $S(\xi)$, guaranteed the same maximum of 10 for the modified assessment score, calculated by using $\xi$-s, (i.e., $\sum_k \xi^k_{\text{max}} = 10$).

The influence of modifying the overall ranking of PhO participants was analyzed by calculating the differences between the original and the modified scores ($\Delta P$) and rankings of the PhO participants ($\Delta R$). Linear correlations between random variables $X^1$ and $X^k$ were identified from the values of the covariance matrix in Equation 1. The described modification procedure was applied to obtain independent random variables (modified scores of PhO participants).

The effects of modification on results of particular PhO participants showed differences in scores ($\Delta P$) and ranking (order) ($\Delta R$). Figure 1 shows the maximum differences in scores corresponding to maximum differences in ranking and the frequency of modified cases with non-zero differences in scores $f_{1P}(\Delta P)$ or ranking $f_{1P}(\Delta R)$ per one participant.

The effects of modification on results of particular PhO participants were analyzed to observe:

- differences in scores $\Delta P$ and ranking (order) $\Delta R$;
- whether the maximum differences in scores correspond to maximum differences in ranking;
- frequency of modified cases with non-zero differences in scores $f_{1P}(\Delta P)$ or ranking $f_{1P}(\Delta R)$ per one participant.

**Results and Discussion**

Quantitative results of characteristics of the analysis for four physics problems solved in D and E categories are presented in Figure 1 and Figure 2, and in more detail, can be found in Hanáková and Teleki (2017). The PhO participants were ranked according to their original overall scores, with a score of one denoting the best.

![Figure 1: Effect of modification on ranking of Physics Olympiad participants after solving one particular physics problem in D category](source: Authors)
The maximum difference in D category in scores is $\Delta P = +3$, and the maximum difference in ranking, as shown in Figure 1, is $\Delta R = -8$. The PhO participant’s position in ranking changed from 9th to 17th place, where the negative number indicates the result of the PhO participant was worse after modification of the scores. The frequencies characterized above have the values $f_{1P}(\Delta P \geq 0) = 2.1$; $f_{1P}(\Delta R \geq 0) = 0.6$.

The maximum difference in scores in E category is $\Delta P = +3$, and the maximum difference in ranking (Figure 2) is $\Delta R = +20$ (which indicates an improvement for the PhO participant after modification of scores). The frequencies characterized above have the values $f_{1P}(\Delta P \geq 0) = 2.8$; $f_{1P}(\Delta R \geq 0) = 1.7$. Non-zero differences in ranking were observed for each physics problem.

These results show that in observed cases a higher frequency of differences in the scores $f_{1P}(\Delta P \geq 0)$ resulted in a higher frequency of differences in the ranking $f_{1P}(\Delta R \geq 0)$.

The modified overall scores of the PhO participants in D and E categories increased when compared with the original scores, in all cases (Figure 3). We assume that this could be explained by non-zero linear correlations between original scores (random variables).

**Conclusion**

The performance of the PhO participants was quantified and then compared according to the scoring scheme applied for assessing their written solutions to the physics problems. The main objective of this article was to underline the need for improving the scoring scheme and to present and describe a
A statistical tool that could provide a more objective assessment of participant solutions to the physics problems. We found non-zero linear correlations between the probability vectors $\mathbf{X}^j$ and $\mathbf{X}^k$ that were determined using a covariance matrix. This result was considered relevant towards proposing a modification of the scores to provide independent random variables. The study identified certain cases of original scores changing after modification in the range of $-0.4$ to $3.0$ points for individual physics problems. The ranking of the PhO participants also changed after modification in the range of $-12$ to $+20$ places for particular physics problems. As the modification by way of the proposed tool was focused on the results of PhO participants, the context of the modified random variables remains a matter for future research. This paper describes, in detail, a proposed statistical tool as a basis for developing a suitable method of modifying scores as well as analyzing over- or underrating of performance in solving physics problems. Finally, because of its universality, this tool can be applied not only to the Physics Olympiad but also to other cases where solutions to physics problems are assessed.

A QUARTER CENTURY OF NATO-RUSSIA RELATIONS

Raluca Iulia Iulian

Abstract: After the end of the Cold War, in the new international context, two important actors emerged on the international scene, namely NATO and the Russian Federation. The cooperation between them was a necessity to ensure and strengthen a climate of security and peace in Europe and all over the world. In the new challenges of the security environment, NATO was turned from a purely defensive military alliance for Europe into a political and military alliance that can act wherever needed around the globe. The Russian Federation, the successor of the former USSR and inheritor of its military arsenal, has initiated a transition process towards democracy and market economy. Russia has acted permanently to establish a special relationship with the Alliance, different from that with the other Central and Eastern European countries. The relations NATO-Russia followed a continuous development from 1991 to 2008, with periods of crisis, but hopes of establishing a productive partnership. Then, they went into decline, and in April 2014 they were suspended. The Alliance and Russia have different views on European and global security issues. After 25 years of NATO-Russia relations, this paper aims to point out the main aspects of the stages from 1991 until now and analyze the reasons why the collaboration is not yet productive and cooperative, as shown by recent events.

Keywords: European security and stability, NATO-Russia cooperation, institutional structures.

Introduction

The political events that took place during the period 1989-1991 have led to profound political changes in Europe, which have radically improved the security environment with consequences at European and global level. The Berlin Wall fell on 9 November 1989 and Germany has been united. On March 3, 1991, the Warsaw Pact ceased to exist and was formally dissolved at the Prague meeting on July 1, 1991. On June 28, 1991, the Council for Mutual Economic Assistance was dissolved too. During 1989 the communist regimes collapsed in Central and Eastern Europe. Moscow's former satellite states have initiated profound economic, political and social transformations. On December 26, 1991, the dissolution of the USSR (Union of Soviet Socialist Republics) took place. Its former satellites have fully regained their sovereignty. Fifteen ex-Soviet republics appeared, along which the largest, which was the Russian Federation or Russia. They had undergone a radical change.

26 years ago, the heads of states of the two Cold War superpowers – the Soviet Union and the United States – Mikhail Gorbachev and Donald Regan, expressed the bilateral willingness of cooperation in the new international context. During the London Summit of 15-16 July 1991, the two heads of states declared their intention to establish a Soviet-American partnership that represents the end of the Cold War. The basis of this partnership was the Soviet-American cooperation during the war in the Middle East (1990-1991).

After the breakup of the Soviet Union, the cooperation between NATO (North Atlantic Treaty Organization) and Russia began. The collaboration between them knew several stages, and different forms of collaboration were created. In time a special relationship had been realized between NATO and Russia. It has experienced periods of development and periods of crisis.

After 25 years of NATO-Russia relations, this paper aims to point out the main aspects of the stages from 1991 until now and analyze the reasons why the collaboration is not yet productive and cooperative, as shown by recent events.

Perceived as a paradox because the confrontation between the United States and the Soviet Union defined the Cold War period, the cooperation between NATO and Russia – the opponents in the Cold War – occupies a predominant place in the evolution of the security environment since 1991 to date. The collapse of the Soviet bloc and the dismantling of the USSR constituted the most influential events of contemporary history. At that moment, the two important actors in International Politics emerged: NATO and Russia. In the framework of the Alliance, the United States carries the weight and possess the important nuclear potential. The Russian Federation is the political and military heir of the former USSR, owning of the nuclear arsenal of the Soviet Union.

NATO after the Cold War

In the international context of the post-Cold War period, the Alliance initiated a transformation process to adapt to the Europe's new security situation. At the Summit meeting in London (5-6 July 1990) the heads of states and governments of NATO members decided to adopt the Alliance to the new international situation. For this purpose, a New Strategic Concept has been elaborated to respond to the new risks and challenges. It was adopted at the NATO Summit held in Rome on 7-8 November 1991. Unlike previous concepts, the New Strategic Concept emphasized the cooperation with former adversaries instead of confrontation but added the specific obligation to work towards extending and strengthening security throughout Europe. The New Strategic Concept was based on the principles of cooperation and multidimensional security. The enlargement of the Alliance by the integration of the former communist countries became a priority after 1991 for increasing the area of stability, security, and democracy in Europe. The U.S.A. and its Western Allies expressed the desire to transform NATO into a strategic alliance covering the whole Europe (The Alliance's New Strategic Concept, 1991). During the history, Europe has been confronted with many wars. The goal was to ensure security and stability in the Euro-Atlantic area and beyond.

The area of intervention of the Alliance was extended outside Europe, anywhere in the world where action is needed. Because the threats came not only from Europe but had a global character, it was necessary to restructure NATO and transform it from a military alliance into a political and military alliance, reflecting a new balance between Europe and North America. After the end of the Cold War, the main security threats were the proliferation of weapons of mass destruction, terrorism and organized crime. These new threats are complex and have two dimensions: civil and military. The Alliance had to adapt its policies and institutions in order to meet the new threats of the contemporary world. In these conditions, NATO has been restructured, thus it diversified its attributions, multiplied and diversified its functions. It has emerged as a stronger security and defense organization.

The Strategic Concept adopted at the NATO Summit in Lisbon on 10-20 November 2010 provides the main lines of action of the Alliance for the next decade. The summit was dominated by two major events: the military operations in Afghanistan and a new approach to the relations between the Alliance and Russia. For the first time, an official document of the Alliance stated that Russia is not an enemy and that NATO is a partner for stability and security and a common space of security and stability should be created in which Russia should participate. Regarding the relations between Alliance and Russia, NATO Secretary General Anders Fogh Rasmussen expressed his desire to see progress in cooperation in three directions, which he considers essential to build confidence between allies and Russia: missile defense, conventional arms control and reducing of short range nuclear weapons (Lisbon Summit Declaration, 2010, para. 23).

Nowadays, NATO has to respond to the new challenges enumerated above, but also to the „increasing confidence of Russia in its forces, the country that does not hesitate to use the force to defend their interests against its neighbors”, as affirmed the chief of Czech diplomacy, Karel Schwarzenberg, 10 years after the admission of the Czech Republic to NATO (as cited in Mihăescu, 2009).

Russia after the breakup of the USSR

The Russian Federation, internationally recognized as the successor state of the Soviet Union, heir to its military arsenal, after 1991 experienced a decline in its regional and global influence. In internal politics, it experienced the transition from imperial status to post-imperial status. The Soviet Union was a superpower, one of the two superpowers during the Cold War. After 1991 Russia represented a powerful country, with an important nuclear military potential. Russia kept the atomic arsenal of the former USSR completely and continued the position of the Soviet Union as a nuclear power in the world, with a capacity comparable to that of the U.S.A. In the first years after 1991 it was considered a secondary power pole.

After the end of the Cold War, Russia experienced a period of political and economic transition from centralized economy to market economy, from totalitarianism to democracy. From the economic point of view, some effects of the Cold War led to a stagnant Russian economy and unemployment. During and after the disintegration of the Soviet Union, wide-ranging reforms including privatization and market and trade liberalization were undertaken, including the radical changes along the lines of „shock therapy” recommended by the World Bank and the International Monetary Fund. The result
was a major economic crisis, characterized by a 50% decline in both Gross Domestic Product (GDP) and industrial output between 1990 and 1995 (Glenn, 1996).

The territory of Russian Federation is about 17,000 km² out of 23,000 km² which represent the territory of the former USSR. It remained, however, “a geographical superpower, stretching across 11 time zones, from the southern Baltic coast to the Bering Strait (…) essential to the international system by virtue of its unique geographic position in Eurasia” (Trenin, 2002, pp. 20 and 29). Although it experienced a territorial decrease, Russia is the largest country in the world. In terms of its population, it is currently only the ninth country in the world. At the census of December 2010, Russia's population was 142,905,200 inhabitants (Terzi, 2011). As Trenin notes „Today’s Russia encompasses just about 50 percent of the Soviet population, 60 percent of its industrial capacity, and 70 percent of the land mass. The latter is of key importance” (Trenin, 2002, p.12).

Although Russia cannot be confused with the USSR in size, population and especially as the military and political power, most of its leaders, regardless the political party to which they belonged, did not accept that Russia is a secondary and limited regional power and continued to believe in its great power status. In all administrations of Presidents Yeltsin and Putin „efforts have been made to develop what may be called multi-directional influence: that is, to balance relations with the U.S.A. and Western European states by fostering strategic partnerships” (Smith, 2006, p. 39). Consequently, Russia experienced a consolidation process gradually after 2000, especially in the first decade of the 21st century. This decade represents an important stage in Russian history because it regained the status of great power in Europe and all over the world. From this moment Russia began to reaffirm in international relations, in world politics. These circumstances have led to the shaping of a special relationship of cooperation between Russia and the NATO.

President Putin expressed the intention that Russia reaches the international status of the ex-USSR and maintains control of the former republics of the Soviet Union. Since the collapse of the USSR, Russia continued to pay special attention to the territories that were part of the Soviet Union. The Russian doctrine is founded on the term near abroad (Russian: ближнее зарубежье, blizhneye zarubezhye).

In the National Security Strategy of Russia, NATO is still perceived as an opponent. According to the document approved by the Kremlin in 2009, the NATO expansion is seen as a threat to the Russian national security. It reaffirms Russia's right to use nuclear weapons if the state is threatened. Russia's new military doctrine shows that the expansion of NATO into Eastern Europe is the „main external threat that could lead to an armed confrontation” (Russia's National Security Strategy, 2009).

NATO-Russia cooperation forms

The first step in the evolution of NATO-Russia relations is represented by the “Message from Turnberry” (Scotland), initiated by the governments of NATO members in June 1990. In July 1990 at the NATO Summit in London, offers of friendship and cooperation have been made to the Soviet Union and other countries in Central and Eastern Europe. For this purpose, the contacts with the governments, leaders, and representatives of the Soviet Union and of the ex-communist countries who were invited to NATO Headquarters in Brussels have been established. The bilateral relations have been developed between Moscow and Brussels. NATO Secretary General visited Moscow immediately after the London Summit to „transmit to the Soviet leadership the proposals contained in the Declaration and the decision of the Alliance to constructively use the emergence of new political opportunities” (NATO Handbook, 2001, p.38). An important step was the announcement made by President Gorbachev in July 1990, concerning the acceptance of the inclusion of the East Germany in the Alliance, after the unification.

In 19–21 November 1990 in Paris was adopted the Charter of Paris for a New Europe (Paris Charter) by European governments in addition to those of Canada, the United States, and the Soviet Union. The charter is a common non-aggression commitment, established on the foundation of the Helsinki Accords, and further amended in the 1999 Charter for European Security. Together, these documents form the agreed basis for the Organization for Security and Cooperation in Europe (OSCE).

After the dissolution of the USSR, NATO and Russia begun to develop relations which evolved and were institutionalized in time. NATO took the initiative to get closer to Russia and the states of Central and Eastern Europe, former members of the communist bloc and former NATO adversaries. In the conditions of the transformation of NATO into a political and military organization and redefining
the role of NATO in post-Cold War era, Russia was looking to establish a special relationship with the Alliance, different from that of the other Central and Eastern Europe countries. The special relationship was justified by its economic and military weight and by its nuclear potential.

Since 1991 until now, several forms of collaboration have been established between the Alliance and the Russian Federation. They have gradually increased in complexity: North Atlantic Cooperation Council (NACC) was created on December 20, 1991 renamed Euro-Atlantic Partnership Council (EAPC), in 1997, Partnership for Peace (PiP) created in 1994 and perfected as a Partnership for Peace Intensified and More Operational in 1999, in which Russia has an equal position like the ex-communist countries of Central and Eastern Europe. By the Founding Act on Relations, Cooperation and Mutual Security between NATO and Russian Federation signed on May 27, 1997, the Permanent Joint Council (PJC) was created. It marks the beginning of the NATO-Russia special relations. It was replaced by NATO-Russia Council (NRC) on May 28, 2002.

The creation of NRC represented the realization of a new stage in the relations between the Alliance and Russia. This represents the highly evolved form of cooperation between NATO and Russia until this moment. In this structure, Russia has an equal position to other members and shares the same responsibilities (Danilov, 2013). However, Russia does not have the veto right concerning the decisions of the Alliance, although constantly it acted to get it. The NRC did not bring anything new regarding the security relations between NATO and Russia. The article 5 of the Washington Treaty was not mentioned in the founding documents of the NRC. Relations with NATO remained controversial and inconsistent. They present problems and large differences of opinion. Although there were achievements in the framework of the NRC, there is no „full transparency” between NATO and Russia (Ivanov, 2005).

Favorable proposals toward Russia conditioned the realization of NATO-Russia collaboration institutions. The PiP was signed after long-term negotiations and after concessions made to Russia (the agreement “no vetoes, no surprises”). The Founding Act (the creation of PJC) was signed in May 1997 before the NATO Summit in Madrid (July 1997). NRC was created in May 2002, after September 11 attacks, during the period of collaboration against terrorism between Russia and U.S.A.

**Assessment of the cooperations forms**

The relations NATO-Russia from 1991 until this moment went through several stages. During the period 1991-1993 there were consensual relations between NATO and Russia. The international events influenced the relations between them by approaching the two international actors. In the history of NATO-Russia relations, one important issue is the collaboration between them in the fight against terrorism after September 11. Other international events have disrupted the NATO-Russia relations and generated crisis.

The periods of crises usually were determined by NATO’s actions that Russia did not agree with or Russia’s actions that NATO did not agree with. Thus, the crisis in 1994 was caused by the decision of NATO to start the military intervention in Bosnia without consulting Moscow. In response, Russia postponed the conclusion of the adhesion document to the Partnership for Peace. In 1999, the crisis was determined by the NATO decision of March 24, 1999, to start the bombing of Yugoslavia (Kosovo) which was strongly disapproved by Russia. Another crisis between NATO and Russia was caused by the second NATO enlargement concerning the admission of the Baltic States (2004), countries that Russia considers to belong to its near abroad. Generally each NATO Enlargement toward East generated tensions in NRC. The Alliance included all the ex-Warsaw Pact members and three former Soviet republics, the Baltic countries. Russia had constantly manifested opposition against NATO Enlargement and perceived it as a threat to its national security. According to the Russia Security Strategy „the post-Soviet geographic area should be recognized as Russia’s exclusive sphere of influence” (Margarete Klein, 2014). Gordon Hendrickson, attaché of the US Embassy in Moscow, expressed his conviction that „Russia cannot content to look at the NATO expansion Eastward without taking attitude” (Hendrickson, 2006).

The Russia’s attitude depended on its economic and political development. In the first years after the breakup of the USSR Russia was weak compared to the Soviet Union. The period 2000-2008 represents the economic and political upswing of Russia as a result of the economic and political reforms proposed and put in action during Putin mandates.
Regarding the West, during the first years of collaboration, the Allies presumed that Russia is a country in crisis after the breakup of the Soviet Union. Consequently, they took important decisions without taking into account Russia’s opinion: the military intervention in Bosnia, the NATO bombing of Yugoslavia (Kosovo). These actions sparked discontent of Russia and perturbed their relations. Moscow perceived the establishment of the missile defense shields in its proximity as a violation of agreements made in 1997. According to these agreements, there were not supposed to be important military bases on the territory of the new member states, in the proximity of Russia.

Since 1991 the West has been divided. After the end of the Cold War, the divergences between NATO members became deeper. Therefore, concerning the enlargement process, in time, different positions appeared. The Summit in Madrid (8-9 July 1997) was consensual; there were no divergences between NATO members. At the Prague Summit (21–22 November 2002) there were some hesitations of Germany concerning the admission of the Baltic States. At the Bucharest Summit (2-4 April 2008) the European NATO members were divided for economic reasons and presented opposing points of view concerning the adhesion of Georgia and Ukraine. The division of European NATO members influenced the relations between the Alliance and Russia and gave Russia the possibility of imposing in international politics.

The Russo-Georgian war (August 2008) represented an important moment in NATO-Russia relations. In March 2008, after the unilateral declaration of independence of Kosovo, Putin said that its recognition “undoubtedly fired up separatism and presents a very dangerous precedent” (Putin: Recognition of Kosovo, 2008). This was used as a justification for military actions in 2008 and 2014. The Russia’s actions: the Russo-Georgian war (2008), the annexation of Crimea and the conflict in Eastern Ukraine (2014), which followed after the secession of the provinces Donetsk and Luhansk determined opposition of NATO and the international community. The Ukraine conflict generated the strongest crisis in NATO-Russia relations until now.

Compared to the previous crises which were brief and did not lead to the total interruption of the relations, this crisis led to the interruption of the NRC activity on April 1, 2014, and created suspicion between the two partners. Three NRC meetings took place in 2016, but they did not bring anything new. The NRC did not begin the activity yet. Russia and NATO kept only the diplomatic and military contacts.

**Conclusion**

The NATO-Russia relations presented a predictable evolution after the creation of PJC and NRC. Each attempt to get closer to one another was ended with crises followed by a cooling-freezing period, then another period of improvement, then another crisis. The NATO-Russia relationship has not been consolidated and strengthened in time although there were initial prerequisites for this.

NATO and Russia have different views on European and global security issues. After the Cold War, the Alliance initiated an Enlargement to the East for extending democracy, security, and stability in Europe. Russia has perceived the enlargement of NATO as a threat to its national security. It considers that the OSCE has to be the main entity in charge of European security and that NATO should be subordinated to OSCE. Russia considers that it deserves to have the veto right concerning the Alliance’s decisions. NATO could not accept this because it contravenes the basic principles of the Founding Act. In these conditions, Russia believes that the West did not behave as expected.

Taking into account the fact that NATO and Russia were rivals during the Cold War, approximately a half of century, the creation and institutionalization of relations between them represent important accomplishments for the European and global security and stability. This represents an inedited collaboration between the most powerful military alliance that existed during history and the largest country in the world. Despite the different perceptions and misunderstandings, the beginning of the collaboration between the two rivals of the Cold War represents an important achievement for the European security and stability. The forms of collaborations that have been created can evaluate in time and develop a framework for global peace and prosperity.

MAPPING AND RANGING OF CULTURAL AND CREATIVE INDUSTRIES IN THE CITY OF PLOVDIV

Vesela Kazashka,¹ Margarita Ruseva,² Paulina Stoyanova³

Abstract: This paper reflects the goals and objectives of the fundamental scientific research project “Young Scientists 2016” at the Scientific Research Fund of the Bulgarian Ministry of Education and Science. The aim of this research is to analyze and map the cultural industries in Plovdiv. The intention is the resources of cultural industries to be researched using empirical data and then based on this research to be ranged and mapped. Furthermore, the research team is looking for a new model and tool-set for appraisal of the cultural industries. The methods employed are based on success indicators borrowed from economics and statistics.

UDC Classification: 7.1/06; DOI: http://dx.doi.org/10.12955/cbup.v5.999

Keywords: cultural and creative industries; mapping, ranging, Plovdiv

Introduction

Cultural industries are a reflection of science, education, culture and the personal development of man and the nation. They exhibit historical, cultural, spiritual and religious processes in the community. Cultural industries are an actual sector of economy.

In the last 25 years Bulgaria has undergone a transition from a closed to a market economy. This fact has also influenced the development of the cultural industries in the country. An exchange of cultural and creative resources has been made possible. The representation of cultural industries has been changed, too. Following the accession of Bulgaria to EU, a trend towards stimulating our cultural and creative identity has been noted. The national culture of the EU member states is not only a local national priority of each country, but also of the EU, as seen in the European strategic documents (Barkalova, Kazashka, 2010).

Scoping analyze – target arts

The new opportunities have led to the elaboration and supply of many programs, politics and strategies relating to cultural industries.

Prof. Prodanov (2005) distinguishes four major community functions of culture: The first function is the unifying of the separate individuals into forming a common identity. The second function of culture is forming social capital and trust which facilitates the voluntary gathering of individuals in pursuit of common goals. The third function is legitimation of the authority structures. The fourth function of culture is rendering existential meaning for human life through creating a common horizon of existential acts in large groups of individuals. By means of these functions humans discover the unifying cultural identity that rationalizes their behavior both within and beyond their being. (Prodanov, 2005).

Plovdiv is the second largest city of Bulgaria, next to the capital city, and it is the oldest living city in Europe. It is situated on the banks of the Maritsa river, with green hills in its heart. It has been known, since ancient times, as the “The City of the Seven Hills,” which defines part of its identity. Since the time of its founding in 6 000 BC, it has been continuously inhabited, being a cultural and commercial center. The antique beauty of Plovdiv, its strategic location and the whole year-round cultural events determine it as a place of constant encounters of cultures and civilizations. Plovdiv is a combination of heritage and prospects. It is the heir of many civilizations and their culture, a mixture of unique resources, traditions and ancient and contemporary art.

There are five main rules that govern the urban economy. These are rules that economic entities should comprehend, accept and apply in their actions. They determine the functioning and development of five markets: (1) the commodities and services market; (2) the labor market; (3) the proprietary investments market; (4) the land market; (5) the urban economy public benefits market. From this

¹ Academy of Music, Dance and Fine Arts, cpo@artacademyplovdiv.com
² Plovdiv’s University “Paisyi Hilendarsky”, ruseva_margarita@mail.bg
³ Plovdiv’s University “Paisyi Hilendarsky”, paulina_stoyanova@abv.bg
perspective, the general urban economic development is a function of their dynamics (Urban Research, 2012). The development of cultural industries in urban centers is related to the development of the city itself, the market principles, the labor market, and the proprietary investments.

The resources that make Plovdiv a major cultural center and are a prerequisite for its being a European Capital of Culture in 2019 are as follows:

- Geographic facts – geographic location, landscape, climate, waters, eco-sphere, biosphere;
- Historical and cultural heritage – arts and architecture, living culture and intangible cultural heritage: folklore, crafts, traditions, cultural events;
- Population and personalities (contemporary and historical), inhabitants, cultural diversity;
- Infrastructure – transport infrastructure, tourist destination, halls, facilities, communications, services, banking, hospitality business;
- Economy – existence and implementation of projects, investments, cultural development strategies.

Prof. Ivan Chalakov (2006) has found that cultural industries in Plovdiv represent 10% of the functioning economic entities and account for about 4% of the net profit. Culture industries provide employment to 1 of 20 inhabitants. The employers are mainly micro-companies not exceeding 10 employees and sales volume of Euro 50,000. (Chalakov, 2006).

Studies prove that cultural industries are a dynamic sector with significant effect over the economy of Europe and Bulgaria, and in this particular case – the city of Plovdiv. This effect is a key mechanism and it is generated by the individual need of the cultural industries. The impact of the operations of cultural industries is multidimensional and encompasses:

1) Economic effects demonstrated by employment among the population, making profit, promotion of innovation, and introduction of new technology;
2) Social effects, the result of which is the encouragement of creativity;
3) Cultural effects seen in fostering the cultural diversity, preserving the cultural and national identity, the satisfaction of those engaged in cultural industries.

The sources of funding for cultural industries are various, but, the major part is that of the government. On one side is the regulatory system conforming with the European legislation, and strictly abiding with national cultural traits, and on the other side the government appears as a source of funding through budget subsidies or guarantees on European programs.

Based on specific statistical and economic indicators, the major task of the research team is to conduct an inquiry among those engaged in cultural industries. The result presupposes the possibility of mapping the cultural industries in Plovdiv. This approach would allow for expanding the knowledge and potential of the cultural industries, appraisal, and for the selection of appropriate business models for administration and financing of art organizations.

Mapping would benefit the local government too - in establishing and implementing policies grounded on scientific proof, which includes the funding of cultural industries nationally or locally. Mapping is also useful for strengthening the relationship of culture and business in promoting contacts, visions, programs and development strategies.

This research is being funded by the Scientific Research Fund of the Ministry of Education and the theme of the project is “Art Management: Plovdiv – Modern Trends and Classical Artistry.” By mapping the cultural industries in Plovdiv, their cross section shall be clearly outlined for this city. Applying the market principle, ranging of the cultural industries shall be done. For the mapping and ranging it is not possible to use directly the existing statistical data in the classifiers of businesses without conducting additional research of the registered companies. Therefore, for attaining the research objectives an inquiry shall be used instead.

What is interesting for this research is the progress of economic and market trends in view of assessing the opportunities for utilization of particular investments. The scheduled inquiry shall have a qualitative aspect, too, employing groups of not more than 100 people, in-depth interviews based on a questionnaire.

For conducting the research a systematic approach is selected. The object of the research shall be studied as a whole (the cultural industries of Plovdiv), while composed of separate components. The
required data shall be recorded directly by the managers of the entities engaged in cultural industries. The respondents (legal entities represented by their managers) should meet the following three criteria:

First criterion: companies registered in the city of Plovdiv;
Second criterion: doing creative works or being part of the cultural industry;
Third criterion: performing operations relating to or subject to copyright.

The results shall be analyzed and presented before students, professors, politicians and institutions that could utilize this information in their studies, teachings or businesses connected with art and culture.

The methodology for appropriate mapping is characterized with the following specifics:

- Data is comparable, since this indicator allows for more precise and more detailed measuring on the enterprise level in the sphere of cultural industries;
- This methodology takes into account the market principles of development in the cultural industries of Plovdiv;
- This methodology employs standard statistical indicators approved by the National Statistical Institute of Bulgaria and the European Statistic Office “Eurostat” for 2016.

Based on data received from National statistical institute a scoping analysis of the cultural industries registered in Plovdiv was conducted. The total number of companies registered (2016) was 272, they are differentiated by economic activity as shown in Table 1.

Based on the statistical data a scoping analysis was conducted and a special framework has been developed for segmenting the cultural industries in Plovdiv into several sub-sectors depending on the type of the artistic sphere in it. The following sectors are distinguished:

- Cultural industries in the sector of stage arts (opera, theatre, music, dance) of wide publicity and strong social effect;
- Cultural industries in the sector of contemporary visual arts (video, photography, cinema, design, etc.), exhibitions, installations, etc. forms of presenting contemporary art;
- Cultural industries related to cultural historical heritage;
- Cultural industries, inter-relating art, culture, education and modern technology, inter-cultural dialogue, partnering, mobility and European cultural cooperation (workshops, debates, forums, events);
- Cultural industries relating to cultural press, scientific research, documentary editions, collections, analyses and studies;
- Cultural industries for development of alternative space of culture and alternative art forms.

The Scoping analysis is the first step of the fundamental project research. The next stages include developing questionnaire, inquiring focus groups, analyzing data and mapping of cultural industries in Plovdiv.
The inquiry shall be held using a questionnaire with the aim of collecting data on the particular organization, address, the sphere of business, proprietorship of the cultural industry, the size, the funding, the turnover, the wages and the number of employees. The empirical research will be conducted in November 2017.

The planned deadline for concluding the research and completing the project is November 2018.

**Conclusion**

Cultural and creative industries are a strongly innovative component, possessing significant potential for forming capital and the opening of new jobs through generating and utilizing intellectual property. The development of cultural and creative industries and the setting up of partnering networks in this field is a contemporary and vital objective of the modern social and cultural space. One of the most important perspectives of the regional development is the search for opportunities for realisation of creative potentials and for the establishment of innovative business models which contribute to the cultural projects.

MODERN MODELS AND APPROACHES FOR DESIGN OF ARCHITECTURE OF A SOFTWARE APPLICATION FOR MONITORING AND QUALITY ASSESSMENT IN HIGHER EDUCATION

Kristina Kilova,¹ Vanya Lazarova,² Tanya Kitova,³ Desislava Bakova,⁴Angelina Kirkova-Bogdanova⁵

Abstract: Processes such as economic and cultural globalization put forward the issue on the quality of education. The increasing interconnectivity between economy and different societal spheres, driven by the accelerated development of information technology and the free movement of capital, increasingly links the prosperity of a country and its individuals to knowledge and technology, to the ability to learn and understand experience. In this context, it is of paramount importance to set national educational goals and to shape relevant policies.

Constructive student feedback, establishment of systems of continuous control, and implementation of changes based on a scientific conceptual framework will help the education to move from quality assurance to quality improvement. The quality of education is a responsibility of all participants – lecturers, students, institution management. Automating the feedback process with students will lead to a faster analysis of the results, making adequate management decisions in order to achieve the ultimate goal – improving the quality of higher education.

In the present paper the need for regularly providing students with the opportunity actively to participate in the management of quality of education is justified. The paper deals with the automation of collection, analysis of the needed information and consequent adequate management decisions. A conceptual model of “Web-based information system for quality assessment of the education” in higher schools with a focus on the survey and its design are also presented.

UDC Classification: 378; DOI: http://dx.doi.org/10.12955/cbup.v5.i1000

Keywords: quality assessment, higher education, conceptual model, information system

Introduction

Quality and its assessment are essential for the modern management of education. It is included in the mission, goals, and tasks of every higher school detailing in the collection, analysis of the needed information and consequent adequate management decisions (Peeva, 2010).

The paper deals with the automation of these processes, including the analysis of the requirements for the development of a model of a “Web-based information system for quality assessment of education” (Web-SAQE) and its design. In the focus of the statement, we present modern models and approaches for a design of the architecture of the software application for monitoring and quality assessment in higher education. Functional and non-functional requirements and restrictions for the system are defined. The Automated Feedback Generator, for example, is an automated feedback software system, designed to provide superior quality assurance and efficiency in both assessing student assignments and providing feedback (Debuse et al., 2007). Testing has demonstrated that it offers quality control, efficiency, and effectiveness while generating consistent feedback from the student’s perspective (Hadzhikoleva et al., 2010).

This paper presents the results of a study examining the major contemporary models and approaches for designing architecture of a software application and its construction. It provides a rationale for selected technology solutions for such a design and construction.

Literature Review

An analysis of the requirements for developing a model of the Web-Based System for Assessing the Quality of Education (Web-SAQE) revealed the following.

¹ Medical University - Plovdiv, Bulgaria, Faculty of Public Health, Dept. "Medical Informatics, Biostatistics and E-learning", k_kilova@abv.bg
² Plovdiv University "Paisii Hilendarski", Bulgaria, vanya@liveauthentic.net
³ Medical University - Plovdiv, Bulgaria, Medical Faculty, Dept. "Anatomy, Histology and Embryology", tanyakitova@yahoo.com
⁴ Medical University - Plovdiv, Bulgaria, Faculty of Public Health, Dept. "Healthcare Management", desislavabakova@abv.bg
⁵ Medical University - Plovdiv, Bulgaria, Faculty of Public Health, Dept. "Medical Informatics, Biostatistics and E-learning", akirkova@meduniversity-plovdiv.bg
Non-functional requirements, called quality requirements, are crucial in building a software system (Bontchev, 2012). The most significant of these are:

- Reliability, to fulfill the defined functionalities under certain conditions for a specified period;
- Multiple uses, the system modules must be reusable and unexpected, or invalid environmental conditions must be tolerated;
- Interoperability, the system must ensure compatibility with other products. It also must comply with established standards and norms for presenting information and technological realization (national and international);
- Scalability, the ability to add new functionalities without the need for major changes in the architecture;
- Sustainability, the designed software system must be resistant to damage;
- Easy maintenance, the system must be designed in a way that it requires easy maintenance;
- Modularity, the individual modules must be tested in isolation before being integrated into the overall system. They have to perform low connectivity and high consistency;
- Easy usability, the system must provide an interface which is easy to understand and use;
- Privacy and data security;
- Internet access including mobility; and
- Simultaneous access by multiple users.

The main restrictions are related to the data processing system, the realization of communication, consistency with copyright law, consistency with legal requirements for exchange of personal data, and access through the Internet (Lazarova, 2015; Doneva et al., 2011).

Thus, the defined requirements for a modern information system show a necessity for designing a Web-SAQE as an information system that provides quality management with the necessary level of customization. Hence, it requires a study of the following components:

- Environment; and
- Users (subjects).

The environment is the main component that contains services for assessing the quality of education, access to surveys, and control of user access to different functionalities of the system. It is represented by a technological platform that provides all necessary elements, technologies for synchronous and asynchronous communication, user management, content management, evaluation and monitoring, and web services.

Data and Methodology

For analyzing the requirements, a classification was created in which the functional requirements were placed into several groups, and quality requirements and restrictions to the system were identified. Target groups and their responsibilities and needs were classified.

The study examined the sites of national and international universities consistent with the educational policies and strategies for the development of higher education. This was prompted by a survey conducted in September 2016 that showed a positive attitude of students toward registration in a Web-SAQE and in completing online feedback surveys as part of the quality management in the Medical University of Plovdiv (Kilova & Stoyanova, 2016). As a result, this study defined functional requirements for a modern information system as follows:

- Maintenance of database about students, teachers, staff, curriculum, and data for suspended students;
- Automation of actions, such as:
  - organizing and conducting surveys to assess the quality of education;
  - processing, analysis, and graphical presentation of data
- User management (roles, rights);
- Import, export data from or to various file formats; and
- Connecting with existing systems.
The users were students, postgraduate students, teachers, and staff from the Medical University of Plovdiv.

An analysis of Web-SAQE design and conditions provided a description of the functional and quality requirements of the system, taking into account the basic subjects, objects, and processes in the field of research into the quality of education. All elements of the architecture of the software application were documented.

**Results and Discussion**

As a result of the studies and systematization of sources, consistent with the functional requirements formulated for the Web-SAQE, the following service groups were differentiated:

1. Administrative assistance to the process of the survey;
2. Process management of the surveys, i.e., feedback system of the medical university as part of the Web-SAQE;
3. User management (roles and rights); and
4. Security management and access to the system.

An essential feature of these service groups was their connection with each other and with external systems. Table 1 provides additional details on the management of the feedback system of the medical university.

Source: Author

The automated actions listed in Table 1 were crucial in the design stage of the Web-SAQE. The study identified the following key management processes:

- Automating and creating surveys including defining the purpose and the respondents;
- Gathering information, including protection from unauthorized access and recurrence of responses from one person;
- Data processing, and disclosure and storage of the results; and
- Storing information about the history of voting.

An automated service of the survey process had the aim of automating the management including the administration of the following:

- Publicly available information;
- Planning the educational process; and
- Assessing and analyzing the results.

Figure 1 shows the integration of the Web-SAQE with external information systems of the Ministry of Education and Science (MES), the National Evaluation and Accreditation Agency (NEAA), and the Medical University.

Source: Author

Figure 2 shows that the functional levels of building the architecture are the web-client, web-server, application server, server database, and requests.  
Figure 3 illustrates the different elements in managing the feedback system of the medical university. These elements are subject to design and future implementation.
The module for monitoring user activity involves realization of a role model in the system for identification and authorization. Figure 4 shows the authorization process.

When the registration is successfully completed, the Web-SAQE sends an e-mail advising this. The user is able to restore their forgotten password. As well, a teacher can also act as an administrator or a manager.

Providing personalized access to a designed software system highlights the issue of protecting data of these services and restricting access to information. For creating access restrictions at a functional level, this group of services must meet the following requirements:

- The student has the right to manage their right to freedom of opinion. If it is already exercised, he or she only sees how the respondents have voted without having access to the analyzed outcomes.
- The teacher sees the percentage of the respondents who have voted at the time. He or she creates, edits and deletes the questions in the survey. If the survey is 100% completed, the teacher is able to end the form completion before the deadline.
The manager or supervisor defines the cognitive aim and the management; he or she identifies those who are responsible for the survey and sets the duration of the survey; he or she is informed about the process of conducting the survey and then of its results.

Creating restrictions at a database level are performed by
- administrator of the system;
- teacher; and
- administrator of the survey.

These requirements provide two levels of information security: functional security and data security. Functional security involves determining user access to system functions. Data security includes providing user access to the specific data.

The information system provides services for user management and access control to information. The system allows access in two ways: 1) through public (anonymous) access, and 2) through identification and authorization.

Regarding approaches in the design of software architecture, modern paradigms for designing the architecture of the software application offered by Bontchev (2012) are object-oriented design, component-oriented design, design based on a contract and context-oriented programming, and service-oriented architecture design.

The object-oriented design is based on creating classes as a container of objects. Component-based architecture and service-oriented architecture are currently at the center of the object-oriented design. The component-oriented design software introduces a new paradigm in which systems do not work from scratch, but rather involve a cluster of existing components (Berberova & Bontchev, 2009). Their construction aims to reduce the cost of the assembly through prototyping rapid-built software systems that are flexible, lightweight and easily maintained.

The design, based on a contract and context-oriented programming, requires software designers to define the interface specification of the software components precisely. A major part of this methodology is the question of how the elements cooperate with each other.

Designing the architecture of the Web-SAQE involves the component-oriented paradigm (Figure 5). This is due to the large range of complete technology solutions that currently exist.

**Figure 5: Component-based model of web-based system for assessing the quality of education (Web-SAQE)**

| ISMU: information system of the medical university |
| FSMU: feedback system of the medical university |

Source: Author
The design of the individual components is governed by two main principles in software design: poor connectivity and strong consistency. The less information exchanged between the components (i.e., components are simpler), the weaker will be the connection. The main task for consistency is for all elements inside the component to solve a common problem (Stoyanov, Stoyanova, & Doychev, 2006).

**Conclusions**

The presented model of the feedback system of the medical university as a component of the Web-SAQE complies with specific requirements for compatibility with the university information system and forms part of it. The Web-SAQE is designed to operate as an integrated Web-based system. It provides a high level of security and safety of the data (in data transmission so that they cannot be intercepted or modified) by the creation of backups, archiving, recovery, and protection. A high level of data integration is maintained by providing a repository for data and system development for updating the data, suggesting the use of an integrated and dynamic database. The Web-SAQE provides access to all pre-authorized users (students, teachers, and employees) regardless of their location. The system is compatible to work with mobile devices (smartphones, tablets, and netbooks). The architecture of the system is based on a modular principle for easy integration into various functional modules. Finally, the survey module, which is incorporated in the Web-SAQE, provides the ability to manage surveys dynamically.

Abstract: Healthcare specialists should have a sound level of computer literacy to work with medical information systems, electronic health records, telecare solutions and other modern ICT applications. A successful career in an ICT supported position as in healthcare requires proficiency in using computer technology in performing tasks. The knowledge about the level of computer literacy of our students allows two important decisions to be taken: first – the necessity of restructuring the content of the subject “Informatics” to make up for the gaps from previous education in technologies and second – the evaluation of volume and nature of electronic educational resources to be included in the training.

The aim of the present study is to assess computer literacy of health care students and to investigate the self-assessment of their computer skills.

Materials and methods: The study was conducted in the period April – December 2016 among 279 students from different health care specialties. To receive an objective grade, computer literacy was assessed by a didactic test specially designed for this purpose. The process of creation and validation of the assessment tool is discussed. Students were also asked to self-assess their computer literacy.

Results: The students demonstrated good computer literacy with no statistically significant impact of gender and age. Female students tend to underestimate their computer skills, while men have realistic self-assessment. Students become more critical with age – older students have lower self-assessment compared to their real performance.

Conclusion: The computer literacy of healthcare students is not alarmingly low, it allows them to take full advantage of e-learning. However, the course in informatics should include more activities that would allow them to upgrade their computer skills.

UDC Classification: 378; DOI: http://dx.doi.org/10.12955/cbup.v5.1001

Key words: computer literacy, assessment, healthcare, students, medical informatics

Introduction

The use of information and communication technologies in medicine and healthcare requires professional competence that includes computer skills. Healthcare specialists should have a sound level of computer literacy to work with medical information systems, electronic health records, telecare solutions and other modern ICT applications. Healthcare students are not technologically oriented since they have chosen a humanitarian profession. Their interests are focused in an area different from the technology, and we cannot expect them to master excellent digital skills. The knowledge about the level of computer literacy of our students allows two important decisions:

1. The necessity of restructuring the content of the subject “Informatics” to make up for the gaps from previous education in technologies.

2. The evaluation of volume and nature of electronic educational resources to be included in the training.

The aim of the present study is to assess the computer literacy of pre-graduate healthcare students and to investigate the self-assessment of their computer skills. The production and validation of the assessment instrument – a didactic test is described. The results are statistically processed, analyzed and conclusions are drawn.

Literature review

National League for Nursing states that computer literacy content focuses on computer basics and the use of generic software applications such as word processing, databases, presentation software, and the use of electronic communication such as email. (National League for Nursing).

Computer literacy is the foundation of information literacy – a broader concept for abilities for information search, retrieval, evaluation, usage, processing, and presentation. According to Anderson and Gantz (2013), computer related skills and especially Microsoft Office are in the top twenty skills for tomorrow’s best jobs. A successful career in an ICT supported position as in healthcare requires proficiency in using computer technology in performing tasks. As Safabakhsh et al. (2016) state, the

1 Medical University”, Faculty of Public Health, email: akirkova@meduniversity-plovdiv.bg
implementation of evidence-based practice requires nurses and nursing students to be computer literate. This statement is valid not only for nurses but all healthcare staff and students. Nevertheless, the well-understood necessity of such skills for healthcare staff, Michel-Verkerke (2010) reveals that computer literacy is not at an adequate level for all nurses. Topkaya & Kaya (2014) summarize that ICT competencies are not acquired at the undergraduate and graduate levels of nursing education.

Spenser (2012) explains that the National League for Nursing, the American Association of Colleges of Nursing and other institutions prompted initiatives to make informatics a fundamental part of nursing education. Deltsidou et al. (2010) say that there is a slow emergence of nursing informatics in nursing curricula even in developed countries. At the Medical University of Plovdiv, informatics has been included in the curricula of all healthcare specialties since 1993. Since then, the course has been regularly updated to reflect the technological advances and their implementation in healthcare, in general, and in the context of the national healthcare system. Nowadays the content focuses on two competencies:

- Information literacy and presentation skills;
- Understanding of ICT in healthcare and medical information systems, working with software for medical practice.

As Choi & Martinis (2013) point out, studies on informatics competency assessment in undergraduate and graduate nursing students are scarce. Most of the research on the subject is based on self-reported questionnaires, rather than objective tests of skills. Self-assessment reflects personal confidence and self-esteem and as such is not objective. Elder & Koehn (2009) argue that nursing students rate themselves higher on their skills than their actual performance of computer skills. Similar results are published by Grant et al. (2009). Discrepancies between assessed and perceived knowledge and skills may lead to stress and withdrawal of technologies in real settings. Lin stresses the inadequate attention paid to computer literacy and computer competency scale validity (2011). Elder & Koehn (2009) also discuss the value of using a computer graded assessment. In our research, special attention is paid to construction, statistical analysis and validation of the assessment tool.

According to Digital Economy and Society Index 2017 (https://ec.europa.eu/digital-single-market/scoreboard/bulgaria), low performance in digital skills acts as a brake on the further development of Bulgaria’s digital economy and society. Informatics and Information Technologies are mandatory disciplines in primary and secondary education in Bulgaria. A pilot online national external evaluation of digital competences of tenth-grade students from secondary schools in all the 28 areas of the country was conducted in 2016. The average success rate was 50.03% (Ministry of Education and Science of the Republic of Bulgaria, 2016). These facts are worrying, and the level of competence of students for working with computer and information in electronic format is put into question.

**Methods and materials**

The study was conducted in the period April – December 2016. The survey was anonymous and 279 students from different health care specialties at Medical University – Plovdiv agreed to participate. To receive an objective grade, computer literacy was assessed by a didactic test specially designed for this purpose. The students were also asked to self-assess their computer literacy on a five point scale from poor (2) to excellent (6) prior to the test. The influence of gender on grade and self-assessment was analyzed by nonparametric tests of Mann-Whitney and Kruskal-Wallis for independent samples. The relationship between grade and self-assessment was analyzed by Wilcoxon nonparametric test for two related samples. Bivariate Spearman correlation was used to study the relationship between age and grade or self-assessment. We accepted 95% confidence interval. Data were processed with the statistical package SPSS 17.0.

**Construction of the assessment instrument**

The test aimed at measuring the level of knowledge and skills of students in the following areas:

- Operation systems and organization of information;
- Word-processing and spreadsheets;
- Safe networking.

Windows 7, MS Word 10 and MS Excel 10 were accepted as working environments.
The test was based on criteria, i.e. it measured the degree of achievement of educational goals in the defined areas of knowledge, as set out in the Informatics and Information Technologies curricula in the secondary education (Ministry of Education and Science of the Republic of Bulgaria, 2016). The originally developed test contained 30 multiple choice questions with one correct answer and three distractors. The main reasons for choosing this type of questions were:
- Fast and objective assessment;
- Ability to evaluate not only reproduction of knowledge, but also comprehension and application;
- Students are not required to demonstrate reasoning, give examples or original ideas, i.e. situations where multiple choice test items are difficult to apply.

Some of the questions were taken from Mateva et al. “Medical Informatics – test items and practical exercises” (2015). Most of the questions were written specially for this assessment tool. The questions assessed the competence of students at different cognitive levels. The principles of creating quality multiple-choice questions, outlined by Burton et al. (1991) were observed in adapting and writing test items.

The test was content valid, because:
1. Skills and knowledge in each of the three upper mentioned areas of assessment were measured by at least three test items, and
2. Each question was discussed with experts – the staff of the department “Medical Informatics, Biostatistics and e-learning” at the university.

Criterion validity could not be defined because there was no benchmark test to compare results. Construct validity had not been determined because the results of the validation testing did not comply with the requirements for a factor analysis.

Face validity was guaranteed by the experts’ opinion that it seemed to be a proper way of testing the level of computer literacy of health care students.

In order to validate the tool 35 students agreed to do the test anonymously, conscientiously and without cheating. They were given 30 minutes.

The received results were processed with the program for psychometric analyses jMetrik (http://www.itemanalysis.com/index.php). The aim was to select for the final version the items which:
1. Had a difficulty level 0<p<1, i.e. there were no questions answered by everybody as well as questions that nobody had answered;
2. Had a discrimination coefficient r>0.2, according to Shotlekov (2015)
3. Did not compromise test reliability.

The analysis of the test items revealed that there were no questions that did not fulfill the first requirement, but there were nine test items with discrimination coefficient below 0.2. The analysis of the internal consistency showed Cronbach’s alpha α=0.76. Further analysis showed that if each of the nine questions with r≤0.2 were removed, the Cronbach’s alpha would increase. So, the number of the test items was reduced to 21, and the new version was tested again. The results showed that all questions comply with the requirements, α=0.82 and there were no questions that if removed, the reliability would increase.

A question was considered answered correctly if there was only one answer and it matched the right one. The final score was the total number of correct responses, min. 0 and max. 21. The results from doing the test by the students were: $\bar{x} = 12.09$, $M_e=13$, $M_o=14$. The frequency distribution of scores has a weak left negative skewness, so the conclusion was that the test was medium to easy for the students. In such cases, according to Ivanov (2006) the cut-off score for equating to a five-point scale is 30% of the total score, which is 7 for our test. The equating of the score to a grade on the five-point scale from “Poor” 2 to “Excellent” 6, which is the formal assessment scale in Bulgaria was done through splitting the score above 7 into approximately equal intervals (Table 1), as described by Shotlekov (2015).

Results and discussion

The age of the students varied from 18 to 45 years, n=269, $\bar{x}=22.42\pm5.57$. Ten students did not announce their age. Distribution by gender was: men: n=53, 19.00%; women: n=226, 81.00%. According to the Mann-Whitney test there was no statistically significant difference in the age distribution between genders – $p=0.146$. We might expect age and gender to affect computer literacy independently.

The students’ grades as results of the didactic test and their self-assessments are given in Table 2 for men and for women.

The average computer literacy of the investigated sample of healthcare students at the Medical University of Plovdiv was good. The percentage distribution of grades is given in Figure 1.

Figure 1: Distribution of grades among healthcare students

The students, who study health care specialties at Medical University Plovdiv are computer literate. The ratio of those, who are not, i.e. who received “Poor” is low – 4.42%, same is the percent of excellent students. Less than a quarter of the students – 24.34% got less than 50% of the total score – these are the students with poor and fair grades.

Ranasinghe et al. (2012) report that nearly half of the first year medical students in Sri Lanka obtained computer literacy score less than or equal to 50%. Results of a study in Iran by Zarei, Rokhafruz & Dianat (2012) showed that medical students’ familiarity with computers were low. A study by Deltsidou et al. (2010) indicated that there was a deficit in nursing students’ IT competencies in
Greece. On the contrary, Choi & Martinis (2013) found out that undergraduate nursing students at the School of Nursing at University of Massachusetts were competent in basic computer knowledge and skills. Compared with their colleagues from other countries, our students have a sufficient level of computer knowledge and skills.

Ranasinghe et al. (2012) and Deltsidou et al. (2010) point out owning a personal computer as a strong predictor for computer skills availability. Our previous research, Kirkova-Bogdanova et al. (2016) revealed that the ratio of students possessing their own computer with internet connectivity is relatively high – 83.75%, compared to other countries. Another major factor, raised by Ranasinghe et al. (2012) for sound computer literacy – previous formal education is also fulfilled for our students. This explains their relatively good understanding of using computers.

Ikolo & Okiy (2012) found gender differences in computer literacy skills of medical students with males more familiar with computers than females. Safabakhsh et al. (2016) found gender differences only in the connectivity aspect of computer literacy. Ranasinghe et al. (2012) did not find significant gender differences in the mean score of a computer literacy questionnaire. We did not find statistically significant difference between computer literacy of men and women – p=0.080. We explain this with the equal opportunities for men and women for education. Another possible explanation is that men, who choose a health care career are not so technologically orientated as they are believed to be.

The results of our survey showed that students tended to underestimate their computer skills and their self-assessment was statistically significantly lower than their actual grade – p=0.0001. We found the statistically significant dependence of self-assessment on gender – p=0.025. Further analysis showed that it is the women, who have a significantly lower self-estimation – p=0.0001, while men demonstrated realistic judgment of abilities to work with computers – p=0.362. Literature findings do not support this result. According to Grant et al. (2009) undergraduate university students in North Carolina had a higher perception of their proficiency level than their performance on the assessment for word-processing and spreadsheets. Elder & Koehn (2009) also support the fact that students overrate themselves. A study in Romania by Cazan et al. (2016) reveals that there are no significant differences between the male and the female participants concerning computer self-efficacy. Our students demonstrate critical thinking about their skills. Women do not feel well prepared to work with computers, and they need more encouragement. The implications for the teachers are to include more practical training for basic computer skills in the informatics classes for the students to improve their computer literacy and to increase their self-esteem and confidence to work with computers.

Niyomkar (2012) found a positive relationship between age and computer literacy in undergraduate nursing students – as age increased, computer competency advanced. We did not find a significant correlation between age and computer literacy – r=0.088, p=0.150. However, a statistically significant weak negative correlation existed between age and self-assessment - r=-0.3142, p=0.0001. Results indicate that older students have the same computer skills as their younger colleagues, but their self-effacement increases with age. Educators should pay attention to older students’ concerns, assure them and make them feel comfortable with technology.

**Conclusion**

The computer literacy of health care students is not alarmingly low. It is good enough to enter and complete the course in informatics successfully. It allows them to take full advantage of e-learning. Nevertheless, computer literacy does not differ across gender and age, female students, who are the majority, self-assess themselves lower than their actual skills. The same applies for older students. The course in informatics should include more activities for upgrading computer skills on the one hand, and building confidence and a feeling of comfort with computers on the other. Increasing the computer literacy and self-efficacy of our students is a guarantee for a successful career.

PROJECT MATURITY OF ORGANIZATIONS IMPLEMENTING RESEARCH PROJECTS - PREPARING FOR QUESTIONNAIRE RESEARCH

Agata Klaus-Rosińska,1 Jan Betta2

Abstract: The purpose of this article is to provide a way of creating a maturity model for organizations implementing research projects. This will be done with an emphasis on constructing questionnaires to collect the necessary data. The result of the article is not the final version of the questionnaires but a guideline on how the construction can look like. The article presents also the reasons and explanations why maturity models in project the management area are important. The methods used in the article are literature review and lessons learned from previous experiences.

JEL Classification Numbers: D02, M21; DOI: http://dx.doi.org/10.12955/cbup.v5.1002

Keywords: maturity, project, questionnaire

Introduction

The issue of the research fits perfectly into the project management area, which importance from the last century growing all the time (Project Management Institute Inc., 2013). More and more organizations carry out their activities through projects, in addition there is a noticeable increase in the complexity of the projects. A new challenge for organizations is (among others) the multi-project environment (Spalek, 2013). For organizations implementing research projects a multi-project environment is visible. The development of "science" is carried out through projects (requirements of funding bodies) and the number of projects is increasing. The reason for this is the greater amount of possibilities of the funding for research projects, the need to raise the prestige of the organization and the need to develop the potential of the faculty’s staff. According to Piecuch (2015), management of research projects is project management in a distributed and multi-project environment, which faces a number of problems. They are primarily related to:

- high rate of failures of projects, characterized by not achieving the intended outcomes within them,
- lack of good practices based on the team’s experience which implemented the projects and after their completion were terminated,
- inefficient planning and use of human resources for the implementation of projects, mainly due to the creation of new teams often involving people without necessary experience in project management,
- lack of uniform standards of project management, which should be applied to all teams implementing projects,
- lack of control of the portfolio of projects implemented by the scientific institution.

Difficulties in project management in the university environment (so, in the typical research organization), have been identified in (Klaus-Rosińska and Zablocka-Kluczka, 2014):

- rigid organizational structures that are unsuitable for the implementation of the project,
- lack of formal authority for projects and their managers,
- poor internal and external communication,
- inadequate or overly formalized project documentation,
- inadequate or poorly designed mechanisms of project quality management,
- lack of qualified project personnel.

Research project management is difficult. Their effective realization requires the organization having competences in the area of project management and the ability to manage multiple projects simultaneously (Piecuch, 2015). Research projects are characterized by a great diversity (in terms of the variously defined size of the project, the organizational structure, the stability of the project team, division of labour among the members of the project team, qualifications, degrees and titles held by members of the project team) (Birnbaum, 1977), which significantly makes their coordination hard.

1 Department of Computer Science and Management, Wroclaw University of Science and Technology, e-mail: agata.klaus-roinska@pwr.edu.pl
2 Department of Computer Science and Management, Wroclaw University of Science and Technology, e-mail: jan.betta@pwr.edu.pl
The project maturity model dedicated to organizations conducting research projects will assess the severity of applied solutions (implementation principles), methods and processes of research projects management. Performing an assessment of maturity in the organization of the research project management is the starting point for the continuous process of improvement in the area of research projects and performance of the whole organization. The findings of the evaluation would allow to get to know the strengths and weaknesses of the organization in relation to the management of research projects and thus to identify and determine the actions which should be taken in order to increase the effectiveness of the management of these projects. The results of the evaluation would also provide information about the causes of the problems identified for research projects and tell to stakeholders about the consequences of the usage of incorrect or non-uniform procedures. Also, the findings can indicate the organizational improvements which should be implement, resulting from the knowledge of project management (Piecuch, 2015; Rad and Levin, 2006).

**Project maturity models**

Maturity models in project management are related to the issue of maturity in economic sciences. The maturity here can be understood as the ability of the organization and/or its processes to improve and thus to bring better results (Rosemann and de Bruin, 2005). The literature on the subject also refers to the term of maturity level, which can be defined as the degree of achievement of the directives indicated by the adopted concept (Kucińska-Landwójtowicz and Kołosowski, 2012). The mentioned definitions indicate that maturity defines a path that an organization and/or processes goes through, along with getting experiences. The path is visible in maturity models.

In the project management area, there are many maturity models developed for specific branches, mainly for software and civil engineering industries. However, top researchers like Crawford (2006) or Kerzner (2001) regarding maturity in project management suggest designing a universal model assessing maturity for every type of organization. Since the last century a number of project management maturity models have been developed. It is possible to find more than 30. The majority of these models indicate 5 maturity levels, where the first level is the ‘initial’ level (here there is no established project management practices), and level 5 is the ‘optimising’ level where the company is fully mature (Pretorius et al., 2012). In the literature often appear models like (Spałek, 2014):

- **OPM3: Organizational Project Management Maturity Model,**
- **PMMM: Project Management Process Maturity Model,**
- **CMM: Capability Mature Model (and its improved version CMMI: Capability Maturity Model Integration),**
- **Prince 2 Maturity Model.**

Nevertheless, we did not find the model of maturity in project management, which have been developed strictly for research projects (see more about maturity models related to research projects in Klaus-Rosińska, (2016)).

Considering the above mentioned statement, researchers from Wroclaw University of Technology intend to complement the knowledge of assessment with the maturity in research project management. The main objective of their research is to propose the concept of maturity assessment in the management of research projects, aimed at improving the performance of organizations implementing research projects. In order to achieve the main goal, it will be necessary to implement the specific objectives:

1. to examine the area of project management in organizations carrying out research projects in order to identify functional solutions and adopted strategies,
2. identification of the characteristics of research projects and their comparison with characteristics of other project types (IT projects and construction projects will be considered), which will help to determine the suitability of project management maturity models which are used in organizations conducting these types of projects on maturity assessment in research projects management,
3. to examine existing models of maturity in project management, showing their flaws, areas for improvement and to determine their fitness for assessing the maturity in research project management,
4. to propose a model of maturity in research project management and its initial verification,
5. to develop a set of best practices (recommended paths) aimed at raising the level of maturity in research project management.

The research hypotheses are as follows:

- **H1**: In the organizations implementing research projects, there is a need to improve performance in the area of project management,
- **H2**: In organizations implementing research projects, models for assessing the project maturity are rarely used,
- **H3**: Organizations carrying out research projects, would await the development of a set of good practices (recommended paths) which help the achievement of higher levels of maturity in research project management,
- **H4**: Organizations which acquire experience in implementing research projects, improve the effectiveness of such projects.

**Preparation for questionnaire research**

In the study research methods like surveys, in-depth interviews with people from the area of project management (project managers, contractors, people of administrative support) and persons managing organizations implementing research projects will be applied (amongst others). For the purpose of conducting surveys and interviews, questionnaires to gather the material needed for fulfilling the specific objectives: (1), (2) and (3), will be developed.

The construction of the questionnaires will be based on:

1. previous but recent research, indicating critical success and failure factors for research projects (the project related to this topic is currently implemented at Wroclaw University of Science Technology, the title of the project is "Identification of success and failure factors of research projects", Grant no.: NCN 2014/13/B/HS4/01660, Funding agency: National Science Centre (NCN) in Poland, Funding period: from 2015-03-17 to 2017-03-16),
2. bibliographical overview of existing best practices in project management area (including research projects), and the analysis of them,
3. bibliographical overview of existing best practices of maturity models in project management area, and the analysis of them.

Showing how to develop questionnaires can be useful for:

- organizations carrying out research projects. They would need the development of appropriate questionnaires. Therefore, it can be a “good practice” for them too.
- researchers, people working inside research projects, who wants to do similar scientific works.

Taking into account four research points of view: the nature of the problem, the goal of the research, the underlying theory and the appropriate techniques (Miller and Salkind, 2002), the presented research is applied in one of them. The presented research is focused on a technique related to data gathering.

Sampling is one of natural methods of studying the stochastic phenomena. There is no unique quality standard necessary in each sampling. This quality depends on the stage of research work and on the destination of information being the sampling result (Rossi et al., 1983). Questionnaire are one of recognized and most important tools of sampling and data collection in applied research. The questionnaire is a self-completed document, which is filled in by respondents (Dornyei and Taguchi, 2009). The list of questions depends mostly on the author’s creativity, who should take into account the time and cost restraints. The final quality depends on responder’s perception and their answers. Both kinds of questions – open and closed – are admitted, but the authors should be conscious of advantages and disadvantages of both (Rossi et al., 1983).

Some recommendations of question formulation should be observed (Rossi et al., 1983):

- vocabulary should be simple,
- question shouldn’t be too long,
- inappropriate questions specify alternatives rather than indicating one possibility,
- the questions should respect some psychological order,
- questions on one subject should be grouped,
length of the questionnaire depends on many factors, like psychological preparation of respondents,

- nature and quantity of resources needed,
- questionnaire format is important and should be chosen properly.

The questionnaire can contain three types of questions: factual, behavioural and attitudinal. General parameters of each questionnaire are: length layout and attention to sensitive subjects and anonymity. The main points of the questionnaire are: title, instructions, questions, complementary information and the closing part (Rossi et al., 1983).

Conclusions

The final construction of the questionnaires could be a useful tool for achievement of research objectives. It should accomplish all the principles of questionnaire development mentioned above, and conform to the classic "rules of art." The authors are conscious of the necessity to make this questionnaire as flexible as possible, because of the high level of complexity, innovation and incertitude of research projects.

ANALYSIS OF THE PROFESSIONAL SATISFACTION OF PHARMACISTS IN BRATISLAVA

Zuzana Koblišková,1 Zuzana Haramiová,2 Tomáš Tesár3

Abstract: A pharmacist is an expert on medications. At the same time as the most accessible health care provider, the pharmacist fulfills an important social mission. For a pharmacist, work satisfaction plays an important role in several aspects of his practice in a pharmacy. Our primary goal was to conduct a local analysis with the purpose of testing the proposed questionnaire evaluating various dimensions of the professional satisfaction of pharmacists. Our secondary goals were as follows: to analyze individual dimensions of pharmacists’ professional satisfaction, to assess the quality of life in the context of the pharmacists’ professional satisfaction and to analyze the impact of selected characteristics (age, location of the pharmacy) on the pharmacists’ quality of life. The study is based on a questionnaire survey among pharmacists in Bratislava from July to September 2016. Data were collected in person. Respondents were randomly selected from community pharmacies. Equal number of respondents were selected from three different types of pharmacies: a) public pharmacy or its branch in a medical facility or a health centre b) public pharmacy or its branch in a shopping centre c) public pharmacy or its branch in a residential housing development. The results of the study show that the professional satisfaction of pharmacists in Bratislava is evaluated positively. Out of all 27 questions of the questionnaire, only three were evaluated negatively. The analysis points out that pharmacists are dissatisfied with the conditions in the workplace, regulation and legal responsibilities stemming from the profession of a pharmacist, healthcare system, and health insurance companies. The majority of the pharmacists characterized their state of mind on the job as concentrated. Older respondents were more tired and less energized. With regards to the location of a pharmacy, respondents that work in pharmacies located in residential housing developments feel the most concentrated. The knowledge of needs and problems of the profession is the essential precondition for its continued successful development, and its position in current as well as future European and Slovak healthcare systems. Until now, the quality of the professional life of pharmacists has not become a subject of systematic research and evaluation in Slovakia. Our study showed that the professional satisfaction of pharmacists in Bratislava is evaluated positively.

UDC Classification: 159.96; DOI: http://dx.doi.org/10.12955/cbsp.v5.1003

Keywords: pharmacist, professional satisfaction, pharmaceutical care

Introduction

Pharmaceutical care

Slovak Act No. 362/2011 Coll. defines pharmaceutical care as one of the three forms of health care provision, and from the perspective of the Slovak legislation, it covers the providing, preparation, inspection, storage, dispensation of medications with the exception of preparation of transfusion medications and medical aids, mail order dispensation, providing expert advice about medications and medical aids, and consultations with regard to determination and monitoring of the treatment. Pharmaceutical care is provided: 1. in public pharmacies that are set up as educational bases 2. in public pharmacies and branches of public pharmacies 3. in hospital pharmacies 4. in dispensaries of medical aids 5. in dispensaries of orthopedic and prosthetic medical aids. Stanko & Minarovič (2011) state that based on the legislation of definitions and the conception of pharmaceutical care development defined by international authorities in the field of health and pharmacy, basic roles, and functions in the pharmaceutical care system can be categorised according to the character of individual activities into following groups: a) logistics b) dispensation c) consulting d) distribution e) screening and monitoring f) other activities.

Professional satisfaction of pharmacists

Snopková et al. (2014) argue that since pharmacists play a key role in informing patients about prescribed medications and ensuring suitability of the prescribed treatment, it is important to consider the question of which qualities of a pharmacists’ work environment have a connection with the integration of the pharmacotherapeutic monitoring into the daily practice, and what obstacles are present in this process. For a pharmacist, the work satisfaction plays an important role in many aspects of his practice in a public pharmacy. A low level of work satisfaction can have a negative impact on his work performance. Dissatisfaction can also influence the way a pharmacist interacts with patients. Consequently, patients tend to limit their cooperation with a pharmacist. It is important to obtain information about pharmacists’ attitudes toward performing their work, and about factors associated with their work attitudes. Given that healthcare workers can suffer from stress, especially due to the

---

1 Faculty of Pharmacy, kobliskova@fpharm.uniba.sk
2 Faculty of Pharmacy, haramiova@fpharm.uniba.sk
3 Faculty of Pharmacy, tesar@fpharm.uniba.sk
long-term effect of negative factors present in the workplace, their work attitudes should be examined. Matthew et al. (2008) describe the positive influence of pharmacists’ work satisfaction as follows: 1) A satisfied pharmacist at work will positively impact his community; as a result, fewer work position changes occur 2) Work satisfaction of a pharmacist positively impacts his own mental and physical health. 3) A satisfied pharmacist positively impacts the patient and his health.

**Workload in the pharmaceutical profession**

McCann et al. (2009) emphasize that pharmacists today need to meet many high (professional, communication) demands. This fact is caused especially by a rising competition in healthcare and the need to improve healthcare services. This change may positively impact patient’s satisfaction (Mináriková et al., 2015; Mináriková et al., 2016). This trend has shown to have an influence on the overall prosperity of community pharmacy and both accessibility and availability of pharmaceutical care (Malovecká et al., 2015, Malovecká et al., 2016). However, as a result, pharmacists at work often deal with stress and mental strain. Pelcák & Tomeček (2011) define workload in a pharmacy as a sum of specific situations and activities (breach of the confidentiality zone, communication with problematic types of patients, dealing with complaints) that can be subjectively associated with mental burden. Consequently, cumulative stress can lead to professional failure or personality disintegration.

**Methodology**

The analysis of pharmacists’ professional satisfaction in Bratislava was carried out between July and September 2016. Data collection was realized in person. Respondents were randomly approached in community pharmacies. We aimed at collecting responses from an equal number of respondents from three different types of pharmacies:

- a) a public pharmacy or its branch in a medical facility or a health center
- b) a public pharmacy or its branch in a shopping center
- c) a public pharmacy or its branch in a residential housing development

In total, we obtained 25 questionnaires from each type of pharmacy. Overall, 75 respondents from a total number of 23 pharmacies participated in our research.

The questionnaire consisted of the following parts:

- Dimension A: internal environment – altogether nine questions were allocated here, pertaining to the organization of a pharmacy as a workplace, work hours, and relationships in the workplace.
- Dimension B: external environment – 9 questions were allocated here, pertaining to legislative issues in providing pharmaceutical care, relationships with health insurance companies, professional organizations, and patients.
- Dimension C: personal satisfaction – 5 questions were allocated here, pertaining to personal matters such as financial remuneration, career advancement, etc.
- Dimension D: quality of life – 3 questions were allocated here, pertaining to a subjective assessment of the state of health, quality of life during the last month, and its comparison with the time period of 10 years ago.

Satisfaction was evaluated using 26 predetermined questions (Are you satisfied with…) using a 5-point Likert scale (no – more likely no – neither yes nor no – more likely yes – yes).

The results were processed using the Microsoft Excel program and expressed quantitatively (count, percentage). We consolidated the proportions of respondents from the Likert scale into three ranges as follows: 1) no / more likely no, 2) neither yes nor no, 3) more likely yes / yes.

**Results**

Dimension A was focused on evaluation of the internal environment. Here, pharmacists expressed the highest level of satisfaction (82.66%) with the question concerning superior-subordinate communication. Satisfaction with a work team, the atmosphere in the workplace, communication of tasks, feedback based on work performance, and satisfaction with the support from the direct supervisor were rated highly positively (81.33%). More than half of the respondents (54.66%) were satisfied with the determination of work hours and the length of their work day. In this dimension of questions, respondents were the least satisfied with conditions in the workplace (satisfaction was expressed by only 33.33% of pharmacists). Table 1 displays the results from Dimension A in detail.

Dimension B assessed the external environment. Here, most positive aspects were: attitude and respect of patients and pharmacists' readiness for their profession during their studies. Cooperation with physicians and employment opportunities available abroad were also rated highly positively (72.00%). Almost 59% of the pharmacists were satisfied with the opportunities for continuing education and activities of professional and specialized organizations for pharmacists. In contrast, pharmacists expressed a high level of dissatisfaction (77.33%) with the healthcare system, and with the cooperation with health insurance companies. Dissatisfaction with the regulation and legal responsibilities stemming from the pharmaceutical profession was expressed by almost 51% of respondents. Table 2 displays the results from Dimension B in detail.

Dimension C concerned pharmacists’ personal satisfaction. Here, responses were positive to all of the questions. The most positively rated aspect (100.00%) was professional pride. Pharmacists expressed a high level of satisfaction with their work position and job content (78.66%), and relaxed feeling at work (77.33%). Furthermore, 68.00% of pharmacists expressed satisfaction with the acceptance of their proposals and requests in the workplace and 60.00% with their financial remuneration. Table 3 displays the results from Dimension C in detail.

All aspects within Dimension D evaluating pharmacists’ quality of life were rated positively. Pharmacists were most satisfied with their quality of life in the last month (76.00%) and their current overall physical and mental health (74.66%). The question in which pharmacists were asked to compare their current quality of life with their quality of life 10 years ago, was rated positively as well. Table 4 displays the results from Dimension D in detail.

Analysis of the impact of selected characteristics on the pharmacists’ quality of life
The results of the analysis show that the majority of pharmacists in each age group described their state of mind on the job as “concentrated” (Table 5, Figure 1). Pharmacists aged 31-45 feel the most “concentrated” (79.31%) on the job, while the least “concentrated” on the job is the youngest group of respondents. Our analysis suggests that there is a correlation between the respondents’ age and state of mind while performing their work at a pharmacy: the older the respondents were, the more “tired” and “less energized” they felt.

In regard to the pharmacy location, respondents working in pharmacies localized in residential housing developments feel most “concentrated” (76.00%). Pharmacists working in shopping centers feel least “concentrated,” while at the same time, they are the most tired of all pharmacists.

Discussion

Increasing demands on professional and communication competencies, rising competition in healthcare, and integration of healthcare services all impact sustainability of a traditional manner of pharmacy development. The emphasis on quality of pharmaceutical care lies above all in the responsibility toward the patient. Nowadays, it is important to give enough space to the satisfaction of professionals – pharmacists as well and to look for new opportunities to improve their professional life. A positive evaluation emerged from a study of the American Pharmaceutical Association, regarding the quality of professional life of pharmacists in a pharmacy environment, and focused on issues pertaining to work satisfaction, career advancement, realisation of plans of organizations, and patient care. However, it discovered differences in the quality of professional life related to practice in the area of primary care,
depending on demographic and gender variables. Urbonas et al., 2010 conducted a study in Lithuania focused on the professional satisfaction of pharmacists. This study analyzed the attitudes of pharmacists toward the quality of pharmaceutical care. Their results showed the positive evaluation of pharmaceutical care by the pharmacists. However, the individual healthcare systems of the European Union still do not pay enough attention to the professional satisfaction of pharmacists. Moreover, financial remuneration impacts the quality of pharmaceutical care as well. The study carried out by Mosadeghrad et al., 2008 endorse the fact that financial remuneration could increase the level of professional satisfaction of pharmacists, and thus improve the quality of provided health services.

Conclusion
Patient satisfaction is one of the main indicators of the quality of provided pharmaceutical services. The identification of weak points in the pharmaceutical profession and subsequent targeted solutions open possibilities for increasing professional satisfaction and self-confidence of pharmacists as healthcare workers. The knowledge of needs and problems of the profession is the essential precondition for its continued successful development, and its position in current as well as future European and Slovak healthcare systems. Our primary goal was to carry out a local analysis using a questionnaire evaluating various dimensions of the professional satisfaction of pharmacists. We have analyzed individual dimensions of pharmacists' professional satisfaction, assessed their quality of life in the context of their professional satisfaction and evaluated the impact of selected characteristics (age, location of the pharmacy) on their quality of life. The results of our study suggest that professional satisfaction of pharmacists in Bratislava is evaluated positively.

ART MANAGEMENT: A NEW DISCIPLINE ENTERING THE CULTURAL AND ACADEMIC LIFE IN PLOVDIV

Vasil Kolev,1 Asya Ivanova2

Abstract: This paper presents the conditions of economic and political changes within the 90s in Bulgaria and the necessity of a new way of thinking at managing cultural institutions in the conditions of the market economy. As a response to that problem it was created the first of its kind in Bulgaria master’s degree program „Art management.” For that purpose a brief overview of the formal models of funding the arts worldwide are presented along with the characteristics at regional levels which led to the creation of the new educational programme. The main disciplines studied in the educational module aiming to develop a new set of skills among artists are listed with a brief introduction of their scope. A local survey conducted at the Academy of Music, Dance and Fine Arts – Plovdiv, analyzing the interest of the first of its kind in Bulgaria master’s degree program „Art management” is presented. The initial result of the evolution of the educational programme based on the number of students enrolled per year are the motivation for the start of a larger research project “ÄRT” funded by the SRF, Ministry of Education and Science.

Arts and management

Art is one of the greatest achievements of human civilization. Communicating with it elevates, enriches and ennobles us making us better, wiser and more sensual. The pleasure and joy that people experience when communicating with art would not have been possible without the targeted and actual implementation of management of Art or as it’s called in this specific area art management. (Busheva, Stoichkova, Aratunyan-Vasilevska, & Konstantinova, 2014, p. 7)

One result of the political and social upheaval of the last 400 years has been the establishment of institutions designed to provide continuing support and recognition for the artist and the arts. The increasing complexity of an industrially and technologically based society hastened the shift from the artist-manager as the dominant approach to organizing and presenting the arts. As many communities began to establish arts institutions late in the nineteenth century, year-round management experts began to emerge. Many arts institutions now appear to be organized along patterns similar to large business corporations. (Byrnes, 2013, p. 24)

Economic realities for the arts at 20th century

Although management is a unique activity growing for centuries, particularly in arts management is even more specific in terms of the final product and the need for realization not only of creative excellence, moral and cultural benefits but also financial results.

Irrespective of the large economic costs of modern developments of arts and placing them at free market conditions, there was no serious research nor any publications on the economics of the arts until the mid-60s. Pioneers in the area of economics of the arts are two American scientists William Baumol and William Bowen, who in 1965 published their work “On The performing arts: The anatomy of their economic problems” after conducting vast economic research in the USA, United Kingdom, Australia and New Zealand on the economic and financial difficulties the arts were facing.

Baumol and Bowen determined the main economic principles under which the arts functioned and the real necessity of outside financial aid. They laid the foundations of the so called “positive theory of financial aid of the arts” (Baumol & Bouen, 1965).

In the modern world there are various forms of financial support for the arts. In her work "Management of the Arts" Lydia Varbanova a Bulgarian scientist examines the evolution of the forms of State funding and the involvement of market principles in the arts world and determines the existence of three formal macroeconomic models:

- Model of full State finding of the arts- this model is spread across Central and Eastern Europe between the 50’s and the 90’s and its main characteristics are:
  1. The State is the main financial source for development of creative organizations
  2. Cultural politics are orientated to direct financing of the arts

1 Academy of Music, Dance and Fine Arts, vasko_kolev@abv.bg
2 Academy of Music, Dance and Fine Arts, asiaiv71@gmail.com
3. There is little diversity in the forms of organization of cultural institution
4. There is stability in the development of the arts
5. There is no market for the arts
6. The arts are accessible for wide audiences

- **Model for development of the arts at free market conditions** – this model originated in the USA and its main characteristics are:

Main institutional form of the creative industries is private organization
1. Managers in the arts are mainly mediators between the artists and the audiences, with a main concern of selling the art product
2. There is a wide and developed market for art products and artists
3. The artists are mainly temporarily hired for a specific performance

- **Mixed model for developing of the arts** - this model originated in the United Kingdom and today is widely spread across Europe. The proportions between state funding and financing at market principles varies between different countries. The mixed model has the following characteristics:
1. Different sources of financing are available- state, private sector, variety of forms of charity
2. There is a wide variety in terms of purpose of creation, financial sources, forms of organization and management for the creative industries
3. Part of the art organizations are funded by the state, the rest are funded by themselves mainly with selling their art products

In the contemporary world of arts the differentiation of the tree models is more theoretical then practical. The American free market model "has been fractured” in the 60’s with the creation of the National Endowment for the Arts, stabilizing the legislation for encouraging the investments in the arts and the emergence of the first non-profit organizations, today it is leaning more towards the mixed model for development of the arts. (Varbanova, 1997, pp. 46-49)

**The necessity of change and the response of the academic society**

In Bulgaria after the political changes in the 90’s and the transition to democratic government and free market economy, the model for development of the arts has changed from “state funding” to “mixed model of funding”. The state funding of the cultural industries was reduced but it is still the main source of income. The art organizations were facing the necessity of raising additional funds thru ticket sales, outside sources - sponsors, patronage and charity. In that point of time the functions of the art managers were strictly administrative, but the transition from centralized state funding and management of the arts and placing them in market conditions requires from the art managers to build a vaster and more comprehensive management skill set.

In response to the need for new management skills the Academy of Music, Dance and Fine Arts - Plovdiv developed a new educational module for Master’s degree “Art management”. It is the first educational program of its kind in Bulgaria. The main disciplines included in the program are:

- "Art management” – studies basic management theories, characteristics of business environment in terms of specific organizations associated with different types of art, basic management functions, the stages of the management process; It aims not only to acquire knowledge but also to develop skills to carry out all management tasks in the arts.

- “Legal Framework and Cultural Policy” - it aims to give students basic knowledge in the matter and should help them to develop sound knowledge on the use of the art products as well as ways to prevent unregulated and illegal exploitation of intellectual property.

- “Cultural Industries” – studies structure, organization and management of various art organizations in the field of cultural industries.

- “Public Relations” - studies the role and importance of communications and public relations in modern society; the connections between the concepts - public relations, popularity, marketing, advertising and publicity; the functions of PR in various organizations and their place in the organization structure.

- “Marketing” - the aim is to give basic knowledge and initial skills in marketing and advertising, developing skills to conduct market research and the organization of successful advertising.

- "Project Management"- the accession of Bulgaria to the European Union in 2007 opened new opportunities for securing additional external funding for the art organizations through
participation in projects under the programs financed by European funds, leading to the addition of a new discipline in the tuition module.

The tuition program is fully customized and aimed at developing managing and marketing skills in the field of arts at the conditions of the market economy.

As we all know any change in the routine of our lives is perceived to be difficult. The presentation of the new training module of the Academy of Music and Dance Arts raised mixed opinions and the interest in the program was not high as it can be seen from “Figure 1” representing the number of students enrolled in the specialty since its existence (please mind that the Academy is a boutique University with 800 students in total).

![Figure 1. Art management students since the creation of the program](source:Authors)

The first students who signed up for the new educational program in master’s degree were bachelors from the Academy of Music, Dance and Fine Arts – Plovdiv. After graduation, the first students found easy realization as managers in the cultural industries and one of them created his own boutique theatre. In subsequent years, the interest in the specialty has increased not only from students of the Academy who perceived “Art management” as a natural development of their education, but also by managers of cultural institutions conscientious of the necessity of obtaining managerial skills. A curious fact is that after the first four years of existence of the program, interest in the specialty was expressed by people who had no previous education in the arts. The increased interest in the program and stable number of students over the years led to a natural inclusion of “Arts management” as an education module in other universities in the country under different names.

**Conclusion**

In conclusion, we can say that the Academy Of Music, Dance and Fine Arts laid the foundations of the “Art Management” in Plovdiv and that the impact of its development will have a beneficial effect across all cultural industries in Bulgaria. None-the-less the specialty “Art Management” is in total compliance with the idea of an university education – to create interdisciplinary and thinking professionals. The results of the survey in the Academy of Music, Dance and Fine Arts were the motivation for the initiation of a lager research project „Art management: Plovdiv – new tendencies and classical art (ART)“.

FROM CREATIVE THINKING TECHNIQUES TO INNOVATIVE DESIGN SOLUTIONS – THE EDUCATORS’ PERSPECTIVE

Joanna Maria Kowalewska,1 Maria Jolanta Soltysik2

Abstract: For every designer, it is crucial to be creative. But generating new, innovative ideas tends to be a difficult task. Nevertheless, some technique can be used to improve the quality of the designing process. Getting knowledge about such tools can be of much value for all future architects and engineers. This article presents an original academic course, which was inaugurated in 2015 at the Faculty of Architecture in Gdańsk University of Technology and organized for the first year students of Spatial Planning. The course was repeated in 2016 and is being currently led in 2017. The title of the course was ‘Garden Cities and the Gardens in the Cities. A Course with Elements of Training Creativity’. The aim of the course was to encourage the participants to develop their creativity by introducing creative thinking techniques and thus to facilitate their projects. Among the recommended creative thinking techniques were mainly the ones presented in the ‘Odyssey of the Mind’ educational program, including such techniques as the ‘Mind Map,’ the ‘Brainstorm’ and the ‘Superheroes.’ Moreover, during the study, participants had a chance to improve their team working skills. The practical usage of the introduced innovative methods was to be tested on issues concerning green environmental projects in urban areas. At the end of the course, most of the participants declared, in the final students’ questionnaires, to use the recommended techniques in future, and that they strongly appreciated all that they had learned during the study.

Keywords: creative thinking, problem-solving techniques, academic course, innovative designs, team working skills

Introduction

In this article, we present a structure and basic tasks of a new original academic course, which was introduced at the Faculty of Architecture in Gdańsk University of Technology (2015, 2016, 2017). We describe the main parts of the course in detail, which were: theoretical background lectures, creative ‘warm-up’ activities and problem-solving techniques. At the same time, we paid attention to another basic aim of the course, which was the development of team working skills of the participants. In the last part of the article, we present the process of evaluation of the students’ work and the final results of the students’ questionnaires.

Traditional and non-traditional way of creating projects

Traditionally, at the beginning of the creation process, a designer usually sits over a blank sheet of paper and tries to find an idea for the project. More often than not it is quite difficult to get one. For many reasons, one can be ‘blocked’ and needs help to proceed with his work. Therefore, the architects and designers should know that there are several specific techniques to facilitate the designing process. These techniques give us a tool – a detailed instruction what actions to undertake in order to generate many creative ideas for our project. However, the question is: how to teach the future designers about the non-traditional, more innovative ways of design? How to teach them ‘the problem-solving techniques’ and ‘creative thinking’?

Innovative course for students

The above questions were the primary drivers for introducing a new academic course for the first year students of Spatial Planning at the Faculty of Architecture in the Gdańsk University of Technology in the year 2015. The title of the course was ‘Garden Cities and the Gardens in the Cities. A Course with Elements of Training Creativity’. The 15-hour course consisted of seven meetings, six of which were divided into three parts: a theoretical background lecture, creative ‘warm-up’ activities and implementation of problem-solving tools and techniques. The course ended with a final presentation of the project (at the 7th meeting), which was entitled ‘The Fantastic Innovative Green City.’ Every group of students had to do one such presentation, which needed to contain five obligatory elements: (1) A keynote-slogan of the city; (2) An original architectural idea for a Vertical Farm; (3) An unusual building/structure covered with a green roof; (4) One defined social or spatial problem to be solved by citizens; and (5) At least one other green or ecological solution created by the group.

1 Faculty of Architecture, Gdańsk University of Technology, joanna.kowalewska@pg.edu.pl
2 Faculty of Architecture, Gdańsk University of Technology, mjsol@wp.pl
Some parts of the course were inspired by the famous worldwide program – ‘Odyssey of the Mind’ (Kowalewska, 2016). It is an international educational project, introduced in over 25 countries. It promotes a creative, problem-solving competition, that was developed and started in 1970’s at Rowan University in New Jersey in the USA (Creative Competitions Inc., 2017). In that competition, teams of up to 7 members, in four age divisions (from primary school to university students) compete in two basic categories – long-term problem-solving presentation and spontaneous problem-solving presentation. The long-term problem-solving presentation is an eight minute public performance on a given topic, prepared by the team before the competition; whereas the spontaneous problem-solving presentation is a short answer to the task, given to the team at the day of competition to be solved right away in a few minutes (Odyssey of the Mind Polska, 2017). One of the authors of this article has been a team member of that program and since 2004 has been a volunteer for Polish part of the ‘Odyssey of the Mind.’ Therefore, using this experience in her educational practice seemed to be a natural consequence and resulted in the organization of the training creativity course at the Faculty of Architecture in Gdańsk in 2015.

The first part of the class: a theoretical background lecture
At the beginning of every meeting during the course, the teacher was presenting a theoretical background of the subject. Since the main theme was ‘Garden Cities and the Gardens in the Cities,’ every lecture reflected the different aspects concerning the most important ‘green’ solutions for an urban space in modern history. Among those solutions were: (1) the idea of Howards’ Garden Cities of Tomorrow; (2) the concept of green roofs; (3) the modern projects of vertical gardens; (4) the contemporary idea of vertical farms; and (5) the new concept of a social farm. There were two goals in those lectures. The first was to deliver a basic knowledge about some significant historical and contemporary solutions for green urban areas, and the second was to inspire innovative ideas as a good continuation of the former creativity - not just a repetition.

The second part of the class: creative ‘warm-up’ activities
The second part of each class were short ‘warm-up’ activities, stimulating the participants’ way of thinking. In order to prepare students for creative work during the further part of the meeting the lecturer gave them a simple task, involving invention and innovation. The task could be connected with a sort of design, drama or artistic activities, performed either in a team or individually. At the same time the teacher encouraged participants to look at the problem from a few different perspectives, preferably quite unusual ones. Some of the tasks could be inspired by the spontaneous part of the ‘Odyssey of the Mind’ educational program and could introduce a kind of competition between the groups of students. For example, during the 2016 year course, the chosen task-competition was ‘who would build more bridges connecting two tables in a limited time and using limited materials.’ After that competition, the winner group was presented with a catalog of ecological solutions in urban areas. Figure 1 presents a photo of one of the groups solving this task.

The third part of the class: the problem-solving techniques
The last part of every class in the course was the introduction of so called problem-solving techniques. Students could learn how to use this tool to solve their designing problems. For example – to make the final design of ‘The Innovative Fantastic Green City’ each group of students was asked to generate at least 60 ideas, using for it all of the five recommended problem-solving techniques. Those techniques were: the ‘Mind Map’ technique, the ‘Brainstorm’ technique, the ‘Problem Reversal’ technique, the ‘Superposition’ technique and the ‘Superheroes’ technique. They are today the most popular thinking techniques during various kind of workshops.

The ‘Mind Map’ technique, in its contemporary form and under this name, is known since the 1970s when it was popularized by Tony Buzan. According to Buzan (2005), it is a graphic technique used to unlock the capability of the brain to develop creativity in solving problems. To use this tool one has to write a keyword in the center of the sheet of paper, and then, around the keyword, a few associations and memories connected with it. The next step is to write other associations to the ones already noted, creating kind of a tree or a map. Those notes could be in the form of graphic images or simple words, drawn or written in different colors. Part of the process of the ‘Mind Map’ creation is shown in Figure 2.
The ‘Brainstorm’ technique is the most popular one of all the creative problem-solving techniques, and is based on noting down all the answers and ideas that can be given to the chosen ‘primary question.’ It was invented by Alex Osborn in 1950s. Osborn (2009) indicates four main rules of the technique. The first of them says to leave away criticism, as at the first stage of the technique there is no such thing as a wrong answer. The second rule is that the wild ideas are much welcome. Next guideline highlights that the more ideas would be noted, the more possible it is to find a creative solution. The last one recommends to combine and improve answers and ideas using them as an inspiration for further actions. Consequently, a group of participants simply write down all the answers to that ‘primary’ question that come into their minds. That technique has also some modifications. Among them there is the ‘Problem Reversal’ technique, introduced by Charles Chic Thompson. According to Thompson (2007) starting the ‘Brainstorm’ with a reversed question may bring even more innovative and adequate results.

The next technique introduced during the course was the ‘Superposition’ technique. This one refers to the ability to connect distant things and phenomena. As Szmidt (2013) indicates it rests on connecting two or more objects to get a new one after proper modifications. Firstly, the user writes associations to some separate objects. Later, he draws individual associations to different objects and tries to connect them creating a new idea.

The last technique introduced during the course was the ‘Superheroes’ technique. It was created by Arthur B. Van Gundy and its main goal is to look at the given problem from the new perspective – perspective of a superhero. At the beginning, the group of participants notes a problem to be solved and some names of superheroes. For each of the heroes the group writes down also the hero’s superpowers and all the team members have to recognize all of the chosen characters. Then the team writes down how each of the superheroes would solve the given problem using his superpowers. Further on, as Lewandowska-Walter et al. (2015) describes those ‘super’ methods are converted or are the inspiration for inventing the ‘real’ methods of solving the problem.

Every part of the final students’ presentation had to be done by a different technique. The ideas for the keynote-slogan for the city ought to be developed with the ‘Mind Map’ technique. An original architectural ideas for a Vertical Farm should be created using the ‘Brainstorm’ technique, while the concepts of an unusual building or a structure covered with a green roof had to be generated with the ‘Problem Reversal’ method. The ‘Superheroes’ technique should be used to prepare one defined social or spatial problem to be solved by citizens, whereas the ‘Superposition’ technique ought to be employed to create at least one other green or ecological solution to the design of ‘The Fantastic Innovative Green City.’

Team-work activities
The crucial part of the course were the teamwork activities. They were very important in developing the ability of cooperation, which was and still is one of the most desired manpower ability at the labor market according to Lowden et al. (2011). During the whole course, the students worked in groups of 5 to 7, creating their final project presentation together. The groups were chosen randomly during the first meeting. In the beginning, some students did not like that idea, but in the end, it appeared that the
majority of them appreciated the possibility of working with teammates they would never choose by themselves. In that way, members of the groups had different backgrounds, attitudes, styles of working and experience, which as the result gave a greater variety of ideas. To strengthen the groups’ identity, every team had to choose their name. The names were arbitrary, like for example Urban Heroes, Blue Forks or Fantastic Designers of Green Cities – as were the ones chosen during the course in 2015 and 2016. From the teachers’ perspective, it was also important that every student had to work with many others because during the warm-up activities groups were chosen each time differently. But the final project was done by the ‘basic’ teams – the teams with names.

Final presentations
The results of the teams’ work were presented during the 7th meeting. Time of presentation was strictly limited to 10 minutes. The method of presentation was facultative. Even though some of the groups (5 out of 13) chose simple PowerPoint presentation, there were also many other interesting forms of final reports, such as drama, songs, films, and models. Figures 3 and 4 show some of the final presentations of the 2016’s course.

**Evaluation criteria**
To ensure that the students obtain fair and differentiated marks at the end of the course, there were three main evaluation criteria. Each team got the scores for the group project presentation, but at the same time each individual got scores for the involvement and presence in the class.

Scores for the group’s presentation
Each of the five obligatory elements of the presentation was scored for its originality and degree of refinement. Teams also got scores for the cohesion of all the elements of the project and originality of the presentation form. In every category, the group could get 10 points. Additionally, if all members of the group took part in the presentation, they could get ten extra points.

Involvement in the preparation process
As the educators were not able to observe each individual’s involvement in the team’s work, this part of the evaluation was made by the students themselves. Every student was asked to value the teamwork and involvement of the other members of the group, sharing among them 100 points in both categories. A large majority of the students divided points evenly. However, some of them differentiated the scores to reflect the actual individual involvement and thereby influenced the final marks of their teammates.

Attendance during the course
In this type of the course, which was focused on the teamwork activities during the class, it was not possible for the students to make progress without a presence in the class. Scores for attendance were an integral part of the mark. However, individual cases were discussed if needed.

**Students opinion in questionnaires**
At the end of each year of the course, students were asked to fill the questionnaires. After the courses in 2015 and 2016 there were 84 participants in total that filled the questionnaires. The questions referred to each part of the class. In the first part, there were questions testing the overall opinion of the course, checking whether it was interesting, attractive, and useful for the participant. In further
three parts, the teachers asked the detailed questions to verify how students valued the blocks of the theoretical background lectures, the warm-up activities, and the problem-solving techniques. In the last part of the questionnaire, there was some space for comments. Below, the authors of the article are presenting detailed results of each part of the questionnaires, filled after the courses in years 2015 and 2016.

Students’ overall opinion of the course
At the beginning of the questionnaires, the participants were asked if the course was interesting. The answer ranged from 1 to 5 points, which indicated the range from ‘not interesting’ to ‘very interesting.’ 42% of the students gave the course the highest score, 37% marked 4 as a score in this category. Seventeen students ticked middle score (3 points), only 1 person selected 2 points, while no one stated that the course was not interesting.

Next, the students were asked if the course was attractive. As it had happened earlier, they could give from 1 to 5 points as the answer. 39% of the respondents gave the course the highest score, and the same number of respondents chose 4 as a score in this category. Fifteen students (18% of the surveyed) ticked the middle score, two students selected 2 points as an answer, and only 1 person judged course as not attractive at all.

The results of the students’ evaluation concerning the usefulness of the course were slightly worse. 53% of the respondents gave the course the highest scores (5 or 4 points). Only one person judged the course as not useful at all, while ten students selected 2 points as their answer. Figure 5 shows that 33% of surveyed students ticked the middle score.

Students’ opinions on the theoretical background lectures
Further part of the questionnaire had four questions concerning the theoretical background lectures. The first question in this part tested whether the gained knowledge at this part of the course would be used in future. The possible answers were: definitely yes, rather yes, maybe, rather not, definitely not. Most of the participants (65%) chose ‘rather yes’ as an answer, fifteen students (18%) seemed to be sure to use this knowledge in future, whereas 17% selected ‘maybe’ as an answer. No one declared not to use the theoretical knowledge of ‘green’ solutions in urban areas in future. Then the students were asked to choose the ‘green’ solutions, which were presented during the lectures and which they liked most, and reckoned as the most effective and useful in future. 40% of the participants chose green roofs as the solution they preferred, and 43% of them pointed out that solution as the most probable to be used in future. On the other hand, the biggest group of students considered not only green roofs but also vertical farms as the most effective ‘green’ solution for urban space. This data are presented in Figure 6.

Students’ opinions on the warm-up activities

Four questions concerning the warm-up activities were in the next part of the questionnaire. The first of these questions verified whether the tasks given during those activities would be useful in future. The possible answers were: definitely yes, rather yes, maybe, rather not, definitely not. The total of 28% of the participants declared that they ‘rather’ or ‘definitely’ would use that kind of activities in future, while 26% would ‘rather not’ or ‘definitely not’ use them. The most numerous group of students (39 persons) selected ‘maybe’ as the answer though. Then the students were asked to choose the warm-up activity that they liked most and considered the most efficient and useful in future. In that category, they pointed out the spontaneous task of the ‘Odyssey of the Mind’ as the most popular (28%), the most efficient (29%) and the most probable to be used in future (32 %) kind of warm-up activity. But as it can be seen in Figure 7, every warm-up activity presented during the course was declared to be used in future by at least ten students. What is more, only 8 out of 84 participants did not point out any of those tasks.

Students opinion on problem-solving techniques

Another part of the survey concerned the problem-solving techniques introduced during the course. The first question examined whether respondents would use them in future. The possible answers were: definitely yes, rather yes, maybe, rather not, definitely not. The great majority of respondents (84%), declared ‘rather yes’ or ‘maybe’ as the answer, while eight students (10%) were sure to use the techniques in future. As can be seen in Figure 8, only 6% of participants answered ‘rather not’ or ‘definitely not.’

Figure 7: Respondents’ answers to the question: Point warm-up activities that you would use in future

Figure 8: Respondents’ answers to the question: Would you use problem-solving technique in future?

Then the students were asked to choose the technique that they liked most and considered to be most effective and useful in future. The technique which was pointed out was ‘Brainstorm,’ and it was chosen not only as the preferable technique but also as the most effective and useful in future by 28-31% of participants. Seven students regarded every of the introduced techniques as useful and only five people did not choose any of those tools.

Students’ suggestions and comments

In the last part of the questionnaire, there was some space for the students to write their suggestions and comments. Only 26 out of 84 students decided to enter a few remarks. The majority of the comments were positive – saying that the course was very nice and suggested that there should be more hours devoted to it. However, 12 comments could be qualified as negative - four of them concerned the organization issues while eight claimed that the atmosphere of the course was too relaxed and that tasks were too easy.
Results of the questionnaire

To summarize the above-mentioned results of the questionnaire, most of the participants considered the course to be interesting, attractive and useful. What is more, the great majority of the students declared to use the achieved theoretical knowledge about the ‘green’ solutions for the cities in future. Furthermore, the majority of the participants allow the possibility of using the warm-up activities as well as the problem-solving techniques in practice.

Conclusion

If we take into account the high quality and variety of students’ projects presentations, as well as the good results of the students’ questionnaires, the conclusion is that the goals of the course were achieved. In particular, the structure of the course appears to be correct, it was properly led and evaluated. Nevertheless, there is still room for improvement, regarding mainly the organization matters and the teachers would introduce them. But the fact is, that after the 2015 year edition, the teachers were asked to repeat the course in the years 2016 and 2017. It means that not only was it appreciated by the students but also by the staff and head of the Faculty of Architecture.

HOW UPRISING IN ROMA FAMILIES HAS CHANGED OVER THE CENTURIES
Michal Kozubík,1 Barbora Odrášková2

Abstract: This study compares family upbringing in Slovak Roma during the 18th century with that of current times. It attempts to identify parallels between the Samuel Augustini’s 18th-century masterpiece: Gypsy in Hungary, and more recent data from a long-term study of Roma people in the eastern Slovakia–Poprad District. Open and axial coding inspired by the Strauss and Corbin Grounded Theory method is used to analyze the data. The primary results reveal that the common feature in all social classes of the settlement is a strong relationship between children and family. The poorest parents fail to provide adequate living conditions. Their children are brought up on the ‘street’ and come home only when hungry, thirsty, or want to sleep. Parents do not support further education of their children for several reasons: fear of an unknown environment, distrust of most educational institutions, or financial benefit of the family.

Introduction
Despite the Romological literature containing many scientific works and quality final research reports, there exists a gap in knowledge regarding the field of Roma education, with centuries of literature focused on inhabitants of Eastern Slovakia segregated settlements. The traditional Romany culture of Wallachia Romany is recorded in more detail. First, the work by Horváthová (1964): Gypsies in Slovakia, to date, is unbeaten in its complexity of detail. Socio-cultural regulations are described in detail in, Amáro Trájo [Our Life], by Wallachian Roma authors, Stojka and Pivoň (2003). However, this study focuses on the almost forgotten work of Samuel Augustini ab Hortis: Gypsy in Hungary (1775–76). In fact, this is the very first ethnographic work dealing with Roma life in the territory of Slovakia. This work contains information about the origins of Roma based on the work of several European period scholars. One motive for writing the Augustini monographs was the radicalization of opinions of a part of the Hungarian public for solving the ‘Gypsy’ issue. The situation, after more than two hundred and fifty years, may be similar. The aim of this study is to analyze the work of Augustini, to identify parallels between the past and present in the context of cultural change affecting the Roma living in the Podtatransky Region. Theoretical sensitivity and ethics of scientific research were considered in writing this article. The study of the traditional elements of Roma culture cannot be done “at the table” (Kozubík, 2015, p. 8). The history of famous anthropological works that record the study of culture from a distance includes the notable work of Benedict (1946). This present study explores the Roma culture through fieldwork, centered on the environment of Eastern Slovakia settlements. The aim was not to explore in a manner type regarded by Roma as “a ‘gadjo’ [white man, non-Roma] explores the Romany in the tube” (Kužel, 2004, p. 9). The examination of classes of cultural phenomena in a given environment requires considerable knowledge from social science disciplines. Some time was spent directly in the settlement, shaking hands, eating, and drinking with the residents. Such an approach is thought to bring new dimensions of knowledge (Kozubik 2013; 2015).

Data and Methodology
The study involved ethnographical field research. Ethnography combines various techniques and methods of data collection and evaluation (Brewer, 2000). It can be defined as the study of people in their natural environment using methods that describe their social perception and everyday experiences. It requires the direct and active involvement of the researcher.

1 Michal Kozubík, Faculty of Social Sciences and Health Care, Slovakia, mkozubik@ukf.sk
2 Barbora Odrášková, Faculty of Social Sciences and Health Care, Slovakia, barbora.odraskova@ukf.sk
Samples

Methods of data collection involved observation, individual and group interviews, and collation of artifacts, and historical and current documents and videos.

Study Location

There were several reasons for selecting Popradský region in Podtatranský district. One was the parallel in origins of Augustini ab Hortis Samuel and an author of this article. Both authors were born under the Tatra Mountains; Augustini in Veľká Lomnica (b. 1729) and Kozubík in Poprad (b. 1981), and thus, both can relate to the life of the Roma under the Tatras. Moreover, an important consideration was that Augustini described the culture of Roma in a geographic area familiar to the author.

Analyses and Reporting

The work was analyzed and interpreted using ‘thick description’ (Geertz, 1973) and ‘grounded theory’ (Strauss and Corbin 1997). The Geertz’s method treats the social science data in a way that recognizes cultural context and examines the sense of the observed phenomena. Geertz stressed that explaining social science is not necessarily simple, but rather involves the replacement of complicated images with simpler ones with the impressive clarity often associated with plainer illustrations (Geertz 1973, p. 33).

Geertz further stated:

In finished anthropological writing … this fact that what we call our data are really our own constructions of what they and their compatriots are up to – is obscured because most of what we need to comprehend a particular event, ritual, custom, idea, or whatever is insinuated as background information before the thing itself is directly examined. (1973, p. 9)

This original citation illustrates Geertz’s work most appropriately.

Results and Discussion

Roma Upbringing in 18th Century

The most critical passages of Augustini’s work can be found in the description of education for Roma children: “Their lack of morals and exuberance cannot be attributed to other causes, but the lack of education.” When closely monitoring the text of Gypsy for any changes in Roma education, which extends from birth to adulthood, one realizes that not only Augustini’s physical but also his mental balance is being devastated, degraded, and disgraced (Augustini, 1775). The next part of the text is similarly critical. One of the most important views applicable to this day is his opinion that: “…their marriage and household is then in the same mess they have seen and learned from their parents” (Augustini, 1775, p. 26). He also states that Roma “people are extremely fertile” and from early childhood, they teach their own children to steal. He even writes that Roma mothers defend themselves against attacks and strikes to their small child, who they usually carry wrapped in a sheet. Finally, he notes that there is a small group of families that are “similar to other useful people.”

Roma Upbringing in 21st Century

Being present among Roma families and children is one of the most important focuses of social work with these families. Field social work that involves staying within the natural environment of socially deprived families is essential for determining the family history and for other professional and consulting practices. Where the education of preschool-aged children is severely neglected, it is the duty of social workers to intervene. The most commonly applied and effective tool is the establishment of a special beneficiary. The introduction of such a role is regulated by §23 of Act no. 417 of 2013 on material needs. In the environment of segregated settlements, most frequently the village acquires this position. The Office of Labour, Social Affairs, and Family designates the special beneficiary, especially when the existing provision of benefits in material needs does not fulfill its purpose. In such cases, the financial support intended to cover basic needs for the children is misused for various reasons. In particular, this misuse includes incompetent spending, “everything is spent in three days,” usury, and expenditure on alcohol and other social-pathological phenomena. Where a village has a field social worker, the responsibility for this agenda becomes theirs primarily. Considerable power accumulates in the hands
of these professionals. They have the right to work with the family and divide and use the allowance to satisfy basic needs of the children and the family. The fact that raising children is gradually changing for the majority of the population is evident in the testimony of H.R. (25–30 years old, female):

We had an education of a ‘strict hand.’ This we could not do what our children can now. Mama just looked at me, and I had to go into the bedroom and had to stay there for half a day. We were hungry, thirsty until she did not come to ask: kids do you want something to eat? But now I do not command my children, but they command me. But it is not only our children but also white; it is about all. We have respect for our parents. I have my own kids, but I do not light a cigarette in front of them. I have respect, you know.

The statement: “We do not command our children, but they command us” was a surprising finding in this study. The Roma themselves realize what it is like for the majority. But they cannot explain the resulting situation and what has changed between the education of their parents and themselves, as realized by a Roma man, P. A. (26 years old):

I think we fail in many cases. The emphasis is given to irrelevant rather than to the essential. You have more important things and less important things. I would say that there is something a little reversed. I noticed that the mistake in education among us, the Romany, is that we do not keep our word, and then the children are rebellious, that I have a problem with my mother, with my father. I, for instance, now that my kid is on the earth, I ignore it. It is screaming, no! I do not care! But some else yes. And listen, then when the child grows up, it boldly yells on father and mother! It can boldly gain what it wants. So it is no longer the word of a father and mother, but the word of a child. I see it as very bad and distorted, but in many, many families it is like this. Even I was raised like this.

While recording this interview in a modest cottage, there was a mother who was confronted by her son’s words. She expressed herself as follows:

Well, you were brought up like this, you were spoiled, but you never told me anything bad. This is already in you! You swore, okay, but you were five, six years old! But as you were 14, 15 years old you were a normal boy. (P.B., 50 years old, female)

The responses have been deliberately published word-by-word, in a slightly abridged version of the interview. Members of both middle and upper social classes, living in segregated parts of the study villages of Kravany and Hranovnica, expressed similar opinions. In what was considered the poorest classes of the settlements, the love of children was observed as immense. This observation was noted in everyday routines, for example, with the care of newborns, the mother would embrace her child lovingly, or the father would caress his son. Verbal responses can often be framed towards what the researchers want to hear. Hence the truth in these could be greatly distorted and they lacked adequate validation. However, it is difficult to fabricate the non-verbal communication, body language, looks, or gestures. Nevertheless, there were also opposite opinions:

Education is different when you compare the settlement, Mlynská street and SNP street (the poorest parts of settlement). They do not have the upbringing of children in the settlement. Children educate themselves; they only bring those children. We are divided into three groups, such as family (i.e., poor, settlement, author’s note), medium family and a better, higher family. Sometimes parents respected their children and children their parents. Then the parents cared about the education, attended parents’ meetings at school, there was a hall full of sitting parents, and they were interested. (L.H., 45 years old, male)

In all three social layers of the Roma community, the love of children was evident. These Roma children are the reflection of their culture. Few ‘white’ children are brought up on the street with a key around their neck. The Roma children are raised by the settlement. This contradiction is best described by a Roma woman (H.P., 40 to 45 years old):

We, the Roma people, terribly love our children. We would give them even our last; even the white kids do not have this what Roma children have. Every day with our children is sweet,
even if there is no money, I do not know ... even when she does not cook (mother), but she
gives the children what they want, mom will buy it to them, even if she does not cook what she
would like to cook. She cooks a full pot of soup, but she will satisfy her children. At least on
the 18th, 19th, 20th of the month (date of money allowance for poor people in Slovakia). It does
not matter which family, but they give their children also from the last. Last few years, the
children do not want to go to school on 18th, 19th, 20th, because they go to pick up allowances
with their parents. We can thus say that they cannot live off, they do not have, but they look
after the children. They love their children, but it is about the time and education.

Conclusion
Every day spent in the settlement was an experience, and each visit of a new family brought some new
knowledge. The atmosphere was unique in all respects. During the interview, people kept coming to the
house as children, family members, and others wanted to see a ‘gadjo’ [white person], who for them
was the journalist writing a book about their life and culture. They would mend the television and
position the satellite. The children were crying, and the adults were smoking tobacco from a rolled
cigarette. In this atmosphere, it was almost magical to talk about the relationship between parents and
children. The period of ‘enlightened’ is gone and so are the views of Augustini ab Hortis Samuel on
education. It is not just about the mothers who bear children into a pit, teach them to dance, collect alms,
and steal. Roma people, similar to Slovak people and all human beings, love their children and realize
that education is important, especially at a young age.

The main differences between centuries is more freedom in family education in the present. It shows
mainly in the independent decisions of the children: choice of partner and career. The principal common
thing which is the same within centuries is strong familial bond not only between close family members
but also between distant relatives.

IDEAS ABOUT NATIONAL IDENTITY IN RUSSIAN LITERARY REVIEW,
HISTORICAL AND LITERARY DISCOURSES OF THE 19TH – EARLY 20TH CENTURY
Viacheslav Krylov¹

Abstract: This article analyses the evolution of literary reflections among the representatives of the 19th-early 20th-century trends and schools where ideas on national literature distinctness were formed. The study specifies both an invariant of the notions of national literature identity and individual variations that did not find further development in literary self-awareness. The essays of the 1870-80s suggest that there was formed an image of the original literature opposed to European literature. A new impetus to the problem of national identity in literature was attached to the era of the Silver Age; however, the analysis of the literary review, historical and literary discourses of the turn of the century leads to the conclusion that it was in this era that the ideology of literary centrum was further strengthened, and the exclusive status of Russian literature in culture received detailed reflection.

UDC Classification: 821.161.1; DOI: http://dx.doi.org/10.12955/cbup.v5.1007
Keywords: national identity, Russian, literary centrism, discourse.

Introduction
There exist well-known ideas made by foreign writers and researchers about the national originality of Russian literature. However, the study of a national identity requires a view made by the natives since the concept of identity presupposes a stable self-image developed in self-reflection and introspection. According to the British researchers Simon Franklin and Emma Uiddis, ideas about Russia and Russian... to a great extent are the fruit of those who can be called “the producers of culture” “in the broadest sense of the word” (Franklin and Uiddis, 2014). They also stated that a significant part of Russian culture, either directly or indirectly, to a greater or lesser degree, is addressed to itself and is permeated with the theme of Russia and Russianness (Franklin and Uiddis, 2014). Russian criticism, journalism, and the history of literature exist as a feature of culture in which the Russian theme is constantly discussed and dreamed of.

One of the forms of literary self-consciousness is criticism, especially the critical and aesthetic texts of the writers themselves, their declarations and manifestos. The ideas developed in them about Russian literature as a holistic phenomenon, its specific features, and national identity have undergone a long evolution – from the Romantics – Pushkin, Gogol, I. Aksakov, to the Symbolists – S. Vengerov and others.

The aim of this article is to present a comparative analysis of reflections on literary reviews of representatives of different trends and schools of the 19th-early 20th century, during which the construction of ideas about the national originality of literature was carried out. The materials and results of the research can be used in teaching the history of Russian literature. They also contribute to the study of the issues of national identity in Russian culture. In the course of the study, new questions arose related to the study of the fate of the literary-centrist ideology in the Soviet and post-Soviet epochs.

Data and Methodology
In recent decades, the topic of national self-identification, the study of the mythology and the ideology of imperial consciousness, their reflection in various cultural practices have been of interest in contemporary humanities. One of the latest issues of the independent Russian journal Novoe literaturnoe obozrenie was devoted to the theme “The Imperial Imagination and Cultural Policies”. The editorial staff rightly proceeded from the premise that “cultural texts and cultural sources can sometimes tell us more about imperial ambitions and fantasies than the openly declared political projects” (Prokhorova, 2017). Many researchers turn for the reconstruction of national identity to the texts of fiction, but even today literary review, historical and literary discourses are still on the periphery of the research interest. The basis of our research is the methodological idea that literary criticism is not only a reflection on literature, but also a discussion about the social structure of society, psychological problems; it is a way for a person to take a closer look at life. The concepts

¹ Kazan (Volga Region) Federal University, krylov77@list.ru
introduced by Wilde (1966), Frye (1973), Hartman (1980), and Man (1983) influenced our understanding of the literary review discourse.

Results and Discussion

The experience of German aesthetics was of great importance for Russian literature, including the impact of understanding of the nation and national identity that goes back to Herder and the German Romantics.

The topic of national identity dates back to the era of Romanticism. From the standpoint of the aesthetics of Classicism, this or that national manifestation in literature was recognized as an unauthorized deviation from the universal human norm which rested on rational grounds. But the pre-Romantics raised the topic much earlier. Here is an example of the opening of A. Turgenev’s “Speech on Russian Literature” read in “The Friendly Literary Society” in March 1801, “On Russian Literature! Can we use this word? Can it be an insignificant notion for something that does not exist?” (Turgenev, 1980). Following A. Turgenev, the famous slogan of the Russian Romantics “We have no literature” was developed by V. Kiukhelbeker, A. Bestuzhev, D. Venevitinov, A. Pushkin, and early Belinsky. All of them blamed the contemporary literature for imitation, reckless following of patterns, and oblivion of national identity. It should be noted that it triggered the mechanism of diachronic excluding of certain texts from the literature that Yu. Lotman wrote about: “Exclusion of certain texts from literature occurs not only synchronically but also diachronically; the texts written before the appearance of the declared norms or not related to them are considered non-literature” (Lotman, 1992).

D. Venevitinov in his article “On Enlightenment in Russia” (1826) argued that Russia had received everything from the outside; this concerned the feeling of imitation, complete absence of any freedom and true activity. He called the position of Russia in the literary world as “completely negative” (Venevitinov, 1980).

Romantic treatises were created in the rhetoric of the expected future, anticipation, passionate expectation of the original Russian literature. Romantics reasoned to a greater extent that we could have a truly folk poetry.

The most important Russian浪漫istic treatise “On Romantic Poetry” by O. Somov begins with a typically romantic thesis: “Literature of every nation is a self-explanatory picture of its customs, traditions and a way of life. Every writer, as if involuntarily, displays folk features. Thus, it is almost possible to guess the composition of a German, an Englishman or a Frenchman, at least in translation”. (Somov, 1974). Somov argued that the properties of poetry depended on the “spirit of the language,” “inclinations and customs of the people,” properties of the surrounding objects. (Somov, 1974). In Russia, there are all conditions for a truly original literature, free from imitations.

In this respect, the evolution of Belinsky's views on the specifics of Russian literature is indicative. There is good reason why his first significant work was titled “Literary Dreams.” Here Belinsky also noted the absence of Russian literature. Having put forward the thesis, Belinsky at the same time was full of confidence in the emergence of original literature:

“We have no literature. I repeat this with delight, with pleasure, for in this truth I see a pledge of our future successes. Take a good look at the course of our society, and you will agree that I am right” (Belinsky, 1948a).

Six years later, in the review “Russian Literature in 1840”, while reviewing the question of lack of literature in Russia, Belinsky argued, “The source of literature of the people may not be some external impulse or an external push, but only a world outlook of the people” (Belinsky, 1948b). According to Belinsky, Russian literature started with Pushkin – “this is not Russia’s acquaintance with Europe, but Europe’s with Russia” (Belinsky, 1948a).

The article “The general Meaning of the Word Literature” displayed a change of the tone of the assessment. European influence on Russian literature was interpreted by him from the standpoint of special properties of the Russian character (NB: long before Dostoevsky!). And in the review “Russian Literature in 1842” (after the publishing of “The Dead Souls”), he definitely said, “Our social life is predominantly expressed in literature” (Belinsky, 1948b). Literature strengthened “on the basis of
Russian nationality, entered the life of society” (Belinsky, 1948b). Thus, one can conclude that Belinsky was one of the first to state the fact of literary centrism in Russian culture.

Revealing the influence of literature on society, Belinsky noted:

“Our literature has created the morals of our society, raised several generations, and formed a kind of public opinion” (Belinsky, 1948c).

It was then that the tradition of criticism to determine not only the content properties of Russian literature but its enhanced functional role in society too was introduced. Henceforth, most of the discourses on Russian literature were created within the literary-centric focus. Rare voices of a different position do not change the general picture, but they cannot be ignored.

Thus, I. Aksakov, in his article “On the Exaggerated Significance Attached by Us to the Action of Literature”, expressed, contrary to the general opinion, an unexpected thought, “...because of our abnormal social development, literature does not mean what it must mean to us, it is forced by circumstances to play a role that is not characteristic for it, and, in fact, illegal. In all other educated countries, literature is one of many organs by which the actions of the social organism are committed” (Aksakov, 2006). This is no longer a recognition of merits, as Belinsky did; an exaggerated significance of literature is a “wild anomaly” (Aksakov, 2006).

The Slavophil discourse excluded a positive influence of such literature on society, the tyrannical power of literature was an imaginary power. This trend was continued in the early 20th century. The reasoning of I. Aksakov is attributed to those peripheral voices, which were destined to manifest later. But on the whole, the arguments about Russian literature since the 1840s were built in the rhetoric of what was accomplished, albeit with constant reservations about the “youth” of Russian literature. M. Alekseev wrote, “A few decades later everything that Belinsky dreamed about and believed in became a real fact and was fully realized. A friend and pupil of Belinsky, I. Turgenev, acquired the pan-European significance, Herzen’s voice sounded throughout Europe and in all European languages, he was followed by Leo Tolstoy and Dostoevsky who received worldwide recognition” (Alekseev, 1976).

Starting with the 1870s and 1880s, when Russian literature gained recognition in Europe, critical discourses were based on the juxtaposition of Russian and European literatures. Here, first of all, it is necessary to name the speeches of I. Turgenev (June 1878, Paris, The International Literary Congress) and S. Vengerov. In these arguments, there was constructed an image of original literature that exerted an immeasurably greater influence on Russian society than in European countries.

Returning to the logic of criticism of the 1870s-80s, one can note that it always strove to raise Russian literature. Academician M. Alekseev drew attention to the storm of indignation caused by Turgenev’s speech at the Paris Congress among all Russian writers and in the Russian press, “Why did, according to Turgenev’s critics, he chose such criterion for the value of Russian literature as its proximity to European models?” (Alekseev, 1976).

At the same time there appeared arguments about the originality of the form of Russian literature expressed in the writer’s own environment. For example, L. Tolstoy’s article “A Few Words About the Book “War and Peace” (1868).

In the late 19th – early 20th centuries the problem acquired a new impulse: there was an aspiration to integrate, give results of the literary development of the entire 19th century – the “golden” century of Russian literature, during which the language, forms, and the content of literature changed so much and its influence on Russian society changed radically.

During this period, we can speak of two positions in relation to literary centrism, of the coexistence of two, to a certain extent, oppositional ideologies. One ideology appealed to literary centrism as the core property of Russian culture and even, despite its crisis, sought to “preserve,” that is to keep the special status of literature.

A literary historian Petr Morozov in a little-known essay “Russian Literature in the 19th Century” (1902) outlined the path of new Russian literature from the time of its apprenticeship and imitation to independence. Russian literary heritage of the 19th century was contrasted here with the decline of the last decade. “Our literature has always set itself the goal of life teaching – to help a thinking reader in their quest to understand the surrounding life.” (Morozov, 1902).
According to Morozov, at a time when Russian literature acquired national identity and gained world recognition, modern literature began to decline, “our literature was constantly losing the thread of its once organic development; new writers do not know whether to continue Turgenev and Tolstoy or follow Zol’s footsteps, or imitate Ibsen, or transplant the rotten shoots of French decadence into the Russian soil” (Morozov, 1902), that is, its identity is lost.

Other less prominent voices (although their number increased in the Silver Age) talked of “moving” literature to a normal, equal place among all literature in a broad sense (here you can see the continuation of I. Aksakov’s point of view).

In a little-known article by Nikolai Shapir with an indicative title “Literature Teaching” published in the journal “Russian Thought” (1913, no. 4), a special public role of literature in Russia became a reflection of the low intensity of the national culture. (Shapir, 1913).

“It is necessary to put literature on a par with all other books” (Morozov, 1902).

In this regard, the attitude of critics to contemporary literature changed. For some, as has already been shown at the example of Morozov’s work, Russian literature finally acquired a national status, but it lost its identity. Others saw in the contemporaries’ attempt to “teach” (Gorky and others) a step back.

Lev Shestov, defining the distinctive properties of Russian literature (“simplicity, truthfulness, and perfect absence of rhetorical embellishments”), saw in them “a consequence of our relative lack of culture” (Shestov, 1996). In the book “The Apotheosis of Groundlessness” (part 2, Chapter 45), he contrasted Western European and Russian people, which, according to Shestov, also influenced the writer’s behaviour, “A European person relies only on themselves and nobody else. They firmly believe that if they do not help themselves, then no one will help them. Accordingly, all their thoughts are directed to the best possible arrangement of their life... Russian writers, with few exceptions, quite sincerely despise the pettiness of the West”. (Shestov, 1996).

Perhaps the most serious blow to the literary-centred ideology was inflicted by V. Rozanov in his late articles of 1917-18 in which he drew an almost apocalyptic image of the entire country’s demise from literature. He, in fact, made Russian literature the culprit of the Russian revolution. (Rozanov, 1995).

But, despite these tendencies of revision of the existing paradigm, the literary-centric discourse still prevailed in the Silver Age in judgments both of symbolist and religious and philosophical criticism, and the trend of “pushing back” literature remained on the periphery of public consciousness.

Russian symbolism from the late 1900s, having acquired a neo-Slavophile orientation, was also in this paradigm. A significant place in Andrei Bely’s article “The Present and Future of Russian Literature” (1909) occupied a comparative characterization of Russian and Western European literature (as already noted, the Russian discourse on literature in the 19th century rarely touched upon meaningful characteristics), “The task of contemporary Russian literature is to accept the provision of Western European aesthetics: the form is inseparable from the content. But Russian literature will never agree to such a conclusion. A form is only a product of religious creativity. A literary device is the outward expression of a living confession”. (Bely, 1994).

Therefore, we can see that the literary-centric discourse of the early 20th century appealed to the past; it was filled with the memory of the tops of the 19th century.

A kind of final historical and literary reflection on Russian literature was Semyon Vengerov’s presentation “What Is the Charm of Russian Literature of the 19th century?” (The speech was delivered in Moscow on October 22, 1911 at the celebration of the centennial anniversary of the Society of Lovers of Russian Literature.). S. Vengerov dwelled on the question: what is actually Russian literature. He did not follow the path of functional definitions of literature, but tried in a capacious but expressive form to define its key meaningful constants. To determine the essence of Russian literature, Vengerov used the term “suggestion” introduced by J. Guyot referring it to the word “charm.” This, according to Vengerov, was “the only key to understand Russian literature in particular” (Vengerov, 1919).

Russian literature, according to Vengerov, was created remarkably by a “conscience-stricken gentleman.” Developing the populist argument, Vengerov saw it in the “conscience-stricken gentleman” as the main source of its “charm and spell.” And even for the unprivileged intellectual who succeeded him in the 60s “the problem of conscience, the problem of subjugating the personal good to
the common good proved to be... as burning as for the “conscience-stricken gentleman.” (Vengerov, 1919).

Reconstructing the model of life in Russian literature, the type of thinking reflected in it, behavior and attitude toward life Vengerov argued that in Russian literature “the ideal of personal happiness is completely banished.” “Personal happiness in the understanding of Russian literature is either criminal, if it is created at the expense of others, or, at best, is vulgar. The fact was striking and at the same time profoundly touching, profoundly significant for the establishment of the heroic character of the 19th-century Russian literature: there is no Russian novel, no Russian story written by a real coryphaeus with the so-called happy denouement which was typical of European literature and first-class writers”. (Vengerov, 1919).

This ethical orientation of Russian literature created a special emotional pathos: “Hence another source of fascination of the 19th-century Russian literature is what I call Great Sorrow. It seems to me that this Great Sorrow, spilled all over new Russian literature, is in close organic connection with the entire Russian national character. Russian landscape is sad, which, however, Nekrasov so yearned for among the luxurious nature of the south. A Russian song is sad, “like a moan,” by the definition of the same Nekrasov... But the sadness carries unspeakable beauty. Carefree and cheerful laughter is completely alien to Russian literature. It knows only bitter laughter”. (Vengerov, 1919).

Conclusion

Thus, we examined in the diachronic aspect a set of ideas of Russian writers about themselves at different stages in the development of literature. The study specifies both an invariant of the notions of national literature identity and individual variations that did not find further development in literary self-awareness. The starting point of the formation of Russian literature uniqueness is attributed to the pre-Romanticism. Necessity for original Russian literature inspired A. Turgenev to claim that Russian originality should manifest itself, first of all, in the surrounding life free from uncritical borrowing. Following A. Turgenev, the idea of denying truly national literature in Russia became a trend and was continued in the speeches of Kiichelbecker, Bestuzhev, Venevitinov, Pushkin, and early Belinsky. A symbolic expression of this idea is the formula “We have no literature.” Most romantic treatises were written in the rhetoric of the expected future. Belinsky’s articles occupy a special place in the formation of ideas on national literature originality. Besides, his early works resemble the findings of romantic aesthetics. However, after reviewing Russian literature of the 1840s, we can say that he linked the history of literature with the world outlook of the people. Belinsky was one of the first to note the tendency for emerging literary centrim in Russian culture. Starting with Belinsky, most of the critical, historical and literary discourses about Russian literature were created with the focus on literature.

The article highlights two opposing ideologies based on the essays of the critics of the late 19th-early 20th century. One of them appealed to literary centrim, but the number of those critics who talked about the artificiality of such a situation increased. Nevertheless, the ideology of literary centrim remained predominant. The fate of these views in the Soviet and post-Soviet eras may be the topic of a separate study.

TRANSLATION AND DICTIONARIES IN FOREIGN LANGUAGE ACQUISITION: 
THE CASE OF THE LATVIAN LANGUAGE

Diāna Laiveniece,1 Linda Lauze2

Abstract: In modern linguodidactics, there is no uniform understanding of the necessity of translation in the acquisition of a foreign language. The aim of the research is to find out the language attitudes held by full-time and Erasmus exchange program foreign students towards translation in acquiring Latvian as a foreign language on language proficiency level A1 and A2.

The research is based on a qualitative study dealing with the results of survey data as well as direct observations inferred from the work with foreign students. The questionnaire consists of 11 questions on translation and usage of dictionaries and a question about personal information. The answers of 35 respondents from 12 countries have been analyzed. 91.43 % of the respondents enjoy translation tasks, only 8.57 % of answers are negative. The highest evaluation was given for word translation, that is, 4.23 for translation from a foreign language (Latvian) into English (being the intermediary language) and 4.15 the other way round in a five point scale. Diverse linguistic experience, differences among language systems, students’ language attitudes establish the purposeful use of translation in foreign language acquisition.

UDC Classification: 8111; DOI: http://dx.doi.org/10.12955/cbup.v5.1008

Keywords: Latvian as foreign language, foreign language acquisition, translation, dictionary, plurilingual teaching/learning environment

Introduction

Translation is a major component in foreign language acquisition at an early stage, particularly at A1 and A2 level, when learners’ knowledge of English is insufficient, minimal or the learners even do not know the language at all. Translation is one of the ways that serve as a transition from one language to the other. It is either used automatically or in cases when the teacher asks students to translate. In most cases, we translate a foreign word, sentence or text if we do not understand them. Language learning is, in any event, a transference process in which literal, word-for-word translation is essential at early stages.

In some publications authors (Carreres, 2006; Marquíes-Aguado, Solis-Becerra, 2013; Mutore, 2013) compare didactic guidelines on translation as a tool for language acquisition in the education process of translators and interpreters. Also, the Common European Framework of Reference (CEFR) for Languages focuses on mediation strategies when discussing language learner’s communication. “In mediating activities, the language user is not concerned to express his/her meanings, but simply to act as an intermediary between interlocutors who are unable to understand each other directly [...]”. Examples of mediating activities include spoken interpretation and written translation as well as summarising and paraphrasing texts in the same language when the language of the original text is not understandable to the intended recipient.” (CEFR, 2001, p. 87) To translate orally or in a written form, one’s command of the language is to be on a rather high level. This study focuses on the early stage of foreign language learning when translation helps to understand the person who learns the language rather than others, so this aspect will not be discussed in more detail.

Methodology

The aim of the research is to find out language attitudes held by full-time and Erasmus exchange program foreign students towards translation in acquiring Latvian as a foreign language on language proficiency level A1. Studies on updating translation in the acquisition of foreign languages form the theoretical basis of the research (Cook, 2010; Leonardi, 2011; Mogahed, 2011; Dagiliené, 2012; Tsagari, Floros, 2013; Fernández-Guerra, 2014, etc.). The empirical part of the research is based on a qualitative study dealing with the results of survey data carried out in 2017 as well as direct observations inferred from the work with foreign students. The questionnaire consists of 11 questions on translation and usage of dictionaries and a question about personal information (age, gender, native language, and proficiency in foreign languages). The sample consisted of 35 respondents – 11 female

1 Faculty of Humanities and Arts, Liepāja University, diana.laiveniece@liepu.lv
2 Faculty of Humanities and Arts, Liepāja University, linda.lauze@liepu.lv
and 24 male, 19–45 year old bachelor and master level students from 12 countries (Lithuania, Portugal, Ukraine, Turkey, India, Sri Lanka, Pakistan, China, Russia, USA, Germany, Nepal). Students mentioned 13 different mother tongues (Urdu, Tamil, Punjabi, Turkish, Hindi, Sinhala, Nepali, Lithuanian, Russian, Chinese, German, Portuguese, Ukrainian), three respondents were bilingual (English/ Russian; Tamil/Sinhala; Urdu/Punjabi). All respondents understand English, to about a half of them English is the only foreign language, but 17 students indicated that they know other foreign languages at different levels, in some cases, also mentioning Latvian language skills. The research also analyses the usage of dictionaries in learning the Latvian language as a foreign language.

Results

First, it was found out in the survey what respondents do if they do not know the meaning of a word, by offering the possibility to mark several options of the six answers provided (see Figure 1). In general, foreign students have ticked 64 choices, preferring the answer look it up in a bi-lingual dictionary (29.69 %). Direct observations show that in cases in which students have chosen the option toask somebody for help (15.62 %) it reflects two kinds of activities – during a class ask a course mate who is also a foreign student or the language teacher and outside classes ask a native speaker that is usually a student living in the university dormitory. It should be noted that the respondents’ knowledge of the language is not sufficient yet to analyze the usage of the new word in context as they are elementary learners. This option is selected just by 10.94 % of the respondents who know some other foreign language, quite often even two, three or four languages. Students use bi-lingual dictionaries more often than explanatory dictionaries. It corresponds to learners’ language skills necessary for simple language proficiency level, that is, students can use a bilingual dictionary and are aware of the need to check the used words and their meanings carefully (Šalme, Auziņa, 2016, p. 174).

Analyse the current issue Do you consider a book format dictionary or a digital one to be more convenient for usage in language acquisition? Why? We can conclude that 81.82 % of the respondents consider digital dictionaries as the most suitable ones, 9.09 % of the students use both types of
dictionaries, but 9.09% point out the advantages of paper format dictionaries. There are some common positions:

- I use both versions. However, during the last three years I used the Google version as it is faster than the standard dictionary (male, 45, USA);
- Digital one. Easy to search, easy to use, handy (male, 28, Pakistan);
- I prefer digital one because on the Internet I can listen to the pronunciation and learn the language better (male, 21, Pakistan);
- Digital ones are easier to use, but I like a book format dictionary and touching a real dictionary. Reading explanations from them is more permanent (female, 19, Turkey);
- I consider a book format because it is easy to understand (male, 25, India).

Students highlight the following advantages of digital dictionaries: they are modern, you can quickly find and understand words, they are portable, and you can hear the pronunciation of the word. The authors can agree with a foreign student who says:

- The digital dictionary is very useful because it’s easy to take away like in the phone and it is updating after some time. So, that’s why we are able to set more information (male, 32, Pakistan).

Another advantage is that the words are arranged in a definite system and that it is easy to understand the meaning of a word.

Since learning a foreign language is connected with specific cultural and social differences, pictures can help with getting to know the meaning of new words. For example, learning the vocabulary concerning fruit, a picture of a melon may assist the student to understand that the Latvian language has two different words: melone (‘melon’) and arbāzs (‘water-melon’). When teaching the phrase bērzu sula (‘birch sap’) pictures of a birch and birch sap help students to have an idea of this drink. All respondents (100%) confirmed that pictures are useful for understanding the meaning of a new word when it is necessary to clarify it.

In the survey respondents were asked to rate the usefulness of the translation, both from Latvian into English and from English into Latvian, as a means of learning a foreign language. Translation of different level language units (a word, a phrase, a grammatical unit, and a text) was assessed on a five-point scale where one stands for not at all useful and 5 for very helpful. In all the translation positions the index is higher than 3.5 (see Figure 2). In the translation from the Latvian language into English, word translation ranks highest – 4.23, and translation of a grammatical unit is the lowest – 3.51 points. There are slight differences in the translation assessment from the English language into Latvian. The translation of a word ranks the highest here as well – 4.15 points and the translation of a grammatical unit is the lowest as well – 3.67 points. The results show that elementary learners are not yet aware of the significance of the word’s grammatical meaning. In flective languages, both lexical and grammatical meanings of the word are important to understand a text.

**Discussion**

In modern linguodidactics, there is no uniform understanding of the necessity of translation in the acquisition of a foreign language. The question about translation as a teaching method and the use of it in foreign language acquisition has become essential in the recent ten years. Currently, there are radically restrictive policies. In some researches translation is disproved and considered as an artificial, unproductive, totally useless exercise and a frustrating, not motivating learning activity (see for example Fernández-Guerra, 2014, p. 154). Other researchers, on the contrary, point out that translation is a cognitively meaningful and purposeful language learning exercise.

In some foreign language learning methods, such as in the grammar translation method, translation is one of the most important training techniques. It helps learners to more accurately understand whether the meaning of words, their grammar forms, and syntactical structures are similar in their native language or the intermediary language to those in the target language they learn (Skujina, 2011, p. 91).

---

3 In their answers students’ use of language is preserved.
Whether the translation component from the classical methods of foreign language acquisition will be integrated into the modern teaching methods – that is the question that is currently topical for foreign language teachers. There is an opinion that translation as one of the foreign languages learning techniques is suitable for teaching literary (formal) language or working with linguistically oriented language learners who like learning grammar and vocabulary in detail (Carreres, 2006). Whereas, when teaching the so-called “average learners,” translation is completely inappropriate. It is well known that translation is a complex activity associated with language, culture, communication and cognitive factors (Fernández-Guerra, 2014, p. 157). Therefore, not all language learners can do a qualitative translation.

At the beginning of the 21st century the issue of using translation in the foreign language learning process and the productivity of the communicative approach, as well as the evaluation of modern teaching methods, has become topical (see for example Cook, 2010; Tsagari, Floros, 2013). In the previous centuries, when foreign language learning was dominated by other approaches, mainly the above mentioned grammar translation method, translation as a right or wrong teaching method was not discussed or considered. Nowadays there is a need to improve the communicative language learning method by adding translation tasks (Mutore, 2013, p. 96). It is undoubtedly influenced by the availability of new technologies – if learners have a Smartphone, they also have the most extensive translation options.

It is more and more increasingly stressed that translation itself is a useful skill. In the globalized world and multilingual society, translation as a means of public communication is around us. We see it in announcements, labels, menus, news subtitles, etc. (English Language Teaching Global Blog 2011) and it is just logical to consider the question how to use translation in language learning.

To understand the issue of “for and against translation in language learning,” it is worth learning more about at least one publication against translation in language learning and try to rebut it taking into account recent positions. For example, in the introduction of the book “Translation and Language Teaching” seven arguments are mentioned against the use of translation in language acquisition (Malmkjær 1998, p. 6). The interpretation of these arguments follows, and they are at least partly rebutted from a modern foreign language learner.

</tbody>
</table>
1. Translation is independent and radically different from the four skills which define language competence: reading, writing, speaking, and listening. Rebuttal: for some time already thinking is considered to be the fifth language skill (Fisher, 1990). You cannot use the language without thinking. Translation, if it exceeds the boundaries of one lexeme, requires lots of thinking, so, when you translate, your habit to think about language is developed which in its turn contributes to the development of all four language skills above mentioned.

2. Translation takes up valuable time which could be used to teach those four skills. Rebuttal: you do not need to do translation during all language lesson, though translation can be helpful to develop the skills of independent work.

3. Translation is unnatural. Rebuttal: in today’s dynamic world it is not possible for monolingual speakers to learn all the necessary foreign languages at a level of the native language or for bilingual language users at a level of the first and the second language, so the translation is a natural daily necessity (see more: Leonardi 2011).

4. Translation misleads and prevents students from thinking in the foreign language. This view can be partially accepted, but only in respect of productive language skills: speaking and writing. Reproductive language skills (listening and reading) are improved by using translation.

5. Translation is a severe test of language skills. Rebuttal: translation cannot be the only way of testing language skills, but it is beneficial for testing vocabulary.

6. Translation produces interference. Rebuttal: interference is a natural consequence phenomenon of two language contacts, which is reinforced not by literally translating words and phrases but by the uncritical attitude to the use of language.

7. Translation is only appropriate for training translators. Rebuttal: if the translation were applied only to the education of interpreters and translators, the mutual impact and interconnection of both areas – didactics of translation and language learning would not be widely studied.

In the process learning the Latvian language as a foreign language, translation is not used to translate everything that learners do not know, but only in some cases when there is a reason to believe that learners have not understood something. In such situations, it is essential not to translate the entire sentence or text, but to highlight only some words or phrases and ask the learners to explain them in intermediary language. As soon as the teacher feels that translation is not needed, namely, the unknown words or phrases do not interfere with understanding the text and using it; translation becomes the language learner’s individual choice.

What language learner already knows, gives him a positive self-esteem, allowing him to look at the yet unknown without suspicion. Therefore, when involving translation, the language teacher should focus more attention on the new language elements and not ask students to translate what the learner already should know from previous studies. Though, if it is required, it can be seen as a motivating activity – when translating language learner gets a confirmation that they know and understand a lot of the target language. As is known, understanding in reading or listening – perceptive skills – precedes always productive skills. It is worth using the target language as a motivating factor when learning the target language (see also Mogahed, 2011).

Sometimes when you need to get a more accurate meaning, for example, šķūnis (‘shed’) or ligzda (‘nest’), which learners do not also know in English being the intermediary language, either a third language – the native language – is involved in the translation process. As mentioned before, the availability of electronic dictionaries in mobile phones makes this process much easier and faster.

In this respect, the so-called transparent vocabulary – international words or phrases, whose pronunciation/spelling and meaning students are already known to students, such as kiwi, garage, mango yogurt. Those are words whose meaning and form are recognized and understood immediately because they are similar to corresponding native language words. Transparent vocabulary is “the first key to information decoding” (Gridina, 2006, p. 148). Latvian language as a foreign language is often learned in a plurilingual learning environment in which language learners use knowledge of several languages to learn the target language. Plurilingual approach “is based on the belief that learners of a new language look for similarities between the new language they are learning and others they already know and that in communicative situations the influence of those familiar languages appears in the use
of the new language” (Bliska, 2015, p. 5). A person does not learn every language in isolation but forms links with the languages known to them, constructing metacognitive strategies, called language acquisition and is also used in language use. In the process, it does not matter which language “promotes recognition” (Bliska, 2015, p. 92).

One of the arguments why translation as part of foreign language learning is not considered appropriate is the fact that getting to know the meaning of the word by translating it. It is used in an instant action (the sentence is understood), but you do not memorize it, because you do not create associations which can be done, for example, by using pictures or detailed explanations. The quickest way to understand the unknown word is to translate it in the language the learner knows. However, it does not promote the memorization process. Therefore, if the translation is used in the language learning, learners must work with their dictionaries – their notes where all the new words are recorded and later remembered.

Using personal dictionaries ensures learning the meanings of the word, but does not guarantee its inclusion in active vocabulary; therefore the new words have to be included in the further learning process, both texts, and tasks, several times. If learners still do not understand the translated word, the teacher has to return to the first context in which the word was used. In this process, it is better to use the target language rather than translation, as in this way associations are created that promote memorizing the word. The use of cognitive effort and associative thinking to recall the meaning of a translated word is an important part of foreign language learning.

Both during and after the lesson when students do different tasks independently, translation is done with the help of a bilingual dictionary. When working with dictionaries, you need to focus on the lexical and grammatical aspect of the Latvian translation. At the early stage of language learning, students find it difficult to choose the best translation if the dictionary offers some options. Students have not formed the feeling for the foreign language yet. Thus they trust the dictionary and use the first word the dictionary offers.

Some foreign students are interested in the use of bilingual dictionaries in paper format; therefore they ask the teacher to suggest which one would be the most suitable for them. The authors have to admit that both English-Latvian and Latvian-English dictionaries lack metalinguistic information, which is important for Latvian language learners. Let us consider the verb to buy (‘pirkt’). The English-Latvian dictionary gives the English pronunciation of the word, states what part of speech it is, provides the dominant forms of the verb and the translation into Latvian is given, as well as prefixes that change the meaning of the verb are added (Kalniņa, 2001, p. 37). In the Latvian-English dictionary, the information on the verb pirkt (‘to buy’) is scarce – only the English translation and pronunciation of the verb are given (Kalniņa, 2002, p. 476).

Conclusions

To conclude it has to be admitted that when using translation, one must take into account the individual needs of learners, the process of their thinking when they want to understand the meaning of syntactic units not only at lexical but also at a grammatical level. Metalinguistic explanation in the intermediary language can be used both in simple cases to show the difference between phrases (for example, Es esmu meita (‘I am a daughter’) and Man ir meita (‘I have a daughter’)) where the dative case is necessary instead of the nominative case compared to the rule of the English language and in more complex situations in which misunderstandings have arisen. 91.43% of the respondents enjoy translation tasks, only 8.57% of answers are negative. Word translation has got the highest evaluation – 4.23 for translation from a foreign language (meaning Latvian) into English (being the intermediary language) and 4.15 in a five-point scale for translating from English into Latvian. As elementary learners, students use bi-lingual dictionaries more often than explanatory ones.

Although in language acquisition pictures and images can ensure the perception of the meaning of the word, in the translation process dictionaries help most of all. Taking into account today’s situation when the Latvian language as a flective language may also be a foreign language, the compilers of bilingual dictionaries should supplement Latvian language dictionaries with metalinguistic information to make them useful for learning the Latvian language as a foreign language. Diverse linguistic experience, the difference among language systems, students’ language attitudes establishes the purposeful use of translation in foreign language acquisition.

APPLICATION OF MOTIVATION-HYGIENE THEORY AMONG WORKERS OF SOCIAL CARE INSTITUTIONS

Rovena Kushta

Abstract: Motivation of workers is a field of interest to any institution. Motivated workers displaying high levels of satisfaction, or otherwise lack of dissatisfaction, have a positive impact on the overall work performance. The study aims to measure motivation levels and the influence of factors such as motivation-hygiene on satisfaction/dissatisfaction level among workers of social care institutions. A quantitative method of assessment is used. The sample consists of 110 workers. Results show a positive and statistically significant correlation between motivation factors and the levels of satisfaction with work. Responsibility is the selected factor with the biggest impact on satisfaction by the workers of the institutions surveyed. There is a positive but not statistically significant correlation between such factors as hygiene and lack of satisfaction at work. To the workers, the responsible supervisor is the factor with the biggest impact on the lack of satisfaction at work, while administrative policies are calculated as being \( r \) (Pearson) = \(-0.27\) and \( \sigma = 0.761\), which shows that they influence the dissatisfaction levels at work. Therefore institutions must pay attention to motivation strategies with the purpose of increasing satisfaction and thus decreasing dissatisfaction levels at work.

UDC Classification: 159.9; DOI: http://dx.doi.org/10.12955/cbup.v5.1009

Keywords: motivation, workers, Herzberg’s theory, Institutions of Social Care

Introduction

A series of definitions of the concepts of motivation at work have been proposed since the beginning of the 20th century. According to Maslow (1946) “Motivation is a desire, a tendency, a drive to complete a task or a job started earlier.” Vroom (1964) sees motivation as closely related to performance at work and stresses out that “the more motivated are workers in their work, the higher will their performance and results be.” While Golembiewski (1973) defined motivation as “a willingness of the organization to fulfill the established goals by taking advantage of the sources at disposal.”

While in the 21st century other authors have studied motivation at work from different perspectives. Cole (2004) gives the definition as “the willingness of the individual to exert high level of effort to reach organizational goals, to satisfy some personal need.” While Armstrong and Taylor (2014) put forward that “motivation is the art which helps people to focus their thoughts and energy on performing his/her tasks in the best way possible.”

Several theories are observed in the field of motivation. Individuals have different needs, set goals to attain and undertake a series of actions. As a result, a single theory or strategy is not capable of satisfying everyone. Theories of motivation try to analyze and explain why workers tend to react accordingly to their efforts and personal contribution. They also describe the efficient ways how institutions/organizations can stimulate their employees toward achievement of results, and why there are not satisfying an individual’s personal needs. Thus, the different theories are widely used by managers to explain the motivation of employees.

All theories can be grouped into two categories:

- Theories which try to explain motivation by focusing on content (the inside) - analyzing factors in the mind of an individual which stimulate, control, or hinder behavior and the way which individual lists them according to the degree of importance s/he places on them.
- Theories that try to explain processes explaining and analyzing the way how behavior is stimulated, controlled, or hindered; focusing on thoughts and cognitive processes which take place inside the human mind and affect behavior.

For the purpose of this study, we chose to focus on Herzberg’s theory of motivation-hygiene. Herzberg’s theory has widespread due to the practical implications it has had on the motivation of workers. Herzberg (1966) concluded that the opposite of satisfaction is not dissatisfaction, unlike what was previously held. Upgrading work conditions does not necessarily result in a higher level. Based on the results of the study, the opposite of “satisfaction” is “non-satisfaction” and the opposite of

---

1 European University of Tirana, Department of Education, Tirana, Albania, rovena.lika@uet.edu.al
“dissatisfaction” is “non-dissatisfaction”, while the factors contributing to satisfaction are separate and different from the ones which lead to dissatisfaction.

Factors that bring about satisfaction are the above mentioned inner factors, which Herzberg (1966) termed as motivating factors, while the factors that lead to dissatisfaction are outside factors for which he used the term hygiene factors.

More concretely, a state of dissatisfaction may be caused by the company’s policies, supervision, interpersonal relations, and salary or work conditions. When these do not meet a satisfactory level, workers tend to feel dissatisfied. On the other hand, when these factors measure to a sufficient level, workers are simply not dissatisfied. Satisfaction means achievement, gratefulness, work itself, responsibility, promotion, and these are the factors which account for motivation, while the absence of the abovementioned does not result in any particular dissatisfaction.

**Methodology**

The object of this study is to measure the level of motivation and the impact that factors motivation-hygiene, have on satisfaction/dissatisfaction levels among workers of Social Care Institutions in Tirana.

Hypotheses of this study are:

1. A positive relationship exists between motivating factors and satisfaction at work.
2. A positive relationship exists between hygiene factors and lack of satisfaction at work.

**Measurement instrument**

The study uses a quantitative method, which consists of a questionnaire as an instrument to measure the level of motivation and the impact of factors motivation-hygiene on satisfaction/dissatisfaction among workers of social care institutions. The questionnaire consists of 48 questions in total.

Subjects were asked questions to gather demographic data such as: gender, age, education, job position in the institution they work and the period of time they have been occupying the position.

The second part consists of 31 questions regarding the level of satisfaction and dissatisfaction. Subjects were asked if they feel satisfied with their work; if they are familiar and agree with the institution’s policy; if they get along with the other work mates; if they find their salary decent; how do they perceive supervision at work; if they find their work environment acceptable, etc.

The third section asks respondents 12 questions on factors that are sources of motivation or not at work. Subjects were asked how motivating factors (achievement; promotion; work itself; recognition; responsibility and advancement) and hygiene factors (administrative policies; responsible supervisor; work conditions; salary; interpersonal relations and status) influence the motivation of employees at work.

**Results**

Most subjects were females (91%), aged over 48 years (40%), having high school education (49%). Most respondents occupied the position of caregiver and working period in that position stretching over 1-5 years.
What is evident is that there is positive (indicated by Pearson’s coefficient) and statistically significant (P-value=sig being smaller than 0.05 in all cases) relation ship between each factor and satisfaction at work. This can also be explained by the correlation motivation-satisfaction.

For the respondents, “responsibility” factor has the biggest impact on satisfaction (Pearson=0.436), pointing to the fact that workers prefer being responsible for the work they do and feel satisfied with this fact. “Work itself” factor follows logically (Pearson=0.418) demonstrating that workers like their job and are satisfied with it, while, “recognition” factor has the lowest impact on job satisfaction to the surveyed subjects (Pearson=0.194).
As it can be viewed from the table not every relation between hygiene and lack of satisfaction factors is equally important from the statistic point of view. It is clear that the “responsible supervisor” factor (Pearson=0.327 and sig=0.000) has the biggest impact on the lack of satisfaction. Workers value supervisors for the task they perform and consider them as a factor contributing to dissatisfaction. On the other hand, the other factors do not show a statistically significant relation which means that they are not responsible for lack of satisfaction. “Administrative policies” show even a negative relationship with lack of satisfaction.

**Correlation between motivating factors and satisfaction at work**

Based on the data from the above table a positive relation exists between motivating factors and satisfaction at work, where \( r=0.484 \) and \( P \)-values=\( \text{sig}=0.000 \). Therefore to workers of Social Care Institutions in Tirana, motivating factors (achievement, promotion, recognition, work itself, advancement, and responsibility) influence satisfaction at work, which confirms Herzberg’s theory.
Correlation between hygiene and lack of satisfaction at work

Source: Author

Through the data obtained from this study we conclude that, “the relation between hygiene factors and lack of satisfaction is positive, but not one which is statistically significant”. This means that the phenomenon is not true in all cases, or in other words hygiene factors do not always influence on the lack of satisfaction.

To the respondents (workers of social care institutions) hygiene factors (institution’s policies, supervisor, interpersonal relations, salary, work conditions, status) do not always bring lack of satisfaction.

Conclusions
This study, targeting workers of social care institutions in Tirana, aimed to measure motivation levels and the impact of factors motivation-hygiene on the level of satisfaction/dissatisfaction at work experienced by the workers of the surveyed institutions. After analyzing the quantitative data collected through the questionnaire carried out among 110 workers, we conclude as follows:

The staff of social care institutions consists mainly of females, which points to the fact that caregiving is viewed as a gender role associated with women, but also because caregiving is often the job preferred by many of this gender category.

Motivation factors show a positive relationship with satisfaction at work, and among the factors, responsibility was the one ranking highest in terms of impact on satisfaction levels for the workers of social care institutions.

Workers of social care institutions consider work in itself a source of motivation for performing their tasks, which is observed by the positive relationship between this factor and satisfaction at work.

Praising workers for their effort and professional advancement was seen as a source of encouragement and enthusiasm at work by the respondents, which is confirmed by the positive and statistically significant relationship between this factor and satisfaction at work.

Workers of social care institutions result to feel satisfied with their job, which can be seen in their answers to the question if they would prefer to work somewhere else not in the field of social care.

Social care institutions encourage promotion opportunities, and to the workers of these institutions this is seen as a motivating factor that leads to satisfaction at work.

Social care institutions acknowledge cases when their workers do unpaid work, which results in being a factor that increases enthusiasm and encourages workers, therefore having an impact on satisfaction.

Responsible supervisors are deemed by workers as the factor having the biggest impact on lack of satisfaction, indicating that they agreed with supervising practices at their workplace and found their supervisors supportive rather than reproaching.

Workers admitted having friendly relations with co-workers, which according to Herzberg’s theory is viewed as a factor influencing lack of satisfaction.

Workers spoke highly of their work environment, which proves that work conditions are a factor which leads to the reduction of dissatisfaction among workers of social care institutions.
Salary and status are factors which increase enthusiasm and encouragement at work, and in the case of workers of social care institutions correlations show that there is a positive relationship between factors and lack of satisfaction, but not statistically important, which means that when the factors are of a low level they do not always result in lack of satisfaction.

Administrative policies show a negative but not strong relation with the lack of satisfaction at work, which according to Herzberg means a hygiene factor resulting in dissatisfaction.

Recommendations

Some recommendations that can improve the situation are listed as follows:

- Importance should be given to the work performed by the employees as referring to the wage system, and rewarding financial stimuli should be applied in order to increase satisfaction at work.
- More frequent seminars and training sessions should be organized by the institutions or higher hierarchic structures, thus encouraging participation and inclusion of workers as a valuable asset.
- Qualification of workers, particularly of those having direct contact with the target, should be of a university level conveying the necessary professional competence for a more efficient performance at work.
- Supervising practice to acquire a supportive role for workers due to its impact on satisfaction at work.
- Institutions to provide agreeable work facilities to serve performance, the accomplishment of objectives and increase of satisfaction levels.
- Collaborative interpersonal relations should be fostered by eliminating hierarchical barriers which result in reduced levels of dissatisfaction among workers.

Overview of legal framework of public private partnerships in Albania

Ermira Lleshi

Abstract: Albania has made positive steps in improving the legal framework of Public Private Partnerships (PPPs) and the political environment. The laws have encountered several amendments in the last 10 years, but there is still room for improvement. Albania has incorporated the EU directives and the UNCITRAL recommendations into PPPs legislation and we have to admit the effectiveness of the law 125/2013 “On concessions and public private partnership.” This paper aims to present a view of the actual legal and sublegal framework of PPPs in our country and to note the development of this sector in potential benefits for both sectors, private and public.

Moreover, judicial quality has improved in Albania even though there is room for further improvement. Moreover, there has been noticed a strengthening of institutional capacity due to co-ordination of consultants and external advisers, but government agencies are at the early stages of developing PPPs. The political environment for PPPs is favourable, especially in the energy and transport sector. Further improvement is required in the transparency and fairness of procedures in practice.

UDC: 3'34 ; DOI: http://dx.doi.org/10.12955/cbup.v5.1010

Keywords: Albania, Public private partnership, benefits, legal framework, government agencies

Introduction

Public Private Partnerships (PPPs) are nowadays a very good instrument of the private sector in compliance with the public sector. Many countries are turning to PPPs in order that the private partner helps the public partner in various areas financially. PPPs are used to hide public borrowing, whereas they provide guarantees in long-term state for profits to private companies (Hall, 2014). A PPP is a contract made amongst a public authority and a private partner in which the private partner incomes and exercises features same as a public authority and it is paid by this one for the services of works in long term payment.

Albania is also a country where PPPs have known a great development especially after the year 2000. They are more used in the field of infrastructure and water. It is clear that governments prefer the method which is most suitable to establish the most money. The aim of Law 125/2013 is to sustain a friendly and sustainable scheme for building up, attracting and facilitating investments, which are realized as public private concessions/partnerships. The legislation is actually a modern one and has different positive aspects that have regulation in the field of public private partnership, but there is still much to be done to improve transparency and to facilitate procedures.

The concept and definition of PPPs

PPPs are needed to fill the gaps of two other traditional contracts of public administration, such as public procurement and concession. PPPs are the involvement of the private sector in the goods and works generally supported by the public sector. A characteristic of PPPs is the transfer of risk from the public entity to the private entity.

There are various definitions of this concept according to different sources. The PPP Knowledge Lab defines a PPP as “a long-term contract in between a private entity and a government entity, for securing a public asset or service, in which the private entity brings a considerable risk management responsibility, and the payment is related to performance” (World Bank, 2014).

According to Investopedia, public partnerships between a public entity and private-sector are used to finance, establish and perform projects (Investopedia, 2017). Otherwise, a public private partnership is a legal contract between the public and private sectors for the arrangement of assets and the distribution of services that assigns responsibilities and risks between the various partners (Partnerships British Columbia, 2003). According to the Law Dictionary, PPPs are projects that will be useful to the public that are partly owned by the public sector and partly by a private entity (The law dictionary, 2017).

1 University of Tirana, Faculty of Law, Tirana, Albania, ermira.lleshi@yahoo.com
In several countries, the concept of PPP is applied as a guard term for various types of collaboration among a public entity and a private entity, while in other countries there is a clear difference of regime for PPPs and concessions.

As Albania aspires for EU membership, the domestic legislation is aligned with European legislation. On the other hand, EU legislation does not have a definition of PPPs. Generally, the term points out to forms of cooperation between public institutions and private sector which aim to secure funding, building, renewal, administration or conservation of an infrastructure or the arrangement of a service (European Commission, 2004). Regarding the OECD, PPPs are designate as an agreement among the public authority and one or more private entities according to which the private entity distribute the service in such a way that the service distribution objectives of the public authority are regulated with the benefit objectives of the private entity and the success of the alignment depends on an adequate transfer of risk to the private entity (Burger and Hawkesworth, 2011).

According to Law no. 125/2013 “On concession and Public Private Partnership in Albania”, a PPP contract means a contract for public works or a contract for public service that fulfils the conditions which designate it as a Public Private Partnership, as stipulated in this law and, which is signed between the Contracting Authority on the one side and economic operator selected as most successful tenderer on the other (Albanian Assembly, 2013).

The main purpose of this joint venture is to develop the efficiency and quality of service and goods.

**Differences between PPPs, public work contracts and concessions**

In a perspective, the regulatory framework of PPPs/concessions acts as a *lex specialis* from the regulatory frame of public procurement. In almost all legislations, the rules of public tenders precede those of PPPs/concessions. It is also obvious that the majority of rules and procedures of public procurement are applied for PPPs/concessions. Governments prefer the method which is appropriate to establish the most value for their money.

The main difference between them is that in public work contracts the risk of success of the work weights on the public authority. Furthermore, there are methods that are applied to secure the value for money (Burger and Hawkesworth, 2011).

It is widely admitted that concessions are one of the types of PPPs, so we cannot pretend to clearly demarcate these two concepts. One of the main differences is the procedure of payment. In the case of PPPs, the public authority pays the private entity for the offered services/works, while in the case of concessions, usually the revenues of the private partner are created by the payment they collect by the sale of product of the concessionaire project to the third parties (Burger and Hawkesworth, 2011).

Another difference between them is the transfer of risk. In some countries, the risk may remain totally on the contracting public authority, but in the case of concessions even if the risk is divided between parties it is mainly held by the private partner. Appropriate risk transfer from the government to the private sector is the main requirement if PPPs are to distribute services of high-quality and with effective cost to consumers and the government (International Monetary Fund, 2004).

**The contract of public private partnership according to the Albanian law**

Law no. 125/2013 “On concessions and public private partnership” treats concessions as a form of PPP. As they are treated with the same law, we may say that the public private partnership contracts are global. According to Albanian law, PPPs are a wider concept than concessions, they include concessions but at the same time they are clearly different from them.

- **Parties in the PPPs contract**

  The two parties of the PPPs contract are the Public Authority and the Economic Operator, according to articles 3/2, 3/3, 3/22, 3/23 and 8 of “Law no. 125/2013 “On concessions and public private partnership.”

  In addition, the contracting authorities are stipulated in the above law, meaning the bodies that shall undertake a procedure for concession/PPP. According to article 13 of the law these bodies are: the Parliament, the line ministries, Council of Ministers and the local government authorities. The contractor is the economic operator that is going to sign the contract with the public authority. For purposes of this law, special purpose vehicle can be set up which is a private legal entity with its main office in the Republic of Albania, which is established upon the demand of the Contracting entity by
the economic operator selected as the most successful tenderer and, with which the contract shall be signed thereof (Albanian Assembly, 2013). The economic operator is the contractor which means the natural person or the legal personal, or group of people or other bodies in the market that offer public work or services. It is obviously deducted by article 8 of the law that concession contracts may be signed between two public bodies, a PPP can be signed only by a public authority and a private partner. In this form of the contract, we have a transfer of the public sectors of a public interest to the private partner. If there is no transfer from public authority to the private partner, of organization, management and accountability of the specific sector of public interest, we do not have to deal with a concession/PPP contract.

- Area of implementation of the law “On concessions and public partnership” in Albania

As we mentioned above, the PPPs are applicable in realization of works and also in services. It is stipulated in article 4 of the law the concrete area where this kind of contract is implemented in Albania. The areas are: all types of transport; distribution of electricity and energy; production and distribution of water; waste management, including their collection, transfer, treatment and disposal; telecommunication; various areas of science and education; areas of tourism, leisure and hospitality; areas of culture, sports, health, social services; prison; rehabilitation of forests; industrial parks, mines and similar business support infrastructure; housing; public administration facilities, IT and database infrastructure; Urban/suburban rehabilitation and development; agriculture. In each case, the Council of Ministers, upon the recommendation of the line ministries or, upon proposals, which they receive from local government units or central bodies of Concessions/PPPs policies, shall decide on the Concessions/PPPs to be implemented in other sectors. (Albanian Assembly, 2013).

Moreover, the law “On concessions and public partnership” envisages the specific cases where it is not implemented, where exception take place. So, the law shall not apply: under the low monetary threshold; when their achievement must be accompanied by certain security measures in conformity with the laws in force, or when the protection of the State’s main interests is required; and for the acquisition or rental, by financial methods, of immovable property. Nevertheless, financial service contracts concluded at the same time as, before, or after the contract of acquisition or rental, in whatever form, shall be subject to the Law; the acquisition, development, production or co-production of program material or commercials intended for broadcasting by broadcasters or publication in the media, and contracts for broadcasting time; Concessions, which are subject to different rules and are awarded pursuant to special procedural rules of international organizations; For arbitration and resolution services; For financial services linked with the sale, purchase or transfer of securities, in particular transactions by contracting authorities to raise money or capital; For air transport; Concessions/PPPs, which are subject to different rules and are awarded in accordance with international accords, which the Albania concluded with several states, signed according the Treaty on the Functioning of the European Union, and which include, supplies, works or services intended for joint application or use the projects by the countries that are members; Concessions/PPPs, which in case that this Law conflicts with an obligation of the State under, or arising out of, an agreement of an international organization, the provisions of that agreement shall dominate. In all other aspects, award procedures and principles shall be governed by this Law; service concessions awarded by a Contracting Authority to another Contracting Authority, or to an association of Contracting Authorities, on the basis of an exclusive right which they enjoy according to the legislation (Albanian Assembly, 2013).

**Forms of PPPs in Albania**

Pursuant article 8/4 of the Law, depending on the means of remuneration as well as allocation of key inherent risks, a PPP may be realized either as Public works concession, or Public service concession, or Public works contract, or Public service contract (Albanian Assembly, 2013). These are the forms of a PPP contract and there is no reason to confuse them with the concession or public procurement contract. In the concession contract the remuneration is granting to the concessionaire the right to use the work or service, and in case it is foreseen, it includes a payment by the public authority, and the risk is transferred also to the private entity. Whereas in procurement contract remuneration of private entity is composed by the payment of a price by the public entity and risk is held by the public authority.
Legal framework of PPPs
Albania has a specific law that deals with PPPs, whereas there are other countries that do not have a dedicated law. The basic law that elaborates PPPs in Albania is Law no. 125/2013 “On concessions and public partnership.” Decision of Council of Ministers no. 575, date 10.07.2013 “On Approval of Rules for Assessment and Granting with Concession / Public Private Partnership.” Decision of Council of Ministers no. 130 date 12.03.2014 “On the electronic performing of the competitive procedures of concession/PPP.” Decision of Council of Ministers no. 634 date 01.10.2014 “On approval of rules for Assessment and Granting with Concession / Public Private Partnership of public work and services for building, operating, maintenance and rehabilitation of national streets.” Decision of Council of Ministers no. 211 date 16.03.2016 “On creating and administrating of electronic register of concession/Public Private Partnership.”

Whereas during the public procurement stage, the process is based on legislation for public tenders. So, legislation and by-laws are as followed:

Besides the above legal framework in the PPPs procedures, there are also more general laws which are applied when there is no explanation in the specific laws and subordinates. Thus, the Administrative Code of Procedures and Civil Code are fruitfully implemented.

Whereas in an institutional view, the competent authorities that are part of a PPP project are the ministries, municipalities and districts. In cases when according to the provisions of the law, the object of contract and specific competencies, competence for a concession project or PPP, can belong more than a public authority that fulfills the conditions to be a contractual authority, then the Council of Ministers with a special decision, assigns the contractual authority or authorities, case by case. (((ATRAKO)))

Besides the mentioned authorities, there are more authorities involved in the procedure of concession or PPPs according to their field of competences, such as Council of Ministers, ministry of economy, ministry of finances, Commission on Public Procurement and Agency of Treatment of Concessions.

Legal procedure of PPPs
There are several steps that must be fulfilled in order to finalize a PPP. The law no. 125/2013 envisages the legal procedure, which is divided in concrete actions pursuant the law. The first phase is the stage of identification of the project, which begins with a proposal for the possibility of a PPP project. The proposals shall come from the public authority competent of the field in which is undertaken the project, other public institutions, organizations, investors, etc. The common is that the proposal must be evaluated by the public authority competent of the field in which the project is undertaken.

It continues with the assessment of the proposed project. This is a stage in which the concrete project is analyzed and an opportunity is made for evaluation in order to realize if the project is possible to be implemented. The competent public authority for the identification, evaluation and granting the project of PPP, according to law no. 125/2013 and the Decision of Council of Ministers no. 575, is the public authority competent for the object of the PPP. This public authority appoints an ad hoc commission. It aims that all the stages of the legal procedures of PPPs are followed by a specific structure and with specialized staff. The commission is in charged to make a prior verification of the project proposed. Regarding the results of this evaluation the commission prepares a report regarding the possibility of the realization of the project and presents it to the public authority. Moreover, pursuant article 19 of Law no. 125/2013, the commission shall prepare the Feasibility Study which consists of an operational summary, general project description, technical financial economic and legal analysis, environmental study and nature implication, and accompanying annexes, required addendums, conclusion and recommendation. In this meaning, the commission gives to the public authority a complete view and a deep analysis of all aspects of the project elements. The results of the Feasibility Study are crucial to
the public authority because this document serves as a core document to evaluate if the concrete project shall be implemented or not. If the evaluation of the project gains a positive evaluation, it continues in the other stage, which is the granting of PPP. This stage includes other procedural stages, which begin with the public tender competition and the evaluation of the bids by the private operators. Pursuant article 23 of the law, the most economically viable offer based on various criteria. In the tender documents, it should be envisaged prior the evaluation coefficient and the respective marks, of each of implemented criteria. In case of unsolicited proposals, the proposer shall compete with the other offers. Otherwise, in cases the unsolicited proposer is approved a bonus by Council of Ministers, he competes with a bonus up to 10% of total points of competition. Tender procedure starts with contract notice which consists of intention of contracting an entity to grant a concession. In cases when this stage is finalized with success, it proceeds with the conclusion of the contract. Before the signing of the contract, there is prior action taken by contracting authority, which guarantee the contract by the private partner, such as the value, form, and manner. This serves as a compensation tool for the damage caused in case that the contract fails. The conclusion of the contract is the finalization of this process. The duration of the contract shall not extend 35 years according law no.125/2013. The contract shall envisage the rights and obligation of the parties with the general principle of balance of their rights and obligations. The contract should foresee the risks that are foreseen for the implementation of the contract, the division between the two parties. The risks should be charged to the party that is objectively capable to manage it. The contract shall also envisage the conditions regarding the works and services and the mechanisms of payment. Another key element of the contract are the sanctions and penalties in case of violation of contract and the mechanisms for solution of disputes. The conclusion of the contract is not the final stage because it is included in the stage of management of the contract, monitoring the effective implementation of the contract until the successful implementation of the project. 

Advantages of Law no. 125/2013 and by-laws

The aim of the Law is to provide a positive and sustainable framework for attracting, promoting and helping investments, which are realized as public private concessions/partnerships. The legislation on this field tries to establish a good basis in the field of investments with cooperation among public and private partners. The law relies on these principles: transparency, non-discrimination, proportionality, efficiency, equality, reciprocity and legal security. The principle of transparency is sine qua non for the application of the others. It is closely related with the information, publication and access of public, obliging the public authority to pursue transparent procedures.

The legislation also meets the international standards set out by international bodies such as the United Nations Commission on International Trade Law, Organization for Economic Co-operation and Development, the European Bank for Reconstruction and Development, etc. In contrast with the previous law no. 9663, dated 18.12.2006 “On concessions” the new law is drafted in approximation with the EU legislation and with the assistance of OECD. It is also a law harmonized with the law “On public procurement” and there are no double procedures and standards in the administration of complaints.

Conclusions

In the infrastructure field, PPPs can improve the quality of the field if they are implemented with transparency and fairness. PPPs transfers the risk of performance to private partner. The usage of this form of cooperation among public and private partners is an encouragement innovation. PPP projects can deliver better value of money. Legislation of PPPs in Albania has known great improvement but there is still work to be done to strengthen fairness and facilitate procedures.

DESIGN, ANALYSIS AND IMPLEMENTATION OF ELECTRONIC TEST FOR KNOWLEDGE EVALUATION IN THE COURSE OF INFORMATION TECHNOLOGIES FOR PHARMACEUTICAL STUDENTS

Hristo Manev,¹ Mancho Manev²

Abstract: The increased usage of information technologies in everyday life and especially in education leads to demands for new forms of teaching, studying and the appropriate examination and evaluation of acquired knowledge and skills of the students.

Modern electronic educational systems use only those technologies that improve the learning process and make it more effective. Interactive education provides an opportunity to develop skills for independent literature research and activation of cognitive activity.

In this work, it is shown how modern electronic education is implemented in the curriculum of English language pharmaceutical students at the Medical University – Plovdiv in the course of Information Technologies. It is developed with a methodological approach of a hybrid system, i.e. compulsory attendance at lectures in combination with two different types of conduction of the final test for comparison – a paper-based test and a remote web-based one. The results received from the parallel tests are processed and analyzed and the conclusions are used to enhance the quality of the developed test and the type of implementation. Moreover, the examined students fill in an anonymous poll to show the authors their thoughts for this type of hybrid educational system.

UDC Classification: 378; DOI: http://dx.doi.org/10.12955/cbup.v5.1011

Keywords: interactive learning, e-learning, educational technology, electronic test

Introduction

Modern web-based e-learning systems relate only to those information technologies that improve the learning process. The effectiveness of education depends on many factors. One of the most important of them is the involvement of the students in the related course activities. This involvement can be achieved by interactive courses.

Interactive education provides many opportunities to develop the skills of the students. On the one hand, this type of teaching gives the opportunity for the implementation of interesting educational materials in order to increase the motivation and the interest of the students. Also, another positive result is the so-called two-way interaction teacher – student. This type of education can be for the both sides of the educational system a very valuable feedback and a teamwork booster.

The teaching and learning of the university discipline: Information Technologies, is a complex activity and many factors determine the success of it. The nature and quality of instructional materials, the presentation of the content, the pedagogic skills of the teachers, the learning environment and the motivation of the students are all important parts of the teaching-learning process and must be kept in view of any effort to ensure the quality of modern university education.

Blended Teaching of IT at the Medical University – Plovdiv

The so-called Educational Technology is a very wide field. Therefore, we can find many definitions of it. The most popular are – Educational Technology is the usage of technology to improve education which is a systematic, iterative process for designing instruction which is used to improve the performance of the students; Educational Technology according to International Technology Education Association: Someone teaches with technology (uses technology as a tool); Concerned with the narrow spectrum of information and communication technologies; The fundamental goal of Educational Technology is to enhance the teaching and learning process.

Educational Technology has a dynamic character. The educational process starts with certain conditions. Permanent control of the lecturer is needed, stable reverse connections with the students and making competent decisions for managing the technological process. Furthermore, Educational Technology allows simultaneous usage of traditional and modern technologies. In the process of

¹ Professor Hristo Manev, PhD; Medical University – Plovdiv, Faculty of Public Health, hmanev@meduniversity-plovdiv.bg; ² Professor Mancho Manev, PhD; Plovdiv University Paisii Hilendarski, Faculty of Mathematics and Informatics, mmanev@uni-plovdiv.bg; and Medical University – Plovdiv, Faculty of Public Health, mmanev@meduniversity-plovdiv.bg;
learning Information Technologies, the students are incessantly proposing their issues, research questions and solving problems in order to impress their teachers (Kenderov, 2010).

The so-called blended courses integrate face-to-face and online learning. Some of them use the online environment for their content or lecture delivery and the classroom for active learning opportunities. Others use the face-to-face time for lectures and the online environment for discussions, assessments and other learning. Another approach is to use a combination of these two, namely to employ the so-called "flipped classroom." In this type of teaching-learning process, the lectures are delivered online for some of the classes and students use them to prepare for active learning in the classroom. The in-class activities involve peer learning in small group activities to engage the students in problem-solving.

Nowadays the interest in online tests as a students’ knowledge and skills evaluation has increased significantly. Some of the main reasons for this are: high efficiency of online tests, i.e. for a limited period of time the lecturers could assess a large number of students; opportunity for simultaneous testing of students from different specialties, courses and groups through various tests; the possibility of obtaining student’s assessment immediately after completing the test; the teacher’s ability to manage and expand the database of the tests’ questions and the evaluation criteria.

Model
Looking to the aims of teaching Mathematics and Information Technologies, it can be seen that the important objectives underlying the mathematics subject are critical thinking, analytical thinking, logical reasoning, decision-making, problem-solving. Such objectives are difficult to be achieved only through verbal methods that are usually used. Therefore, in this work, it is proposed a model for the realization of a hybrid educational site in Information Technologies for English language pharmaceutical students at the Medical University – Plovdiv, consisting of attendance hours for lectures and exercises, combined with the remote implementation of the test.

In most of the universities in Bulgaria, and abroad, for these purposes the open-source system Moodle is mainly used (Rice, 2006; Cole, 2007; Manev and Enkov, 2012). There are also many Bulgarian university projects which are integrated into the studying process (Manev and Golev, 2014; Rahnev et al., 2014).

Implementation
In this work, using the e-education system Moodle, a methodological approach of the hybrid system is developed, i.e. compulsory attendance at lectures in combination with two different types of conduction of the final test for comparison – a paper-based test and a remote web-based one.

The main part of this project is the development and implementation of an electronic test for knowledge evaluation in the course of Information Technologies for pharmaceutical students – one of the most used forms of knowledge verification of the trainees. This form is used not only to test knowledge evaluation of the students but also for training by exercising their skills. The advantage of web-based teaching is that it can be done asynchronously, i.e. the educational information is available to students on-line and they can read it at a convenient time. The problem occurs when the student is required to perform tasks and tests. Online courses have difficulties in controlling fraud on tests. The lecturer could set a specific day and time for the test activity to contribute for the objectivity of the evaluation. Even if the student checked its answers in a textbook or online, the teacher can limit the time. So, if there is not enough knowledge gained in their preparation the students are going to fail to end on time.

In the present work, an interactive test for the English language students studying the course "Information Technologies" at the Pharmaceutical Faculty of Medical University – Plovdiv is designed.

The creation of a test in the e-system Moodle requires parameterization to list the different options related to the purpose of the examination (Figure 1 and Figure 2).
When the test is created and configured it is necessary to create a database of questions that will be selected for the examination. Obviously, the larger database of questions makes the tests more variable and of course the evaluation of the students more accurate (Figure 3).
The tests are evaluated automatically and can be evaluated again if it is necessary. The questions can be open for the learners only for a certain period of time. After that, the students will not have access to the tests. After the completion of the tasks, the system allows comments or it can be shown the correct answers. The questions and the possible answers can be displayed in a different order to avoid cheating.

A great practical value has the submenu “Statistics.” It provides a statistical analysis of the test. A dropdown menu allows the teacher to select which attempts of the students to be involved in the calculation of the statistics. The lecturer has the right to choose whether to display information about all attempts or just the first attempt. The full text of the statistics report can be downloaded in various formats. The Moodle system also allows more detailed analysis of each question individually (Figure 4).
Results
For comparison, we implemented to the same group of 10 students the electronic test and a paper-based one for knowledge assessment. The results received from the parallel tests are processed and analyzed and the conclusions are used to enhance the quality of the developed test and the type of implementation. The evaluation is performed by a percentage scale (0-100%) corresponding to estimates by six-point scale (Weak (2) - Excellent (6)) (Figure 5).

Conclusion
The successful integration of e-learning and the resultant good results and positive feedback from students are preconditions for the continuation of this form of teaching in the future. Moreover, the examined students fill in an anonymous poll to show the authors their thoughts for this type of hybrid educational system. Their responses will be taken into account in the future development of this type of education.

The relevance of e-learning environments today and the need of actualization of the educational courses are the main reasons for the usage and the integration of this form of teaching more and more. In this article, a model for an educational platform of a university discipline which can also be applied in other teaching courses is shown. The results of the conducted parallel two types of testing show us that e-learning is welcomed by the students nowadays.

ETHICAL ASPECTS OF SOCIAL WORK IN MODERN SOCIETY

Hermína Mareková¹

Abstract: The basic principle for the exercise of professional social work is the respect for human rights and social justice. The social worker’s activity is associated with high expectations on the part of society, although the moral standards of society are typically on a lower level. The legislative environment or norms governing the decisions of social workers are determined by legislation as well as generally applicable ethical norms. In practice, this creates ethical dilemmas consisting in the acceptance of a hierarchy or priorities of individual norms, whereas the adopted and applied values and norms can be counterproductive. This situation may cause a conflict between professional ethics and valid social norms. The following article tackles the issues in social work arising from the stereotypes surviving in society and a lack of competence of many social workers.

UDC Classification: 364-2; DOI: http://dx.doi.org/10.12955/cbup.v5.1012

Keywords: ethics, human dignity, morality, social work, values

Introduction

The concept of ethics and its dimensions have probably been a subject of interest for each of us. These issues have been tackled in many different publications, as evidenced by the fact that upon entering the word ethics in the Google Scholar search engine, the number of results referring to this topic for the year 2016 is 133,000 in 0.08 seconds and the word morals yields 25,400 results in 0.06 seconds. Even in everyday life, people increasingly face a variety of serious ethical issues and dilemmas, and stand before a decision. They must often make decisions and every decision may have an ethical aspect with various consequences. We daily hear from the media that this or that contradicts medical, judicial or teaching ethics. It seems as if some professions were supposed to be more ethical than others. As if there could and should be a distinction between professional ethics and valid social norms. The truth is that a certain norm applies in public and another one at home, behind the closed doors of our apartments and houses. This is a Slovak reality surviving from the time of socialism. But this double standard of society, its schizophrenia, has very detrimental consequences in the long term, because this atmosphere is where a new generation socializes. We usually refer to ethics, to moral principles, and we can say for sure what is ethical and what is not, based on our values, valid norms of our society that we have acquired during our education, our socialization.

Socialization has for some time been considered a key factor in the functioning of society and an important attribute for achieving authentic being. In practice, this produces ethical dilemmas consisting in the acceptance of a hierarchy or priorities of individual norms, while the adopted and applied values and norms can be counterproductive. This condition may cause a dilemma between professional ethics and valid social norms.

These are the ethical dilemmas that, if we recognize them, still offer an opportunity to correct our behavior in a timely manner and prevent more serious damage. In this case, it can also be a discriminatory behaviour towards a person who is dependent on our help, so that we have a better argument than the one by Bertrand Russell (1956): "I cannot see how to refute the arguments for the subjectivity of ethical values, but I find myself incapable of believing that all that is wrong with wanton cruelty is that I don't like it." It is becoming ever more desirable for us to pay more attention to ethical dilemmas not only in the field of social work, but in other humanities as well.

Ethics Or Ethics In An Unethical World – Social Work

The word ethics comes from the Greek word ethos "character, moral nature." Philosophically, it is the discipline or teaching about responsible behavior within the human society (Petrušek et al., 1996, p. 269). There is an interesting term introduced by M. T. Cicero: philosophia moralis from Latin mos "custom, manner," an expression that replaced the term ethics in classical antiquity and scholastic philosophy. According to a sociological dictionary, the term morals means "settled patterns, behavior, generally accepted norms." In the same way the terms manners, customs are used. W. G. Sumner wrote in 1906 that, in his opinion, morals are formed from customs and traditions (volkways) and are based not only on generally accepted stabilized activities, but also on abstract moral principles. They

¹ Danubius University, Sládkovičovo, Slovakia, hermina.marekova@gmail.com
are subject to stronger social control (ibid, p. 653). According to other sources, ethics (Greek ethos "moral character") is the sum of all the principles upon which the correctness of acting is assessed (Jandourek, 2001). From the above definitions, the term ethical may not fully express the intended objective, responsible behaviour and habit (stereotype).

With some authors, such as Dupré (2007), we find ethics in conjunction with moral philosophy, which is divided into three areas. The most general one is meta-ethics which explores the origin or basis of morality and asks whether ethics is objective or subjective. The second one is normative ethics, which examines the norms, standards underlying the moral behavior, for example utilitarianism, based on the standard of benefit. The third area, according to him, is applied ethics, which applies a philosophical theory in practical, everyday issues, such as the question of just war, the attitude towards abortion or to animal abuse. In this area, we have seen different ethical attitudes. There is the absolutist stance, according to which deeds are either right or wrong, in all circumstances. The consequentialist argues that the correctness or incorrectness of acts can be assessed only by reference to their effectiveness (utilitarianism). The deontologist considers acts as intrinsically right or wrong, regardless of consequences. Their meaning is associated with the intention of the actor (Kantian ethics). The naturalist believes that ethical concepts can be analysed and identified with the help of science. The non-cognitivist says that morality is not a matter of knowledge, because it ignores facts (emotivism, prescriptivism). The objectivist says that moral values are part of the inventory of the universe, independently of all humans, and ethical concepts are metaphysically true. The subjectivist claims that value has no basis in the external reality. An example of subjectivism is relativism.

According to Hume (Hume's guillotine, Hume's Law), we believe, on the one hand, that we live in a material world that can be explained through science, in a world of facts, out of which value is excluded. On the other hand, we feel that in making moral judgment, e.g. that genocide is wrong, we declare something true about the world, regardless of how we feel about it (In Dupré, 2007).

According to some authors, our morals arise from our prejudices. The term prejudice comes from Latin praejudicium (pre-reasoning, antipathy). According to Giddens (2006), prejudices are our preformed opinions, inflexible, ossified evaluation, customary ideas of another person or group that are not based on experience. They are mostly adopted opinions that keep forming constantly and stubbornly, despite changes, and are maintained. Strictly set expectations and norms form the basis for discrimination (including the gender-based one).

**Culture – Values – Value Change**

Culture is a "sum of spiritual and material values created by humankind throughout its history" (Buchtelová et al., 1997, p. 526). Each society has its own culture and these cultures can be very different. Cultural values existing in our society may not apply in other cultures. However, due to constant interaction with social environment, they are subject to constant change.

An important, now increasingly topical issue, says Huntington (1996), is the question if the liberal values of the West are truly universal, or it is just our opinion. In sociology, the elements of culture are the norms and values existing in society. Values and value orientations are the ideas of people about what in society is regarded as good and desirable or, conversely, as bad and undesirable. From the perspective of sociology, the values and norms are very important elements of culture, because, for the functioning of society, it is necessary that its members adhere to certain regulations and norms (Mareková, 2013). The norms define a person's behavior in a certain situation. Without these social norms (which can be understood as conventions), collaboration in society is impossible. Non-compliance to norms results in unpredictable behavior of the members of society. This also prevents cooperation. Violation of a norm is always followed by a penalty.

Adoption of norms takes place during upbringing, which is called socialization in sociology. According to a psychological definition, it is the time of personal development (Hurrelmann, 1988). According to Durkheim (1984), a norm is an elementary component of social existence of humankind. On the one hand, there are the norms of society, on the other hand, the behavior and conduct of a member of a group that should correspond to valid norms of society as much as possible (Ondrejkoči 1998).

Andorka (2003) speaks about the five most important facts in connection with norms:
1. Norms in a society can be contradictory. For example, criminal law punishes an act, and the majority of citizens are morally opposed to the sanction (they disagree e.g. with sanctions for speeding). Contradictory norms can be adopted by different groups, for example religious or ethnic ones.

2. Norms are constantly changing during the development of society.

3. Various societies adopt different norms. (e.g. vendetta)

4. The fact that a particular society has accepted a norm, does not necessarily mean that that norm is profitable in terms of the existence and development of the particular society, such as the holy cow slaughter ban in Hinduism.

5. During the development of society, norms are subject to constant change, so it is very difficult to assess the behavior of a certain society in the past and consider it negative just because it contradicts the currently accepted norms in the society or collides with the criminal law.

The question arises whether there are also norms that are valid in every society, in every age. Certain moral values could be such (Andorka, 2003). It seems that certain taboos are generally accepted (incest, child abuse).

Empirical evidence shows that changes in our values scale are oriented towards materialism and individualism, while solidarity has fallen on a lower place, below materialism. This question was answered by Inglehart - Abramson (1995) in four points: According to them, the materialist is a human who puts material values on the first two places, while the post-materialists is someone who puts two post-materialist values of the first two places. According to Inglehart and Abramson (1995), the number of post-materialists has increased in every western country since the seventies. Not everyone agrees with their opinion and most sociologists hold the view that changes in values are cyclic and that a "hippie" society is followed by a "yuppie" one, which puts more emphasis on material values.

According to Hankiss (1983), a negative modernization took place in post-communist countries: in the case of individualization, society has progressed much faster, while in other indicators, such as work efficiency, independence and innovativeness, the post-communist countries have fallen behind other modern societies.

"Our ideals are constantly changing," wrote Fritz Bohnsack in 1996 and said that significant changes in the recognition of previously existing values have occurred in his country. According to him, a few decades ago the accepted, recognized, valid values and norms in society used to be qualities such as submission, discipline, performance of duties, reliability, openness, loyalty, punctuality, self-sacrifice for the good of society, and modesty. German sociology calls them the values of duty and acceptance. The new values are called the values of self-actualization. Such values include spontaneity, pleasure seeking, self-fulfilment, and immediate satisfaction of someone's needs. "Not everyone accepts it, but most of society lives according to it," says Bohnsack (1996). In general, there are certain values and norms that have been, are and perhaps will be valid in every society and they are called taboos. Taboos in most cultures include incest, child abuse and such. (Mareková, 2014).

Social Identity – Socialization

Identity comes from Latin identicus "identical." In general, it is the unity of inner, mental life and action – also called authentic existence. The term is used in various meanings. E. H. Erikson (1955) uses it as a concept of an essential feature of adolescence, which is associated with questions such as Who am I? Am I adult? A. H. Maslow (1954), a humanist psychologist, defines it as the ability to be what I really am, i.e. myself. It is the pursuit of self-actualization. In social psychology, identity is broadly understood as authentic being. Its opposite is an inauthentic being that is hypocrisy. In philosophical anthropology, identity is understood as "living in truth." In sociology, identity is discussed by R. G. Darendorf (1950) and E. Goffman (1959). (In: Petrusek – Vodáková, 1996, p. 414)

Socialization (from lat. socialis - sociable, allied, marital) is a complex process during which the human as a biological creature becomes, by means of social interaction and communication with other social beings, able to behave as a member of a group (ibid.). Socialization is a lifelong process, a lifelong interaction of the individual with their environment. The adoption of norms takes place during upbringing, which is termed socialization in sociology and represents acquiring the values and norms of a society.
According to a psychological definition, it is the time of personality development. Meeting norms happens often because people are afraid of sanctions, but it can also take place because these norms are identical with their value orientation (internalization), therefore they comply with them without any control or sanctions, or condemn the individual who does not respect them (Mareková, 2013). Socialization after Brimm (1966) is the process, in which an individual acquires such knowledge, skills and abilities that enable them to become a more or less useful member of various groups or society.

Awareness of the Self is a process that begins in early childhood. Within it, I differentiate myself from "the others." The development of our personality, ourselves, is a process that accompanies us since our birth, when we have no idea of society, and throughout our lives, as Parsons wrote in his publication back in 1956: " The birth of every new generation of infants is a recurrent barbarian invasion..., because the newborn does not have the slightest idea about the rules and norms of the society in which s/he was born."

Socialization has for a longer period been considered a key factor, a very important element of the functioning of society and an important attribute in achieving authentic being. The process of socialization was covered by Freud. According to him and his classical psychoanalysis, the essence of socialization is a suppression of social and biological instincts, of animal sexuality and aggression. In other words, a creation of impulse control.

According to Hartman, socialization is a process of acquiring the ability to adapt. English empirical philosophy (Locke, Hobbes), as well as Skinner, assumed that the human socializes solely on the basis of interaction with their social environment. According to social psychology, we socialize under environmental influences – by learning.

Modern theories talk about learning roles according to society's expectations. Of course, all of these factors are crucial for our behavior at a later stage, but, from the point of view of a social worker, they can also produce an unwanted behavior. Europe has always been more or less homogeneous and the principle of the nation state has been customary: Germany used to be inhabited by the Germans and England by the English. This has changed with the arrival of large numbers of people with completely different cultures. The skills acquired during socialization do not provide us a comfortable climate anymore and we are beginning to feel lost in our carefully constructed world. But then we form the ground for fear and for other attributes, such as prejudices, discrimination, aggression, and violence.

**Ethical Code – Values In A Valueless World**

Professional ethical codes contain sets of ethical rules that society expects from the workers in a profession and they should also include sets of rules and sanctions for those who do not meet these expectations. They are actually sets of rules about what is good and right and expected by society. Most professions nowadays have such a set of rules. Problems arise when the individual values contradict or some norms are no longer valid.

In the now obsolete Code of Ethics of Social Work from 1997, the Preamble of social work stated that "...the social workers are also guided by the norms they formulate themselves" That was a source of problems, because socialization and the accepted norms of individuals can be very different. Not to mention the fact that it contradicted the subsequently adopted international documents. The issue consisted in differences of formulating one's own values based on the accepted culture, socialization (upbringing), multicultural environment, etc. The question is whether we can create a "timeless" code of ethics, because the determinants defining our values and norms are constantly changing. The Code of Ethic of Social Work should be in line with the values of the European Union and the legislation, which is part of the Treaty of Amsterdam. A code of ethics can be formed only on the basis of respect for human rights and norms, social justice, international codes and anti-discrimination.

**Dilemmas In Social Work**

What is a dilemma? It is a "necessity of choosing between two mutually exclusive (often unfavorable) options," or, in logic, a syllogistic judgment with two implicative and one disjunctive premise" (Buchtelová et al., 2008. p. 215). These are often hidden problems, difficulties creating tension. Dilemma is such a need of choice, when we do not have sufficient information, or what we have is contradictory. Theoretically, these dilemmas have long been tackled in various postulates, but we must realize the importance, the necessity of resolving these problems in practice, the more so that
In social work, ethical dilemmas arise from the acceptance of a hierarchy or priorities of individual norms, while adopting and applying certain values and norms can be counterproductive. This condition may cause a dilemma concerning the relationship between professional ethics and valid social norms. The social worker must often make a decision, even in a situation where they do not have enough information, or the pieces of information come from various sources (e.g. the media) and are contradictory. When this is the case, information is untrustworthy and cooperation is difficult or even impossible. Dilemmas arise on the professional level (lack of competence), on a personal level (patterns, models) as well as in the social and cultural field (traditions, values, stereotypes). They can also occur in the field of politics.

According to Banks (2006), there is a difference between ethical issues and dilemmas. She thinks that an ethical dilemma arises when we must choose between equally unfavorable alternatives that are contradictory to our moral principles and it is not clear, which option is the right one, and regardless of our choice, it will leave us in anguish and remorse. According to her professional ethics, we must constantly re-evaluate.

An ethical dilemma arises when a social worker faces one or more contradictory values. The very first one is the dilemma of intervention or non-intervention. What takes precedence? Justice or equality, efficiency or competence, or the right to self-determination? Is good what society expects, or what we have learned during socialization? There is a very strong and complex pressure from society. Every action has a broader perspective, as in the case of an alcohol addict: assistance is needed by the whole family and there are both objective and subjective elements. Objectivity is necessary, lest social workers are not only amateurs, writes Max Weber (1970). An amateur differs from a professional only in that s/he is not sure about the firmly established working methods, and therefore mostly unable to control, assess or realize the significance of their ideas.

These tensions and dilemmas are being developed in various fields, such as professional and personal environments, social, political, cultural areas etc. According to some sociologists, for example Bauman (2000), they are “liquid modernities,” because they reinforce individualization. According to Giddens (1994, p. 5), the growing reflexivity results in a reduced respect for traditions and a growing importance of communication. He thinks that the more tradition weakens, the more one is forced, for various reasons, to make personal choices in one’s life (possible ethical dilemmas). There are big debates about the common values: if they are receding, or social solidarity is being reduced (Putnam, 2000).
The performance of social work is a long process with the human and is completely different from the direction of the society development, which is focused on results and, where possible, immediate ones. Among other dilemmas is the question of the worker's motivation in a society where this work is extremely undervalued, both financially and socially.

**Gender Sensitive And Gender Insensitive Social Work**

Even social work can be discriminatory, if it is carried out under these deterministic ideas. Non-stereotypical, gender sensitive social work can be promoted only on the basis of respect for human rights and norms, social justice and anti-discrimination (Mareková, 2013b).

**Conclusion**

"Imagine us living in a world where no one ever imposes anything, where there is peace and open possibilities for all," says Watkins (2000). We all long for the same, but we often expect solutions from others. We live in a time when our consumption of material goods far exceeds our real needs and, as Dorian Grey said, we need only unnecessary things. We are unable to set our priorities and give up some of the material achievements. We have rich choices at the disposal, but do we really need 35 programs in the washing machine, when we use only three of them, or a hundred TV channels, when we usually watch about five? And do we exploit the full potential of our "superphones"? Instead of true values, we seek trendy advances in science and technology, in accordance with society's expectations. We often spend a long time exploring various technical achievements, which limit our freedom and make us slaves of materialism. We balance between understanding how to secure freedom for people in decision-making and between the expectations of society in instances where social values and institutions are at risk. On the one hand, society is supposed to provide every human with achievable options and, on the other hand, the social worker does not have sufficient competence, time, personal capabilities or financial provision. Practical experience shows that during the performance of not only social work, but also various other professions, the existing international legislation on racism, discrimination and gender bias is violated on the part of social workers. This happens both because of unpreparedness (ignorance), but also because of the maintained stereotypes in society. We lack a unified vision and an ethical, normative and legislative uniformity, within which the work should be done, despite the determinants shown above.

SOCIETY ANXIETY AND SELF-REPORTED TIME SPENT ONLINE IN A SAMPLE OF ALBANIAN UNIVERSITY STUDENTS

Erika Melonashi

Abstract: Online activity serves different purposes, one of them being communication and social interaction. Studies have demonstrated that individuals tend to display online behavioral patterns that are similar to their social groups; also there is some evidence that individuals who have interaction difficulties in real life (e.g., social anxiety) might engage more in online behavior. The purpose of the present study was to investigate the relationship between self-reported time spent online, descriptive social norms, and social anxiety symptoms in a sample of 356 Albanian University students. Participants were recruited online. Results showed a significant predictive model for self-reported time spent online, F(7,342)=48.99, p<.001, R²=.50. Age, gender, and the four social anxiety components were not significant predictors; only descriptive norms had a significant effect, β=.70, p<.001. Results are in line with the social normative approach to internet use and have several implications which are discussed in the paper.

UDC Classification: 159.9; DOI: http://dx.doi.org/10.12955/cbup.v5.1013

Keywords: Albania, social anxiety, online, students

Introduction
The widespread use of the internet has affected the dynamics of social relationships and communication patterns especially among youth. The excessive time spent online particularly during this developmental stage, represents a growing concern, both in terms of its impact on quality of life (interference with everyday functioning) and the greater risk for addiction. Hence it is important to investigate patterns of internet use, particularly in regard to the specific functions it fulfills during this developmental stage.

In the recent years, internet use in Albania has become quite widespread among different age groups. This phenomenon has been accompanied by growing concerns regarding negative consequences such as, gaming addiction, online sexual harassment, view of inappropriate content (for children) etc. (World Vision, 2014). Nonetheless, research on internet use patterns is still in its infancy as data comes mainly from organizations such as UNICEF and World Vision and focuses particularly on children and adolescents. So far, no research has been conducted among young adults, and also there has been no examination of theoretical constructs related to the specific behavior (in addition to frequency and prevalence data).

The present study aimed to assess the relationship between self-reported time spent online, social anxiety symptoms and descriptive norms among Albanian University students. Hence the study would determine whether a social normative approach or a stress-response/self-medication model, would better explain self-reported time spent online.

Literature Review
Internet use patterns are related to very diverse functions, including communication and social relationships, entertainment, stress management etc. According to a social normative approach of internet use, internet use patterns of youth are highly similar to their social groups, friends and peers (Chang, 2004; Zhou & Fang, 2015). Thus, internet use patterns among youth might be explicable through processes such as social learning/modelling and group belonging, as well as factors such as descriptive or injunctive norms for internet use (how widespread and acceptable the behavior is) (see Brechwald & Prinstein, 2011; Steinberg & Monahan, 2007).

Yet another line of research focuses on an alternative function of internet use, e.g., as a stress management or anxiety relieving tool (e.g., Koc & Gulyagci, 2013; Liberatore et al. 2011; Morrison & Gore, 2012). There is some evidence that individuals who have difficulties in forming relationships in real life might turn to the online medium as a safer environment to experiment, approach others, and build new social connections (Joinson, 2001; Weinstein et al. 2015). In this context, several studies have reported relationships between social anxiety symptoms and internet addictive behavior (Yen et al., 2007; Wei et al. 2012).

1 Faculty of Social Sciences and Education, European University of Tirana, erika.melonashi@uet.edu.al
Social anxiety is a psychological disorder characterized by constant anxiety/fear as well as avoidance of social interaction or performance situations; most important, the presence of anxiety and avoidance behaviors interfere with normal functioning of the person (American Psychiatric Association, 2013). Data from the United States have reported that most college students experience at least some of social anxiety symptoms, although they do not fulfill the necessary criteria for diagnosis of the disorder (Baum et al., 2001; Bryan, 2005). Indeed, young adulthood poses significant developmental challenges on the individual in terms of achievement, acceptance, belonging, intimacy etc. (Erikson, 1978). Moreover, several studies with college students have reported relationships between social anxiety symptoms and problematic internet use suggesting that the online medium might serve as a safe place to experiment, form new social relationships, and relieve stress (Alavi et al., 2010; Liu & Kuo, 2007; Montag et al., 2011).

To summarize, internet use patterns among youth might be explicable both in terms of social normative approaches (descriptive and injunctive social norms) and self-medication models (e.g., to manage social anxiety symptoms).

**Methodology**

**Participants**

Participants were 356 Albanian university students, 115 men and 241 women. Mean\(_{age}\)=24.7 years, SD=7.8 years. In terms of field of study, participants were classified as follows: 112 students from the Faculty of Law, 133 students from the Faculty of Economics & Information Technology and 111 students from the Faculty of Social Sciences.

**Procedure**

The study was conducted online as emails were sent to 500 email addresses of students randomly chosen from the institutional database. The content of the email explained the purpose of the study, ensured the anonymity and confidentiality of the respondents and provided the contact address of the researcher for further questions/clarifications. Students were asked to access the questionnaire through the link contained in the email (Google Docs Platform).

**Instruments**

The instrument was a self-report questionnaire with 3 main sections. The first section gathered information on demographics (gender, age, education profile). The second section included five questions referring to the time spent online (number of hours per day) of the participant, their best friend, the peer group, partner, and sibling. The response options were as follows: ‘1-2 hours’, ‘3-4 hours’, ‘5-6 hours’ and ‘more than 6 hours’. The four items referring to reports of best friend, peer group, partner and sibling were grouped into the variable ‘Descriptive norm for online behavior.’ The internal consistency for these items, Chronbach’s alpha held an acceptable value of \( \alpha = .73 \), allowing the use of these items as a subscale.

The third section of the questionnaire was the Liebowitz Social Anxiety Scale (Liebowitz, 1987), an instrument consisting of 24 items, 11 referring to Social interaction situations and 13 to Performance situations. This scale asks participants to answer the questions twice, once for anxiety levels in the specific situations and once for avoidance behavior in the same situations. Response options were from 0 (None) to 3 (Severe) for Anxiety, and from 0 (Never) to 3 (Usually) for Avoidance. The total score of the scale has a maximum of 144 points, and the categories are as follows: Up to a score of 30, social anxiety is unlikely; Up to a score of 60, it is probable; Up to 90 it is very probable, while higher than 90, highly probable. The internal consistency for Liebowitz scale as a whole was Chronbach’s \( \alpha = .94 \). The four subscales also had acceptable internal consistency as follows, Anxiety in social interaction \( \alpha = .86 \), Anxiety in performance situations, \( \alpha = .84 \), Avoidance of social interactions \( \alpha = .84 \), Avoidance of performance situations \( \alpha = .79 \).

The first and second sections of the instrument were constructed in Albanian, while the Liebowitz scale was translated from English. To ensure that the translation process was correct, the scale was translated by two independent translators and Albanian versions were compared by the researcher. In the few cases of word mismatch, the researcher (proficient in English), chose the ‘most appropriate’ item. This pre-final version was piloted with 5 students, to ensure the comprehensibility of the items. No major corrections were done after this stage.
**Results**

Descriptive analyses revealed that students reported a mean time spent online of 2 hours/day (M=2.00, SD =.89), whereas the mean time reported for others, i.e., descriptive norm, was M=2.40 hours/day, SD=.75. As regards social anxiety, 21.3% of the sample (76 participants) reported total scores up to 30, i.e., social anxiety was unlikely for almost 1/5 of the total sample. Additionally, 43.5% of the sample (155 participants) reported total scores up to 60, falling thus into the category of probable social anxiety. Finally, 30.1% (107 participants) reported scores up to 90, falling into the category of very probable social anxiety and only 5.1% (18 participants) reported the highest scores in the scale (i.e., social anxiety was highly probable in this fraction of the sample). Descriptive statistics for total scores as well as the specific dimensions are shown in Table 1.

Correlation analyses between the variables of interest revealed significant relationships only between time reported online and descriptive norms for online behavior, r=.70, p<.01. The four dimensions of social anxiety as well as the total score had no significant correlations to time spent online. An interesting finding involved correlations between descriptive norms and three of the dimensions of social anxiety, respectively with Fear of social interaction, r=.12, p<.05. Avoidance of social interaction, r=-.16, p<.01, and Avoidance of performance, r=-.11, p<.05. Table 2 shows correlations between the variables of interest.

Subsequently, a regression analysis was conducted with \textit{time spent online} as the dependent variable, and gender, age, descriptive norms and the four dimensions of social anxiety as independent variables. Results showed a significant predictive model for self-reported time spent online, $F(7, 342) = 48.99$, $p<.001$, $R^2 = .50$. However, age, gender, and the four social anxiety components were not significant predictors; only the variable descriptive norms contributed significantly to the model, $\beta = .70$, $p<.001$.

\textbf{Discussion and Conclusions}

The present study aimed to assess the relationships between self-reported time spent online, social anxiety and descriptive social norms. Results demonstrated no significant relationships between social anxiety (as a total and also specific subscales) and self-reported time spent online. The only significant influence on time spent online, was that of descriptive social norms.

These results are in line with a social influence approach to explaining online behavior; indeed, participants reported that the online behaviors of their partners, peers, friends, siblings were highly similar to theirs. These results are in line with studies on adolescent internet use (e.g., Chang, 2004; Zhou & Fang, 2015) suggesting that similar to that developmental stage, social influence in young adulthood might still be highly relevant in understanding online behavior.

Conversely, these findings might also highlight once more the positive function of the online medium as facilitator of social interaction and relationship maintenance (Young, 2015; Zhou & Fang, 2015). Indeed, a very interesting finding was the negative relationship between descriptive social norms and three of the dimensions of social anxiety. More specifically participants who reported a greater involvement in online behavior of their social groups also reported lower levels of fear or avoidance of social interaction as well as less performance avoidance. This finding is in line with research suggesting the positive social supportive effects of online communication; for instance, Wangberg et al. (2007) have reported relationships between internet use and social support (social provision) and also subjective health. Nonetheless, the present study did not investigate the purpose/function of being online, (i.e., communication, work, information seeking etc.), an aspect which is very important to consider in future research (see Pontes, Szabo, & Griffiths, 2015).

Another important aspect refers to excessive or problematic internet use, which certainly cannot be assessed through time spent online only (Lehenbaue-Baum & Fohringer, 2015). Indeed, several studies have found relationships between internet addiction and social anxiety, suggesting that the relationship might become evident at more severe levels of problematic behavior (Alavi et al., 2010; Montag et al., 2011). Further research is needed to examine whether this is actually the case among Albanian youth, using measures of internet addiction apart from social anxiety measures.

Nonetheless, the present study also provides some other findings worth mentioning, especially in terms of social anxiety. For instance, descriptive analyses indicated that only 1/5 of the sample fell into the category of 'unlikely social anxiety,' while the rest ranged from 'probable' to 'highly probable social anxiety.' Although the sample is too small and limited to conclude on prevalence rates, this data suggests the need for further research on social anxiety especially among Albanian youth. The socio-economic and political transition of Albania in the last 27 years, as well as poverty, crime, corruption, job insecurity, the dissolution of the traditional family, the instability of values and social norms, are only some of the macro-level factors, which might suggest the relevance of investigating further disorders such as social anxiety. In support of this claim, Hofmann, Asnaani, and Hinton (2011) have suggested that the cultural context is very important in understanding a disorder such as social anxiety and have also reported significant differences in rates of the disorder across countries. Hence future research with more extensive and representative samples might be needed to examine this aspect also in Albania.

To conclude, the present study suggests that perceived social norms are relevant in understanding internet use behavior (time spent online) among Albanian students. Social anxiety with its two components Fear and Avoidance, was not related to self-reported time spent online; also, other factors such as age and gender were irrelevant. Despite the several limitations, the findings of the present study have important implications in terms of future research within this field in Albania.

CURRENT CONCEPTUAL APPROACHES FOR ASSESSMENT OF THE PROCESS OF AGEING AND OLD AGE

Vanina Mihaylova,1 Dimitar Shopov,2 Iliya Bivolarski,3 Adolf Alakidi,4 Kristina Kilova5

Abstract: Ageing should be considered not only as an increase in the number of elderly and old people in their absolute and relative numbers, but also as a unity of the transformations of the lifecycle, with an emphasis on: later retirement, prolonged period of good-quality life, an active approach towards the process of retirement and differentiation of the category of “fourth age”. The general preparation for old age has earned a new appeal in the contemporary societies. Motivation of the old people for activity – both physical and intellectual – is of great importance for the better survival of the old age and long life in good health, supported by realized well-being and feeling of joy from life. In this aspect the study of both risk and protective factors for human health (in a salutogenetic perspective) becomes increasingly fundamental. The issue of population at an advanced age has definitely been considered as an independent subject since the beginning of the 21st century. Moreover, the society perceives it as an essential basis for further progress and flourishing of the mankind. In this sense the demographic strategies treating the problem need to address it in a new positive way, with different and positive attitude, accepting the population-related failures and anxiety and turning them into challenges and advantages.

“We live as long as God decides. But there is a significant difference whether we spend our old age miserably or well and meaningfully; a good physician can definitely contribute to this.”

Goethe

Introduction

With these words Goethe, in the beginning of 19th century concedes to the physicians the main responsibility for solving the problems of ageing and old age. He had not presumed that this burden would be assumed by the entire society. In the past century the average expectation of life almost doubled and the number of old people sharply increased.

The first signals of ageing of the population date back from the 1960s. The global society is already older than ever before in human history. Europe is the region in the world with the oldest population. At the same time it is assumed that research in the field of ageing on this continent has considerably fallen behind in comparison with the USA.

Ageing of the population on the Old Continent can be attributed mainly to two major demographic tendencies – decrease in birth-rate and increase life expectancy. This process creates a fundamental problem of complex nature – social, economic, psychological, medical, etc. Experts from the World Health Organization have established the that the stages typical of the second half of the human life are: medium age (maturity) – 45-59 years of age; advanced age – 60-74; old age – 75-89; long-living persons (macrobios) – 90 and over.

In many countries at least 10 % of the population belongs to the group of people over the age of 65 (Bassuk et al, 1999). In the following decades the developed countries will likely witness a sharp increase in the actual and relative numbers of old people, while doubling the number of those over 65, and probably tripling (possibly even quadrupling) the number of people over the age of 85. World Trade Organisation and the World Bank include ageing of the population among the future problems of highest priorities for the developing countries (Kumar and Steinmann, 1998). Currently about one fourth of the population in our country is over 60, and the fraction of society over the age of 65 is bigger than 15 %.

Psycho-emotional well-being for healthy ageing. General provisions

The main societal challenges since the end of XX century have been maintenance of health and a good quality of life of the ageing population. For 60-year—old people, it could be expected that at least one fourth of their remaining years will be spent with a disability, including of psychogenic nature. According to Bretschneider and McCoy (1987), Isaacs (1992), Shah (1998), the age at the beginning of the deteriorating health could be increased faster than the rate of extension of human life due to the “compression of the sick-rate”, i.e. a shorter period of illness and disability, reduction of untimely death and good health almost until death.

The long-term tradition in medical ethics confirms that the real objective of medicine is to contribute to the increase in patients’ well-being. The psycho-emotional well-being and the possibility of overall healthy life are influenced by a relatively limited number of incurable conditions whose incidence is associated with ageing. An elderly person is no longer able to overcome their withdrawal from their habitual functions in their former social environment. Only a fast return to the typical social environment could prevent the unfavorable course of events. It should be noted that the main objective of medical treatment in old age is not necessarily the elimination of a disease, non-progression is often deemed sufficient. Other factors might prove to be more beneficial, such as maintenance of the habitual home environment, social relations and contacts, the life outside institutions; the perspectives for the future. This is so because health in old age can no longer be defined as a lack of any disturbances (of physical, psychological or social nature), but as an individual’s potential to manage and to live with such disturbances.

In the contemporary dynamic world an individual, especially an elderly one, faces extremely difficult situations in life. The intensity of the experience opposite to well-being – the spiritual discomfort – is explained by Higgins et al. (1987) through their theory of discrepancies in the self-consciousness and the ego, differentiating conflicts in three varieties. In this way, the feeling of being rejected, which often and even inevitably accompanies old age according to Maslow (2001), is the key to many other events such as intrusive desire for gaining back love, development of defence mechanism, accumulation of hostility and other negative motivating conditions. In this sense the human ability for building “new structures” is of great importance and becomes a prerequisite for imitativeness and originality of one’s image. The popular so-called “repertory grids” (Popova, (1993), creating readiness to search for an adequate response and adaptation mechanisms to stressful situations, and establishment of which is unique to the individual, appear to be of utmost importance, and at the same time the effectors of the increase in psycho-emotional well-being.

The concept of “old age” and its successful reception

If we make an attempt to summarize the viewpoint of leading authors with respect to the definition of the concept of old age, it is basically reduced to the following: an individual is as old as is his adaptation ability, i.e. the adaptive potential and speed of adaptation towards certain situations and their changes (Fink, 1987), (Schutz, 1980). Ageing cannot be interpreted as an illness. If the functional parameters of the thirty-year-old people are conditionally indicated with the initial value of 100 %, then within the framework of the reverse process, i.e. of regression or attenuating functions, the different values are reduced, affecting the heart, blood circulation, respiratory system, secretory system, etc. And as long as this regression is measured in physiological parameters, it can clinically remain unrevealed during the overall process of ageing. On the other hand, the reduced adaptation abilities lead to decreased resilience. In this sense we can talk about intrinsic predisposition to diseases leading to higher susceptibility to diseases (Bock, 1989).

This expected increase in the “predisposition” to diseases may provoke different reactions in the individual so that the health, well-being and overall capability could be preserved until reaching advanced age.

Preconditions for “successful reception” can be:

- Prophylactic medical checks
- Prevention of risk factors
- Personal hygiene and maintenance of the muscle tone
- Rational nutrition
- Optimal clothing, especially in transitional seasons, for prevention of adverse effects of atmospheric changes and temperature fluctuations
- suitable home environment
- Maintenance of interpersonal contacts
- Physical and mental independence
- Established structured daily regime, in which activities and rests alternate at reasonable intervals.

Therefore the environment and lifestyle contribute to a large extent to healthy ageing and are prerequisites for the psycho-emotional well-being, the main determinant for the content living in the third stage of life. The ability of the individual to make changes in this direction is determined by the social and cultural context of their life, including personal choices, access, availability, information and income. Environmental factors, such as housing and air and water quality, which are fundamental for health, are not always satisfactory or acceptable.

Healthy ageing includes social, as well as physical and psycho-emotional well-being. Decisive factors are the social framework and policy which enable elderly individuals to realize their potential and achieve optimal health.

Application of scientifically substantiated approaches for infiltration in the personal theory of the elderly individual's inner worlds is envisaged with a view to achieve efficiency given the struggle of risk factors, as well as ratification and development of protective personal models of salutogenic nature (Mihaylova and Lyochkova, 2012).

**Deficit models of ageing and their overcoming**

Sociological surveys show prevalence of various specific negative age-related stereotypes such as (Schutz, 1987), (Smith, 1994):

- Advanced age is inversely proportional to the working capacity/capability
- Old people do not manage strain well
- Elderly individuals have been burdened with enough work, strain and hardship already; they should be allowed to just enjoy their life.

These so called deficit models of ageing describe the public status of the elderly people with the key phrases: deprived of role functions, and reduction of the ability for establishing new social relations, connections and contacts. In this way the situation of the older generation is presented in a distorted manner. This feeling of being damned has a negative impact on their behavior. According to this conception differing from the contemporary understanding, the elderly people are directed towards incorrect and inactive behaviour, even though they are able to perform many versatile and meaningful activities. The extremely drastic definition of the third stage of life by using the term “retirement” is nonsensical since it leads the elderly individuals to inactivity and condemns them to permanent free time. As a rule, life after retirement passes without any social structure because the society has not defined the role of the elderly person (Dunn et al., 1999). A similar risk exists mostly with reference to people of lower social status. This eventuality has been very successfully described by the American author Mulford in his book “Lit up by death” in 1938: “The capability of the old person decreases only because of the fact that he has been told that it should decrease with ageing” (Schutz, 1989).

It is ascertained that in the economically underdeveloped countries the elderly remain economically and socially productive even after retirement, for a long period of time (Krassen Covan, 2003), (Popova, 1993). According to Pichora-Fuller (2003), prevention of the psycho-emotional decline and promotion of the functional independence of elderly people is the key objective of modern geriatrics. This opinion is based on the circumstance that the interval of increased life span is divided into “active continuity” and “dependent continuity of life.” The concept is entangled with the vision of the above-quoted compression of sick-rate ensuring healthy ageing. With some justification, Evans (2002) supports the opinion that preventive strategies aimed at extension of the active part of life at the expense of reduction of the period of functional dependency before death is one of the most
fundamental objectives of the modern medicine and psychology.
Along with observed biological modifications and the increased susceptibility to diseases and psychiatric disorders, there has not been proven a general decrease in the mental capacity in the elderly (Bassuk et al., 1999), (Glass et al., 1999). Most affected and slowed down are the quick readjustment and reaction in resolving complex and combinational tasks, in situations requiring fast involvement of the analytical systems and concentration. However, the intellectual qualities requiring update of available and accumulated experience and knowledge are constantly preserved, independent and unaffected by the old age (Bickel, 1998), (Fortinsky et al., 2003).

It should be taken into consideration that the majority of people over 60 years of age passively accept the proposal for early retirement. They are not prepared to oppose, although they are complete masters of the potential of their capability, but lack information about the particular tasks and activities which could fill up their daily life. Insurmountable feeling of emptiness occurs, leading to depression, often followed by alcoholism or “escape to sickness” (Engelhard, 1986). Gerontological studies show that in the post-professional period only a well-structured daily routine guarantees social contacts and involvement. Free time, though not filled with duties, should be actively distributed and used with careful consideration in order to avoid boredom or dissatisfaction. It can be surely stated that efficiency can be preserved in the old age if the elderly people are motivated and cooperate for this. It should be kept in mind that the strongest motivation in human behavior is not the reasonable contemplations but the socially substantiated impulses (Clark et al., 1997), (Freund and Riediger, 2001).

Reasonably ageing people start looking for new roles and tasks which could completely satisfy their need for both mental and physical activity even before retirement. The assistance of new role functions in this search is a priority of the contemporary social policy.

Two dimensions of old age
Old age as a chance
From the point of health promotion, old age, even if it is accompanied by a disease or disability, should be regarded as a chance. Based on the possibility for comparatively optimal utilization of the available capacity for work, the following key phrase may be considered valid for the seventh decade of human life: “I should always consider the things I can still do and not the things I cannot do any more.”

The above mentioned old age stereotypes also appear in case of chronic diseases. They affect mostly people who have in the course of their lives identified themselves with their professions, their personal successes and careers, with responsibility and power, i.e. qualities which fade away pretty fast upon retirement (Bassuk et al., 1999), (Engelhard, 1986). If favorable preconditions are set, the elderly individual remains independent and competent, i.e. manages their life and does not need care and service. But if they feel stifled by problems of any type – financial, social, housing, cultural or health-related, even the most insignificant event may lead to deterioration of their well-being; they feel (and according to the cognitive theory are) ill (Thomae, 1971), (Young, 2004). These short notes should confirm the unsoundness of the existing biased statements that old age presupposes obstinacy, rigidity, restricted mobility, unwillingness for establishing social contacts, deep absent-mindedness, non-commitment and inactivity. They should be replaced by categories such as unchanged capacity for work and readiness for acquisition of knowledge, independence, experience and competence. Elderly people are free from the pressure of doing a certain, possibly unwanted activity and have obligations which are without deadlines; they possess free time, i.e. advantages which can be related to the concept of advanced age (Schutz, 1987), (Tokarski and Schmitz-Scherzer, 1987).

Health value
Sociological surveys show that values such as subjective feeling of good health, satisfaction with life, independence, freedom, meaningful role in the society, family, and other are outlined as important (Parker et al., 2001). At the same time, the impact of social environment on health is also taken into consideration, for example income, sex, age, education and profession. The lifestyle is connected with the chances in life which provoke a desire for equalization of the health chances.

The cultural and personal specifications related to health are also considered. Studies indicate that
health is not always the most important goal in life for people, including the elderly. Health norms and needs often give way to other goals in life, such as personal happiness, favorable living conditions, even the ability to travel, experience adventures, etc. (Ruffing-Rahal and Wallace, 2000). Despite that, in most European countries health and its maintenance stand high on the scale of the value systems of individuals, including those over the age of sixty, while disease prevention occupies a middle level. On the other hand, one’s own behavior with regard to health and also the ability to correct harmful behavioral deviations, is very low especially in the elderly. It is pointed out that the attitude towards health in the advanced age should not be expressed as permanent anxiety with regards to one’s own health and well-being. In correspondence with the concept of salutogenesis, health does not exist in itself and there are differences in its manifestation during certain time intervals (Mihaylova and Lyochkova, 2012).

The main social threat of old age is related to the breakup of the family and transition to an independent and insolated way of life. The return to the patriarchal relations typical of the 19th century, and in our country until the first half of the 20th century is impossible. The efforts are directed towards the increase and diversification of the forms of communication between the generations and finding new models of co-existence in contemporary architectural solutions –flats designated for that purpose or other family residences. Groups and associations for old people who put to front their priorities and values – self-protection and solidarity – have lately been formed. The category of the so called “young elderly person” is outlined as a unit of observation. Moreover, it is supposed that they dispose of multiple competences which can be used meaningfully and efficiently even in this inactive period of life. In this way the desire of most elderly people to bear personal responsibility for their vital activity is achieved. Mutual assistance is also covered – this is the basis for development of initiatives, both professional and social, at an advanced age.

SAFETY MANAGEMENT AS A SUPPORT ACTIVITY IN THE LOCAL SELF-GOVERNMENT

Ján Mišík,1 Jozef Kubás2

Abstract: A prerequisite for performance of self-government and its integral components is the government’s ability to adequately execute self-governance, which is essential for its efficiency and thus, the meaning of its existence. In villages, in addition to the main activities, a number of supporting activities are carried out to ensure smooth functioning of the core business. Among the supporting activities for municipalities is safety management. The current management guidelines and processes of many municipalities cover components of safety management, but not in a systematic approach. The adoption of an 'official' process of safety management realizes the need for a critical review of their existing practices and its process in the field of security. This contribution deals with the issue of safety management and the responsible roles for creating a safety management system of a village. The purpose of such a system is to ensure the safety of all operations involved in achieving village objectives and to prevent security threats to life, property, and the environment. This contribution mainly focuses on the safety sector of municipalities, which forms the core of the safety management system of a village.

Keywords: efficiency of local self-government, safety management

Introduction

There are currently several non-military security risks that exist worldwide and each is capable of causing serious harm. These risks affect every reference point within a state and villages within a state need protection. Local authorities have an important role in protecting life, health, property, rights, and freedoms of citizens of villages and towns.

Preventing security threats to life, property, the environment and ensuring safety all rounds to achieve government objectives center on two primary activities:

- Protection of persons and property in emergency situations
- Additional strategies to maintain the security of individuals, property, and the village environment

In small villages, where the issue of safety is less extensive, both sets of activities are the responsibility of either the Mayor within the municipal council or the commander of the voluntary fire brigade of the village (where established).

In larger municipalities, this issue is much more complex requiring more organizations and officials. The primary and irreplaceable role, however, still involves the Mayor and some members of the (city) council who deal with security in creating and commissioning the municipal council.

A large part of village security is administered by the crisis management community, which has a primary aim of preventing and resolving emergency situations. For this group, responding to major emergencies (natural disasters, accidents, disasters, public health threats, and second degree and terrorist attacks) while ensuring citizens' constitutional rights to life, health, property, and the environment, imposes ever increasing demands.

In addition to the components of crisis management community, many safety problems are usually allocated to municipal police, who deal with crisis situations and any other types of security that cannot be easily resolved. Moreover, the crisis management organizations and municipal police are not always clear on their respective responsibilities, and therefore, this study focuses on reviewing this issue to seek possible ways of:

- safety management including areas other than crisis management, and
- solutions and cooperation between the components.

Methods

Used methods were analysis, synthesis, comparison, induction, deduction and logical thinking, the main source of information was drawn from of available professional literature and to use the acquired knowledge during the study of the given topic.

1 Faculty of Security Engineering, University of Žilina, Slovakia, jan.misik@fbi.uniza.sk
2 Faculty of Security Engineering, University of Žilina, Slovakia, jozef.kubas@fbi.uniza.sk
Results

In Slovakia villages, a large number of main and supporting activities, in practical terms, is carried out by the authorities in control of the village to achieve administrative objectives. The main activities are determined by the purpose for which the municipality is formed as an organization.

To improve competence, the main activities for the village include:

- Management - planning, organizing, staffing, and monitoring
- Planning, budgeting, and design
- Asset management (asset and municipal facilities)
- General administration
- Services
- Business and investment activity
- Procurement, marketing management
- Transportation
- Other main activities

In a village, a number of supporting activities are performed to ensure proper functioning of the main activities listed above. These include the following particular areas:

- The safety and security of persons, property, and the environment
- Crisis management
- Human resource management
- Quality management
- Information, technology, and telecommunications.
- Operation, maintenance, and servicing of structures, and technological equipment
- Energy security
- Emergency services and other activities
- Other support activities

The safety of the village involves all activities aimed at protecting the interests of all subjects and the village itself. The overall safety includes safety of the village outside the period of crisis management as well as preventing and managing crises.

Both of these profiles contain different areas of security that ultimately create the conditions for the overall safety of the village. These individual safety areas can be grouped into security subsectors for the village (Mišík, 2016).

Safety of the Village outside the Period of Crisis Management

The subsector of safety for the village

When outside the term of crisis management is part of the security for the village that consists of areas needing continuous and improved monitoring on a daily basis. Figure 1 shows the security for the village when outside the period of crisis management.

Source: Authors

The starting point for physical security is with the rights of inhabitants of the village in requesting cooperation to protect their persons, their families, and property located in the village.

An abnormally critical component of security is the physical safety of public property used for village activities. The municipal property should be cultivated, recovered, and its overall policy values
maintained unabated. Municipal property can be used for general purposes, the municipalities’ self-governance performance, and business.

Where the municipality uses their property for business purposes, business security is pertinent. Business security involves the village authorities (even where only marginal), for example, the economic committee of the municipal council and the Department of Finance and Accounting.

The safety and health security area at work stem from the competence of departments and municipalities protecting the health conditions and healthy way of life and work for village inhabitants. It also applies to the municipality as an employer. Some municipalities establish a commission for occupational health and safety and fire protection.

Safety of operation in the village includes security of business continuity, especially with utilities and services (municipal waste management, adherence to cleanliness in the village, management, and maintenance of public green areas and public lighting, water supply, and similar services). For operational safety, the management and cleaning of local roads, sidewalks, and public spaces, for example, snow shoveling, are also included. An operational safety issue in the village involves professional technical services and components of crisis management of the village.

Information safety in the village consists of securing information systems of public administration and of important data (e.g., personal data protection and protection of taxation privacy). The village leads the register and performs verification of documents and signatures on all documents, and decides in matters of local taxes and charges, and whether to manage them.

The community processes personal data. The village uses various software tools in which, for example, are kept records of residents, a permanent list of voters, registration of taxpayers, accounting, local taxes and fees, public property, personnel and payroll, and similar data.

Information safety in a village is related to computer security since information and communication technologies that allow electronic records, store, search, process, transmit, and disseminate information are often used in the municipalities.

Safety and protection of internal order of a village are the responsibility of the municipality to provide for regulation of activity, the implementation of which is prohibited or restricted for a given moment or in a certain place. Safety and internal order are solved through regulations by the village Mayor of the municipal council. The advisory organization is the Legislative Committee of the village where established.

Area of environmental safety of a village stems from the obligation to protect the environment of the village. The village provides the protection of cultural heritage. The village has to shape all the conditions necessary for the conservation, protection, restoration, and use of monuments in the municipality. The Monuments Fund is an important part of the cultural heritage, and the village provides maintenance and administers cultural monuments, historic sites, and monuments of the village.

The situation in many municipalities is one where the economic potential of municipalities lags behind, compared to the actual requirements of its development. Under this influence, existing towns and villages have pressures that limit the number of members in the municipal police force, even when there are protracted radical views on its abolition. Therefore, it is imperative that the extensive opportunities for the development of municipal police are depleted, and it is necessary to find new intense forms in their work to ensure their sustainable mission (Belan, 2015).

Crisis Management in the Village

Crisis management is another significant social concern. Municipalities should provide the necessary immediate assistance to the population in case of an emergency. The village contains the crisis management organization. Organizational units of the municipality in crisis management focus on addressing safety and security threats in the period of threat or periods of action for major events against life, health or property. In these periods their activity mainly focuses on solving crisis management in the case of a fire, flood, major industrial accidents, or other similar emergencies.

The village in its territory:

a) establishes the crisis staff
b) coordinates the activities businesses and legal entities in civil emergency planning
c) implements measures to deal with crisis situations

d) carries out civil emergency planning

e) oversees other activities

Table 2 shows the organizational units of crisis management at the local level. Table 2: Organizational units of crisis management on the local level

This study assumed all aspects of security of the village were integrated into one system, which would have a structure for centralized management, and facilitate the management of the security in an efficient and effective manner (Mišík, Štofko, 2016). Security is a matter for the whole organization. Thus, it should be centrally managed. An organization’s management must decide how it wants to deal with a security or safety management system that will be implemented in the organization and how it will assess the state of security and shape its future development. The overall management of larger, more complex organizations improves with the continuous integration of a safety management system (Sennewald, 2003). An Integrated Safety Management System (ISMS) is a single cohesive system for centralizing management of all security structures and processes to meet the security objectives of the organization and satisfaction of all interested parties (Štofková, 2015).

Conclusion

The security sector of the village consists of several different areas of safety with two main subsectors: 1) the safety of the village when outside the period of crisis management, and 2) crisis prevention and management.

The safety of the village when outside the period of crisis management is usually allocated to the municipal police, who are not always able to deal with all types of security. Crisis management components of municipalities are aimed at preventing and dealing with emergencies.

This system combines all components related to the safety organization for easier management and operation. It is not a common connection of separate systems, but rather their integration, with the mutual connection so that their structure and processes are continuously managed and carried out without duplication.

An introduction of an ISMS to the municipality will allow for efficient operation of security personnel and the use of local sources, as well as the achievement of safety targets for municipalities in various areas of the security sector. This system can assign the responsibility for various areas of the security sector and will adhere to the norms and rules of safety. It would coordinate activities of the various security forces of municipalities, establish internal safety standards in all areas of activity, and provide continuous management of security risks, as well as a comprehensive system of protection to safeguard the security and protection of life, health, property, the environment, and other important municipalities. As well, it would reduce security incidents and support internal and external communications about security issues.

Abstract: When considering the various areas of computer mathematics, especially geometry sticks out, where the problem analysis clearly and fully illustrates the computer. The discipline called "Computer Geometry" (F. Preparato, M. Sheymos) worthily appreciated by modern scientists. However, the practice of training in the higher education institutions (especially training of future teachers), does not provide studying of the Computer Geometry as an academic subject. Perspectives and methodology of Computer Geometry are developed by detailed study of specific problems, and the selection of the content of such course should be conducted on the basis of certain principles, all of which in total have to reflect the prospects of formation of the identity of the trainee as the subject of education adequately.

Introduction

Education Reform in the current socio-economic conditions has specific requirements for teacher training. Modern teacher of Mathematics and Computer Science is required to possess not only the mathematical material and traditional teaching methods but also new, including information technology training. New forms and methods of training of highly qualified specialists who are able to use the computer in teaching of various disciplines competently are under active search in recent years.

One of the most effective means of developing the competencies of future teachers is the introduction into the educational process of various special courses. However, literature analysis shows that at pedagogical high schools the system of special courses on Mathematics and, in particular on Geometry by using computers has not developed yet.

The content of education in pedagogical institutions is intended to ensure a high mathematical and professional training of teachers. The main content of education is supplemented by various special courses.

Research analysis

Algorithmic study of these and other problems had appeared in the scientific literature in the last century, and their intensity has increased in the past two decades. However, a systematic study of geometric algorithms has been made only recently and this discipline, named by F. Preparato and M. Sheymos "Computer Geometry" worthily appreciated by modern scientists. (Pervin, 1992)

Perspectives and methodology of Computer Geometry are developed by the detailed study of specific problems. One of the main characteristics of this discipline is to realize that the classic characteristics of geometric objects often do not have an impact on designing of efficient algorithms. To overcome this drawback, it is necessary to find useful concepts and set their properties to facilitate the computer efficiency. In short, the computer geometry must convert the classic discipline into its computer form – where it is necessary.

Methods of Computer Geometry are based on the works of great scientists (K. Gauss, I. Newton, A. Cauchy, Sh. Hermit, B.G. Galerkin, A.N. Krylov, N.I. Lobachevskii, P.L. Chebyshev, L. Euler, and etc.), and also substantial contribution to the development of Computer Geometry was made by American scientists as F. Preparato and M. Sheymos, who managed to unite, broaden and deepen existing knowledge of this science. (Pervin, 1992).

Impact of research

Computer Geometry is a young and rapidly developing field of applied mathematics. Its uprising was caused primarily by the invention and widespread introduction of personal computers into our lives, an essential element of which is a flat screen, which provides feedback to the user.

With the advent of personal computers, there was an opportunity to work with a flat electronic image by controlling it "directly" (in real time) by a sufficiently powerful computing device. In its turn, this led to significant changes in the areas of human knowledge, which anyway connected with geometry and visual (usually flat) representation of graphical objects - for example, in the drawing, design, construction, various modelling (both technical and art), medical diagnostics, design practice, and so on.

Currently, the using of personal computers in all these areas is not a surprise, although 30 years ago many of them worked without any computing devices. However, the last-user is not always aware of the fact that behind those programs that allow him to work with the screen image lays a rather complicated modern mathematics. In the first place, it is a differential geometry, and that is a differential geometry, which is the foundation and source of many important ideas for the modern Computer Geometry.

Many exhibitions are regularly held worldwide, for example, the SIGGRAPH, the pictures drawn by the computer. Development of fractals would be impossible without computers with the appropriate graphical display means. Multimedia has led to the emergence of new sources of information, which combine the static and video images, text, and sound. The latest operating systems work in graphical mode and initially implemented the methods of computer graphics.

Further, we consider the publications, the authors of which invest particular sense in the content of Computer Geometry.

The training aid of E.E. Sirotina (Nikulin, 2003) thoroughly investigates the mathematical foundations of computer graphics. Therewith, it is revealed the structure of such concepts as: the concept of homogeneous coordinates, geometric transformations on a plane, a parametric equation of the line in a plane, point-like normal equation of the straight line in a plane, the determinant equation of a line in a plane, the intersections of straight lines and line segments in a line, geometric transformations in three-dimensional space, rotary movement toward an arbitrary vector, linear interpolation and twinning, the parametric equation of the line in three-dimensional space, the parametric equation of a plane in three-dimensional space, the plane equation in point like normal form, determinant equation of the plane, the intersection of a line and a plane in three-dimensional space, and others.

Many books on Computer Graphics deeply explore narrowly specialized areas such as the development of subroutine libraries for the implementation of the method of backward ray or high-speed methods for displaying three-dimensional scenes that are used in computer games, or low-level programming of video adapters. Thus, for example, for students who are just beginning to investigate this area, often suffer from lack of general information, which allows to navigate in the rapidly expanding field of computer graphics.

The texts of lectures, authored by A. Kazantsev (Kuk and Beyz, 1990), are a tutorial for beginners to learn computer graphics that is the material aimed at compensating of above-mentioned gap. Also, there is information necessary for the development of three-dimensional applications of computer graphics. The textbook is based on a special course of lectures read by the author for four years at the Kazan State University, on the Faculty of Computational Mathematics and Cybernetics, while maintaining a close connection with the best traditions of classical Russian education.

The work of Kostnikov (2011), shows the role of geometric transformations in the systems of computer graphics. The regularities and features of application of shift transformations, rotation, scaling, reflection, and the central projection in two-dimensional and three-dimensional computer graphics are described there. The lecture notes are designed for students of specialist programmes, bachelor’s and master’s degrees in technical specialties.

"Training not only in mathematics but also by mathematics" is the leading idea of the academic and methodological complex on mathematics, aimed at strengthening the common cultural sounding of geometrical education and increasing its relevance to the formation of the personality of the future
specialist.

The content of the material is aimed at developing students' ability to observe, to compare, to generalize, to find simple patterns, allowing them to learn different methods of reasoning, logic thinking, developing divergent thinking as an essential component of mental activity, geometric culture and allows you to expand ideas about the world by means of mathematics.

The aim of work "Computer Graphics" by Porev (2002) is to develop the aid of computer graphics for students who also study programming. The programming facilitates the perception of computer information technology, it allows insight into the world of computers, to get answers to many questions such as "why so."

The main feature of the course is that it is useful to construct a computer graphics course from the viewpoint of programmers. For a better perception of the course, it is desirable at least to be able to program on computer language C ++ or C. The material represented in this book considerably corresponds to a course of computer graphics that was read by the author at the Kiev Technical Institute for the last several years. The experience of the author as one of developers and programmers of a geographic information system "OKO" was useful for writing the book. This manual is an attempt of the author to generalize some aspects of the current state of computer graphics, to write about them using simple and clear language as much as possible, accurately and clearly explain an essence of things. It is primarily for those who want to create something of his own and get satisfaction from the creative process. Computer graphics gives you endless scope for creativity, it excites the human imagination which is one of the factors of its popularity.

Work of Sosnin (2008) is a part of the electronic educational complex on discipline "Computer Graphics," including the curriculum, laboratory practice, guidelines for coursework, methodical guidelines on practical training, methodical guidelines for self-work, testing and assessment materials "Computer graphics. Bank of tests", visual aid "Computer graphics. Presentation materials". The mathematical foundations of computer graphics are considering there. Geometric transformations of points, straight lines, two-dimensional and three-dimensional transformations of projections are given. The computational models of solving geometric problems are also presented. Designed for students of the following specialties: "Vocational training (on branches)," "Education and Pedagogy," "Automated Information Processing and Management," "Software of computer facilities and the automated systems," "Computer Science and Engineering." The content of school subjects EUMK focused on promoting and supporting the emotional and intellectual development of students; to create conditions for the demonstration of self-dependence, initiative, creative abilities of students.

Book named "Computer Graphics" Porev (2002) considers the types of computer graphics, software of computer graphics, geometric modeling. Basic concepts of geometric modeling. Affine transformation, geometric models of flat objects, methods (models) of describing a straight line, the mutual arrangement of graphic elements on a plane, equations of the beam of lines and the bisector of the angle, curves of the second order. Splines. Bezier curves and etc. The material presented in the textbook purposefully creates all kinds of learning activities of students. This is facilitated by: a logically built course content, a variety of methods of educational activity of students, educational tasks directed to carry out different types of actions by students. During the course students acquire: mathematical knowledge, abilities, and skills, and they will learn how to use them to describe the regularities, processes, phenomena, assessment of quantitative and spatial relations; will seize abilities: to build reasonings; to reason and adjust statements to differentiate reasonable and unreasonable judgments; to reveal regularities; to establish causes and effect relationships; to perform the analysis of various mathematical objects, allocating their essential and insignificant signs that will provide them successful continuation of mathematical education.

The main features of the content of the course "Computer geometry and graphics" (Golubenko, 2009) are: integrative presentation of knowledge; targeted skills development during the mastering subject knowledge and skills. The paper deals with a wide range of issues in the field of computer graphics: the basic concepts are defined, a row of classical algorithms is considered, the review of the modern hardware and software facilities of computer graphics is given.
Continuity of study

Broad integration of knowledge in which connections of a different level (metadisciplinary, intersubject and intrasubject) allow to reach the main objective - to show students a wide aggregate picture by means of science, and direct learning. The course organically combines work on perception of classical algorithms, the modern hardware and software facilities of computer graphics. Also designed for the students of technical specialties.

Nikulin (2003) gives the most complete presentation of geometric and algorithmic fundamentals of modern computer graphics: mathematical models of graphic elements on a plane and in space, the fundamental laws of geometric optics and the algorithms based on them for the construction of optical effects, the methods of geometric transformation, analysis and synthesis of models of lines, surfaces and volumes, geometric visualization tasks - a complex of algorithms for 2d- and 3d-clippings, block diagrams of algorithms and examples of their implementation. It is useful for the students of the higher education institutions and specialists studying computer graphics and who are engaged in the development of new algorithms and applied graphical programs.

N.K. Kukov’s study guide deals with mathematically rigorous stated all the relevant information from differential geometry and topology, the basic concepts and tools of computer geometry, the mathematical description of some important algorithms of geometrical modeling and automatic designing are given there. The latest results of achievements in the field of computer processing of modern digital image – the splice of projectively converted images are also described. It is written for students of higher educational institutions of technical direction. The author proceeds from the fact that the foundations of geometric modeling are differential geometry and topology, and the working materials are different curves and surfaces. At the same time, geometric modeling also develops its own methods.

The common feature of all system of textbooks is that the same educational content may be in the form of visual and / or verbal (or other) images in the form of theory, as a collection of facts and other. A variety of presentation of educational content allows you to activate different types of thinking - visual-active, eye-mindedness, verbal and figurative, verbal and logical (theoretical); different types of perception and processing of information like kinesthetic and visual, and as a whole creates prerequisites for the individualization of training and retention of learning. One and the same object (phenomenon) is treated with the great possible number of parties. Knowing about it is naturally fixed in the student's mind as with the other study material and a personal experience. Knowledge becomes valuable, gains the personal importance and practical sense. It gives a chance to each student to show the strengths and to develop insufficiently created skills.

As Kuk and Beyz (1990) consider the computing an exact science, and the systematic examination of all aspects, including such areas as database development, system testing and the development of software with the need to use mathematical models. From this perspective, many training programs in computing at universities and institutes provide special courses that acquaint students with the relevant mathematical structures and methods.

Teacher training program doesn't provide studying of computer geometry as an academic subject, though it is a very interesting area of geometry, therefore, it would be reasonable to introduce it in a variable part of the training program.

Conclusion

Summing up the result we can say that the selection of educational material, its restructuring should be conducted on the basis of certain principles (criteria), which together should adequately reflect the prospects of forming of the identity of the trainee as the subject of education, social actions and educational and productive activities on the basis of pedagogical forecasting data. From this point of view, we can offer the following principles in the training content forming:

- correspondence of training content to the requirements of modern production and socio-economic forecasting of the region;

- the accounting of the substantial and procedural parties of training (when developing the content of a training material it is necessary to take into account the regularities, methods, the principles of training; it is necessary to reflect in programs and textbooks the ways of conveying and learning, also
learning levels along with the content);
- a unified approach to designing of the content of education (theoretical aspect, subject, training material, pedagogical activity, the identity of the students).

ETHICAL CONCERNS REGARDING MALE CIRCUMCISION CULTURE: A SELECTED ETHNICAL GROUP

Cabangile N. Ngwane

Abstract: Traditional cultural practices reflect values and beliefs of members of a community. Culture is an umbrella term, which explains common things people share such as language, customs, beliefs and the way of life. This paper seeks to look at male circumcision culture of a certain indigenous group in South Africa. Male circumcision is associated with ethnic marks, virility, masculinity, rite of passage to manhood however, there are many ethical concerns centering on male circumcision. Hence, this paper seeks to explore the ethical concerns surrounding male circumcision culture of a selected ethnic group in order to contribute to ethical execution of the practice. Little has been done on ethical issues surrounding male circumcision. The fallacy surrounding this phenomenon needs further investigation. The paper intends to contribute to the debate on male circumcision as a way of mitigating HIV/AIDS infections. The Social Norm Theory has been used to explain the phenomenon under study. The constructivist research paradigm enabled the interviewing of participants from the target population, as the study is inductive in nature. The key finding was that they do male circumcision mostly in an unethical way that it also affects women and children. They also do it based on the misconception and the fallacy that they will not get HIV/AIDS.

UDC Classification: 314.39; DOI: http://dx.doi.org/10.12955/cbup.v5.101

Keywords: Male circumcision, culture, fallacy and ethical concerns.

Introduction

This paper is about ethical concerns centering on the male circumcision culture of a certain ethnic group in South Africa. It is vital to note that male circumcision is associated with ethnic marks, virility, masculinity, rite of passage to manhood. This paper seeks to explore the ethical concerns surrounding male circumcision culture of a selected ethnic group in order to contribute to ethical execution of the ritual. The philosophy underpinning the study is the constructivism research paradigm that informs qualitative research. In order to collect data in the field interviews were conducted at Mpolweni informal settlement in the Reservoir Hills. The Social Norm Theory was used to explain the phenomenon under study better.

Constructivism research paradigm

The worldview underpinning the study is the constructivism research paradigm. According to this paradigm “the nature of social constructions requires individual constructions to take place through the interaction between the researcher and participants” as (Mackenzie & Knipe, 2006) asserts. I chose

---

1 Faculty of Arts and Design, Durban University of Technology, cabangile12@hotmail.com
this paradigm because it is a philosophy to qualitative research and I wanted to “utilize open-ended questions to allow participants to share their views” as Creswell (2014) confirms. The case study was conducted in the Reservoir Hills informal settlements focusing at Mpolweni as a target population. I interviewed 12 participants (2 mothers, 3 fathers and 7 initiates). I conducted interviews because I depended on the views of the participants regarding the male circumcision phenomenon. A thematic analysis was used. Research ethical rules were adhered to including seeking participant consent, avoiding plagiarism, fabrication and falsification of data, etc. Consequently, the results are valid, credit and trustworthy as they are based on theoretical and empirical data.

Results
In addressing the objective of the research, it was discovered that custodians of circumcision do not only perform it unethically; but they also break the law. They violate the standard principles of surgery by circumcising babies without their consent and without medical justification. They harass women based on the myth of cleansing, which is sexual harassment and women abuse. They also believe that they do not contract HIV/AIDS because of circumcision. Consequently, when they get sick because of AIDS they attribute their sickness to witchcraft. All males do circumcision because they are afraid of the stigma as they will be perceived as boys (not as men) for the rest of their lives. They believe that they will gain respect if they undergo this process and become the real men. The government needs to engage various stakeholders so that they could work together through the participatory mode in order to avoid unethical practices and complications. The awareness campaign is necessary to educate community members about the advantages and disadvantages of the routine circumcision.

Discussion
It is important to remember that the paper sought to explore the ethical concerns surrounding male circumcision culture of a selected ethnic group in order to contribute to the ethical execution of the practice. The major ethical concern regarding male circumcision is circumcision of babies that violates standard principles of surgery. This is performed with no medical indication and reason. According to the standard surgery principle, no operation should be done when there is no disease. In addition, an operation needs to be done if it can be substantiated that its risk cannot be equated to the risk of the disease. Furthermore, Hutson (2003) concurs by positing that even if patients have diseases, dangerous procedures can seldom be justified if the risks are higher than the disease. The routine circumcision is done when there is no complication or disease; therefore, its risks are not balanced against the disease risks. Szabo and Short (2000) further assert that the cost-benefit analysis approach renders routine circumcision unnecessary, as it is not justified by the medical indications. Participants made it clear that they will not allow medical practitioners to undermine their culture by posing some unnecessary threats and warnings. It is clear that the people feel strong about their culture and customs. They may feel strong about their culture but routine circumcision goes against the standard principles of surgery and when complications prevail in a process, they consult the medical practitioners. It will be crucial to run an awareness campaign that would not criticise their practice.

There have been some cases of men who experienced surgical complications from childhood because of the circumcision resulting in inadequate sexual function. Stein (2008) confirms this by saying that circumcision reduces enjoyment in lovemaking. Moreover, Laumann et al. (1997) contend that a serious complication is when the tip of the penis is cut accidentally or excessive cutting of the penile shaft skin causing deformity. Such people end up having gender issues because of losing part of their penis. This could be avoided by abolishing the practice. This angered participants. They felt that this undermines their capability. They perceived them as the people who have no potential and who are careless. The medical practitioners need to work with traditional people to avoid victimisation of initiates. Apportioning blame will not bring the solution. Collaboration will help. The people are protective of their culture as the social norm theory explains

The male circumcision practice affects women in different unethical ways. The practice is associated with the cleansing myth that affects women adversely. Maluleke (2012) confirms that civil society organisations in KwaZulu-Natal, Limpopo and the Eastern Cape are unhappy about this cleansing of newly circumcised initiates. In addition, Gwandure (2011) explains that the cleansing ritual occurs when the initiates have to get a woman or even a widow to gang rape as a cleaning procedure. The participants do not like to talk much about circumcision in general because of a warning that women
should not hear anything about this ritual. They did not want to confirm or refute this myth. The Zulu speakers strongly believe in Ubuntu and this myth is absolutely against Ubuntu. Moreover, it violates the law, which means it is the criminal act. Furthermore, it is highly unethical. It also violates the United Nations Declaration Charter that promotes equal human rights and human dignity. The Social Norm theory states that those who break social norms face consequences, those who commit this abusive act against women should face punishment. This myth needs to be investigated and be exposed.

There is a fallacy that male circumcision protects circumcised men from contracting the HIV. However, the Doctors opposing male circumcision (2008) confirm that there is a likelihood that circumcision has a potential of decreasing female-to-male HIV transmission. As a result, medical male circumcision has become part of comprehensive strategies to prevent the HIV infection. Furthermore, Talbott (2007) explains that studies conducted in Africa (South Africa, Uganda and Kenya) discovered that non-circumcised men contract the virus more quickly than circumcised ones. The studies further reveal that it could be because the circumcised men abstain for a certain period after their circumcision. It was sad to discover that participants in the field had a strong misconception that they would not get the virus because of the circumcision or their partners have been circumcised. Consequently, when they get sick because of the virus they always blame witchcraft. They do not see themselves having the virus. They refuse to consume any form of medication such as anti-retroviral or tuberculosis tablets.

There is belief that the male circumcision is likely to reduce HIV infection by the use of female-to-male heterosexual transmission method. Glick (2005) maintains that the male-to-female transmission risk is extremely higher than of female-to-male transmission. Glick further explains that the means of partial prevention is a futile exercise as it prevents men at the expense of women. There is no indication that the male circumcision could protect women from the HIV infection. Moreover, Spearman (2006) concurs by asserting that circumcised males protect themselves from HIV while putting their partners at risk. However, Doctors opposing male circumcision (2008) contend that the circumcised men may still contract the virus and pass it on to their sexual partners. The participants stated that their partners will not get the HIV because they will not get it. This confirms their ignorance, fallacy and misconception. This confirms the Social Norm Theory as it contends that they perform the male circumcision practice because it is a cultural norm and run away from a stigma. They are also afraid of the costs of deviant behavior. Therefore, this means that the male circumcision ritual protects men, but not women. It is unethical to protect a certain group at the expense of another. Although the men are not 100% immune.

Performing circumcision at any age should be done safely in order for it to be ethical. Safe circumcision is expensive. Rennie et al. (2007) maintain that fee estimates differ, but the cost could prevent this practice to those who are poor in developing countries. To avoid this problem, it could be a good idea to perform this ritual in clinical settings. In addition, Cassell et al. (2006) explain that the less privileged groups could only access cheaper circumcision that exposes them to greater complication and risks as well as the risk of HIV infection. This forces them to go to self-appointed circumcisers who render dubious services at cheaper prices. Furthermore, some circumcisers commercialize the ritual by charging exorbitant prices. This side-lines the poverty-stricken group as it cannot afford the ritual. The participants explained that even clinics charge fees. They mentioned that if it is done in clinics it would not serve the purpose because they learn various manhood practices at the initiation school. If they could not go to initiation school, they will be insulted and they will be viewed as boys forever. Their peers will undermine them. This confirms the Social Norm Theory as it says that they fear the stigma and they want to be relevant.

Social norm theory
The value of circumcision is based on culture. The primary purpose of male circumcision is a social reason rather than a medical one. The cultural norm supporting male circumcision has an impact on how parents decide on the phenomenon. Waldeck (2003) asserts that the dynamics of circumcision may not be able to reduce its rate dramatically with no legal interventions. Perceiving circumcision as good or bad should be left for parents to decide. Parents circumcise their children because of cultural norms rather than medical reasons. Furthermore, Waldeck (2003) explains that norms regulate behavior because of associated costs of failure to adhere. As a result, people who do not comply could
experience the self-imposed guilt. In addition, parents have their children circumcised so that they do what their peers do because non-circumcision is a stigma. Most importantly, social norms have costs for deviant behavior. Moreover, social norms affect the way the people think, understand and process information. Consequently, educating the people about the advantages and disadvantages of circumcision may not lead to the decline of circumcision. If one could keep warning the parents about circumcision, they might resent the information. They may despise a person who challenges their ancestral culture. They may ignore the warning and costs.

**Conclusion**

The paper intended to investigate how a certain ethnic group in South Africa circumcises boys. To conduct the research interviews had been conducted in the Mpolweni informal settlement in the Reservoir Hills suburb. The study discovered various unethical practices that occur during the process. The misconception and fallacy have been addressed.

ETHICAL SUPERVISION AND MENTORING OF STUDENTS DURING THE WORK-INTEGRATED LEARNING PROGRAMME

Cabangile N. Ngwane1

Abstract: The study investigates ethical supervision and mentoring during work-integrated learning (WIL) placement as WIL has emerged as a new venture in higher education. Work-integrated learning has emerged as a higher education endeavour that has created a new role for senior leadership and management. The study aims to investigate the ethical supervision and mentoring of students during the work-integrated learning programme in order to contribute to the effectiveness of the programme and improve student employability. More work has been done on work-integrated learning however, little has been done on the ethical supervision and mentoring of students during WIL. The study contributes to the debate of WIL implementation. The study revealed that there is a lack of adequate training for supervisors, which sometimes results in students running errands. The positivist research paradigm underpinning the study led to the use of a survey research design and questionnaires. During the research process, research ethical rules had been adhered to in order to ensure reliability of findings. A socio-cultural theory has been employed.

UDC Classification: 314.37; DOI: http://dx.doi.org/10.12955/cbup.v5.1018

Keywords: Supervision, Mentoring, Employability and Work Integrated Learning.

Introduction

Work-integrated learning has emerged as a higher education endeavour that has created a new role for senior leadership and management. WIL encompasses other aspects including supervision and mentoring. Supervision addresses the aspects of support and integration. The supervisory process places emphasis on the relationship between students and supervisors. On the other hand, the idea of mentoring is about the development of a relationship, focussing on longer term and well-defined academic and social achievement. Both mentors and students should gain intellectual, emotional and personal achievement from the experience. The study aims to investigate the ethical supervision and mentoring of students during in the work-integrated learning programme in order to contribute to the effectiveness of the programme and to improve student employability. More has been done on work-integrated learning however, little has been done on the ethical supervision and mentoring of students during WIL. The study contributes to the debate of WIL implementation. The positivist research paradigm underpinning the study led to the use of a survey research design.

Positivist research paradigm

The philosophy underpinning the study is positivism that explains that there is a single reality (Mackenzie and Knipe, 2006), which could be explained better by employing the quantitative approach. This approach resulted in the use of the survey in one programme at the Durban University of Technology (Faculty of Arts of Design) in South Africa. In order to collect data, a Likert scale questionnaire had been used. The intent of following this route of enquiry was to test the theory objectively in order to get reliable results. Thirty respondents had been selected randomly from the target population to ensure population representation. From the WIL coordinator perspective, this phenomenon could be explained better. The research ethical rules including avoiding plagiarism, fabrication and falsification of data, seeking consent, etc. have been adhered to in order to achieve reliable results.

Results

It has been discovered that WIL presents many learning opportunities when supervisors and mentors have been adequately trained to execute their roles during a WIL placement. However, the research revealed that there are no comprehensive supervisor/mentor development programmes in many universities, particularly the university under study. Thus, universities need to develop a comprehensive development programme for both academic and industry supervisors/mentors to ensure ethical supervision and mentoring of students. Consequently, there is a shortage of mentors, a lack of mentoring capacity and uncertainty in working with young mentees.

Moreover, universities do need analysis for both students and supervisors/mentors so that all stakeholders will perform well in their roles during placement. Institutions and employers do not

---

1 Faculty of Arts and Design, Durban University of Technology, cabangile12@hotmail.com
understand that they have a reciprocal relationship regarding student placement. Employers and institutions need to understand their reciprocal relationship as they need each other to improve student employability. Departments and Programmes that do not have effective WIL should implement it for the sake of students as it has been discovered that some Programmes do not implement WIL at all. All stakeholders need to help students to bridge a wide gap between theory and practice through ethical execution of WIL to enhance students’ employability. Students should not be used for errands in organisations as this impacts on their morale as it has been revealed that students end up doing irrelevant tasks. Monitoring and evaluation are crucial during placement to ensure ethical supervision and mentoring of students. Universities need to open a platform where students, employers and other stakeholders provide feedback to enhance the curriculum and student employability. University leadership at all levels need to look into ethical and effective implementation of WIL throughout the institution.

Discussion

Supervision is about execution of determined educational goals. Supervision is a responsibility of institutions and employers during WIL placements. In addition, during the WIL placement students require both academic and industrial supervisors. About 95% of respondents agreed with this because these supervisors play different vital roles on students’ career. Weible (2010) concurs by asserting that academic supervisors set learning objectives by ensuring improved communication between students and employers for feedback reasons. Schilling and Klamma (2010) concur by stating that academic supervisors are responsible for the development of self-learning skills, conflict identification and resolution skills, as well as assessing and monitoring student performance at the workplace. Additionally, an institution prepares students, facilitates integration of learning, and monitors work integrated placements and experiences.

In order to ensure that students’ supervision during placement is ethical, employers and industry supervisors should play their roles effectively. Tynjala (2009) supports this by elucidating that the industry supervisors orientate students into the organisation by stating the learning objectives (the students have to achieve), identifying skills students need, and arranging the required training. The industry supervisor must be someone who is available to students with relevant expertise. The student may rotate through various units in the organisation to acquire broad-based experience however, there should be one supervisor to oversee. Therefore, the industry supervisor needs to be a person with strong leadership and good communication skills and patience. It is essential that these stakeholders empower students in various ways as their roles have been stated. All stakeholders contribute tremendously towards students’ employability and growth, so is WIL. It is vital to execute WIL ethically and efficiently with a high degree of commitment from all relevant stakeholders.

The organisation has to provide relevant work and on-site supervision. On the other hand, the students need to exploit learning opportunities both the organisation and the supervisor provide. Furthermore, Maphosa and Ndaba (2012) elucidates that the students should be professional in terms of timely task completion and submission as well as proper dress code. Some of the respondents (58%) explained that there are cases where they only or mostly do duties that are not relevant to their career. Keating (2006) explains that organisations tend to be reluctant to give students proper tasks because students are inexperienced and they may mess up. This could ruin their relationship with their clients. Some respondents stated that no one visits them in the field from the institution. They explained that they have one day allocated for WIL in a week, which is Wednesday. It is either you do your WIL or spend your time on other things that seem important and pressing to you. The respondents explained that they get to be advised to look for WIL in schools as many graduates are employed at TVET colleges; yet, they are not trained to be teachers. It turned out that was an exaggeration because only less than five graduates from the Programme had been employed at TVET colleges. Employers do not want to accept them for one day in a week. Consequently, their employment rate is extremely low on the course they are qualified for. They resort to enrolling for the Post Graduate Certificate in Education (PGCE) and become Language teachers. This is highly unethical and does not reflect student centeredness. Students enroll for a course they are passionate about. Channelling them towards other career paths is unfair.

Institutions are responsible for monitoring WIL placement to ensure that all stakeholders perform their roles efficiently. Monitoring could be done through site visits, email, phone calls, and chat rooms. The
three-legged relationship (student, university supervisor and industry supervisor) requires efficient monitoring in order to ensure ethical supervision. Tynjala (2009), Maphosa and Ndaba (2012) Weible (2010) elude to the fact that in most cases both academic and industry supervisors are poorly and not prepared for their roles; and 94% of the respondents agreed to this point. Since these students do not have proper WIL they cannot have someone to monitor their WIL. The Programme needs to implement WIL first if it cares about these students’ career, and then ensure proper monitoring of WIL because the respondents revealed the ineffectiveness of the WIL.

Both the institution supervisors and industry supervisors’ evaluation of students during WIL placement is critical to identify strengths and weaknesses. Moreover, Keating (2006) posits that evaluation helps avoid problems related to WIL placements such as misunderstanding of job roles, miscommunication, lack of objectives and goals. Supervisors evaluate the achievement of learning goals, skill and job knowledge, development, dependability, punctuality, attendance, human relations, attitude and capability. The empirical data correlates with theoretical data as 100% of respondents agreed that both supervisors evaluate the achievement of the above mentioned skills.

Both employers and students have a responsibility of giving feedback to the institution whether the programmes and practices are relevant and current or not, in order to enhance the curriculum. This requires effective communication throughout WIL placement. Ideally this is a standard practice; however, the Programme under study will not enjoy this benefit due to the lack of effective WIL. This will result in chopping and changing the curriculum because there is no one monitoring and evaluating the WIL which will lead to the feedback.

Mentoring places greater emphasis on personal development and growth of students. Mentoring involves assisting and supporting students to navigate through their career and find their niche. During this process, they need a space to grow and come up with new ideas and new ways of executing tasks. To achieve this, they must be thrown into the deep while surrounded by mentors to provide safety nets when they drown. Chiappetta-Swanson and Watt (2011) contend that mentoring is the transmission of knowledge and any other form of support given to recipients related to professional development. It encompasses informal communication between a mentor and a mentee (protégé). Maphosa and Ndaba (2012) further explain that a mentor and a mentee engage in an on-going relationship based on mutual agreement. More than 80% of respondents agreed that mentoring leads to personal and professional development hence, specified curriculum requirements should inform it. The Socio-cultural theory concurs as it believes in student development in every aspect. The respondents also mentioned that mentoring is far better than supervision as it provides a semi-formal mode of learning. Supervision and mentoring characteristics should be merged and implemented for the effectiveness of WIL.

A mentor could be either from the academic institution or industry. Duckett (2004) maintains that mentoring helps students to gain independence, confidence and time management competencies. In addition, a mentor helps students plan their career goals and networking in the field of interest and exchange of ideas. This broadens the horizons of students. However, there are some challenges centering on mentoring including the shortage of mentors, a lack of mentoring capacity and uncertainty in working with different mentees and younger generations. The respondents (79%) agreed with the literature that both supervisors do not get proper training. As a result they lack skills of supervision, mentoring, assessing and resolving conflicts which arise during the process of supervision and mentoring. Both the theory and respondents concur with the literature that WIL, supervision and mentoring have a broadening effect on students. Finally, the literature and respondents (73%) agree that both supervision and mentoring enhance students’ learning experience during WIL placement. Students gain various skills and competencies that prepare them for employment. If supervision and mentoring during placement could be ethical and effective students’ employment chances will be high. Programmes that implement WIL effectively and efficiently in the same institution have a high degree of student employment as opposed to this one under study. Some students from those Programmes get jobs during WIL placement. The theory has been used in the subsequent section for better explanation.

**Socio-cultural theory**

Socio-cultural theory is highly concerned about student development. Hutchins (1993) purports that the use of socio-cultural theory for professional education could be substantiated by work place learning. In addition, Spouse (2000) agrees by saying that this theory helps to bridge theory and
practice in the supervisory relationship. Therefore, in order for learning to succeed it is necessary to enforce effective social interactions between a supervisor/mentor and a student through language development and by empowering students to merge theoretical material with practical experience. Chisholm et al. (2009) further contend that WIL is based on the theory of experiential learning. Thus, true education occurs when students solve problematic situation in real life and authentic environments.

Conclusion
The work integrated learning improves employability of graduates and it entails supervision and mentoring. However, the survey revealed that the programme lacks efficiency due to the lack of proper training of the supervisors and mentors. Involved stakeholders need to improve their practice to ensure ethical supervision and mentoring

A COMPARISON BETWEEN UNDERGRADUATE POLYTECHNIC AND MEDICAL EDUCATION SYSTEMS IN ROMANIA

Liana Dehelean,¹ Ana Maria Romosan,² Petru Papazian,³ Mircea Babaita ⁴

Abstract: Background: While medical and polytechnic education systems seem dissimilar in approach, they both share a certain level of difficulty. After graduating, polytechnic students find easy employment in national or multinational companies, whereas medical students are presented with more job opportunities abroad. The purpose of the study was to compare students’ satisfaction with training and career preferences from a technical and a medical perspective. The methods were as follows: the study participants were divided into two samples (polytechnic and medical undergraduates) and asked to fill in a satisfaction questionnaire regarding their professional training. In addition, they were invited to express options about the intended future career. Results: We found no differences between the two samples regarding the participants’ satisfaction with teaching staff and labs. Polytechnic students have more Ph.D. opportunities while medical students were more involved with participation in conferences. Satisfaction with lectures and practical projects was significantly higher among medical students. Conclusions: Both polytechnic and medical students rate their training as satisfying, and half of them consider leaving the country.

Introduction

The Romanian higher education system relies basically on lectures, optional lectures, and practical work (laboratory, practical projects, and practice in a professional setting). Electronic learning is available through e-lectures and educational software. Transfers between different university centers are possible. Research teams are encouraged to include students. As nowadays, performance indicators in higher education rely predominantly on research outcomes, education comes into second place. Concomitantly, a growing pressure is exerted on the higher education system from the environment (Van Vught & Westerheijden, 1994) represented by companies, governments, and students (Ramsden, 1998).

Assessing the quality of undergraduate education implies analyzing both objective and subjective data. The objective outcomes are represented by students’ achievements at local, national, or international assessments (Kellaghan & Greaney, 2001). When evaluating students, one has to keep in mind a complex of factors connected to “what” and “how” to assess (Epstein, 2007). Literature data show that the way the students perceive how they are evaluated influences their learning strategy (Struyven, et al., 2005). According to Lizzio, students’ perceptions of their teaching environment are stronger predictors of learning outcomes at university than prior achievement at school (Lizzio et al., 2002). Resistance to shift from passive to active learning depends on class size, student population and dominant attitudes (Seymour, 2001). In this respect, subjective factors such as students’ perceptions about their professional training may help improve the teaching-learning process.

Medical and polytechnic education systems share a certain level of difficulty imposing high standards for graduating. Although they appear to be different in the content of curricula, both focus on theoretical and practical knowledge. Medical education involves a more humanistic approach. Empathy, defined as the ability to sympathize with, and provide support to another person, has been shown to be correlated with students’ clinical competencies (Hojat et al., 2002). Moreover, in medical students, knowledge and skills must be supported by the comprehension of what others expect from physicians and how they will react to their words and actions (Becker et al., 2009). The aim of the present study is to compare students’ satisfaction with training and career preferences from a technical and a medical perspective.

⁴ Conf.dr.ing. Babaita Mircea, Politehnica University of Timisoara, Faculty of Electronics & Telecommunications, Applied Electronics Department, mircea.babaita@upt.ro
Method
The study participants were medical and polytechnic students at Timisoara University of Medicine and Pharmacy and at Timisoara Polytechnic University respectively. The study was conducted by the Neuroscience/Psychiatric Department of Timisoara University of Medicine and Pharmacy in partnership with the Electronics and Telecommunication Engineering Department of the Polytechnic University of Timisoara. The students were invited to fill in a satisfaction questionnaire referring to their professional training. In addition, they were asked to express intentions about future career. The subjects were informed about the purpose of the study and the confidentiality of collected data. The questionnaire contains basic socio-demographic information (gender, age, year and type of training), closed-ended questions (yes/no opportunity type, or 1 to 5 satisfaction type). The yes/no questions referred to the opportunity to participate at optional lectures, national and international conferences, case presentations (for medical students) or practical projects (for polytechnic students), doctoral (Ph.D.) programs, or transfer between different university centers. The questions rated from 1 (poor satisfaction), to 5 (highest satisfaction) concerned the students’ satisfaction with lectures, teaching staff (professors), and practical activity (in hospitals or laboratories, accordingly). The sources of professional information were also asked (provided by professor, self-research or both). Regarding their financial situation, students were asked to choose what best reflects their subjective perception (good, average, and very good). Additional questions referred to the intended career (academic or not), country of practice (home or abroad), and work setting (hospital, ambulatory or both in medical students, multinational corporation or small private business in polytechnic students). Personal options, comments or explanations were permitted through open ended questions.

Results
The study included 75 medical and 73 polytechnic students. In the medical students’ sample, women were predominant (78.6%). By contrast, in the polytechnic students’ sample, 61.6% of the students were men. The mean age was 24.3 years (SD = 1.47) in the medical students’ sample, and 20.9 years (SD = 1.64) in the polytechnic students’ sample.

Medical students were significantly more satisfied with the quality of the lectures than polytechnic students (U = 2238, Z = -2.01, p = 0.04). No significant differences were found concerning satisfaction with the teaching staff/professors, (U = 2405, Z = -1.35, p = 0.17), the majority of the students declaring their satisfaction and partial satisfaction. There were no significant differences between students in respect with their practical activity in hospitals or laboratories (U = 2362, Z = -1.49, p = 0.13) as observed in Table 1.

Table 2 shows the students’ satisfaction with: optional lectures (ol); conference attendance (c); case presentations (cp) for medical students or practical projects (pp) for polytechnic students; transfer (t) between different university centers; and inclusion in Ph.D. programs (Ph.D.).

Participation to optional lectures (U = 1554, Z = -5.24, p = 0.0001), case presentations (U = 1382.5, Z= -6.48, p = 0.0001), and conferences (U = 2313, Z = -2.11, p = 0.03) is significantly higher in medical students. This result may be explained by the increased need of medical students to meet the demands of a challenging profession based on efficacy and accountability. According to Billings-Gagliardi & Mazor medical students’ decision to attend non-required lectures depends on several factors such as previous experiences with the lecturer, predictions, learning preferences, learning needs at that particular time, but is mostly influenced by the need of maximizing learning (Billings-Gagliardi & Mazor, 2007). A study conducted by Patel and collaborators reports that students from medical schools with a higher-intensity training curriculum reported higher satisfaction than students from medical school with a lower-intensity curriculum (Patel et al., 2009).

None of the medical students expressed an option to enroll in Ph.D. programs, while 35.6% of the polytechnic students wish to undergo doctoral studies. This may be a consequence of the fact that the polytechnic education system offers more time to spend in research activities.

We found significant differences between the two samples regarding transfers between different university centers. Polytechnic students were significantly more interested in expanding their knowledge within other higher education centers (U = 1870, Z = -4.61, p = 0.0001).

There were no significant differences between medical and polytechnic students (U=2712; Z= -0.12; p=0.9) concerning their source of professional information (Table 3). In both samples information is provided mainly by the teaching staff. This finding may reflect an education system relying mostly on conventional lecture-based curricula and using a teacher centered model. On the other hand, self-research through textbooks, internet, or podcasts, has its own downsides, mainly the impossibility for the student to ask questions and of the teacher to receive verbal and non-verbal feedback. This may result in less engagement and lower motivation for study (Schreiber, Fukuta, & Gordon, 2010). In addition to this, the values and experience of the teaching staff may influence students acting as models or reflective practitioners (Harden & Crosby, 2000).
Regarding the postgraduate career, the students had to choose between a medical and/or an academic based one. Students could express preferences for hospital work and ambulatory work alone, or a combination of both. Medical students favored hospital practice alone (37.2%) or a combination of hospital and ambulatory practice (36.0%). In what concerns the polytechnic students, the majority of them favor working in a multinational corporation (76.7%), 13.7% favor small private companies and 5.5% were indifferent. Choosing a hospital or mixed hospital and ambulatory based practice may reflect a proactive attitude towards work, or some financial concerns. In polytechnic students, the choice of working in a multinational corporation reflects more clearly the financial incentives.

Only 8% of the medical students envisage a strictly university career, while 12% wish to have a combined medical (hospital and ambulatory) and university career. Among the polytechnic students, 4.1% wish to follow a strict university career. An academic career may be favored for its prestige. While the medical students included in the study are more interested in the academic career, they expressed no desire to enroll in a Ph.D. program. A possible explanation may be the fact that medical students are confronted after graduating with another 4 years of residency to be allowed to practice, and this may gain priority over doctoral studies.

In respect to the financial situation, there were no statistically significant differences \((U = 2689, Z = -0.333, p = 0.73)\) between medical and polytechnic students (Table 4). The majority of the subjects, regardless of their specialty, rate their financial status as “average.”

We found no statistically significant differences regarding emigration plans between the students from the two samples, while a greater number of medical students intend to practice abroad (Table 5). After graduating, polytechnic students find easy employment in national or multinational companies, whereas medical students are presented with more job opportunities abroad.

### Conclusions and limitations

Medical students are significantly more satisfied with lectures, either optional or non-optional and practical project. While the medical training system encourages students to attend conferences, the polytechnic one offers more Ph.D. opportunities and student exchanges between universities. Both polytechnic and medical students rate their training as satisfying. However, more efforts should be envisaged from the teaching staff to encourage self-learning.

Half of medical and polytechnic students consider leaving the country as an option, with no significant differences between the two samples regarding the intention to work abroad.

The present study was conducted in Timisoara University Center, and does not intend to generalize the results for all the country.

NEURO LINGUISTIC PROGRAMMING AND DIFFERENTIATED TRAINING

Constantin Petrovici,¹ Tudor Stanciu²

Abstract: This article analyses the different modalities of applying the theory of learning styles in the teaching-learning-assessment process.

On the assumption that the mode of receiving information influences how we learn, the researchers Richard Bandler and John Grinder created the Neuro linguistic programming theory. Learning that considers the neuro-linguistic paradigm is an inclusive learning type, which harmonizes the individual needs of the learner with concrete ways to meet those needs. This type of differentiated training represents a tool which allows teachers to achieve the best possible correspondence between their teaching strategies and individual learning styles.

To support our arguments, we created an example of teaching activities using the Neuro linguistic paradigm in mathematics lessons. This example illustrates how each student can be directed in the process of solving tasks useful in the issue demonstration, tasks which are appropriate to his learning style.

UDC Classification: 37; DOI: http://dx.doi.org/10.12955/cbup.v5.1020

Keywords: Neuro linguistic programming, visual dominance, listening dominance, kinesthetic dominance

Introduction

Neuro linguistic programming is exploring how we communicate, think and produce changes. This type of exploration enhances skills related to learning, communication, confidence, motivation, and one’s personal level of success.

This paradigm was created around 1976 by Richard Bandler (a mathematician and student in gestalt therapy) and John Grinder (a linguist) who set out to discover the structure of human excellence (Grinder, 1976)

The main foundations of neuro linguistic programming come from a collection of theories and practices such as Albert Bandura's social-cognitive learning theory (Bandura, 1986), a theory of thought belonging to Gregory Bateson (Bateson, 1972) on the logical levels of learning and a unified field theory, the theory of Miller, Galanter & Pribram (Miller, 1960) on the final orientation of human actions, Noam Chomsky’s transformational grammar (Chomsky, 1965), the concept of “time binding” by Alfred Korzybski (Korzybski, 1933), Glaser's field's radical constructivism (Glaser's, 1996), William James’ theory (James, 1950) concerning sensory representations as foundations for the theory of information processing and the fundamental orientation of human action towards goals (Miller, 1960).

The strategy of Richard Bandler and John Grinder (Bandler, 1976, Grinder, 1976) was to focus on finding answers to the question of how people work. The researchers noted that language (both its discursive level, through which we address others, and its inner form, which is a comprehensive summary of all our experiences) is the support of communication and highlights that thinking patterns determine how we react in a certain context, depending on the culture to which we belong, the education offered in the family and in school.

They revealed the following types: with visual dominance – prefers visual information: graphs, tables, figures, charts and other graphical representations of what is exposed through words; with listening dominance – prefers heard information: lectures, audio tapes, discussions; and with kinaesthetic dominance - prefers exercise and practical connection to reality through experience, examples or simulation. It should be noted that each of us has a unique perceptual style, consisting of a combination of preferences: visual, auditory, and kinaesthetic (VAKOG) (Stanciu, 2012).

VAKOG and Learning

The representational systems we tend to use most frequently are: Visual (V) seeing, Auditory (A) hearing, Kinaesthetic (K) feeling, and we also use our Olfactory (O) – Smell and Gustatory (G) - Taste Visual representation is used outdoors for research and information about the

¹ Faculty of Psychology and Educational Sciences, The “Alexandru Ioan Cuza” University of Iasi, Romania, Str. Toma Codru nr. 3, 700554, Iași, jud. Iași, România iasi_itudsta@yahoo.com
² The “Gheorghe Asachi” Technical University of Iasi, Romania, drtudsta@gmail.com
outside world in images, and inside to view our thoughts. Similarly, the kinaesthetic representation system is used for listening to the voices from outside or inside. The kinaesthetic component is used externally to perceive pressure, temperature, humidity and balance, and balance our internal emotional states, beliefs, etc. In Western cultures visual (V) representation systems (65%), listening (A) (30 %) and kinaesthetic (K) (5%) are primary systems. The senses of smell (O) and taste (G) are less prominent and are often included in the kinaesthetic representation system.

Teachers should encourage students to develop the ability to elaborate and use certain words, gestures, emotions, and sounds in order to facilitate learning in agreement with one or more perceptual styles. In the literature, these are also called anchors or mnemonic techniques.

**Applying the theory of learning styles in teaching-learning-assessment process**

Many researchers have tried to apply the theory of learning styles in the teaching–learning-assessment process. Among them, Dr. Rita Dunn and Dr. Kenneth Dunn (Dunn, 1978) believe there are ways to rebuild the instructive educational approach so as to be useful to every student, regardless of their learning style.

Their so-called "Contract Activity Packages" are educational plans that use: 1) a clear statement of the learning need; 2) multisensory resources (auditory, visual, tactile, kinaesthetic); 3) activities through which the newly mastered information can be used creatively; 4) the sharing of creative projects within small groups; 5) at least three small-group techniques; 6) a pre-test, a self-test, and a post-test.

Marilee Sprenger (Sprenger, 2003) also believes that the VAKOG approach generates useful methods of the teaching-learning—assessment process. She details various ways of teaching – visual, auditory, or tactile/kinaesthetic. Methods for the visual learning style include ensuring that students can see written words, use pictures, and draw time lines for events. Methods for the auditory learning style include repeating words aloud, small-group discussions, debates, listening to books on tape, oral reports, and oral interpretation. Methods for the kinaesthetic learning style include hands-on activities (experiments, demonstrations), projects, frequent breaks to allow movement, visual aids, role play, and field trips.

**The representations that students give of mathematical language, operations and problem solving strategies.**

Therefore, since problem solving strategies differ depending on the pedagogical profile, mathematics teachers must provide: for the visual learning type, a spatial representation of the problem, entailing all the items referred to the utterance; for the listening learning type, a reflection of the problem that can concatenate successive actions; and for the kinaesthetic learning type, an overall successive reconstruction of the problem. Among the strategies of visual learners, we can mention analogy, the spatial reorganization of the problem, the search for regularities and because they are more interested in the situation than in the players, they create representations of all data before they start solving. The strategies for the listening learning type comprise iterative processes, they resort to the decomposition of the problem into chains of simple problems or they think of numerical relationships, and because they have knowledge of the problem gradually their reason unfolds progressively. Strategies for a kinaesthetic learning type include approaching the whole as a part, they treat the issue on the whole, "feeling it," rediscovering the ideas progressively after each reading and analysis of the problem text, identifying specific tasks that can be performed in their attempts.

**Methodological route of training methods differentiated by learning style**

In their activities, teachers should tailor the teaching-learning-evaluating strategies they use to the students’ individual learning style.

The methodological route for each specific training method used in lessons with a mathematical content is different depending on the particularities of individual students to whom it is addressed. In the context of the exposure method, the teacher has to organize their discourse, so they are well received by each student regardless of their learning style. This means that the ideas must be accompanied by drawings, slides, images from a book or displayed on the projector, and they must make graphs, charts, tables which are useful to visual learners. It is important that the main ideas are expressed clearly, possibly accompanied by quotations or excerpts from readings taken by others, to capture the auditory learners’ attention. They should also plan a moment for the kinaesthetic learners,
which involves the exercise of practical skills such as editing a text for note taking, building or construction of conceptual schemes, "spidergrams" and frame patterns (templates) in order to highlight certain ideas.

We constantly asked for feedback from students with auditory learning skills, so they can express points of view, arguing or questioning the opinions of others during the discussion. We can ask the students with a kinaesthetic dominance to answer using practical experiences and descriptions of past tasks, to use role play and enact a situation related to the lesson topic and use this as a basis for discussion or we can assign a sequence of the discussion to these students and ask them to chair the discussion and thus ensure equal participation of all students.

In the context of the exercise method, the teacher must organize the training method, so they are well received by each student regardless of their learning style. This means that students with a visual dominance are encouraged to observe the teacher’s demonstration first so as to see links, to practice and understand what to do, and image-based instructions should be made available where necessary. Students with a listening dominance can be asked about the connection between theory and practice in the exercise given or can be encouraged to talk about the task with the teacher or a classmate. Students with a kinaesthetic dominance can be encouraged to "help" or to work together with others, to practice, to make mistakes and try again.

In the context of the demonstration method, the teacher should organize the exchange of ideas, so they are well received by each student regardless of their learning style. This involves the use of posters, schemes to illustrate what needs to be demonstrated, using colored overhead sheets to allow students to see clearly the dominant visual assumptions and what needs to be demonstrated. In addition, students with a listening dominance should be encouraged to ask questions and discuss the demonstration, explaining each point of view in minute detail, and each sequence of the demonstration must be presented orally. Students with a kinaesthetic dominance should be involved in different ways, for example they can be assistants, they can search for examples to support the demonstration or procedure, they can write on the blackboard while the teacher explains.

The teacher should organize the exchange of ideas, so they are well received by each student regardless of their learning style. This includes supporting visual learners to express their ideas about the solution to the problem, using the color scheme to indicate connections between knowledge which favors the resolution approach, writing down useful ideas for solving the problematic situation by using crayons, "spidergrams," images and symbols. Auditory learners can be stimulated to describe in their own words the ideas they have on solving the problem, talk and exchange ideas with other students. The students with a kinaesthetic dominance can compile a list of actions necessary to approach the resolution and rank these according to their degree of priority actions; can write on the board or flipchart ideas generated by other students using different colors.

Assessment must also be organized in a variety of ways. Homework can be assigned to address simultaneously the students with a visual dominance (the text must use different fonts, different styles, images, symbols, diagrams, "spidergrams"), with a listening dominance (text reading of problems for home and discussing the task set) or with a kinaesthetic dominance (include practical tasks that require the development of activities / investigations that have written elements, but the emphasis is not on writing as such, but on the description of what they have done or discovered).

Assessment of worksheets is an evaluative method common to mathematics lessons. These must be designed to address both visual dominance (layout is very important, important elements of the text should be highlighted and underlined or written in bold, especially the important points and key points in the text of the problem), listening dominance (worksheets can have gaps so that students have to listen to a presentation by the teacher to understand the missing elements, there must be discussions on charts to understand their content and requirements better) or kinaesthetic dominance (worksheets can have empty spaces, so that students need to hear a presentation by the teacher and then complete the missing elements) (Stanciu, 2006).

Assessment of project work is a technique which has its strong points in the field of evaluation of the students with different learning styles. In a project conducted by a team, the students with a visual dominance can be encouraged to use various processes related to the visual scoring of project ideas or to build a new image of the project conducted by the students with a kinaesthetic dominance, the
students with a listening dominance can be employed in the early phases of the project, in which they are required to answer questions related to the given task, to talk about the theme in larger groups with each other or with the teacher, to record information on tape and the students with a kinaesthetic dominance may be involved in carrying out practical activities that require teamwork and skills management or to make a PowerPoint presentation of the final project.

Evaluation by testing can be organized so as to simultaneously address students with a visual dominance (using symbols attached to tasks or questions), students with a listening dominance (it would be preferable to use a "Amanuensis", i.e. a person who asks questions and records the responses as they were given by students in their own words) or students with a kinaesthetic dominance (by formulating questions that must be of a practical nature). The objective items must contain graphics / pictures to expand written information (visual dominance), to encourage students to silently repeat questions (listening dominance) and incorporate practical activities, such as a task or demonstration of certain skills (kinaesthetic dominance) (Andersen, 2008). The half-objective or subjective items must include graphics in the worksheet to turn it into a "chart" filled with blanks (visual dominance), to encourage students to silently repeat various aspects of the requirement or formulating a response (listening dominance), but also to allow students to relate to their past experiences (kinaesthetic dominance) (Radu, 1978).

**An example of teaching activities using the neuro linguistic paradigm in mathematics lessons**

An example of using neuro linguistic training in mathematics lessons teaching is the next sequence illustrating the “problematization” methodological route, in a consolidation lesson for multiplication in the fifth grade.

At the stage of organizing the problem situation the teacher shows an 8x8 chessboard with identical squares and eight castles, leaving the children to examine board and game pieces, the students with a visual dominance are allowed to identify the game pieces and how they operate, the students with a listening dominance are asked to comment on what they think will happen when the game pieces are positioned on the board and how they can be moved them so as not to attack, the students with a kinaesthetic dominance will be guided to move the pieces on their own, so as to comply with the conditions of the problem. Also, the problem is stated, which is the subject of the teaching sequence that we want to illustrate (Consider a checkerboard (8x8) and 8 castles. In how many different ways can we place 8 castles, so the attack becomes impossible?) (Havarneanu, 2009).

At the stage generically called "perception," the students should observe the elements of the problem. It involves a chessboard and 8 identical castles.

At the stage generically called "analysis," students must recall the particularities of movements can shift when attacking two castles. Now it is important that the students notice that the castles are the same color and so identical configurations can be created, and therefore recurring cases should be eliminated. For example, the two diagrams are the same as shifts have the same shape and color (Figure 1).

**Figure 1: 8x8 chessboard diagrams according to VAKOG style of learning**

Source: Havarneanu

Students with a kinaesthetic dominance write the schemes proposed by the teacher on the blackboard; these are useful in solving the problem. Students with a visual dominance observe the proposed
schemes and pupils with a listening dominance comment on the ideas on the schemes presented by the teacher.

At the stage generically called "processing," we considering the number of distinct positions that each turn can do. For the first castle 8 lines and 8 columns are available, that means 8x8 positions. For the second round, there are 7 lines and 7 columns (we excluded those occupied by the first turn), so 7x7 positions. To continue the reasoning, we obtain that for the eighth castle there are one row and one column, so 1x1 positions.

At the stage generically called "selection" it is found that the first castle has 8x8 positions available, but no matter which of the eight castles is chosen as the "first round" it implies that the 8x8: 8 is the real number of distinct positions. By repeating an analogous reasoning, we obtain that the second castle has only 7x7: 7 distinct positions and so the last castle has only 1x1: 1 distinct positions.

In the stage generically called "application," the problem is solved completely and the operations discussed above will be updated.

For each of the 8 different positions of the first castle we build the scheme (Figure 1).

Source: Havareanu

At this stage, students with a kinaesthetic dominance write on the blackboard the schemes proposed by the teacher, which are useful in problem solving and students with a visual dominance observe these schemes, while students with a listening dominance remark ideas related to the same schemes, and
interpret the previous scheme to be read as follows: for the first position of castle 1 we can form seven distinct positions for castle 2, which correspond to six different positions of castle 3 and so on. Thus, for each of the eight castles which are first placed, we could create a scheme of the type previously generated. That means we must perform multiplication. So, the answer to the problem is 

$$8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 8!$$ (Figure 2)

At the stage generically called "systematization and setting new knowledge gained by solving a task," children are asked to solve the same type of problem with 4x4 checkerboard squares and with 6x6 squares.

**Conclusion**

Learning that considers the neuro linguistic paradigm is an inclusive learning type, which harmonizes the individual needs of the learner with concrete ways to meet those needs, representing a tool to allow teachers to achieve the best possible correspondence between their teaching strategies and the individual learning styles. In their activities, teachers should tailor the teaching-learning-evaluation strategies used to the students’ individual learning styles, and throughout the methodological route of each training method specific to lessons with a mathematical content, to differentiate sequences that directly address different learning styles, depending on their dominance (visual, listening/auditory or kinaesthetic). This type of training has the advantage of enhancing mental activity both in the cognitive system (sensation, perception, representation, thinking, memory, imagination) and of the affective and volitional ones, thus significantly improving learning outcomes.

QUALITY OF THE EDUCATIONAL SERVICE – PERCEPTIONS AND EXPECTATIONS OF THE TEACHERS IN HIGH SCHOOLS FROM SUCEAVA COUNTY, ROMANIA

Laura-Mirela Pintilie

Abstract: The goal of this study was to determine the main variables that are part of the management strategies for quality assurance in higher education. The study was conducted in 2016 on a representative sample of secondary schools in Suceava County, Romania. The research methodology has mixed quantitative analysis of collected data using a questionnaire applied to teachers from seven schools in the Suceava County (268 respondents) and qualitative analysis of public documents referring to performances in the secondary education system. To achieve the questionnaire, an adaptation of the SERVQUAL method was used, specific for the services domain. It was aimed at establishing the differences between perceptions and expectations of teachers on human and material resources necessary to ensure the quality of services in education. The results were correlated with data on students' performances in high school and/or professional school. Changing the mentality of the teachers, self-assessment and objective assessment of the work performed and working conditions can lead to increased quality of educational services with direct effects in improving school performance of direct beneficiaries of education, the students.

Keywords: education, strategy, quality

Introduction

In education, compared to the industrial or economic sectors, main studies on the concept of scientific management are just at the beginning, both in theory and especially in practice. Advanced economies, in Europe and worldwide, have proven increased interest in this direction, studies on the management of the education system existing since 1980. In Romania, the scientific approach to the educational management affirms since the 1990s, namely after the 1989 revolution that led to the change of the political regime. A representative definition is the one given by Toca (2008) who considers that management education is consisting in “studying the processes and relationships that manifest within educational institutions during the educational process, in order to discover the laws that generate the educational management and to develop management methods and techniques based on them, which are done to ensure increases of efficiency of this process”. In another work, targeting the quality management in a school organization, the same author states that "Education quality management should focus on processes and not on people" quality being both the "responsibility of the supplier and of the recipient; a mental attitude, a way of life of each and of all vocational schools" (Toca, 2010).

The research performed in this study was based on the interest of identifying specific variables of educational management and of quality management in high schools and/or vocational schools in Romania, given the particularities of systemic, social, economic and educational nature which the education system in this country is confronted with.

Research Methodology

The purpose of this research was a quantitative analysis, through the use of a questionnaire, of perceptions and expectations of teachers from 7 secondary and vocational type of schools, in Suceava County, regarding the available resources needed to provide quality educational services.

The research problem materialized in determining the main variables that are part of management strategies for quality assurance in the pre-university education in Romania. Quantitative analysis of data obtained by the questionnaire was completed by qualitative analysis conducted previously on the basis of reports and documents specific to the educational field, regarding the results obtained at a baccalaureate level by the graduates from high school but also on the school dropout rate at pre-university secondary education.

1 Alexandru Ioan Cuza” University of Iasi, laurapintilie2003@yahoo.com
Objectives and hypothesis of the research

The overall objective of the research was to identify the strategic components needed for the management of secondary schools/technical-vocational schools in Romania in order to obtain optimum operation and performance across the organization.

The general hypothesis of the research says that in the SERVQUAL version there is enough information to perform a quantitative analysis of educational services from the perspective of service providers (teachers) who expressed their expectations and perceptions with respect to important characteristics of strategic and operational management from the school organization.

The study was based on several objectives and specific assumptions that are mentioned below.

Specific Objective 1 of the Research: carrying out the questionnaire’s items from the perspective of compatibility with the SERVQUAL characteristics and attributes: tangible elements, reliability, responsiveness, trust, empathy.

Hypothesis 1: The items in the questionnaire express characteristics and attributes of the five dimensions indicating the quality of a school organization: tangible elements, reliability, responsiveness, trust, empathy.

Specific Objective 2 of the Research: Identification of the main variables underlying the development of management strategies for quality assurance in pre-university education, in high school / vocational school in Suceava County.

Hypothesis 2: The questionnaire in the SERVQUAL version highlights in a large extent, the main variables needed to establish management strategies for quality assurance in pre-university education in high school / vocational school in Suceava County.

Literature review

In the context of socio-economic life, along with many other services addressing individuals to meet the needs, "educational services" are characterized by a number of characteristics that describe the specific of the activities in this sector. In Romania education is an administrative public service type performed at the national level, being provided to the whole community both by public and private institutions (Androniceanu, 1999). In specialized literature (Chitu, Ioana Bianca, Brătucu Gabriel Ispas, Ana, op.cit., P.10-11, Gafencu Zait, Adriana (1996), Ioncică, Maria, Op. Cit, p.17, apud (Bedrule-Grigoruta, 2007)) common features were identified for all categories of services.

In this context, this study shows an alternative to assess the quality of education by adopting a representative method for measuring and assessing the quality of public service, the SERVQUAL method. The method was improved from its first presentation in 1988 right by its creators (Parasuram, 1988) and adapted to the specificities of the analyzed public services. The SERVQUAL method is used to determine the difference between the perceptions and expectations of a service beneficiary, in this case it is about the educational service. This method allows not only the evaluation of its services but also identifying the areas for improvement by comparing the activity that can be achieved with other organizations in the sector (Amia, 2011). Regardless of the public service performed, the recipient’s perception regarding the quality of the products that are more important as the "perceived quality is not the same with objective quality" (Zeithaml, 1987). In a school organization teachers who work are the interface between the direct beneficiaries (students), the indirect ones (parents, community) and the provider of educational services, namely a school unit represented by the bodies of their leadership: the teachers’ board of directors and the school managers.

A measurement of the difference between teacher’s perceptions and expectations regarding the quality of educational services is a first step to identify strategic issues that will improve the quality of educational services. "The objective quality " is difficult to describe in terms of educational services in Romania because there are insufficient performance indicators and the existing ones are not clearly and concisely formulated and are irrelevant to the education system as a whole (Pintilie, 2016).

In the initial version of the SERVQUAL method, the authors identified five categories by which the 10 dimensions of quality public service are described, each with different weights in determining the size of the quality of that service: tangible elements (11%), reliability (32%), responsiveness (22%), trust (19%), empathy (16%) (Badulescu, 2008). The main goal of a strategy is to ensure the competitive advantage for the organization where it is implemented.
Developing the strategy is based on a careful analysis of the quality of the delivered product or service but also on physical resources, material and human resources which are used and which interact with the organization to achieve its objectives. The five dimensions of quality, proposed by the SERVQUAL method are present in all self-assessments and assessments that are targeting the quality produced by an organization, implicitly by a school organization, even if the mentioned shares are different in relation to the original model.

"Quality is the degree of excellence achieved and the control of variables in achieving this excellence in fulfilling consumer desires" (Zeithaml, 1990 apud (Steward)). The SERVQUAL method combines all the elements in the construction of a strategy: resources, objectives, needs to be addressed by the targeted public service, and the main purpose being to improve its quality.

The following table shows the quality grid in the SERVQUAL version.

Source: Parasuranam (1988)

The Parasuranam’s model (Parasuranam, 1988), refers to the relationship between consumers and service providers through assessing this relationship in terms of perceived quality of service recipients compared with their expectations. In this study, the teachers who work in the system were placed in the role of beneficiaries while the service provider role was taken over by the management team as well as by the managers responsible for the good development and for the quality of educational services provided by the school organization.

In education which is a public system, the intervention of managers in terms of financial rewards is limited (employee remuneration is determined centrally by specific legislation). The manager can provide support only to sustain the employee in obtaining allowances expressed as a percentage from the base salary (tutoring, gradation of merit, Ph.D., occasional awards offered by the community).

In this research, targeting pre-university education, the SERVQUAL version was adapted by collecting perceptions and expectations of teachers regarding financial, material and human resources that are needed in the education system to optimize results. Identification of the share of these resources is the premise of establishing the management strategy that can provide competitive advantage of a school organization according to the specifics of that organization. Providing resources is the task of the manager who can guide the organization's strategy for meeting the needs expressed by teachers in the organization.

**Research Variables**

In this study have been highlighted variables that represent characteristics of educational services of a school unit. They are: endowment for theoretical and practical training, attractively presented curriculum and adequate training of students, alternative methods of training and personal development activities, student centred activities, school management improving, activities to improve quality of educational services, transparency in communication and decisions, professionalism of teacher’s motivation, effective marketing, valuing teachers, and situational / participative leadership.

**Methods used for research**

The method used to collect and interpret data is an adaptation of the SERVQUAL method given the usefulness of carrying out a quantitative analysis in this study. For the educational field the gap between perceived quality and objective quality is given by the typology of the interviewed: manager, teacher, parent, student. But, as Zeithaml (1987) said: "The perceived quality is not the equivalent of the objective quality."
The perceived quality cannot be measured by highly accurate technical or physical standards, it is rather an assessment or judgment of a product formed from both the intrinsic attributes (e.g. physical) and extrinsic attributes (ex. price, brand name) that are not part of the physical product (Zeithaml, 1987). In the case of the resulting product of the education system the “perceived quality” is subjectively influenced by the ability of direct and indirect beneficiaries of self-assessment, namely to assess. The intrinsic characteristics are important only for vocational schools (e.g. Sports schools, military, etc.) instead the extrinsic characteristics are of another nature than the products of the industrial and economic fields. In this context, rather elusive of always changing educational policy, in expressing objectivity it is difficult to quantify quality even using a recording device such as quantitative questionnaire. The SERVQUAL version records not only perceptions regarding quality but also the expectations and in these circumstances objectivity in the assessment if it is necessary if completing the questionnaire is done responsibly and carefully. The SERVQUAL original version (1994-1995) set ten dimensions of service quality, subsequently grouped into five categories: tangible elements, reliability, responsiveness, trust, empathy (Badulescu, 2008). For this research, an adaptation of the original five categories of the SERVQUAL model was used. The data required for testing and the confirmation of the made assumptions were collected from high schools and vocational schools from Suceava County.

**Sampling**

The study was conducted during June - August 2016 and was based on statistics provided by the School Inspectorate of Suceava County, for the school year 2015-2016. 44 high schools and / or professional schools were registered in Suceava County. The total number of students enrolled in these educational institutions was 22,064 students, of which 12,565 (56.94%) are enrolled with a theoretical profile, remaining 9,499 (43.05%) registered in vocational and technical education. There were recorded 2,150 teachers of whom 1,496 (69%) women (Source: NIS public information email data 14th of July 2016).

The stratified sampling option was used because the distribution of pre-specified characteristics of the sample is similar to that found in the population. The purpose of this stratification was to provide a representation as high as can be, given the homogeneity of subsets but also the heterogeneity of them (Babbie, 2010). Three layers which conform to the internal homogeneity criterion as well as to lack of homogeneity in relation to other layers have been selected: 1. School Unit profile: theoretical, technological, mixed; 2. Framing in the physical geographical map of Suceava County; 3. baccalaureate exam results, July 2016. Setting the sample, in relation to the total community at the level of the Suceava county, it was carried out in a first stage, taking into account the sampling criteria. The following table provides representative data for this situation.

Source: Author

In order to respect the geographical criterion in the selection of the sample we considered the widest geographic coverage area by selecting high schools that would be in different places in the county. Unfortunately, the receptivity of some of the school’s directors was very low which prevented us to perform the survey in the initial version.
Another aspect in order to ensure the best possible representativeness of the sample selected was linked to results obtained at a baccalaureate exam in July 2016, given the need to start the research as soon as possible. The following table includes statistics that describe the situation of these high schools, in terms of results from the baccalaureate exam.

### Table 3: The Results of the baccalaureate exam session June-July 2016, for the sampled schools

Source: Author

The sample size for teachers in those schools, given that 57% of high school students were enrolled in a theoretical profile, the remaining 43% being enrolled in secondary education and / or vocational education, revealed \( n = 313 \) questionnaires to be applied.

### Results and Interpretations

A first result of this study is the questionnaire designed in a way that adapts a model used in public services, SERVQUAL, to the public education service. In the following table are mentioned the similarities and differences between the two types of questionnaires.

### Table 4: ServQual version adapted for educational services

<table>

<td>Five categories to characterize educational service with shares other than the specific version of the classic SERVQUAL: - Tangible elements: 23% - Reliability: 27% - Responsiveness: 15% - Assurance: 23% - Empathy: 12%</td>
<td>- This survey collects data on how teachers relate to the quality of the educational services so we kept the five categories of SERVQUAL, the classic version, - the specific of the activities in the field of education determined me to change my share of questions characterizing the five SERVQUAL categories, the focus being placed on tangible elements, namely human and material resources in the school organization.</td>
</tr>
</tbody>
</table>

Source: Author

The questionnaire was applied in 7 schools, from which 2 of which were theoretic high schools, one a technological high school and 4 mixed (with both profiles). Were distributed 333 questionnaires, 290 questionnaires were successfully collected. Out of these, 268 were correctly filled out with the rest being canceled (double or partially completed responses).
The questionnaire was structured in two parts. In the first part collected socio-demographic data was collected concerning the age in the educational activity, the level of professional qualification and academic degree of the participants. In this regard there were high percentages of respondents corresponding to full time job (85%), qualified (99%) and seniority more than 20 years (42%) in the education system, so with training and appropriate professional experience job.

Thus, we can say that the views expressed in the questionnaire reflects an objective position on the quality of educational services, regarding the quality standards of the sampled schools and is less influenced by the specific subjectivity of any investigation.

The second part of the questionnaire was structured as two sets of identical questions (26) aiming to record responses, first in terms of "perceptions," then in terms of "expectations" that teachers have on the resources necessary to ensure educational quality of the school organization which they belong. A Likert scale was chosen for assessing the responses, five values corresponding to the numbers: 1 (very little), 2 (to a lesser extent), 3 (neutral, neither large nor small), 4 (a large extent), 5 (in very large extent). On this scale, the recorded answers, regardless of the set of questions "perceptions" or "expectations" were placed in the numerical values 4 and 5. The diagram below shows these results.

Recorded data shows that, for each item, the percentage of responses for the "expectations" is greater than the responses for the "perceptions," the difference between them having positive values that indicates a weaker qualitative service than expected, according to the SERVQUAL model.

However, these differences are up 10% so it can be considered that, in terms of service quality in high schools and / or professional schools from the study area, are provided the human and material resources enabling the development of a quality education process very closed to real standards.

Since the point of views of the teachers highlights this aspect, in the study an indicator was watched for showing quality "products," these are students leaving the secondary education system. From this point of view there appear to be discrepancies reported by both school attendance but also on the results of the national baccalaureate exam. For the Suceava County School Inspectorate, a decrease of the dropout rate, from 0.34% in the 2014-2015 school year to 0.27% in the 2015-2016 school year was found out. Among the 324 students who quit school courses in the 2015-2016 school year, 94 were those from classes IX-XII (Diaconu, 2017).

Regarding the performance of high school students at the baccalaureate exam session June-July 2016, the percentage of registered graduate of Suceava County on this exam was 71.19%. This percentage, however, is not conclusive because, in parallel, a more serious problem currently facing secondary education system is the non-inclusion and / or absenteeism from this exam.

According to statistics from Bursa Online, only 71.23% of classes XII and XIII who graduated in 2015-2016, were enrolled for the baccalaureate exam in 2016. Thus, the problem of school activities centered on the individual student progress is a current one, which must fall within the concerns of future managers aiming at institutional development, obtaining competitive advantage and ensuring quality education.

After applying the questionnaire and result interpretation, we selected those variables, characteristic of the quality dimensions that are basic elements of management strategies specific to an educational institution: endowment for the theoretical and practical, curriculum attractively presented and adequate training of students, alternative methods of training and personal development activities, student centred activities, school management improvement activities, quality of education improvement, transparency in communication and decisions, professionalism of teachers, teacher motivation, effective marketing, valorisation of teaching staff, and situational/participative leadership.

**Research limits**

The study has shown the reluctance of teaching staff relatively to the carrying out of a study that aims to identify management strategies for quality assurance in Pre-university School. In some schools, even the unit manager restricted the access, in other schools, teachers have expressed disinterest to participate in such a study. Moreover, the superficiality with which some teachers have read the introductory part of the questionnaire, where the requirements and the manner of filling in were presented, maybe specified. This has resulted in a series of questionnaires which were canceled either because they had double answers, or because they had unanswered items.
Conclusions

In conclusion, taking into consideration the very high percentages corresponding to full time respondents qualified and with over 15 years of experience in the education system, it can be stated that with appropriate job training and professional experience, the opinions expressed in the survey reflects an objective position on quality of educational services, related to the quality standards of the sampled schools and which is less influenced by the specific subjectivity of any investigation. The first research hypothesis was made in connection with the structure of the questionnaire. The large number of respondents who selected "a large extent" and "a very large extent" on the Likert scale with five values, confirms the first hypothesis outlined in this study. The second research hypothesis, concerning the selection of the SERVQUAL version as an optimal method for collecting the data needed for the study was partially confirmed during this investigation. Through the questionnaire applied in the adapted version were highlighted additional variables that characterize the processes undertaken in a school organization. All the variables included in this study were selected as “important” or “very important” to be part of a management strategy for the quality assurance in pre-university education. At the same time, the differences with the positive values between teachers’ expectations and perceptions have shown a lower quality of educational services than the desired one, so a need to improve these services was perceived. By using an interview guide with the managers of the school units in the sample, the quantitative analysis of the variables in this study will be carried out in the future. Thus, the main variables to be included in the management strategies aimed at ensuring the quality of the educational services in the high schools in Suceava County will be identified.

DOES EMOTIONAL MATURITY HELP TO EXPRESS MORAL BELIEFS? EVALUATING ‘MORAL GAMES FOR TEACHING BIOETHICS’ AMONGST ROMANIAN AND POLISH STUDENTS

Cristina Iulia Ghenu, Laura Brad, Bartosz Płotka

Abstract: The recent development of biotechnology generated a new set of individual and public moral dilemmas gathered under the name of bioethics or biopolitics. These issues are specific because they merge – as nothing else before – moral, private and political spheres. Thus, public awareness of these cases and of any elements that can influence personal bioethical decisions must be stimulated. One of such methods is the academic teaching of bioethics. Since Darryl R.J. Macer defined the latter as “the love of life, reflecting the hope that bioethics may value life in a process involving emotions and rationality” we found interesting to investigate the role of emotional maturity (EM) in solving bioethical dilemmas. The study involved 103 Polish and Romanian students asked first to fill the Friedman’s emotional maturity form and then solve chosen exercises based on UNESCO’s Moral Games for Teaching Bioethics. The results indicate that a high level of emotional maturity correlates positively with the students’ ability to express their moral beliefs for Romanians and negatively for Poles; therefore, the results indicate there is a need to modernize the actual standards for teaching bioethics by enriching them with either emotional or rational components according to the cultural premises.

Introduction

The recent development of biotechnology generated a new set of individual and public moral dilemmas gathered under the name of bioethics. Because of their contentious and conflict-generating nature they have been politicized which, paradoxically, did not bring solutions to these cases but extended their reach and diffused them throughout societies. Since then, they have become ubiquitous thus having an opinion about them became the inherent element of worldview and conscious democratic participation in a public sphere. In addition, the bioethical (or biopolitical) issues are very specific because they merge – as nothing else before – moral, private and political dimensions. This is why public awareness of these cases and of other elements that can influence personal bioethical decisions must be stimulated by social campaigns, public debates, promoting scientific discoveries and education. The latter requires special attention since it is the most engaging and direct method of transferring bioethical knowledge. However, as some discoveries, such as Roache and Clark’s (2009) work demonstrate, bioethics involves not only the usual knowledge (rationality) but also intuitions (emotions). This is why we investigate the possible connections between them by answering the research question: how does the level of emotional maturity (EM) correlate with the ability to express moral beliefs (also called bioethics or B)? Based on the literature review and our initial observations we propose and verify the following hypothesis: people with a higher level of emotional maturity express their moral beliefs significantly more clearly than people with a low level of emotional maturity. For the study’s purposes, we investigated 53 Romanian and 50 Polish students (n=103) by asking them first to fill the Friedman’s emotional maturity questionnaire and then to solve chosen exercises based on UNESCO’s Moral Games for Teaching Bioethics. Our results indicate that only Romanian students with high emotional maturity expressed moral beliefs significantly more clearly, while the results for the Polish sample indicate the opposite. Therefore, since bioethics requires both intuitive and rational explanations, our findings indicate there is a need to modernize the actual standards for teaching bioethics by emphasizing the development of emotional component in bioethical reasoning, but only if cultural differences are taken into account.

Theoretical Background

In this study, we use the newest discoveries of management, human resources, moral philosophy and political science to address the general question: does increasing the public awareness of bioethical issues through education require modernization?

After participating in a number of classes, conferences and seminars on bioethics we have two reasons to believe the answer is positive. First, we discern that many bioethical debates fail in reaching any consensus because the participants suffer from Dworkin’s (1986) “semantic sting.”

1 Bucharest University of Economic Studies, Faculty of Management, Bucharest, Romania, cristina.ghenu@man.ase.ro
2 Bucharest University of Economic Studies, Faculty of Finance, Bucharest, Romania, laura.brad@fin.ase.ro
3 Nicolaus Copernicus University, Faculty of Political Science and International Studies, Poland, bplotka.umk@gmail.com
They are usually unable to identify the source of disagreement, precisely express their own beliefs and arguments, or even to say what in fact is bioethics. Second, the teaching of bioethics depends mainly on presenting facts and trying to approach them in the most rational way possible, while many debates as well as scholars, such as Kass (1997) or Fukuyama (2002), show that disputants base arguments more often on their moral intuitions than knowledge. If we connect these observations and accept Darryl R.J. Macer’s (2008) definition of bioethics – coined as “the love of life” which reflects the expectation that bioethics value life in a way involving rationality and emotions – instead of any normative approach trying to settle what is right in bioethical cases, then we can easily discern that the most important ability in bioethical disputes is to precisely identify and clarify our own moral beliefs, but also facilitates mutual understanding. One thing we cannot omit in Macer’s definition is the role of emotions which significantly influences our choices and convictions. Taking it into account, we propose the following logical reasoning: if emotions influence moral hence bioethical beliefs, the disposition of developed emotions and the ability to recognize them influence the ability to precisely identify and clarify these beliefs. Since Salovey and Mayer (1990) denoted emotional intelligence (EI) as the ability to recognize and modify one’s emotions in order to achieve intellectual and emotional growth, acknowledging their definition allows us to perceive EI not as a disposition but as an ability. Based on the same idea, Athota et al. (2009) investigated the role of EI in moral reasoning. Although the authors confirmed such a link might exist, they focused mainly on the connection between moral reasoning and personality traits such as: agreeableness, openness, extraversion, neuroticism and conscientiousness. Thus, estimating the correlation between EI and identification of one’s moral beliefs based on their study is not sufficient. The same problem concerns the work of Kornilova and Chigrinova, (2014) who also tried to investigate the title connection but their results regarding the clarification of moral beliefs overlap with types of personality and stages of moral development. Other interesting studies were proposed by Parsa (2015) and Fernandez-Berrocal and Extremera. (2005) whose results suggest that moral decision-making might be dependent on the emotions and EI. However, their investigations do not tell us to what extent EI level can impact the clarification of one’s moral beliefs thus the quality of moral decisions. We believe the inability of the aforementioned authors to investigate the direct connection between EI and good clarification of moral beliefs is conceptual. It was caused by a fallacy of choosing a narrow concept – emotional intelligence – which stands solely for the ability to recognize one’s emotions. The solution to the above theoretical problems seems to be focusing on the more general concept which is emotional maturity. This is motivated by the fact that one can have well-developed EI but be emotionally infantile, while the other cannot be emotionally mature without having developed EI. Hence, we recognize EM as the proper factor to correlate with the clarity of moral beliefs and discern a difference between EI and EM – the former is an ability while the latter is a disposition. Based on these observations we support such approach which takes into account EM, as did Arbune et al. (2014), Mărghitan and Crașovan. (2014), Crașovan and Ioviță (2013) and Moldovan (2014) in their studies including the role and meaning of emotions.

Summarizing, all the aforementioned studies have a similar message: they indicate that EI and EM might play a significant role in moral decision-making. Their disadvantages however, are: choosing ‘moral exercises’ not necessarily corresponding to EI’s and EM’s basic assumption of connecting rationality with emotions and not realizing the task of measuring the actual impact of EM level on the ability to clearly express moral beliefs.

Research Methodology

The research aims to provide evidence on the correlation between emotional maturity level and the ability to express moral beliefs – we call this variable bioethics (B) – for both Romanian and Polish students. In order to conduct the analysis, we used quantitative analysis based on a questionnaire consisting of two parts. The first part of the questionnaire is best described by Crașovan (2013) who considers EM as the element that refers to the Superego strength and Ego objectification, comprising 25 questions of “yes” and “no.” While Superego qualities are related to emotional security, a realistic perception about one’s self, others and the world, emotional imbalance is caused by Ego weakness, emotional instability and is accompanied by a series of infantile, childish psycho-affective reactions. Each answer of a question has its own score, the final score being obtained by using arithmetic. We used the same scale as proposed by the author in order to quantify the effects of our results.

The second part was built using Moral Games for Teaching Bioethics that provides a number of participatory games in order to teach moral decision-making and expressing moral beliefs (Macer, 2008). Macer did not indicate any method that could be useful for evaluating the Moral Games for Teaching Bioethics, or teaching bioethics in general, in the emotional context. This is why we reconstructed and expanded the set of most
typical bioethical statements concerning issues such as abortion, euthanasia, human enhancement, organ transplantation, in vitro fertilization, stem cell research, animal rights and general legal and ethical standpoints. The variants “Strongly agree,” “Agree,” “I have no opinion,” “Disagree,” “Strongly disagree” were offered for encircling to each 50 proposed statements concerning moral beliefs. A weight was assigned for each question. For 21 statements a point was assigned and for the others five. These were solely working weights which meant that the numbers 1 and 5 were assigned to define moral beliefs in higher or a lower degree. One can then use other weights, such as A and B, though we used numeric ones to be able to quantify the results.

Since the dependent variable in our study was the ability to clearly express moral beliefs (B) we were not investigating the bioethical worldviews per se, but their intensity. To understand that, we propose to look at the analogy between “to strongly agree vs. to strongly disagree” and “to love with passion vs. to hate with passion”. Both love and hatred are qualities like agreeing and disagreeing while passion is their strength indicator. We are interested not into the qualities, but into their intensity.

Students from The Bucharest University of Economic Studies (Romania) and Nicolaus Copernicus University (Poland) filled the questionnaire. The Romanian respondents came from the Faculty of Management, The Faculty of Marketing and the Faculty of Finance, Insurance, Banks and Stock Exchange. The Polish respondents came from the Faculty of Political Science and International Studies. Since they all studied social sciences including management, finance, marketing, political science, internal security and journalism, hence there was a higher probability that they had classes from bioethics. The groups within disciplines were selected randomly. The initial sample consisted of 70 Romanian and 70 Polish students. In order to have a homogenous sample we have excluded the students who took classes, courses and workshops on bioethics or attended bioethical debates. The justification resides on quantifying if knowledge is above or below the emotional level. The exclusion was made on the basis of four questions in the questionnaire about prior contact with bioethics. If just one answer was positive, a questionnaire was eliminated from the further analysis. The final sample comprised 53 Romanian and 50 Polish students.

In order to attain our purpose of research we computed the scores of the questionnaire, we organized the collected data and performed its statistical analysis. The results for the emotional maturity level were related with Craşovan (2013): 0-9.99 (infantile), 10-11.99 (childish emotional reactions), 12-13.99 (psycho-affective reactions), 14-15.99 (slight emotional immaturity), 16-17.99 (tendency for imbalance), 18-19.99 (slight emotional maturity), 20-21.99 (corresponding maturity), 22-23.99 (good maturity), over 24 (perfect emotional maturity). The results for the ability to clearly express moral beliefs ranged between 0-4. To see if there is an influence of emotional maturity on bioethics score, a regression model was applied. The dependent variable was the bioethics score, while the independent variables were the emotional maturity score together with age and gender. The estimations were conducted in SPSS software. Additional analysis was conducted by providing the influence of gender on both emotional maturity and bioethics score. Considering these aspects, the hypotheses on which the research was conducted were: H1: The higher the degree of emotional maturity is, the higher the clarification of moral beliefs is. H2: Women have higher emotional maturity than men.

**Results**

The first step was to present the descriptive statistic of the two samples, 53 Romanian students and 50 Polish students. The descriptive statistic is going to be provided for all the variables included in the analysis (Table 1).

<table>

From Table 1 it can be seen that the size of the two samples is approximately the same consisting of 53 Romanian students and 50 Polish students. Also, the gender distribution is similar, with the Romanian sample
being formed of 16 males and 37 women and the Polish sample consisting of 15 males and 35 women. Hence, the composition of the sample is approximately computed as 30% male and 70% women.

From Table 2 we observed most Romanian students are aged between 20-21 years old, while most Polish students are divided into groups of 19 and 22 years old. Romanian students came from a second year bachelor degree program, while Polish ones came both from bachelor and master degree programs. We consider this structure can influence both EM and B scores. We assume that an increase in age results in an increase in B score. If we consider the average value of this indicator then the average value of Romanian students is 20.36 years old, while the average value of Polish students is 20.68 years old.
The third variable on which we performed the descriptive statistic was EM. For Romanian students, the min. score was 14.56 and the max. was 23.72. The mean is 18.79 and the median value is 18.81 (with standard deviation of 2.01). For the Polish sample, the min. value was 13.24 and the max. value was 23.32, while the mean of the sample was 18.72 and the median 19.26 (with standard deviation of 2.4) (Figure 1).

The last variable that was analyzed was the ability to clearly express moral beliefs (B score). The min. value for Romanian sample was 0.928 and the max. value was 3.102. The mean was 1.67, the median was 1.60 (with standard deviation of 0.48). For the Polish sample, the min. value was 0.45 and the max. value 2.72. The mean of the sample was 1.46, the median was 1.40 (with standard deviation of 0.49) (Figure 2).

Based on the analysis we conducted, it seems Romanian students have higher EM level and higher B score than Polish students, even though the mean age of Romanians is lower than the one of the Poles. In order to observe if there is a correlation between EM and B level, we conducted a regression analysis, assuming a linear correlation. Additionally, we add gender and age to see if they have an influence on B level (Table 3).

Based on Table 3, several conclusions can be extracted. Before interpreting the results, we have to emphasize that the model includes qualitative data that was quantified as quantitative. Thus, a part of the information is lost as quantitative information cannot encounter all qualitative features that both B and EM have. Moreover, considering that the analysis conducted is quantitative and on a small sample, we are rather interested in the sign of the correlation than their significance level. The results presented in Tab. 3 reveal a different behavior and attitude for Romanian and Polish students. Considering the age variable, it seems Romanian students decrease their B score as their age increases, while the Polish B score increases with age. On the other hand, we can observe an opposite relationship when gender is taken into consideration. Thus, Romanian women seem to have higher B than Romanian men, while for Polish women this indicator is smaller than the one Polish men have. Surprisingly, EM is related in different terms with B level. While for Romanians there is a positive correlation, meaning an increase in the EM level generates an increase in B level, for Poles, a negative correlation can be observed. Regarding the statistical significance of the generated relations, the models could be considered valid if we assume a risk of 16.6% of rejecting the null hypothesis that all coefficients are not different from zero. We can assume this as the number of observation included into the analysis is small, so our coefficients can be biased. Thus, the created model can be considered as valid. If we assume the classical approach of statistically significant, we emphasize that gender influence is relevant at a 5% significance level. Moreover, for EM the relevance of the relationship is found statistically significant for the Polish sample when a risk of 17.7% is taken into account.

768
As the results are referring to the entire sample, we considered it is interesting to see if the correlation in terms of significance is similar for women and men, Romanians and Polish, or if the gender has an influence on the overall results. Thus, regression was re-estimated considering the respondents’ gender (Table 4).

From Table 4, it can be seen that the overall influence of age on B score is based on the women’s influence, so gender affects the general results. In both Romanian and Polish samples women outnumber men twice. On the other hand, it can be observed, for both men and Romanian women there is a positive relationship between EM and B score, meaning that higher is EM, the higher is B. In comparison, Poland registers a negative relationship between EM and B for both men and women. In terms of statistical significance, the models are not valid due to the lower dimension of the sample taken into account. If we take a look, at the value of the coefficients, even though they are not statistically significant, we can assume that women impact on B is higher than the one of men. The results could also reveal women have higher EM than men. In order to see if women have indeed higher EM, we computed the mean values, the minimum and the maximum values and we provided them in a comparison analysis. Results are presented in Table 5.

Source: Author

From Table 5, it can be seen the minimum EM score is smaller for Romanian women compared with Romanian men, while in Poland the relationship is different as the minimum EM score is found for Polish men not women. In terms of maximum value, it is achieved both in Romania and Poland by women. Regarding mean and median, we observed the values are smaller for women than men, but we have to take into consideration the size of women sample is twice the size of the men’s. When standard deviation is analyzed, we observe women have lower standard deviation than men. Based on these computations we can assume women’s data are clustered closely around the mean.

**Discussion**

The results reveal different correlations for both countries but are complementary to the studies of other authors, such as Pfeffer (1990) and WHO (2004), arguing that Romanians become aware of their sexuality relatively early. The authors however, did not try to explain this phenomena in emotions or morality related terms. Another possible explanation for the age-bioethics disproportionality can be pointed out by Pfeffer (1990) and Stephenson et al. (1992), the higher social permissiveness towards bioethical issues in Romania than in Poland which is best reflected by the situation described by Pfeffer (1990), that after the National Salvation Front’s legalization of contraception and abortion Romanian hospitals were sieged by women. One of the hospitals in Bucharest was visited by 200 women demanding an abortion in a four-hour period. On the contrary, such thing never happened in Poland. Also, Polish students, due to more conservative environment, are being taught about their sexuality later. Hence, we can conclude that their emotional reaction is triggered just while Romanian students enter in the next (rational) stage of bioethical considerations.

The overall influence of age on B score is based on the women’s influence, so it can be assumed that gender affects the general results, especially because in both Romanian and Polish samples women outnumbered men. This does not mean however, that the women’s result took dominance which was reflected by the fact that Romanian women seem to have higher bioethical values than men, while for the Polish women this indicator is significantly smaller than the one that men have. This result, or at least its second part, contradicts the presuppositions of gender and feminist discourses that bioethical cases concern women in higher degree than men and reveal a gap in bioethical studies which usually neglect e.g., men’s role in family planning. It also let us presuppose that these and other general concepts, such as health, are not gender (Płotka, 2015) but culture-related. The latter assumption is also supported by the fact that for both men and women in Romania there is a positive EM-B relationship, meaning that a higher EM score generated a higher B score. In comparison with this, in Poland there is a negative EM-B relationship (the higher EM is, the lower B
becomes) also for both men and women. Eventually, these results demonstrate the H2, that women have higher emotional maturity than men, but falsify its assumed meaning that this very fact makes women’s impact on B score bigger.

What is surprising in the context of this study’s pre-initial question “does increasing the public awareness of bioethical issues through education require modernization?” and the first hypothesis (H1) of this study is the result that EM is differently related to bioethical score level amongst Romanian and Polish students.

While for Romanians there is a positive correlation between EM and B level, meaning that an increase in the EM level generates an increase in B level, for Poles a negative correlation can be observed, meaning that higher is the EM level, the lower is the B level. In other words, emphasizing the role of emotions for teaching bioethics in Romania could improve students’ comprehension and awareness while in Poland it could result in the opposite effect. In the context of evaluating Macer’s Moral Games for Teaching Bioethics it shows that its educational impact may differ according to the social and cultural environment in which it was used. In much broader sense, this study deploys an argument against Beauchamp and Childress (2001) idea of global bioethics and any bioethics unification projects as its derivatives, while the argument resides within the statement that the first hypothesis of this research is validated only for the Romanian sample.

There are limitations to this study that need to be challenged. The first one is the small sample size which is also a reason for the low statistical significance of the obtained results. Another limitation is the reductive nature of quantifying the qualitative data. Another element is political culture. Despite that Polish and Romanian cultures seem to be similar, they may differ in substantive aspects. That creates a field for conducting broader interdisciplinary studies. Nevertheless, based on this study we discern a need for further intercultural research with the emphasis on the qualitative differences in understanding bioethics and its problems; and for interdisciplinary studies involving bigger samples of respondents and more advanced methodology.

Acknowledgements

Hereby we would like to thank students from the Faculty of Management, the Faculty of Marketing and the Faculty of Finance, Insurance, Banks and Stock Exchange, Bucharest University of Economic Studies (Romania) and students from the Faculty of Political Science and International Studies, Nicolaus Copernicus University (Poland), for taking a part in our study.

EFFECTIVE TECHNOLOGIES AND TOOLS FOR IMPROVING PROFESSIONALS’ AND USERS’ COMMUNICATION IN DISABILITY SETTINGS

Encarnación Postigo Pinazo¹

Abstract: Communication with individuals who suffer from a severe intellectual disability is a challenging task for professionals. Technological aids have often been put forward as useful tools. However, most well-known programs are usually designed for disabled people who can perform a certain number of tasks and have some skills for communication. Subjects with severe intellectual disability are seldom the target of research and the training of professionals working with them is hardly properly matched. To fill this gap a group of researchers of the ongoing European project EC+ gather to created friendly communication tools with scientific information and multimodal resources to offer professionals and future professionals (university students) tools, materials, and strategies to communicate with users by means of mobile applications using agile technologies, which will improve communication and hence the quality of staff performance and will reduce stressful situations for both groups, the disabled and workers. The tools were assessed by trainees and professionals in the field of healthcare, education, and community interpreting. The present article focuses on the first and second stages of the EC+ project, which aims to engage professionals and students in seminars, online courses and the completion of questionnaires based on their experience, suggestions, and needs. Research shows that the object of the project is really substantial and hence suggests a further improvement for the work of professionals and therefore is extremely beneficial for the intellectual disabled community. Precise scientific training in several syndromes that hinder communication skills, multimodal tools and the provision of friendly agile technologies draws a promising scenario in this particular field. The results of the questionnaires sent by trainees after the following courses show that they have considerably improved their professional skills and gained self-confidence.

UDC Classification: 376; DOI: http://dx.doi.org/10.12955/cbup.v5.1023

Keywords: Severe, intellectual disability, communication, training, professionals, skills

Introduction
The Enhancing Communication+ project was outlined within one of the of the horizontal priorities of the Erasmus Plus European Scheme:

“Social inclusion: priority will be given to actions that promote in particular through innovative integrated approaches balance and non discrimination in education, training and youth activities. The Programme will support projects that aim to: 1) foster the development of social, civic, intercultural competences, media literacy and critical thinking also combating discrimination, segregation, racism, bullying and violence; 2) enhance the access, participation and learning performance of disadvantaged learners, reducing disparities in learning outcomes. Erasmus+ Guide (2017)”

EC+ addresses the needs of the most disadvantaged learners due to severe intellectual disabilities and fosters ways to empower satisfactory communication both for subjects suffering from syndromes that hinder communication skills and for professionals working with them. Recent research literature such as Light and McNaughton (2014) states that few communication studies are devoted to those who have the most severe communication disabilities and most of the work has been focused on those who, although suffering from any disability, still can handle certain communicative skills. The main outcome will be a mobile application to facilitate this communication. For a satisfactory design of the application are vital not only the collaboration of specialized researchers but also the opinion of professionals within a multidisciplinary scope for our work. This paper will focus on the collaboration of both groups within training activities and the elaboration and optimization of the application.

First stage of research
Interdisciplinary approach

Our work is based on the collaboration of three main fields or discipline, Medicine, Psychology and Communication in the field of Community Interpreting. Voice interpreters for the intellectually disabled are rarely found within the framework of social policies (Roisiko & Vesala, 2016), professionals (caretakers, nurses, doctors, assistants etc) working with people with severe intellectual disability experience stress since they have not been trained thoroughly with strategies when communication becomes a complex task.

¹ Department of Translation and Interpreting, University of Malaga (Spain), epostigo@uma.es
The group of teachers and educators seems to hold the wider expertise in communication. However, as stated above, most of the vast research has been focused on disabled subjects with some abilities. Therefore, teachers also ask for further training. Data for these claims were extracted from a survey, still ongoing, posted in December 2015 and addressed to professionals of the three fields:

![Chart](https://es.surveymonkey.com/r/WQ7HGTP)

**Source:** EC+ project survey available at https://es.surveymonkey.com/r/WQ7HGTP

30% of the respondents corresponds to professional interpreters in healthcare, 50% of the answers came from healthcare professionals in fields such as nursing, medicine and physiotherapy and only 20% belong to the educational field.

Subsequently, our research team considered this prior interest an important factor for our work. Geneticists and doctors provided templates with specific syndromes and features. Those syndromes were selected among the ones that deter communication skills. Psychologists provided documents with intervention guidelines for the same syndromes. A list of words and small phrases was compiled and multimodal resources for communication were hosted in an academic portal for training and the same materials are available using an Android operating system for an app in mobile devices. The app is intended for instant use for both disabled and professionals in their daily life scenarios.

**Second stage: training professionals**

As Gray-Stanley *et al.* (2010) state, staff working with intellectually disabled clients need support networks and interventions to help them manage work stress which according to authors can lead to better follow-through and positive contact with clients. This is also supported in recent studies on the global provision of education, as Czyż’s (2016: 307) study states:

Professionalism of the staff is vital for disabled people’s care and education. In addition the process of disabled inclusion is related to the skills of bringing adequate support from consideration of readiness of the disabled person and their expectations, as well as increase the professionalism of staff and provide adequate teaching facilities and the friendly environment.

The vital aim of EC+ project is to empower the professionals and the disabled by means of providing both groups the resources and strategies to reduce the emotional impact of complex situations, to enhance professional competence, to provide additional knowledge on disability both in the scientific and technological fields.

For the purpose of training students, professional staff and other stakeholders, the aforementioned set of medical guidelines and intervention in five languages including English is ready to be downloaded both from an academic portal and from the application. Apart from this scientific information participants can find communication documents on sign language and multimodal communication for interpreters and other professional staff.

Different online courses are currently being offered for professionals and students of the aforementioned areas.

The people who are registering belong to the three areas and they match the data percentage of the initial interest survey, although there is at the moment a slight increase in applicants from the educational field. There is also a call for family caretakers who are in charge of severe intellectually disabled subjects to enroll in the online courses. The way the courses have been designed allows the
training of participants by means of a virtual platform where they find media lectures, questionnaires on Medicine, Psychology and Community Interpreting and Sign Language. They should also need to complete a practical case related to their field of knowledge.

The information listed in Figure 2 is available in five languages (Dutch, Spanish, English, Catalan and German) both in the academic portal as well as in the mobile application that our team has designed. The list of syndromes contains clinical features of those syndromes so that professionals can acknowledge the characteristics of disabled people and possible health risks (Rigola at al, 2016) and also the guidelines for intervention (Brun & Artigas, 2011). The purpose of the training courses is to enable different professionals from the field of healthcare, education, and interpreting who deal with disabled with interdisciplinary approaches to engage in teamwork in their working environments since they have been provided with the same information and be familiar with the same resources and technological tools. A number of scientific lectures were offered in a face to face previous part of the courses for university students. These lecturers were given by doctors, geneticists, social welfare politicians, healthcare interpreters, rehabilitation researchers, speech therapists, psychologists, ICT engineers, and special education researchers. Lectures were recorded and can be downloaded for the online courses. A set of questions on the lectures are displayed to be completed. Access to the mobile application is available for everyone to test using Google Play application ECPlus published by Francisco Chicanco. A set of small surveys is being currently sent to different institutions devoted to the care of intellectually disabled people within the project consortium countries to receive feedback.

All trainees involved in the courses must work with these scientific documents and questionnaires on medicine, intervention and sign language. The questionnaire for interpreters is based on communication strategies, ethic codes and emphasizes multimodal and total communication, which could be in most cases novel information for the latter group of professionals (Parrilla Gómez, 2014), (Pitkäsalo& Isolahti, 2016).

Discussion

The benefits in this case of methodology used (Choi, 2006) are by far larger than any possible drawback. A follow up of the trainees who are currently engaged in our lifelong training program this academic year would provide data of the real impact of the acquired knowledge. Their feedback after making use of it and of the technological resources in their workplace, in the case of professionals, and within the family, in the case of relatives and professional caretakers, will be really valuable.

The positive impact of the courses in healthcare, education students and professionals is a deep approach to face severe intellectual disabilities. Although clinical or intervention features of disability are included in their university academic syllabus, EC+ project provides an insight on specific clinical features and communication barriers related to subjects suffering from syndromes which seriously hamper communication skills. It is really true that a far more humanistic approach is needed for professional performance (Pino Postigo, 2017). The group of trainee interpreters who are registering in
our courses in order to receive training to communicate with intellectually disabled subjects for the first time do not have previous knowledge of sign language or total communication approaches. However, their performances when undertaking the different tasks of the courses are absolutely remarkable both for documentation on different resources, which was careful outlined, and for solving practical cases. This is perhaps due to the skills gained in their training or due to their personalities (Nicholson, 2005:126) which make them ICT experts, good communicators who are eager to fulfill documented tasks and ready to provide accurate information on time.

The feedback on the interest and potential of the course and the application is positive up to date, obtaining an average range of 4.5 out 5 in a satisfaction survey after the first online course was finished. Three more courses are ongoing at present.

Assistive technologies should be user-friendly as Cook et al. (2014, 189) states so that service providers and the disabled themselves are not reluctant to use them. The application for mobile devices (Chicano & Luque, 2016), available for Android and soon for IOS at the moment is being currently assessed by users who agree it is a friendly interface. So far professionals from different fields and those working for disabled day care units or schools have made suggestions for the application to make possible certain actions such as the following:

- Some familiar images such as the ones of relatives should be changed for each particular user so they will be really meaningful.
- Images or video material for housing, food, weather etc. should be changed depending on the culture or nationality.
- Speech therapists suggest that the materials application can be extremely useful for patients suffering aphasia after experiencing cerebral damage. The corpus of words and phrases for the compilation of resources was primarily selected from the Mcarthur Inventory (López Ornat et al, 2005) addressing the needs of people suffering severe or profound intellectual disability and hence complex communication problems. Therefore, some of the professionals when analyzing the application suggest adding more words and phrases, especially those related to their field of work. For instance, healthcare professionals ask for more words on parts of the body, hospital facilities and treatment. The project team will gather responses and study the suggestions from all online courses currently ongoing in the four institutions of the consortium in order to optimize the final version of the application.

Conclusions
The project EC+ tries to cover a gap in research for one of the most vulnerable group of people who suffer rare diseases and syndromes than hinder communication due to profound intellectual disability to such an extent that most of them need the support for every basic activity of their lives. This goal must be accomplished by multidisciplinary approaches. Our project also aims to empower professionals with scientific information, resources, training and technological tools. In initial stages there was an interest for the initiative through surveys which is now materializing in the training activities and in the assessment of technological tools by students, professionals, and other stakeholders from the three disciplines involved. Participants from the different disciplines who have been following the courses so far consider that this training would be an asset for their future careers and will provide them self-confidence in their performance. Interpreters show remarkable performance completing their training tasks although this particular type of groundwork is quite unusual for them. Another indicator of promising interest from the participants of the training courses is the active involvement and suggestions for resources compilation and the application for mobile devices.

A STUDY OF PROPER PRONUNCIATION AS A FACTOR OF SUCCESSFUL COMMUNICATION

Vesna Prodanovska-Poposka

Abstract: Speaking as a productive skill is one of the very first obstacles that foreign language users face when using the language. Knowledge of a language does not refer to the correct and proper pronunciation however, being able to produce sounds, words or utterances in their proper way does not refer to proficiency of a language nor can it assess the overall level of the user of that particular language. The aim of this study is to present the components of speaking as a productive skill emphasizing the role of acquiring proper pronunciation as a factor for effective communication. The study also presents the most significant “common core” of English pronunciation as a lingua franca, details of the requested phonological competence as knowledge set by the Common European Framework of Languages: Learning, Teaching and Assessment and viewpoints of EFL teachers and authors. Additionally, the study includes data from EFL self-assessments from University students in Macedonia regarding their speaking and pronunciation skills and overall evaluation from their assessor—an English language instructor.

UDC Classification: 8, 81, 81-13; DOI: http://dx.doi.org/10.12955/cbup.v5.1024

Keywords: Speaking, Proper Pronunciation, Communication, EFL

Introduction

Speaking as a productive skill is one of the very first matters that foreign language users face when using the new language. Knowledge of a language does not refer to pronouncing it correctly and properly however, being able to produce sounds, words or utterances in their proper way does not refer to proficiency nor can it assess the overall level of the user of that particular language. Speaking a language well and intelligibly regardless of the situation a language user can be found in, appears to be the utmost demand and desire among learners and users of a foreign language. Pronunciation is an inevitable part of speaking skills, and inadequate pronunciation skills can have serious negative effects on the speakers such as lack of self-confidence to speak up, restraining from speaking in front of a group and not participating in social interactions.

Language and speech utterance

According to Stefanova (1999: 89) in real life the aim of speaking is to reach an understanding between two or more partners in a given situation. Yet in SLA the mother tongue is used as a means to explain new concepts in the target language. This applies however, only if the learner and the teacher speak the same native language. While in a situation where the language is foreign to both (teacher and student), then this target language becomes the only means of communication for the teacher and for learner. In the analysis of SLA, it is established that speaking is one of the four language skills which is considered as one of the most used types of language learning activity.

However, which participant involved in the learning process (teacher and student) speaks more is another matter and it is expected that the students should be more active in speaking in order to develop the communication skills in certain situations. In a normal communication between two or more interlocutors everyone involved is dealing with both, speaking and listening.

In the analysis of speaking skill among students Stefanova (1999) states that "very often, especially at the beginning of the learning process, the learners make pseudo-communication, i.e. they speak, but in reality there is no exchange of information, but only the reproduced speech of the teacher or recording. To this kind of talk we can encounter reading out loud as well, which is defined as persistent" (p. 89).

In order to make the formation of speech utterance one must pass through several psychological units, namely Stefanova, (1999) lists the following:

“Motive for speech utterance

This refers to the need to intervene i.e. sharing certain information or own thought. In cases of dialogue, the willingness to respond to the statement of the other party can serve as a motive for speaking.

Concept of speech utterance

1 Faculty of Biotechnical Sciences, St. Kliment Ohridski University- Bitola, R. Macedonia, vesna.prodanovska@uklo.edu.mk
This is the outcome which determines the content. The participant is in a process of transformation of the subjective sense of linguistic meanings that are understandable to the other participants in the conversation.

Forming speech utterance

This process is composed of three parts namely:
- Primary semantic recording (this is an incomplete statement which is further converted into the full form or sentence of words associated with one another)
- Inner speech (this is the second stage of formation of speech utterance)
- Sprawled speech utterance (this is the last stage when the inner meaning becomes the thoughts in built form i.e. the transmission of information from one person to another, which as a whole statement becomes a system with qualities of a closed structure)” (p.90).

The aim of teaching speaking

The aim of teaching speaking is acquiring suitable reactions according to a conversational situation or sphere in direct or indirect contact. Stefanova (1999) brings these teaching targets regarding the speaking:
“-acquiring correct pronunciation
-acquiring lexical units necessary to make the speech intentions in a particular speech situation
-Correct usage of the necessary language tools for the realization of speech intentions” (p.91).

The aim of acquiring proper and understandable pronunciation does not mean that students will have to sound as native speakers of the language they learn. This can occur in exceptional cases among some very talented and motivated students but it is an unrealistic goal. As to that, a realistic goal regarding teaching and acquiring foreign language is to enable students to “escape” the threshold level so their pronunciation does not distract them from their ability to communicate. Having established the level of understandable/acceptable pronunciation, which is one of the necessary components for successful communication, the next question is which additional methodological tools should language teachers use in order to improve the pronunciation of “incomprehensible” speakers of English, so that they would become "understandable” or “acceptable" speakers? However, this is an issue of communicative language teaching, as proponents of this approach have not expressed adequately regarding learning pronunciation in language teaching, nor have developed a range of strategies for teaching pronunciation through communication.

Core Elements of Proper Pronunciation

As for the approaches to the pronunciation of English as a language of international communication, Jennifer Jenkins defines the "common core” of English pronunciation as a lingua franca and identifies four main characteristics (Shopov, 2013, p. 309):
• Inventory of consonants. All consonants are important except for the sounds 'th’ (as in thin and this)
• Consonant clusters at the beginning and middle of a word are important. For example, ‘string’ cannot be reduced to ‘sting’ or ‘tring’
• Quantitative sign of vowels: the contrast between long and short vowels is important
• Nuclear stress which is the stress on the most important word or syllable is important.

According to Stefanova (1999) pronunciation is one of the main prerequisites for successful speech communication and to achieve it the learners need to build habits of pronunciation themselves, i.e. they need to learn to pronounce the foreign sounds, especially those that are difficult and different from their native language” (p.92).

According to Dalton and Seidlhofer (1994), there are two options to feature the pronunciation as production of meaningful sounds:
“First, sound is significant because it is used as part of a code of a particular language. So, we can talk about the distinctive sounds of English, French, Thai, and other languages. In this sense, we can talk about pronunciation as the production and reception of sounds of speech.
Second, sound is significant because it is used to achieve meaning in context of use. Here the code combines with other factors to make communication possible. In this sense we can talk about pronunciation with reference to acts of speaking” (p. 3).

There are two main features of pronunciation - segmental and suprasegmental. Segmental features are actually sounds units of a language- phonemes which are divided into two main categories such as vowels, subdivided into monophthongs and diphthongs (and according to some authors and theories - triphthongs) and consonants, which generally are divided into voiced and voiceless. Suprasegmental refer to the more complex language features, such as intonation and stress namely a bit more of the phonological properties aside from characterizing the sounds as vowels and consonants. Acquiring proper pronunciation comprises competence in both, segmental and suprasegmental features.

**Abilities and Capabilities of Speakers of English as a Foreign Language**

As stated in the Common European Framework of Languages: Learning, Teaching and Assessment (2001) “Phonological competence involves knowledge of and skills in perception and production of:

- the sound-units (phonemes) of the language and their realization in particular contexts (allophones)
- the phonetic features which distinguish phonemes (distinctive features, e.g. voicing, rounding, nasality, plosion);
- the phonetic composition of words (syllable structure, the sequence of phonemes, word stress, word tones);
- sentence phonetics (prosody)
- sentence stress and rhythm
- intonation;
- phonetic reduction
- vowel reduction
- strong and weak forms
- assimilation
- elision” (p.116-117)

Or as described below, acquiring a phonological competence the speakers (referring to the CEFR levels) need to have the abilities as presented in the chart as follows:

<table>
<thead>
<tr>
<th>PHONOLOGICAL CONTROL</th>
<th>As C1</th>
</tr>
</thead>
<tbody>
<tr>
<td>C2</td>
<td>Can vary intonation and place sentence stress correctly in order to express finer shades of meaning.</td>
</tr>
<tr>
<td>C1</td>
<td>Has acquired a clear, natural, pronunciation and intonation.</td>
</tr>
<tr>
<td>B2</td>
<td>Pronunciation is clearly intelligible even if a foreign accent is sometimes evident and occasional mispronunciations occur.</td>
</tr>
<tr>
<td>B1</td>
<td>Pronunciation is generally clear enough to be understood despite a noticeable foreign accent, but conversational partners will need to ask for repetition from time to time.</td>
</tr>
<tr>
<td>A2</td>
<td>Pronunciation of a very limited repertoire of learnt words and phrases can be understood with some effort by native speakers used to dealing with speakers of his/her language group.</td>
</tr>
<tr>

**The Importance of Proper Pronunciation**

Since speaking is the basic element when communicating, pronunciation inevitably is seen and discussed by many authors and teachers that have come across it. EFL learners face speaking as a mere difficulty in acquiring the desired level and often it is depending on the level of pronunciation.
Even though the overall level of EFL learner can appear as high yet the pronunciation can seriously affect the communication when using the acquired language. 

Tench (1981) claims that “Pronunciation is not an optional extra for the language learner, any more than grammar, vocabulary or any other aspect of language is. If a learner’s general aim is to talk intelligibly to others in another language, a reasonable pronunciation is important” (p.1)

Wong (1987) indicates that even when the non-native speakers’ vocabulary and grammar are excellent, if their pronunciation falls below a certain threshold level they are unable to communicate efficiently and effectively.

According to Gilakjani (2012) “learners with good English pronunciation are likely to be understood even if they make errors in other areas, whereas learners with bad pronunciation will not be understood, even if their grammar is perfect. Such learners may avoid speaking in English, and experience social isolation, employment difficulties and limited opportunities for further study. We judge people by the way they speak, and so learners with poor pronunciation may be judged as incompetent, uneducated or lacking in knowledge. Yet many learners find pronunciation one of the most difficult aspects of English to acquire, and need explicit help from the teacher. Therefore, some sort of pronunciation instruction in class is necessary” (1).

Pronunciation is the initial and key aspect in the development of speaking skills. As Burns (2003) points out "... regardless of small inaccuracies in vocabulary and grammar students are more likely to communicate effectively when they have good pronunciation and intonation" (p.5) Nowadays it is not a trend for the learners to express themselves and sound like in their mother tongue. In fact, according to Moyer (2004) and Scovel (2000) (as cited in Kang 2010) "... adult L2 learners rarely achieve native-like speech patterns (Moyer, 2004; Scovel, 2000), and native-like pronunciation among those who acquire an L2 after early childhood is difficult to achieve in typical ESL classrooms” (p.106).

As Ur (1996) observes, "...the aim of pronunciation improvement is not to achieve a perfect imitation of a native accent, but simply to get the learner to pronounce accurately enough to be easily and comfortably comprehensible to other (competent) speakers " (p.52). According to Burns (2003) "... far more important for the speakers to be able to achieve the minimum level of understandability - intelligibility (acoustic models produced by the speaker to be recognizable as English) acceptable - comprehensibility (listener can understand the meaning of what is said) and high intelligibility - interpretability (listener can understand the purpose of what is said)” (p.5)

Self-assessment of EFL university students in Macedonia

In order to support the necessity of acquiring competence in pronunciation the author presents a more thorough view regarding the pronunciation level and difficulties when lacking those skills in communication, through interviews (conducted voluntarily) among two EFL university students. The interviews are a segment of the author’s PhD thesis research. The interview was conducted on two separate groups of students:

The first group- learners of English for a Specific Purposes- Business English,

The second group – students majoring in the English language.

As for the research, the target groups include students with different majors - Business and Logistics vs. English Philology, from Gotse Delchev University in Shtip, R. Macedonia. Both groups consisted of 119 participants fulfilling the prerequisites for the research- B1 level for both groups and successful completion of:

- the first semester of all English courses (including English Phonetics) for English language students, and

- the successful completion of two semesters and passed ESP (Business English course) exam for group participants of Business and Logistics.

The aim of the research was set according to the personal opinion of the students to determine their current condition in terms of speaking and pronunciation issues when using the English language.

The interview was done to both groups separately while the students were sharing their own opinions through answering questions in which they were required to debate on topics outside the curriculum, such as their own vision for the future, favourite books or movies, the reason they choose their major, and finally how they see their own skills in English so far. The answers were given voluntarily, in
order to create an informal and stimulating environment and avoid feelings of anxiety such as being questioned or sitting an exam. For the same reason the author avoided audio or video recordings, including only discrete recording of the most interesting answers and marking the mistakes in pronunciation.

In the interview students majoring in English language and Literature claim they have a hard time when communicating with foreigners at a higher level, in particular with the native speakers. They noticed that except that sometimes the meaning of what was said by the other speaker is lost, they are not being understood correctly in certain situations, especially when trying to explain issues that are almost directly translated from their native language into English. They also pointed out that some English words that are not correctly pronounced lead to ambiguity especially if not paying enough attention for example with the phoneme [th], which is most often mixed with [t, d] or [s, z], improper use of vowels etc.

In the interview, the students majoring in Business and Logistics claim that they sometimes find it difficult to communicate with native speakers or English-speaking person at a higher level than theirs. They feel relieved and more relaxed if they are able to communicate with people at a lower level of English, i.e. alike their level. Similarly to the other group, this group of students claims that sometimes they lose the meaning of what was said by the other speaker, being not understood properly, especially when trying to explain issues that were almost directly translated from their native language in English. In order to explain themselves students use a variety of ways, including hands and gestures. Special attention was paid to the answers regarding how they assess their own skills in English, the ability to speak etc. in which most of them shared that they experience serious difficulties when trying to use the language orally.

As with the interview the author was able to make generalizations and conclusions about the attitude of students in their problems while speaking English and using the correct pronunciation, such as:
- All students more or less are not quite comfortable speaking English because they are afraid of making mistakes. This usually occurs at the level of beginners, but sometimes it is noticed with students of higher level. Most of them act as if they are afraid to be criticized by teachers and other students.
- A problem also arises when students claim that they do not have sufficient information on a topic that is being discussed during the course of a debate. They do not feel able to follow and participate the discussion, miss out the idea to think or to work on their pronunciation and miss out the correct manner or using particular feature of the spoken language, such as proper pronunciation of [th], vowels in their long form etc.

Conclusion

As of the aforementioned, mastering the correct pronunciation is an important sub-objective in the development of speech skills. As widely aware of the pronunciation as a mandatory skill for English language speakers, one should bear in mind that acquiring correct pronunciation would affect the level of fluency (which can be frustrating if opposite), it could impede future success regarding jobs, education etc., and as the most significant matter if the learner masters the pronunciation initially the sooner he/ she would reach fluency. Studies in the field of English as a second language have found that the minimum intelligibility, acceptable comprehensibility and neutral accent can help achieve good oral communication. Once a fluent dialog is established, effective communication is established as well.

VISION OF CHILDREN IN AN ORPHANAGE ABOUT FAMILY AND FAMILY LIFE

Boris Pták,1 Jozef Fecenko,2 Bibiana Barabasová,3 Nikola Benecová4

Abstract: The aim of this paper is to refer the issue of the vision of children in an orphanage about family and family life. The aim of the research is to identify, analyze and describe their own idea of their future family and family life. The theoretical introduction briefly describes the family, types and functions of the family and the institution of a children's home. In this study we used a quantitative questionnaire method and the techniques of descriptive (mean, median, mode) and inferential statistics. Based on the author's questionnaire we can confirm and subvert predefined research questions and draws a clear conclusion. Children from orphanages state that the most important value for them is family. In this regard, the contribution shows importance of family and recommendation of counseling for children before leaving the orphanage to help have a successful family life in the future.

UDC Classification: 304. DOI: http://dx.doi.org/10.12955/cbup.v5.1025

Keywords: Orphanage, Child, Family

Introduction
"The family is based on marriage, which is a relationship between a man and a woman. For her the stability of the marital relationship is most important, hence its durability to the death of a spouse, and just such can create the most favorable conditions for the healthy mental and physical development of children. Therefore it is very important that children grow up in a family that is rightly considered as the basic cell of society" (Tománek, 2015).

The target group consists of children from orphanages from all over Slovakia. To conduct research in advance, we asked the orphanages for permission.

1 Characteristics of Families

Family ties, or relations we can understand in two ways - objectively and subjectively. Objectively we see family from a multiple perspective for example: legal aspect - law (standards, laws); generally through the customs, myths, stories, traditions; religious aspect - religious beliefs, faith itself and economic-economic aspects - material status and economic activity. The subjective approach is based on solidarity and alliances with other members of one another. This is reflected in the realm of ideas associated with desires, feelings, and in the sphere of shared values (Drapaľa, 2008).

1.1 Function of family

One of the functions of the family has always been and will be, to protect its members against various aspects of society such as the economic and social problems, satisfying emotional needs, the need for parenthood and to socialize our children, and many others (Žilová, 2010).

Many other authors describe family function in more details. Tománek (2015) describes the functions of the family as:

1. Biological-reproductive function - new members of society are born in it. Although the sexual relations are also outside of the family, the society tries to motivate its members to start a family, and in this family bring up children,

2. Economic function - the function of the family as self-employed households that manage their funds,

3. Socializing function - generational transmission of social culture. How children will succeed in the future also depends on socialization in the family,

4. Emotional function - this function provides for its members protection, care, emotional support especially when they are going through challenging times in life,

5. Regulatory function - the society determines what are the boundaries of sexual behavior, which describes to its members with who they can enter into sexual relationship and prohibits this relationship between relatives,
6. **Religious function** - parental influence on children through religion,
7. **Educational function** - priority for every single family,
8. **Learning function** - family is the very first educational institution for child,
9. **Advisory functions** - this function is for advice and help for children from their older siblings, parents or grandparents, which must be complied with the rules of ethics, decency and truth,
10. **Vocational function** - helping children by their parents when they choose their future profession based on their skills, their own possibilities and limits. They don’t push their children to future jobs which are unattainable for them,
11. **Regeneration and relaxation function** - proper use of free time to rest - leisure activities for children and parents. This function is usually not used because of financial problems in families and parents spend more time by working.

Drapała (2008) states that the individual functions are different and depend on the nature of society in which the family lives. It is influenced by state, territory, religion, etc. We can not ignore factors such as education, economic status, allocation of responsibilities and authority in the family, age of children and the linkages between individual members.

1.2 Types of Families

Each family in the world is unique and authentic. Many different authors present their own divisions of the functions of families and typology of families. We present the division of Almásiová (2012), which divides the family in terms of:

1. **Leadership role in the family**
   a. patriarchal - the oldest male member leading the whole family,
   b. matriarchal family - mother takes a leadership role - a woman,
   c. egalitarian - the leadership role is shared between the both sexes;
2. **Housing after the marriage**
   a. patrilocal - coexistence newlyweds move into the residence of the husband,
   b. matrilocal - coexistence newlyweds move into the residence of the wife,
   c. non-local - the coexistence of newlyweds in a completely new environment (most currently used).

Rusnáková (2007) adds further division of families:

1. **Families in terms of the arrangement**:
   a. complete family - the educational process in the family is conducted by mother and father,
   b. complete family (unstructured or disrupted) - based on the relationship of parents, disturbed relationships of its members fails to comply with the designated role in society;
   c. single parent family - the educational process is conducted by only one of the parents (relatives), which is caused by the death of his parents, non-closure of the marriage or divorce;
   d. criminal family - patterns of behavior are in delinquent level, all the negatives that children see they see as normal and natural, but this doesn’t mean that every member will inevitably be delinquent.
2. **Family in terms of education**
   a. perfectionist family - one or both parents require specific forms of behavior,
   b. inadequate family - a family type that is immature, seeking help from outside (family, relatives, community, social workers);
   c. egocentric family - one or both parents are more interested in career advancement, mostly wealthy families of cold relations,
   d. asocial family - families that are characterized by aggressive and deviant behavior.

2 **Specification of orphanages**

Orphanages as institutions in the Slovak Republic represent organizations whose primary purpose is mainly to create a substitute environment which provide care for children who for many different reasons can’t be brought up in an environment of their biological family.

Since the family is in our fundamental cell of viewing the whole society and its importance in the life of a child is almost irreplaceable in defining competencies of orphanages in Slovakia, it is necessary to choose an integrative approach and proceed individually in relation to each child. The child and its
needs and requirements must be considered very sensitive because when the child gets into the care of the orphanage, they are going through a very difficult period of their life, which is associated with feelings of separation, fear, sadness, hopelessness and so on. At this point, significantly changing the existing relationship bonds, which are in most cases not associated with positive emotions and there is space for the creation of new bonds, whose role should be to create the conditions for successful integration into society and to prepare the child for adult life.

It is important to remember that the goal of foster homes should only be a temporary replacement of the natural family environment and it is therefore necessary to try to cooperate with other institutions to find out in what relationship binding to a specific child, failed in its original environment, if it is possible try to fix these relations and return the child to their natural environment.

2.1 Organization, structure and operation of orphanages

Organization of orphanages in the Slovak Republic is formed by 3 basic steps of the Government Regulation no. 5/2016:

1. **Micromanagement** - is a central management level, carried out by the Ministry of Labour, Social Affairs and Family of the Slovak Republic,

2. **Middle level of management** - which is the responsibility of the Central Office of Labour, Social Affairs and Family of the Slovak Republic,

3. **Micromanagement** - it's a basic control to which management belongs under different orphanages.

Based on the Law no. 36/2005 Act of the family, child care in orphanages is generally provided in the residence form until they reach the age of majority, 18 years of age. In cases where the person has a specific request, their can stay in the orphanage be extended, but only according to legal conditions and until 25 years of age.

This legislative correction, in our opinion is done like this because at the age of majority it is a difficult situation for a person when they have to enter to independent lives and integrate into society (Act no. 36/2005 Coll., the Family Act, 2005).

The child is accepted by a final court decision into an orphanage, which the court ordered inpatient care, by final court decision on imposing an educational measure or as a result of interim relief the court pursuant to special legislation (Act no. 36/2005 Coll. Act family, 2005).

Many times in our opinion is the problem with integration into society - with becoming independent. It must be said that integration into society is an important step, which involves great responsibility, concern, anxiety and in the case of individuals who grew up in normal conditions their biological families whose ties have been disrupted in more serious way.

We think that it must be harder for a person who went through many critical situations which had the result of disrupting relationship ties especially in relation to their own parents because ultimately, they had to be depended on alternative care in an orphanage.

3 Research

The subject of our research are the visions of children in an orphanage of their future family and family life and also how they see these factors. Specifically, we focus on two factors - the perception of family and family life now and the idea of the family in the future.

3.1 Object of research

Our research sample are children from orphanages from all over the Slovakia. The age range of research sample was:

14 years old (20.8%),  
15 years old (30.6%),  
16 years old (23.6%) and  
17 years old (25%).

3.2 Purpose of research

The aim of the research is to identify, analyze and describe their own idea of their future family and family life.
3.3 Partial goals
So that we know better set a target of research, we created a few targets.

a. Find out how respondents perceive (define) family.
b. Find out the views of respondents on how should their family look like in the future.

3.4 Research questions
1. Research question 1: How respondents perceive the concept of family?
2. Research Question 2: How do respondents see their future family?

3.5 Research Methodology
In our empirical section, we used a quantitative questionnaire method. The author's questionnaire included closed and open questions. In the closed questions respondents were offered the choice of options, the respondents can choose only one of them, and for one of the questions they can choose multiple options. In the open questions, respondents have space to create their own answers. Children will be filling out the questionnaire in the presence of the Contractor, which will at any time answer to their questions. Based on the questionnaire we confirm / refute by us predefined research questions and we draw a clear conclusion.

3.6 Characteristics of the research sample and timing of research
The author's questionnaire was designed for 72 children from various orphanages from all over Slovakia; the selection of the children from the orphanages for the research sample was taken at random. Questionnaires were distributed among respondents personally and their return was 100%. For all statistical operations we used the IMB SPSS statistic program 23.

3.7 Interpretation of research results
As the first open question was: What do you think is the family? After reading all the questionnaires some answers were the same, so we decided to divide them into categories. The most frequent response of our respondents was that, according their opinion family consists of: the closest people who they love and held in difficult situations, trust you, also the family for them is a place where they feel safe and are able to find understanding. Another larger group of respondents sees the family as emotion, respectively, happiness, joy and responsibility. Others, probably on the basis of their past, perceive the concept of family as something that is important or that the family is the only basis of life, but that's all. They were found also those for whom the concept of family does not mean anything, because it is their own family disappointed them repeatedly and they can’t know forget that feeling of frustration.

The following bellow are example answers to above question, we have decided to quote directly from the questionnaire because it seemed to us the most interesting:

- "Family for me is happiness in life, it is the best thing in life. When you have no mother, father or siblings you do not have anything!"
- "The family does not have to be biological. Family should consist of people who love each other."
- "Nothing, family to me now means nothing, because in life I went through a lot of disappointing by my family."
- "The Family - a circle of the closest ones, where everyone is honest with yourself. Consist of father and mother. It is mainly a feeling of love to someone you care for. You have to fall back on, ask him for help."

Second open question in our study was: How our respondents see their own family in the future. In this question again, we have more than half of respondents agreed, in answer that they want their future family to be formed "from the good wife / husband" to have children together and their own housing. They want in their family to feel love and understanding, and to always have all been together. Some of them want bigger family some of them - in meaning of the number of children that would like to have. Other ideas about how they see their family were the modest description and that they would like to have a family with family members who love each other. Other answers were colder such as many of the respondents do not want to imagine their family, or whatever it will look like but they don’t want to have family like they already have.

We also chose examples of the most interesting answers:
"My family should be harmonious. There should not be lies in it. We should be happy."
"Perfect = harmonious, cohesive, supportive, particularly to provide members of security, reassurance and knowing that somewhere are and always will belong."
"My own family is perfect. With children I have a friendly relationship, but I will be strict, tactful and fair. Especially I will not discriminate."

With the third and the last question we investigated the importance of values, according to respondents. The level of importance to indicate on a scale from 1 to 5, where 1 = very important and 5 = not important at all. As you can see in Table 1 which shows the mean values of responses - respondents identified as the most important value (average 1.19) health, the family itself was in second place. The third most important were two values - their own housing, and the independence and education (average 1.46). Other values in order were friends, money, career, fun car. A big surprise was that the respondents reported religion as the least important value (average 2.39).

4 Discussion
The empirical part of our work was focused on the idea of children from orphanage of family and family life. In the following discussion, we answer questions and we complete answers by statements from various authors on the issue.

1 How respondents understand the concept of family?
Children are in orphanages for some different reasons. One of these reasons is the failure of parents. Therefore, we asked what the children in foster care think that the family is and how they see it and what they think of first when they hear the word family. In evaluating the responses of our respondents, the most surprising fact was a very small number of them responded about their vision and perception of families with answers consisting of mother, father - parents and siblings. Most of them described family as feeling, just a circle of people with whom they feel safe and meet the various positive qualities that the respondents reported (eg. honesty, love, security, sincerity).
Matějček (2007) in his publications gives an important insight that the child is coming to the world, is equipped with everything what is needed for living in this world and has every tools to be able to have a human relationship. People with who the child is building a relationship are parents, but when this relationship is absent, it is understandable that the perception of the concept of family is a little different. Some respondents are by this absence of that relationship, and therefore the absence of attachment stigmatizing more.
Nosková (In Mosty k rodine 2011 No. 2) mentions that children who come from risk families create some chaotic bonds, which can lead to the disruption of the development of emotional ties. They have
in themselves a lack of confidence, feelings of anger, loneliness, etc. What they say they are expressed in terms of the family for them does not mean nothing, because it is their family who is hurting them again and again.

2 How respondents represent their future family?
Our second question is more less related to the previous one. Everything that we mentioned affects our respondent’s next answers about how they see their family in the future. The majority of respondents do not want to repeat the mistakes of their parents and want to have a husband / wife, children, his own house, they want just harmony inside of their family.

Výbochová (In Mosty k rodine 2011, no. 2) describes that first relationships for the childare of great importance and the first binding that is not built, affects all its future ties. The author argues that this is the case of children from orphanages. Based on this we conclude that children's ideas about their future family is more or less positive, as real in the future may not be valid and will confirm.

3 What is respondent’s attitude to the selected values?
Children determined from the selected values the importance of their own opinion. From the results, we can say that the most important value they considered the family. This result is attributed to the fact that their family disappointed and failed them and they realize that in the future they do not want to make the same mistake or worse. A surprising phenomenon for us was that religion in children was in the last place in terms what they deem most important. The values that children consider as important are related to how they fill their needs and what they consider as missing for them.

Rusnáková and Szabóová (2014), based on practical experience argue that orphanage fill the following needs of children: biological, psycho-social and material. If those needs are not filled sufficiently, children most likely won’t be able to be ready for adulthood and parenthood. Since orphanages can’t fill 100% of the biological needs of children as they were filled with the family, we believe that is the reason that children have chosen for themselves the most important value as: family.

5 Conclusion and recommendations for practice
Children from orphanages could pass through counseling provided by qualified professionals and receive training before leaving the orphanage for potential family life. Intermediaries of this kind of counseling might be different NGOs that work with orphanages.

Social workers and orphanage workers could attend courses on family guidance and counseling which would help children from the orphanage to be better prepared for family life in the future.

Lectures, meetings, meetings of self-help groups, which could result in "former foster kids" who have already had their own family and their experiences could pass to those kids and in those meetings they could assist in the preparedness for family life in the future.

THE HUMAN FACTOR IN RESEARCH PROJECTS CONDUCTED AT POLISH UNIVERSITIES

Ewa Ptaszyńska¹

Abstract: This article is based on research conducted at the Wroclaw University of Science and Technology and was financed by the National Centre of Science with the purpose of identifying success and failure factors for university research projects. The research shows that the human factor was crucial in determining the outcome of university research projects. This article presents the analysis and results of selected aspects of a research project into human resource management. The study involves in-depth interviews with 40 project managers of university research projects. Based on interview responses, the following features are evaluated: main reasons for starting research projects, different methods of selecting the research project manager, research team member selection criteria, management styles used by research projects managers, and crucial problems connected with the human factor that occurred in the research projects being analyzed.

JEL Classification Numbers: I23, M12; DOI: http://dx.doi.org/10.12955/cbup.v5.1026

UDC Classification: 005.95/.96

Keywords: research projects, management, human resources, personnel.

Introduction

Research projects are usually experimental scientific elaborations that aim to provide novel solutions within a certain domain (Katz & Tushman, 1979).

The following aspects of research projects are of interest in human resource management:

▪ the main reasons for starting research projects;
▪ different methods of selecting the research project manager;
▪ research team member selection criteria;
▪ management styles used by research projects managers; and
▪ crucial problems, connected with the human factor in research projects.

This article’s objective is to present the results of a study into such selected aspects regarding university research projects. Its main aim is to identify success and failure factors relevant to such projects.

Data and Methodology

The study was conducted at several Polish universities and was financed by National Centre of Science. In-depth interviews were conducted with 40 project managers of research projects, with varying team sizes (Figure 1).

Figure 1: Varying team sizes of research projects assessed for success factors

Source: Author

¹ Wroclaw University of Science and Technology ewa.ptaszynska@pwr.edu.pl
Interviews were conducted on the basis of a formal questionnaire, as described in Klaus-Rosińska et al. (2016). The questionnaire was compiled based on the literature concerning project success and failure factors (Balachandra & Friar, 1997; Betta et al., 2014; Blumer et al., 2013; Camilieri, 2011; Elkadi, 2013; Frączkowski et al., 2014; Jain & Triandis, 1997; Luglio & Bertazzoni, 2010; Mahmood et al., 2014; Pinto &; 1989; Zou et al., 2014) and based on Goodman & Ignacio (1999), which contains similar idea for civil engineering construction projects. Interviews were each 1–2 hours duration. During interviews, research project managers were asked why they undertake such projects at Polish universities. More than one answer was possible. The study also analyzed management styles used by research project managers.

This present research considered six styles:

- The Democratic Management Style where project team members are trusted to have the skills, knowledge and come up with decisions to which everyone is committed. Project manager’s role is only to fine-tune and approve the plan;
- The Affiliate Management Style where the project manager promotes harmony, cooperation, and pleasant feelings among project team members;
- The Authoritative Management Style where decisions are made by the project manager. The manager’s goal here is to provide a vision and a focused leadership;
- The Coaching Management Style directed towards the professional growth of employees;
- The Perspective Management Style based on a continuous control; and
- The Process Oriented Management Style focused on standards and how to perform the tasks.

Results and Discussion

The research showed that human factors connected with human resources were valued indicators of success for research projects. Project managers could select as many indicators as they considered relevant for project success. All respondents (40 project managers) considered the involvement of the project team members as critical to the success of their research project. Thirty-nine included strong motivation of project managers. The least popular was the ability to work in a team, which was attributed by 34 managers as a critical factor. This indicator still scored more than 50% of the 40 possible.

![Figure 2: Success indicators for research projects as rated by project managers](image)

Figure 2 presents the project manager responses to the question about their reasons for initiating their research projects. Eleven project managers gave their reasons as a desire to acquire additional funds. Therefore, research topics are selected for the grant rather than for the research itself. Nevertheless, 21 project managers stated that their reason was ‘to solve a research problem’ and eight project managers advised that their main reason for starting a research project was self-development.
The responses to the interview question about methods of selecting the project manager for the research included the following:

- the originator of the research, project initiator, automatically became a project manager;
- the person who submitted the application automatically became a project manager;
- the person selected himself and chose the team;
- the team itself selected a person with the greatest knowledge and experience in the given research area; and
- the head of the research center that received the grant became a project manager.

In most cases (35 of the 40), the responsibilities of the project manager and team members were clearly defined. Though not always formalized in the form of project documentation, responsibilities were defined informally through frequent and regular team meetings. Only in one project had the team members signed a list of responsibilities. Project managers did not use any formal tools for supervising and monitoring the performance of employees. They motivated their team members with their own attitude, involvement, and passion.

The responses to the interview question regarding the criteria and methods for selecting the research team members included the following:

- competence and substantive preparation;
- their number of publications in a given research area;
- current scientific achievements;
- experience in similar projects completed;
- previous successful cooperation and trust resulting from long-term cooperation;
- person was within a given unit that reported themselves to the project from this unit;
- person was an external applicant, accepted on a competitive basis;
- person was the best student or PhD student;
- person was an associate who dealt with the same subject as the project manager.

Results of analysis regarding management styles of the research project managers are presented in Figure 4. In some cases, project managers were associated with more than one management style. Not applicable in the cases where 1-2 people were involved in the analyzed project.

The Democratic Management Style results in harmony and understanding. The Authoritative Management Style or the Perspective Management Style are not ideal because team members usually find their motivation in themselves. One project manager stated that he usually applied ‘the mixture’ of the styles depending on the situation and depending on the people he is working with. The results show that some research project managers prefer to use more than one management style.
Finally, in connection with the human factor, research projects were found to suffer the following crucial problems:

- A project manager resigned from his role during the project due to personal reasons. This delayed the project because it was necessary to recruit a new project manager.
- The institution governing the project changed employment conditions from a contracted to a regular job with a decrease in salaries reducing motivation.
- The skills of the competitively selected members were found to deficient. Thus, it was better to engage people from the home university who were already known to the researchers.
- Conflicts between scientists and administrators. Problems resulted because of differences in understanding the responsibilities of both parties, i.e., what is most important in the project.
- One team was overly small, and team members were overloaded with work. The grant work was surplus (additional) to normal work, and the scientists worked on many grants, and this affected the implementation of the project (e.g., delays).
- Conflicts between scientists within one project team. These were due to personal reasons, different personalities, and views.
- Some projects managers did not have predispositions for managing human resources. During interviews, many project managers stated that it was difficult to manage people who were specialists in the field and had high academic degrees.

**Conclusion**

The results of interviews revealed that human factors were crucial in the success of research projects at the Polish universities is a human factor. This was also confirmed by a preliminary analysis of interview surveys conducted within the same project, but not yet published. Moreover, the study identified the main reasons for starting research projects. Based on the performed interviews with research project managers it can be said that the main reasons for starting research projects are: the need of solving an identified research problem and the need of acquiring additional funds.

The study also defined main methods of selecting research project managers and research team member selection criteria, analyzed management styles used by research project managers and crucial problems connected with human factor that occurred in the research projects being analyzed. Most often the project initiator became automatically a research project manager. The main research team member selection criteria are: competence and substantive preparation in the area of a given project and previous successful cooperation and trust resulting from long-term cooperation. Most often the research project managers use democratic management style in their projects. Conflicts between scientists and administrators is the crucial problem connected with human factor that occurred in the research projects being analyzed.

The direction of future research could involve the views of other stakeholders in research projects and a comparison of the results.

CHILDREN LEARN TO PROTECT ANIMALS – AN INNOVATIVE EDUCATIONAL PROJECT RUN BY "FOUR PAWS" – PRACTICAL CASE

Dora Radeva,¹ Hristina Petrova²

Abstract: The introduction of the FOUR PAWS educational project "Children Learn to Protect Animals" to the Bulgarian school system was prompted by a disturbing trend of a considerable increase of violence among children, including cases of cruelty toward animals. As a response to the social request for proper reaction and relevant decisions, FOUR PAWS offers a flexible educational program that includes an interactive textbook for children "Close to Animals", a complete teachers’ methodology and a new university teachers’ program. All textbooks and qualification trainings for teachers are provided by FOUR PAWS animal welfare charity free of charge. The approach offered is focusing on the specific welfare of and love for animals to address the general issue – teach children to be tolerant and show empathy towards both animals and humans, and thus prevent aggression.

The program is directed to pre-school and primary school children and teachers. It is promoted closely with Bulgarian educational institutions and local authorities.

Results: over 6000 kids included, 130 teachers trained; programme is well-accepted in all sorts of schools: of high and not so high reputation. It helps facilitate socialization and integration of children from marginalized minority groups.

The social acceptance shown proves the programme’s potential and the need for expansion via new educational tools and measures.

UDC Classification: 37; DOI: http://dx.doi.org/10.12955/cbup.v5.1027

Keywords: education, educational system, teachers' qualification, animal welfare, children's aggression

Introduction

This paper intends to present the educational project run by FOUR PAWS named "Children learn to protect animals" (CLPA), to describe its essence and the practical steps that were undertook to put it into practice within Bulgarian schools and kindergartens.

About FOUR PAWS: it is a non-government international organization that operates in the animal protection sector, working for more humanity toward animals, with projects and campaigns regarding wild and farm animals, animal companions, etc. The offices of FOUR PAWS operate in thirteen countries³.

The CLPA project offers some topics that could be specified between civil and ecological education. Also, it is an original tool created to act against the reasons for cruelty both toward animals and humans starting from its roots, to prevent aggression and to educate primary school students at the age of 7-11 in love and care. Its main approach is to make children share some common ethical principles and types of behavior toward animals. Thus, creating a ground of a sympathy towards something in particular (in this case animals) – which appears natural for most (but not all) of the children – to reach the whole, to teach them to show tolerance and empathy to all. So, the CLPA project aims and offers integrated methods for children to develop social, ecological and civil competences and to prevent attitudes to violence.

CLPA Project development

The CLPA project is international, as it first started in Romania in 2005, run by the Romanian office of FOUR PAWS. It was implemented in a number of cities like Bucharest, Brashov, Sibiu, Kluzh Napoca, etc. The team first developed the original textbook for children, named "Close to animals." The authors are Veronica Tulpan, Sorina Cuzum, Mihai Vasile and Gina Velcu. Actually, the textbook is an interactive pedagogical tool that contains flexible, easy-reading and well-accepted texts, games, questions and topics for discussions, and training situations. It was also translated into English.

In 2008, the CLPA project was transferred to Bulgaria to begin its independent life in the country because of the specifics characterizing the Bulgarian educational system. The beginning was difficult and the CLPA’s entrance into the school network was problematic. The Bulgarian educational system

¹ FOUR PAWS Bulgaria, dora.radeva@four-paws.org
² FOUR PAWS Bulgaria, hristina.petrova@four-paws.org
³ More information on http://www.four-paws.bg/en/
not only was but still continues to be old-styled, capsulated enough with a strong hierarchy that allows limited access to children for "players" not recognizable as naturally belonging to the system. Although FOUR PAWS' desire to work with the school directors couldn't allow themselves to open the door for the CLPA project without permission "from above" – namely the Ministry of education itself or its secondary units – the Regional Inspectorates of Education (RIE). In the same time, the system suffered many disadvantages as its heavy bureaucracy was difficult to work with. The extravagant and non-suitable academism in the textbooks made them not attractive for students. There was a total lack of links to present-day topics in the regular contents for most textbooks. A clear analysis made for the Institute for Market Economics (IME) describes the condition of the Bulgarian school education as a system orientated to provide theoretical knowledge rather than practical skills (Nikolov, 2013).

Before 2010, when all the Member States of the European Union adopted the Council of Europe's Charter on Education for Democratic Citizenship and Human Rights Education, the Bulgarian primary and secondary schools used to ignore civil and also ecological issues. The importance of an ecological education is crucial for determining the people's behavior to one of the most polarising 21st century problems (Vacleva 2008). Even after the subject of civil education became compulsory, it was approved as a separate subject for one year only and just for upper secondary education. This statement is provided by a report compiled for the European Commission by the Eurydice network, named "Citizenship Education in Europe" (2012).

In the long term, the common neglect of civil and ecological education terribly affected children and young people's socialization and ability to live in the society. In these circumstances, it was not a surprise when acts of aggression and cruelty became more frequent, and some of the most shocking ones were acts of cruelty toward animals. Periodically, Bulgarian media outlets were reporting more and more cases of violence. They raised a great alarm within the Bulgarian society. The live relation between the violence on animals and people is an object of numerous studies (Arluke, Levin, 1999). FOUR PAWS Bulgaria pointed strongly in the media to this relation (Gechev 2010). It was not until 2011 when the Bulgarian National Assembly approved a change in the Criminal Code that determined sanctions for cruelty toward animals that the CLPA project started operating.

After the CLPA's beginning in Bulgaria it appeared that not only the textbook but the whole programme needed adaptation and more flexibility in order to gain success. Aiming at straightening the project's administrative capacity, FOUR PAWS Bulgaria engaged for CLPA implementation trained experts familiar with specific features of the national educational system. There were few new components developed. First, the textbook was translated from Romanian to Bulgarian and adapted, covering the following topics: 1. "Animals have a home, too"; 2. "Animals do feel"; 3. "Stray animals"; 4. "A dog's best friend"; 5. "Pets"; 6. "Animals have magic powers"; 7. "The animal's unseen world"; 8. "Animals work too"; 9. "In the animals yard"; 10. "Animals can be saved"; 11. "If I only was a bird"; 12. "Altering animals' behavior".

The print and distribution of the textbooks in the school system was fully provided by FOUR PAWS, so the books were free for children. The idea is every single student, without any differences, to have their own book while working in groups. The programme is well-accepted in all sorts of schools: of high and not so high reputation. Without having some special intentions, it appeared that the textbook finds surprisingly excellent acceptance within the children from marginalized minorities, such as Roma. It helps facilitate their socialization and integration.

Second, a new strong focus came in line. For the CLPA project's success, it was evident that not only children, but teachers had to be involved in the entire process. Immediately after the textbook translation into Bulgarian, an original and innovative teachers' methodology 'Notes for teachers' was developed, based on the most modern pedagogical practices. The methodology stands far from the typical extra academic style and is close to real-life topics and situations as well. 2-3 different variations were offered for all of the textbook's 12 lessons. The approach used is based on multiple intelligences (Stavreva, Kitanova 2012) and the activities done a variety due to which teachers can choose their own approach while working with students. It is based on hands-on exercises and learning-by-doing (Pollard 1990) – this way the teachers can see practically and experience the organization of the classroom personally.
At first the "Close to animals" textbook was designed for primary school children, but as it was reviewed by different educational and pedagogical experts, FOUR PAWS was advised children of pre-school age to be joined in their initiatives because of the textbook’s well-determined pedagogical situations. Now the textbook is in its final stage of a process of adaptation for this specific age. Along with its adaptation for kindergartens, a second methodology for teachers was elaborated, based on the popular fundamental pedagogical studies for the pre-school age (Getova 2013), (Koleva 2004).

The authors of both methodologies – for schools Stefka Kitanova and for kindergartens Assoc. Prof. Katya Getova – are well-known names, working in the Bulgarian Academy of Science and Sofia University "St. Climent Ohriskyi".

Third, in 2014 FOUR PAWS Bulgaria signed an agreement with Sofia University "St. Kliment Ohriskyi", via its Teachers' Department (DIUU) for a partnership teachers programme. After its authorization, the programme allows organizing certificated training that increases a teacher’s qualification. Highly experienced Bulgarian experts with great practice were engaged as trainers. The trainings are specified for primary and kindergarden teachers. FOUR PAWS provided the overall financing for these trainings, so the they are free for all teachers involved in the project. The trainings are held not only in the Bulgarian capital – Sofia – but also in other Bulgarian cities as well. By now FOUR PAWS Bulgaria has trained about 130 teachers.

The project is quite flexible in regard to its particular implementation in school. The teachers are free to decide how and where to examine the textbook's 12 topics. They are suitable for the regular lessons of "Human and nature," "Humans and society," "Art," etc. But as the school day for first-graders is organized as a whole-day routine, the programme is usually implemented as free or out-class activities. The teachers are not asked at all costs to finish all topics for one school year. Some of them prefer to expand it longer and the course may continue up to two school years. In the very beginning of the work process, the involved teachers compose an indicative schedule. In the end of the school year, teachers provide with basic feedback information about all they have done. Teachers give their estimations and suggestions freely how to improve the programme. From the beginning of the project until today the number of the involved children was more than 8000.

Another important component of the project is FOUR PAWS' large informational campaigns for the project's promotion. Usually, they are organized with local support of the RIE and local authorities. These are RIEs that are engaged via their internal networks to inform all school and kindergarden directors under their direct submission for the CLPA project. Most often, as part of the campaigns, FOUR PAWS Bulgaria organizes meeting events with all directors in the area, RIE and responsible experts from municipality to present the project and to discuss its resources.

The model created by FOUR PAWS Bulgaria shows good practice on how NGOs could enter into educational systems even when visible obstacles exist. By now, the whole CLPA budget is covered by FOUR PAWS without any external financial support. This includes the printing and distribution of books, training of teachers, project management, etc. As the programme grew, the interest to it grew as well. More and more schools with their children wish to join and participate, so there is a challenge to meet all the needs with only the organization's own resources.

In 2016, a new Educational Law was approved by the Bulgarian National Assemble and new national standards for civil and ecological education were included. The directors of schools and kindergartens were given more freedom to decide about school initiatives. Now there are better preconditions in Bulgaria for better CLPA project implementation. The next step that FOUR PAWS intends to undertake is to work on the determination of special educational subjects with topics like humanity toward animals, animals protection and welfare.

USING CLOUD TECHNOLOGIES AS A TOOL IN ORGANIZING THE EDUCATION PROCESS

Aigul Sadvakassova,¹ Meryert Serik,² Jaroslav Kultan³

Abstract: The transition towards innovative cloud computing technologies will allow universities to reduce the costs of purchasing software licenses and expensive computer parks with large amounts of memory and disks, since the programs used in training sessions, as well as all the results of work done, can be stored in the cloud. The transfer of educational services to the cloud will facilitate switching to a format of "learning everywhere and all the time". This article considers the pedagogical possibilities of cloud technologies, which confirm the expediency of use in the education process. The definition of cloud computing is discussed. In addition, the main task of the research was considered: using cloud technologies as a tool in the organizing education process. The experience of using open source software in training is given. The basic methods of using cloud technology in the learning process are presented.

UDC Classification: 004.75; DOI: http://dx.doi.org/10.12955/cbup.v5.1028

Keywords: cloud computing, cloud storage, open-source software, education process

Introduction

Contemporary computing experiments aimed at solving a great number of important practical tasks require the usage of huge computer capacities. For instance, tasks requiring computing capacities include: precise long-term forecasts of climate changes, genetic engineering, physical processes, chemical reactions and modeling of financial calculations; the auto industry, oil- and gas extraction; pharmacology; circuitry engineering; new materials synthesis; geological cataclysms, and many others.

The solution to the aforementioned tasks requires knowledge in concurrent programming, in the architecture of modern multiprocessor computers; systems software of parallel computers and networks; technology of parallel computers programming; parallel algorithms, dispersed data, client-server technology; grid technology, simulation, mathematic foundations of parallel programming; GPU and cloud computing.

Integration of contemporary information technologies into education enables users to achieve plans only in the case of stable, safe and productive functioning of the entire IT infrastructure (Pang, 2009). It has to meet the increasing requirements of increased productivity and fail-safety with constant increase of the processed information volumes. Simultaneously, requirements are set to reduce expenses on support and development of the IT infrastructure and enhance its adaptability to changing requirements to the IT of educational institutions. The most effective means of satisfying those requirements is IT development relying on cloud-based computing, which represents one of the most promising innovative IT trends.

Cloud technologies as an instrument of organizing the learning process

The ideal goal of cloud computing lies in granting remote dynamic access to end-users for services, computing resources and applications (including operating systems and infrastructure) via the internet. The development of hosting services (hosting is a service of a hosting client’s equipment in a provider’s territory with a provision of connection to high-capacity channels), was stipulated by the demand for software and digital services capable of being managed from within, yet more cost-effective and efficient.

The concept of cloud computing has largely altered the traditional approach to delivery, management and integration of applications. In comparison to a traditional approach, cloud computing enables running bigger infrastructures, serving various groups of users within a single cloud, and implies dependence on a cloud services provider.

Cloud computing in informatics is a model of providing overall and convenient network access on demand for common computing resources (for instance, data-transmission networks, servers, data storage units, application programmes and services – both altogether and separately), which can be

promptly provided and relinquished with minimum operating cost and/or addresses to the provider (Sklejter, 2010).

The main distinction of cloud computing lies in the irregularity of users’ requests for resources. In order to smooth out this irregularity and provide service, an additional layer is placed between real hardware and middleware, i.e. virtualization of servers. Middleware control is the software ensuring monitoring of equipment’s state, load balancing, and provision of resources for problem solution (Sarrab et al., 2015). Servers that run applications get virtualized and load balancing gets performed both through the software and the means of allocating virtual servers, real servers.

**Experience of cloud technologies introduced into the learning process**

Cloud technologies ensure optimization of such activities as collection, systematization, storage, retrieval, processing and presentation of information, are of general academic significance and can be applied in studies of all educational disciplines. Implementation of cloud technologies into the learning process is of great value since the latter can increase study hours without changing the curricula of educational institutions.

At the given stage, the integration of the given technology into the learning process and education is underway and has already yielded favorable results. The teaching staff of the L.N.Gumilev Eurasian National University has been engaged in this issue at the university, i.e. setting up a cluster of high-performance parallel computing on the basis of available computers and networking equipment, using it for solving resource-intensive tasks and introducing cloud-based technologies (Serik & Bajgaraeva, 2014). Scientists of the Russian Federation, Slovak Republic and our university have been dealing with this problem for recent years (Voeyodin & Zhumatij, 2007; Kopyltsov et al., 2010; Schmidt, 2016). Joint articles were published (Kopyltsov et al., 2014; Serik et al., 2016).

Scientists from our country and abroad (the Russian Federation, USA, People’s Republic of China, and the Slovak Republic) have acquainted themselves with some of the surveys’ results. Partially the results have already been used at the leading universities of the aforementioned countries and received positive responses.

At the Faculty of Information-Processing Technologies of L.N.Gumilev ENU special courses on the subject under study have been introduced into the learning process (three course credits) at all levels of instruction. For instance, in the process of the learning discipline “Fundamentals of cloud technologies” free services are used, i.e. Google (Google documents: online word processing program, tabular processor, presentation mode, and a cloud storage service with file exchange tool); and web-oriented software functioning as a web-browser not requiring installation on a user’s computer. Also during the learning process students learn to create their own cloud storage in a local network with the help of the OwnCloud service, and study the possibilities of its usage in the learning process and their future professional activities.

Figure 1 presents the possibilities of cloud storage usage. Calendar and scheduler are essential tools for designing an efficient learning process, which enable to organize a schedule, plan fulfillment of tasks and projects; make notes; look through to-do lists and receive proper warnings in due time. The organization of shared access to files of various users is one of the most powerful and convenient mechanisms, which is enabled through the usage of cloud data storage. Teaching staff can allow access to students for their electronic versions of their lectures, laboratory tasks, additional literature and other documents. In a similar way students have an opportunity to interact both with teaching staff and their group mates. The ownCloud users can grant access to a file to a predetermined group of people. The given concept might facilitate students’ work over a common academic project or any other activities carried out in groups. The concepts also include an opportunity of file distribution among people not registered in ownCloud system - exchange is performed via public links. The change of record is one of the functions ensuring data integrity. A version of a control subsystem enables users to receive access to old file versions with an opportunity to trace down records of their changes. Students and instructors are able to cancel file updating at any moment and return to the earlier version. Also, when assessing students, a lecturer as an administrator can see which contribution was made by each student during their work on the project, hence they can assess separate student’s activities in an unbiased manner.
At the given moment, we have been considering a possibility for students to carry out cloud computing using the resources of a remote server, so that they could compile a program and receive results not without installing software on their own computers.

**Figure 1: Model of data exchange within personal cloud storage between a student and an instructor**

Source: Author

**Conclusion**

One of the educational system’s tasks in contemporary society is to provide every person with free and open access to education during all life with due regard to their interests, abilities, and demands. Cloud technologies are able to assist in solving those problems since they remove restrictions to usage of operational systems; in fact, with the operating system Linux installed, users can work with any applications and applied programs if they have access to the internet. It can save both material and labor resources.

In the learning process, participants display high interest in some information services, which means that it is advisable to carry out work on introducing cloud technologies into the learning process. Information and communication technologies is a powerful instrument of increasing learning efficiency through the solution of a set of tasks:

1. increase of study hours without changes in curricula;
2. quantitative change in control over students’ activities;
3. improvement of information-communicative culture of all the learning process’ participants;
4. enhancement of academic motivation among the students;
5. provision of flexibility in learning process management.

CONTEMPORARY TECHNOLOGY SUPPORT FOR EDUCATION

Teodor Savov,1 Valentina Terzieva,2 Katia Todorova,3 Petia Kademova-Katzarova4

Abstract: The information and communication technologies (ICT) have penetrated into almost all areas of human life. They have a dual impact on education – increase learning efficiency and train students actively to use innovations. We assess this impact by examining teachers’ experience with innovative tools in Bulgarian schools. In an anonymous online survey, we investigate their opinions on the issues related to technology integration in contemporary classrooms. The research shows that educators appreciate the benefits of technology implementation in the teaching-learning process, but they need a single structured system encompassing all technological resources and tools. This work proposes a conception for a smart classroom – an innovative learning environment that can establish and control suitable conditions for education as well as to impact the instructional process directly.

UDC Classification: 004.9; DOI: http://dx.doi.org/10.12955/cbup.v5.1029

Keywords: ICT, smart classroom, personalization, Internet of things (IoT), technology-enhanced learning

Introduction

Recently the information and communication technologies (ICT) have become omnipresent in the whole society, and the educational area is not an exception. The traditional classroom becomes rich of technology to meet the expectations of digital age. Although it provides many facilities, the usage of technology as a tool to boost students learning is still evolving. So as to get know to what extent this practice has penetrated into Bulgarian schools, we conducted an online survey among innovative teachers. It is designed to explore their general perceptions and attitude to technology in education. The main goal is to gain a better understanding of how teachers implement ICT in their work, what are the important aspects and which are the most used tools and services. Data from our study shows that teachers still have a dual attitude to technology – they recognize its value, but they still need more qualification and help when it comes to using it in meaningful and engaging ways for students. Most of the teachers are ready to use ICT tools in classrooms. However, there are not enough appropriate applications integrated into a single structured system. Furthermore, respondents outline contemporary usage trends as well as the forward-looking technology applications to smarten up the teaching-learning process. To generalize, teachers require not only structural but functional enhancement of the learning space. They need an engaging learning environment, satisfying the different educational needs and interests of learners, fostering collaboration and interaction between students and teachers as well as supporting multiple ways to share knowledge. Traditional classroom transformed to smart one, i.e. designed with build internet of things (IoT) integrated into a smart educational system can fulfill such educational needs.

Teachers’ Opinions

According to the survey, only 40% of the respondents have a learning management system in their schools. The use of ICT in support of educational process has versatile effects for both teachers and students. It enables the creation of a dynamic environment that allows students to express both their skills and competencies and to acquire new knowledge. In such an environment various tools for personalization of learning process according to students’ preferences and needs can be used. Relay on their experience, respondents point out some of the most significant advantages of using technology-enhanced learning. Fig. 1 depicts a detailed diagram of their answers. During their pedagogical activities, most of the teachers (89%) recognize increased interest and activity of learners, which is directly related to technology-based resources that add value to traditional training by multi-sensory elements. The method contributes to a more comprehensive perception of the material (imperceptibly learning – 74%), and the result is increased effectiveness (67%). More attractive learning resources and access to extra information increase the motivation, the pace of work and the degree of acquiring of knowledge. Last but not least, students acquire computer literacy (59%) that

stimulates independent learning according to 53% of respondents. Technology is a valuable tool for teachers – it enables new instruction forms and methods (72%), and it helps especially adaptation and personalization upon presentation of the material as well as immediate feedback (61%). As the results of the survey show an excellent effect of the technology-enhanced learning, we come to the decision to develop a concept of a smart classroom.

Conception of Smart Classroom

The widespread opinion is that smart classroom should involve an integration of technology within the learning space. Many researchers stress their attention also on the need of methodological paradigm shift – providing a modern and efficient education services by combining innovative pedagogy and technological teaching tools. Gligorić et al. (2012) present smart classroom concept and methodology for monitoring student's attention. Slotta et al. (2013) work out a pedagogical model (Knowledge Community and Inquiry) and describe an interaction between people, materials, tools, and environments. Rehman et al. (2008) show the great importance of RFID system in an educational environment as a way for increasing physical security of students and teachers. Temkar et al. (2016) study IoT for improving the learning process. Uskov et al. (2016) make a classification of a wide range of applications and software for smart classroom and university environment which could be applicable for the current conceptual model of a smart classroom. Bogart and Wichadee (2016) do research among 40 students concerning smart classroom technologies and take into account their opinions and recommendations. Lane and Finsel (2014) research the usage of Big Data in smart colleges and universities. Their work offers a technique how these data can be collected, analyzed and used for achieving better results.

The paper outlines authors’ concept of a smart classroom – a learning space that better fits the learning needs and expectations of the digital generation. The focus is both on the technology that creates conditions for the effective learning process and innovative technology-enhanced pedagogy. Therefore, as Terzieva et al. (2016) write, the smart classroom should provide basic and functional smartness. The first one is responsible for specifying and controlling microclimate parameters of the room that have an indirect influence on the learning process and ensure learning comfort. Usually, monitoring and control of the microclimate are performed by an air-conditioning system or smart window that open at certain times, depending on the schedule of room usage. Functional smartness concerns provision of appropriate tools for a smart teaching-learning process. A smart classroom is intended to employ technologies that directly impact the methodology, design, structure, and implementation of the teaching process. During the lesson, sensors monitor student's engagement and their activity parameters (response time, the correctness of answers, etc.) and to provide teachers with real-time feedback and information. Furthermore, such information allows teachers to get deep inside
of student’s knowledge acquisition and thus to adapt and personalize the process of teaching for every student according to individual characteristics if needed.

The main purpose of the smart classroom is to enable a smart educational process – from management of the teaching process, through the workspaces for teachers and students to knowledge delivering and testing. Smartness implies pedagogical changes – teaching practices evolve; various innovative teaching strategies that require new roles of teachers and students emerge; new types of learning content and resources appear; extra learning opportunities are offered. Also, smart functionality provides an opportunity for personalization basing on automatic tracking of student’s attendance and recording individual progress. This information helps teachers’ decisions about appropriate interventions in supporting individual needs or overcoming encountered problems and difficulties. The data, related to the teaching-learning process, are stored in a centralized repository as a part of web based smart learning system that serves all the education-related issues.

**Structural Model of Smart Classroom**

This model is a conception for smart learning environment build by using most of the modern technical achievements in fields of IoT, wireless sensors networks, Big Data, etc. according to educational requirements and student’s needs. The project is open for implementation of new features and different technologies not only for responding of changeable educational necessities but also for adapting a system to a broad circle of users. Bogart and Wichadee (2016) write that term “smart classroom” can be misleading because by itself the classroom is not smart in any sense of the word, nor are students who are taught in a smart classroom necessarily going to become smart by learning lessons in one.

A structure of this conceptual model consists of five operational modules in which specialized software operates and controls all physical elements and devices (hardware) – refer to Fig 2.

![Structural model of smart classroom](source: Authors)

**Classroom environment module (CEM)**

This module is responsible for supporting and providing normal environmental conditions in the learning process. There are a variety of sensors and actuators that measure different environmental parameters as temperature, motion or presence, humidity, dust, oxygen level, noise level, lightening, water dispenser shortage, recycle bin fullness, security system, etc. According to these parameters, a microcontroller runs and controls central heating system, light system, fresh air flow, cleaning schedule and sending service messages to school staff. This microcontroller is connected through Bluetooth to the central microcontroller, which is a part of System operation module (SOM). CEM is individual for each classroom and could be set up according to studying material or student's needs. The system could be adapted to work for students with special needs.

**System operation module (SOM)**

This unit coordinates all modules and supports the whole system in working order. It maintains connections with other modules constantly and provides coordination between different subsystems.
That part is the brain of the entire system. This module processes all the data concerning learning process and system functionality. It provides a broad range of settings and different profiles for each user. SOM may coordinate more than one classroom. For that reason, classrooms with same characteristics and parameters are combined and managed by one module.

Educational resource module (ERM)

The educational resource module is the most powerful and provides a broad range of educational services. There are several multimedia servers with various data covering all study materials – electronic textbooks, manuals, movies, audio, learning applications and specific learning software. This module has an interactive system for creating lessons and task for students. The application helps teachers to prepare their lessons and organize classes by using all multimedia devices and smart classroom resources. Slotta et al. (2013) explain that such systems could simulate different learning environments (as rainforests, war scenes, manufacture installation, etc.) and include all students in researching and observing activities. Students also have a right to use this module through a special account and student's profile that allows them to access all learning resources in the classroom or do their homework remotely at home due to the Communication module and secure Internet connection. This module is connected to other modules by SOM and could use their resources for providing better educational process. ERM is common for the whole school. It could be utilized for all classrooms because it contains the full complex of studying materials for students of different course's groups.

Communication module (CM)

The communication module is a combination of various communication applications and services. There are an email server and client software, instant messages applications, Internet connectivity, mobile connectivity and interactive system for voice, text and remote control system for classroom activities (ISVTRC). An important part of the learning process for teacher and students is ISVTRC. This system connects all monitors and peripherals like a touch pad, headphones, camera, microphone mouse and keyboard put on every student's desk, multimedia smart board, projector and teacher's personal computer. Different learning styles can be accepted using a multimedia smart board. Temkar et al. (2016) indicate that learners can learn by touching the board and visual learners can help themselves by observing the teaching on the board. Uskov et al. (2016) classify different software that allows the teacher to communicate via text or voice messages to students and observe student's work on their desks. All students' desk connections are LAN based. The teacher can be in touch with all students in class activities by this system. He/she could send a text or voice messages in real time or monitor student's desktop by remote control. The module also provides Broadband Internet access to all users. A SIM module connected to the system can send short text messages or make a phone call to students or their parents in real time.

Evaluation and control module (ECM)

A module carries out various exams and tests for students. There is an electronic diary for each student and detailed information about student's work and achievements. Parents have a chance to access this electronic diary and be notified about their children's grades. The system could be set up to send instant messages or SMS to parents concerning the behavior, grades or absences of their kids. There is a website and mobile application (Android and iOS) with detailed information for children achievements. Lane and Finsel (2014) conclude that performance of a student in a given semester was not known until course grades were reported and GPA calculated at the end of the semester. While it is possible to track student activity on an almost daily basis and provide interventions in the middle of the semester with the desire of supporting the success of the student.

The vital part of this module is a subsystem for measuring student attention. While active learning activities run, the teacher has an opportunity to monitor each student's care and take measures for increasing student's attention. This system constantly sends data to SOM, which can change some environmental parameters automatically by CEM to increase students' attention and concentration. The system evaluates individual student behavior and behavior of entire group by observing the level of noise, student's movements and analyzing facial expression. Gligorić et al. (2012) write that fidgeting and noise are two most common ways of expressing the lack of interest. Noise sensors, PIR sensors RFID reader, and camera are installed on every student's desk. RFID reader allows students to identify themselves and to log in the system by special RFID ID card. Rehman et al. (2008) point out that this
card could be used for access to classroom, school library, sports facilities, and canteen. Although that allows different groups of students to use one classroom, it is better every group (class) to have an individual classroom. That way in each classroom could have access only student from the specific group. This module manages several databases for system logging and collecting student's grades and other personal data. ECM is specific software for each classroom.

The system is built for the following groups of users:

- Students (limited privileges and rights to access ad hoc applications, devices, and learning resources; rights for setting up a personal profile)
- Teachers (wide privileges and rights to use different applications, upload, remove and create new educational resources)
- Parents (monitoring and communication functions; wide possibilities to contact with students and teachers through the communication module)
- School staff and technical maintenance (specific tasks and duties concerning service and system's maintenance)
- Admin (administrative function).

**Conclusion**

The proposed concept of a smart classroom has many advantages – it presents learning spaces that can be easily adapted to meet a variety of teaching approaches and learning preferences. In fact, it is an active learning environment that can improve students’ engagement by facilitating their focus and concentration. It meets students' curiosity and supports a better understanding of matter by enabling interactive teaching with multimedia learning resources and access to extra information beyond the syllabus. Also, there are technical facilities for recording lectures and digital handouts which are a benefit for absentees and distant students. Smart classroom empowers teachers with the necessary technology tools for managing and providing smart teaching process – real-time feedback, comprehensive reporting and various analyses. It can support different tasks for different groups of learners and provide real-time feedback, assessment, and directions. Furthermore, communication module enables discussions with colleagues, tutors, researchers, experts, etc. as well as the acquisition of relevant information of live events beyond the scope of the textbook. As a disadvantage of the smart classroom, it can be pointed out the need of additional qualification of teachers as well as the maintenance and regular updating of the system components.

METHODS OF ATTRACTION AND RETENTION OF GENERATION Z STAFF

Irina Sidorcuka,1 Anna Chesnovicka2

Abstract: The contemporary job market is facing the arrival of new type of employee – generation Z representatives, known as “digital natives”, who are described as technological, social, global and developed, the most connected, clever and educated generation that ever existed before, driven by social media, influenced by brands and musical culture. At the moment, this generation is considered to be two billion big. This study is looking at the existing methods of generation Z staff attraction and retention in the company Evolution (Latvia), where they make a majority. Further analyzing which of the methods are perceived as most efficient and which values of this generation are met by the company. Methods include company literature review, questionnaires and interviews. It was concluded the Gen Z have specific preferences in communication and can be reached through a variety of social platforms and special events provided by the company. As potential and current employees, they are not looking for life-long employment, put forward their specific values and expect the potential employer to attract them by meeting their needs in terms of flexible working hours, flexible (varied) jobs where their individuality can be applied, company excellent reputation, innovation, speed of change, platform for educational and promotional advancement, specific fringe benefits.

UDC Classification: 303; DOI: http://dx.doi.org/10.12955/cbup.v5.i1030

Keywords: Generation Z, staff attraction, retention, employees’ values.

Introduction

Nowadays, attraction and retention of new staff is becoming more challenging because of the diversity of job roles needed on the one hand and the variety of new methods of attraction and technologies available on the other hand (Blacksmith and Poeppelman, 2014). Recruitment today is more strategic, personalized, and targeted than ever (Sunderberg, 2014). The main challenge for the companies remains finding and attracting new staff that would most successfully fit the company and would contribute to its further development. It is crucial to select right people since it has direct interconnection with the further success of a company on the market and deals with the competitiveness of an organization in general (Osoian and Zaharie, 2014).

The contemporary tendency on the job market, where the increasing number of potential recruits are representatives of generation Z calls for analysing the needs and expectations, values and interests of this potential workforce of the future, in order for the companies to be well equipped in meeting these values and expectations and, thus attracting and retaining the best candidates.

The purpose of this paper is to provide an overview of the existing methods of new staff attraction through recruitment procedures and retention policies, build the profile of the generation Z potential employee, analyze which of recruitment methods and company benefits are the most effective in attraction and retention of generation Z.

The study comprises a literature review and empirical part carried out in the company: Evolution Gaming, the biggest employer in Latvia, where the majority of employees (81% in 2016) are representatives of generation Z.

Literature review

Both prosperity and survival of each organization strongly relies on the quality of human capital employed by the company. This is the reason why organizations should concentrate on attracting highly skilled and competitive candidates, which can be ensured by an efficient recruitment process (Muscalu, 2015). It is important for organization to understand that employees are intangible assets as their knowledge, skills and behavior can play an essential role. Organizations with professional and experienced employees have an enormous competitive advantage (Hawkins, 2007). The main objective of recruitment can be defined as attracting enough candidates that are responding to particular job requirements, so that the employer could choose and recruit the greatest individual to fill the vacancy (Muscalu, 2015).

According to Chand (2015) informing candidates about new vacancies available in the organization and attracting them are essential aspects of the recruitment and hiring process in which both internal and external resources can be exploited.

1 RISEBA University, 3 Meza str., Riga, Latvia, irina.sidorcuka@riseba.lv
2 Senior Schedule Specialist, Evolution Latvia, 151 Brivibas str., Riga, Latvia, Acesnovicka@evolutiongaming.com
Internal recruitment strategy according to Applegate (2015) is usually implemented through promoting employees already working in organization. The following advantages of internal personnel selection for the vacant post were suggested (Reichard et al. 2014): time efficiency, improvement of loyalty and morale of employees, possibility to better estimate the abilities of the candidate, lower costs involved, motivation of other employees to aim at promotion, ease of contacting applicants.

However, in majority cases, organizations refer to external recruitment when there are no appropriate candidates able to fill the particular job position within company staff. Reichard et al. (2014) highlight the following advantages of external recruitment for the companies (Reichard et al. 2014): possibility to invite fresh ideas and welcome innovation, provision of opportunities for unemployed, bigger number of applicants to choose from, possibility to bring new departmental insights.

Decenzo and Robins (2014) and Shamis (2015) identify the following methods of external recruitment: advertising through media (Internet, newspapers, radio and television); employment agencies; recruiters who usually are used in colleges and technical schools; special events when employees of the company are used to attract a big number or candidates for interviews; internship programmes, placing a student in a seasonal or temporary positions for further employment; executive search firms services (headhunting); employee referral (when existing employees are offered to recommend names of individuals they believe would be the right ones for a vacant position, usually in return for a financial reward for such recommendation); unsolicited Walk-In applicants (applicants can be attracted by organizations with perfect reputation without any recruitment method being used).

Whatever methods the company chooses, it should address to the potential hires through the most efficient method taking into account the needs and values of the future employees. As hiring is not only a process of assessing potential candidates in terms of their suitability for the position, but rather an organization as a future employer is being assessed by an applicant (Mason, 2014).

In order to be successful in attracting a large pool of applicants, organizations need to understand their potential candidates looking at such factors as the candidate’s values, motivation and attitude. Mason (2014) highlights that it is crucial to understand motivation of potential applicants as this is going to assist in choosing sourcing strategy and style of communication. Applicants might be employed by another organization holding the same position as the vacant one, or, vice versa they might occupy lower level position, however they are ready for promotion. It is worth considering values applicants may have related to both inside and outside the working place. Often, candidates are interested in the possibilities of a future promotion, advancing specific skills, gaining experience and positive feedback from their direct manager. Outside the working place applicants tend to value family life, communities, cultural activities, professional and social networks.

Armstrong (2006) advises analyzing recruitment strong and weak points from the very start, as this analysis can enhance employer’s attractiveness for the potential candidate through building a special value proposition, thus becoming the “employer of choice.” Barber (1998) suggests that the stage of hiring can be related to applicants’ working preferences and decisions. And to ensure successful hiring, organizational attributes should fit candidate’s individual employment values and critical indicators of employee satisfaction. Basically, organizational attributes include a perception of what the company provides in terms of working conditions and environment. Such aspect as advancement opportunities, fringe benefits and job security are positively appreciated by applicants when evaluating future employer, and influence organizational attractiveness (Robertson et al., 2005).

There are some tangible and intangible factors that attract candidates and motivate them to work for a certain organization, and to stay within it or vice versa drive them away (Regovich, 2014). Among the most widely acknowledged by Crossley and Jamieson (1997) and Regovich (2014) are the following factors that influence staff attraction and retention: pay and bonuses, the job itself (when employee get satisfaction through work), creative benefits and rewards, fun and safe working environment, cooperative and helpful colleagues, the organization’s brilliant reputation and corporate success, and understanding managers.

Fringe benefits offered by companies have a powerful influence on employee satisfaction. According to the survey of annual trends performed by Andrus (2012) 49% of employed respondents noted that benefits were a significant motive when they started working for a certain company, while 60% responded that benefits are a significant reason for remaining within an organization. There is a variety...
of different fringe benefits offered by contemporary employers, starting with snacks and free drinks, to a retirement plan (Horton, 2014). Dishman (2016) highlighted the most important benefits valued by employees: health care insurance (e.g., medical, dental) 40%, vacation/paid time off 37%, performance bonus 35%, paid sick days 32%, and retirement plan and/or pension 31%.

Z Generation Characteristics

Generations are built of people who were born during a certain period of time and who were exposed to the same events, have been impacted by similar technologies and spend their lives under equitable conditions (McCrindle, 2015). According to Burrus (2016), every generation is most likely to form different needs, aspirations and wants accordingly to the various periods of their lives when their responsibilities and tasks change. Generation Z can be described as technological, social, global and developed. They are called the most connected, clever and educated generation ever existed before, who have adopted technological developments, are driven by social media, influenced by brands and musical culture. At the moment, this generation is considered to be two billion big and according to McCrindle (2015), they are not only introducing the future, they are constructing it. There are different thoughts concerning the exact time period when Generation Z starts and ends however, the majority of experts agree individuals born from the mid-90s till 2004 belong to the generation (Mueller, 2015).

The childhood of Gen Z was spent during the economic crisis and periods of terrorism and climate change. There is an opinion that this generation is about to spend their youth and adult years in an era of economic and social renewal. Moreover, they are observers of changes in different household structures. Today they are students and college graduates, nevertheless tomorrow they will become employees of the big organizations, clients and consumers (McCrindle, 2015). Generation Z is sometimes called “digital natives” because of their ability to feel comfortable with ICT. People from Generation Z were born after the Internet and mobile phones were invented, so they do not know life without having those innovations accessible when only there is a need for them. They spend a lot of time online, communicating with their friends, or sometimes with virtual strangers, they are not afraid of sharing personal information in different social media (Bernstein, 2015).

This generation is considered to experience unique stimuli in their lives, starting with the Global Financial Crisis, continued by growing cultural diversity, the spread of worldwide known brands, and acceleration of communication in social media. As McCrindle (2015) assures, this generation will live longer lives, and they will most likely change jobs and work in different organizations than any generation before them. Mueller (2015) notes that this generation is able to grasp and create innovations in technology quicker than predecessors. Generation Z has witnessed a lot of difficult moments during their childhood years: parents losing jobs, sold family homes because of crisis, war and social argues across the world. They do understand that hard work is needed to gain money and live in peace (Harris, 2016).

Gen Z usually are ready to express their opinions, it is significant to respect them and assist, to emphasize their energy and creativity. Companies, that will meet all needs of this generation, will benefit from their hard work, continuous engagement and brilliant ideas in the nearest future (Half, 2015). It is predicted that Generation Z is about to change workplaces with their different attitudes, perceptions and styles as soon as they will enter workforce (Mueller, 2015) like Millennials or Generation Y, born 1977 - 1994 (Harris, 2016). Generation Z are used to immediate access to information and are sure that everything can be found on the internet, similarly to their older Gen Y representatives, they are unstoppably engaged in the processing of information. Like Millennials, they prefer to deal with their problems independently, and before asking for advice or help will search for solution on YouTube or other platforms of video tutorials (Biro, 2015), Mueller (2015) assures, that Generation Z are born multitaskers which is an advantage. However, McCrindle, (2015) argues that at the moment they are completing many tasks at once, their attention is divided by particular tasks, so it may result in losing ability to concentrate so generation requires more time to analyze complex information. It was also stated by McCrindle (2015), that sometimes for them speed matters, not accuracy.

Generation Z at the working place

In 2017 the eldest representatives of Generation Z will turn 22-23, so a large part of them are still not employed however, in the nearest future the situation will change dramatically, by the year 2020 they
are going to comprise 1 in 5 employees. Due to ageing population in Europe, this generation will start their careers in times where the supply of employees is reducing. Workforce shortage will take place since there will be fewer people entering the working force than exiting it. The optimistic point is that the younger generation is going to possess a high level of education however, due to issues arising in the employment sector described above, it is the Generation Z workforce that is going to be in demand, rather than jobs (McCrindle, 2015).

Generation Z’s entrance in the workforce will bring some changes for recruiters. They shall be ready to advertise and engage potential employees on a wide range of different platforms on an everyday basis. Companies will have to understand that it is important to be as connected as Generation Z is if they are willing to recruit young talents. Organizations will need to follow up to their favorite networks, and companies will require to be honest and transparent concerning things they say and promise, as Generation Z tend to be skeptical of marketing (Biro, 2015).

Apart from the need to be connected Generation Z is mostly looking for temporary rather than long-term permanent or even life-long employment as the previous generations (O’Malley, 2006), they are not expected to stay working for the same company for more than a few years.

Flexible schedules will be even more popular as they are nowadays because of preferences of Generation Z to move farther away from classic 9-to-5 hours spent in the office. As Biro (2015) notes, this generation will be able to separate working time and life. As it was told by Baumann (Baumann, 2014) on average, the young generation is planning to be employed by four companies during their lifetime. It can be explained by their willingness to gain robust work experience, which can be obtained from one or two companies, nevertheless this will be reached from working at different organizations.

Generation Z as employees of the future will consider it is important to have life/work balance, trust, flexibility, engagement, fresh ideas, amusement, creativity, and global working atmosphere (McCrindle, 2015). They will appreciate recognition for their efforts, which can be explained by their children years spent in safety and support at home, in public and during their education. That is a reason why they believe support will continue to be around, even at the working place. For nowadays workers it is crucial to have a variety of needs met at work, for Generation Z it more about social connection, experience, education, knowledge, and even environmental sustainability. As McCrindle (2015) notes, this generation is not so much motivated by remuneration as they are by other benefits.

When searching to attract and maintain Gen Z, the employers should take into account that they value ownership and individuality at the working place. Motivation comprises task variety and creativity, while it is the internet that has influence over profession selection. According to Stone et al. (2015) Millennials as employees prefer more interactive, interpersonal, information-rich approaches to all of the areas of HR management. They tend to prefer an interactive training style. They believe the most effective leadership style can be reached through consensus, they are influenced by global and short-term desires. They are expressing their ideas freely and boldly when it comes to management (McCrindle, 2015).

Research process, methodology and design

The research was conducted in the company Evolution Gaming which is a leading B2B provider of Live Casino systems in Europe. The group today employs approximately 1,800 people of whom a majority are based in Latvia and Malta. The parent company is domiciled in Sweden. (Evolution Gaming Group, 2016). At the moment, there are 1,300 employees working in Riga Offices, mostly holding position of Game Presenters or IT specialists. In 2017 Evolution Gaming is planning to expand and to offer 600 new job positions. According to LETA (2015) the CEO of a company Svante Liljeval announced at annual Nordic-Baltic business forum that Evolution Latvia will continue investing in its employees, infrastructure and offices, increasing its office space to 7000 square meters.

As the requirements for the staff are specific and the level of demand is high in terms of skills and competencies (advanced English language competence, stress resistance, artistic and presentation skills, etc.) and the staff turnover is high (approximately 30% per annum), the company is actively working on finding the most effective methods of staff attraction and retention (Evolution Gaming Group, 2016)
The initial aim of the research was to evaluate the existing recruitment practices and to identify the most effective ways how to attract Generation Z staff. To evaluate perception of the company by the young generation and investigate whether Evolution Latvia addresses the values of their existing working force through offering motivation benefits.

The data were collected through questionnaires and interviews with the current staff as well as from the company documentation. The sample for the questionnaire comprised 210 current employees of Evolution Latvia, the age group from 18-21, making 58% or 121 respondents, 23% of respondents in the group from 22-24. The questionnaire was based on graded answers (from 1- least preferred to 5-most appreciated) to the questions regarding the most effective methods of advertising posts, factors influencing attractiveness of the employer, preferred benefits offered, and possible reasons to leave the company. The author calculated the average score of each characteristic by combining the responses of the 210 respondents.

**Findings**

**Sources and methods of job advertising**

Among a wide variety of sources of job advertising used by the company at present Generation Z respondents gave preference to word-of-mouth advertising (4,9) as the most noticeable and effective one. The second and the third most effective methods appeared to be the same as for older than 23 employees – Social Media (4,8), however youngsters tend to notice adverts there more often compared to the group aged 23 and more (4,2). Advertising in Cafes, Restaurants and Cinemas is the third most noticeable (4,6). Both age groups found that Newspapers & Magazines (2,5 and 2,2), TV (2,6 and 2,3), Billboards (2,7 and 2,6) are less effective sources of advertising, that are often being ignored by Generation Z (18-22), and those older than 23. In the interviews it was highlighted that employee referrals and special events organized by the company at schools, colleges and campaigns in social networks are most effective, e.g. Virtual Career Days with www.draugiem.lv, www.delfi.lv, www.cv.lv, using Facebook and Instagram accounts, and a YouTube channel, where they run number of campaigns and competitions. Advertising campaigns were considered more successful if combined with attracting celebrities and brands (e.g.now the company has come out externally in cooperation with Reebok Latvia), supporting a healthy lifestyle, positioning itself as being young and dynamic (Figure 1).

**Factors of employer’s attractiveness to staff**

The most highly valued factors of employer’s attractiveness were: pay (4,5), the job itself (4,3), and benefits and working environment equally (4,2), whereas less important stated were training & development (3,3), new contacts (3,7), and location/position of the office (3,8). However, for the youngest representatives flexible schedule was the most important factor (4,7), followed by the job itself (4,6) which they described as exciting, interactive, communicative and using advanced IT. The corporate image was the third most important factor (4,5). The company’s growth, dynamism, international environment were highlighted. Respectively, the less important elements stated were new contacts (3,5), location/position of the office (3,6) and pay (3,7). Nevertheless, Generation Z considers benefits offered by the company (4,4), and training & development (4,2) to be significant (Figure 2).
Meeting the values of staff

The majority of respondents evaluated flexible schedule (4,8) to be the value of young generation the company is most likely meeting. It is followed by innovation (4,6) and promotion possibilities (4,5). According to the responses of Game Presenters, Evolution Latvia is less successful in meeting such values as ability to show individualism (3,4), trust (3,6), and life work balance (3,9) (Figure 3).

Fringe benefits offered by Evolution Latvia

The most important to respondents benefit currently offered by Evolution Latvia is the gym (4,8) showing that the young generation is supporting a healthy lifestyle, it is followed by paid vacation (4,7) and health insurance (4,6). 25% or 53 people would appreciate to have free parking, a paid day off on a Birthday was supported by 23% of respondents, while 20% would like to have more free sports events it is closely followed by free healthy food that was chosen by 19%.

Special offers for SPA
services would be the most desired fringe benefit for 8%. 5% of respondents falling into “other”
category, have stated that they would like to see different development classes organized, free cinema
tickets, language courses, etc.

Turnover and reasons to leave Evolution Latvia
42% of respondents or 87 people are planning to stay in work from 6 months till one year, that
indicates that they tend to consider short term employment. 25% of respondents would work in the
Company from 1 year till less than 3 years. 23% current Game Presenters are planning to exit in 6
months long period. Only 8% showed willingness to remain at Game Presenter position for 3 years till
5 years, and only 8% of respondents are eager to work for 5 years or more. The potential reason to exit
the company is unwillingness to work long for one company (28%), followed equally (23% each) by
moving to jobs related to an improved level of education/qualification and desire to gain new
experience. 13% have chosen burn-out of Game Presenter’s position, 8% lack of innovation.

Research limitations
The study was limited by the specifics of the jobs profile in the company Evolution, and to get a wider
view on the attraction and recruitment of generation Z a study should be proceeded in a number of
companies in different sectors of economies among representatives of a wider variety of jobs. Another
limitation is specific personal values of each individual which may differ from the generalized values
of generation Z.

Conclusion
The most powerful method in attracting new recruits ,the company Evolution is currently using, word-
of-mouth with employee referrals, a continuous presence in majority of popular media platforms,
attraction of famous brands to cooperate(Reebok Latvia), facilitation of sports and social events, and
promotion in schools and universities.

The most important attributes of employer’s attractiveness appeared to be flexible schedule allowing
to combine work and studies; the job itself which is interactive, varied, communicative, exciting,
connected with new IT; and a corporate image of the company as famous, growing, dynamic.

Generation Z values, successfully met by the company, are flexible work hours, innovation and the
possibility of growth(Evolution Academy). Evolution Latvia is less successful in meeting such values
as the ability to show individualism, development of trust and provision of life work- balance.

The most important benefit for Gen Z currently offered by Evolution Latvia is gym facilities showing
that the young generation is supporting a healthy lifestyle, it is followed by paid vacation and health
insurance. Nevertheless, the majority expressed a wish to have more possibilities for sports, social
events, paid day-off for birthdays.

The majority of Gen Z staff have short-term desires and are not planning long-term employment in
one company, they are ready to leave their current employer in search for better opportunities,
innovation, novelty. This lack of loyalty to their present employer and fast changing priorities of Gen
Z require permanent adaptation to their needs and values, active permanent communication, quick
reaction to change and continuous innovation in the companies.

LONG TERMS AND READABILITY OF PHYSICS SCHOOL TEXT

Ivana Škorecová,1 Aba Teleki,2 Ľubomír Zelenický3

Abstract: This article presents a comparison of two physics school texts from the perspective of readability and use of specific terms. The study uses the survival function to associate the readability of physics school text to the length of terms used in the text. First, the study compares the survival functions of two full texts and that of the terms in these texts, and then analyzes the associated relative readability. Next, the results of two cloze tests involving 150 students are compared. The last step investigates the randomness of the differences between the results. The results show a strong correlation between the test scores and the probability distributions of terms used in the school texts. The difference between the probability distribution of the compared texts corresponds with the differences between the appropriate survival functions, where random fluctuations in the frequency of terms are suppressed.

UDC Classification: 37.02; DOI: http://dx.doi.org/10.12955/cbup.v5.1031

Keywords: Cloze test, Survival function, readability, physics school text

Introduction

Because of fewer classes today than previously, current physics students need greater access to textbooks than ever for learning to remain effective. Thus, for effective study with fewer classes more emphasis is placed on home study. As a result, students need materials free of errors. In the time of the internet, information is easily accessible. However, finding appropriate information, especially in readable text form, is problematic. The readability of school texts is the first and foremost precondition for a valid study hour.

In accordance with Škorecová et al. (2016b), terms are part of physics school texts, and we cannot write school text without terms. Thus, the frequency of terms is critical for a readability study. However, the length of such is also important (Škorecová, et al., 2016a). In this case, where the frequency of terms is similar between texts, the most readable and thus more suitable for study hour relates to the frequency counts and length of the terms.

The aim of this study was to compare two physics school texts from the perspective of readability and use of specific terms.

Data and Methodology

This study examined the following texts:

- Physics for 2nd grade on high school (2r) by Demkanin (2010), Section: Properties of Liquid and Gases
- Physics for 3rd grade on high school (3r) by Pecho (1994), Section: Stationary and Non-Stationary Magnetic Field

The hypothesis was that the readability of physics school text depends on the length of the terms.

The study also examined the importance of theoretical knowledge as part of the learning process, considering terms as the basic building elements of such knowledge. Terms were separated from both texts, prior to calculating the survival function for the terms.

Two cloze tests were used to confirm or reject the above hypothesis (Hₐ). The first involved the text 2r and the second the text 3r. Both tests examined 300 words with every 7th word missed. A total of 150 students of a high school in Nitra performed the two tests before studying this topic.

Finally, the study findings were validated regarding the significance of differences in the survival function and the cloze tests. The null hypothesis (H₀) was that the difference between the survival functions for terms of the different school books was random. For this, the p-value for chi-square (χ²) distribution was calculated using the Monte Carlo method to generate data (Meunier et al., 2001).

Survival Function in Study of Readability

The required information was encoded in the probability distribution function (PDF) of words of a given length (Škorecová et al., 2016a). However, in the case of terms, the appropriate PDF was found to be unsuitable due to the relatively small number of terms. The fluctuation in the PDF was significant where the analyzed text was short. For this reason, the study used the cumulative distribution function (CDF) instead of the PDF. In the CDF, the fluctuations were suppressed due to its random characteristic. The survival function (SF), or complementary CDF, has the same property as CDF. Here, the survival function of probabilities was used to obtain a decreasing function. The survival function $S_n$ was defined as follows:

$$S_n = \sum_{j=n}^{\infty} p_j, \quad n = 1, 2, 3, ..., \quad \text{and} \quad S_1 = 1,$$

where $p_j$ was the frequency of words in the analyzed text. The infinite sum was formal only, as all texts contain a word with a maximal length. The survival function, $S_n$ for words, yielded better results and improved graphical visualization of the results. The readability of the simultaneous comparison of the three texts in graphs was improved using this approach.

**Results and Discussion**

Despite the improvements mentioned above, little differences in readability were evident between the texts, 2r (Demkanin, 2010) and 3r (Pecho, 1994) (Figure 1). The finer scale of Figure 2 displays the difference between the survival functions of the analyzed pair of tests. In this difference, the fluctuation was naturally suppressed.

**Figure 1: Results of the survival function for two school texts**

**Figure 2: Difference between two survival functions of school texts - full text**

![Figure 2](image2.png)

2r: Physics for 2nd grade in high school (Demkanin 2010); 3r: Physics for 3rd grade in high school (Pecho 1994); $L$: the length of words; $P^{2r} - P^{3r}$: the difference between the survival functions $P^{2r}$ and $P^{3r}$.

Source: Author
Table 1 presents characteristics of the analyzed texts. Because of different topics, authors used distinctive terms with discrete lengths. Whereas Figures 1 and 2 show the readability of texts as somewhat similar, Figures 3 and 4 reveal differences in respect of terms. Thus, text 3r was less readable than text 2r (see Figure 5).

Figure 6: The $\chi^2$ distribution calculated from Monte Carlo (MC) generated data with the red line showing the approximation of the $X^2$ distribution defined in (Škorecová et al., 2016a) which is more suitable for practical purposes.

![Chi-squared distribution](image)

2r: Physics for 2nd grade on high school (Demkanin 2010); 3r: Physics for 3rd grade on high school (Pecho 1994); $X^2$: the quantity defined in (Škorecová et al., 2016a) by Eq. (2) has a distribution similar to the $\chi^2$ distribution; $p$: the probability distribution (PDF)

Source: Author
The results validated the hypothesis that text with shorter terms performed better in the cloze test. Thus, school texts with shorter terms are deemed more readable than texts with longer terms. Therefore, readability of school texts depends on the length of terms.

To compare the similarity of the two textbooks, we used the statistical quantity $X^2$ defined in (Škorecová et al., 2016a). This quantity has a similar probability distribution as the well known $\chi^2$ distribution does.

Figure 6 and Table 3 show the results of the $X^2$ distribution using the Monte Carlo method. The results confirmed the null hypothesis ($H_0$) that the difference between the survival functions of terms of the school books was random ($p = 1.80 \times 10^{-4}$).

**Conclusion**

The readability of school texts is a crucial parameter for effective learning. Such readability depends on the frequency of terms. For evaluating school texts, an alternative to using the cloze test is to use the survival function of terms to compare texts. The results of this study show that this type of analysis is useful and can provide teachers with results faster than if they were to use the cloze test alone. By using more readable texts, the studying of texts will be more effective, especially for home study.

SYSTEM OF DIGITAL CRITERIA FOR EDUCATIONAL WEB RESOURCE ASSESSMENT
Valentina Aleksandrovna Solovyova

Abstract: An educational web resource is a tool that can help discern useful data on the Internet. A system of criteria, however, is needed to assess the quality of this resource. Existing assessment models use various principles for this purpose. Ten such models are considered in this paper, though none of these use the basic principles of education. This paper suggests a unique new model that considers the major pedagogical principles of scientific content, visualization, the availability and feasibility of education, humanization of education, and students’ consciousness and participation. These principles are modified for the requirements of e-learning. The main focus of creating the model is the learner. Some assessment-related points in the suggested model are described in a more detailed manner than in previous models. The new model provides criteria that can ensure the quality of an educational Web resource. Thus, the model can form the foundation for creating educational resources.

UDC Classification: 37.02 ; DOI: http://dx.doi.org/10.12955/cbup.v5.1032

Keywords: educational, Web, resource, quality, assessment, digital, criteria, e-learning

Introduction
Such terms as information environment, post-industrial society, information society, information era, and ZettaByte epoch are frequently used to describe today’s era. The cause includes at least these two reasons:

▪ The volume of digital information doubles on average every eighteen months; and
▪ The global IP traffic is set to overpass a ZettaByte (10^21 bit) and increase annually in the future, as stated by the 2015–2016 Cisco Visual Networking Index Forecast and Methodology report.

These scenarios reflect the increase in generated information volume and growth of its use on the net and give rise to certain problems. It is becoming more difficult for an individual to discern useful data and information overload is increasing, which leads to intellectual ‘stroke’ (a term used to describe the state of ‘numbness’ due to information and knowledge overload; Shrayberg, 2016).

This problem is especially interconnected with education, mostly as education involves extremely complicated tasks because of widespread information and technology (IT) development. For example, the digitizing of knowledge that requires mechanisms to facilitate the use of online information and to enable an individual to both use and critically assess such large amounts of data.

One tool that can help solve such problems is an educational Web resource. When used correctly it can provide many advantages to all participants of education (Krelja Kurelovic, 2016; Hilton, 2016; Bacsich, Pepler, Bristow, Ossiannilsson, Creelman, Szalma & Slaidins, 2015). Thus, there is a need to understand whether an educational Web resource is used or created correctly. One possible way could be to assess its quality by way of a comprehensive analysis of its advantages and effectiveness of the operation.

Assessing the quality of a Web resource requires a system of criteria. Classical models for assessing the quality of educational Web resources (e.g., paper textbooks) are counter-productive for two reasons:

▪ Students’ way of thinking changes, therefore, the type of presentation should change also, and
▪ The functioning of an online web resource changes the perception of information.

This paper reports on a new model of assessing the quality of educational Web resources that is based on an analysis of existing models but which incorporates a system using the basic principles of education.

1 Postgraduate Student, Faculty of Nano- and Biomedical Technologies, Saratov State University, Russia, v.a.solovyova@gmail.com
**Literature Review**

In the scientific sources of literature, 10 models for assessing the quality of an educational Web resource were found. These involved various principles, standards, or groups of criteria for specifics unrelated to the course of work chosen for this current study. For example, for estimating the quality of a Web source, Joo, Lin, and Lu (2011) proposed a model based on three subscales: effectiveness, efficiency, and learnability. A model by Toleva–Stoimenova and Christozov (2013) used a similar set of three criteria: effectiveness, efficiency, and user satisfaction.

Polillo (2011) proposed to evaluate an educational Web-source with these characteristics: architecture, communication, functionality, content, community, platform, accessibility, usability (external quality and quality), and usability (internal quality).

According to Jabar, Usman, and Awal (2013), such an evaluation should use factors of attractiveness, controllability, helpfulness, efficiency, and learnability. Under Hasan (2014) the appraisal includes categories of navigation, organization or architecture, ease of use for communicating, design, and content.

Other analyzed models were based on dimensions of content, navigability, structure or design, the appearance of multimedia, and personalization (Matas, 2014). Another was on maintaining current educational resources, enhancing the learning environment, providing quality assurance mechanisms, and aligning open educational resources (OER) to common standards (Orr et al., 2015). Pow and Li (2015) used these groups: perceived usefulness, actual usefulness, perceived ease of use, and actual ease of use. Criteria of authority, update, usability, accessibility, communication, graphic design and multimedia quality, content, navigation, and the speed of access and interaction were used by Santos (2016), and eight general standards were proposed by Lowenthal and Hodges (2015).

Notably, most of these models offer similar criteria for evaluating a resource. Figure 1 shows the different criteria and their frequency of use across the 10 assessment models.

![Figure 1: Criteria and frequency of use across 10 assessment models](source: Author)

**Data and Methodology**

The system of criteria proposed by this current study was based on aligning the educational Web resource with the major educational principles. This decision was justified by a need to achieve a pedagogical effect when using educational Web resources. The analysis identified five major educational principles:

1. Scientific content,
2. Visualization,
3. Availability and feasibility of education, and
5. Students’ consciousness and participation.

These principles were used to discern the digital criteria and to provide insight with consideration to the specifics of e-learning.

The principle of scientific content corresponds to accuracy and correctness of the educational information available to learners and needs to contain scientific facts and knowledge. The following criteria were formulated for the principle of scientific content:

- Scientific feasibility.
- Lack of factual mistakes.
- Lack of unethical information.
- Compliance with the syllabus (in case the Web resource is a part of an educational program).
- Completeness of the subject under study, e.g., the number of didactic units, which have to be included to cover the topic and their proportion against the total number of didactic units.
- Additional materials, i.e., useful links related to the topic and educational material available for downloading (textbooks, articles, and books).

Web page content requires constant verification and updating for authenticity, and thus, timely visualization was another criterion identified as influencing the quality of an educational resource.

The principle of visualization corresponds to the possibility of educational material perceived using several sense organs. Visualization of the material is a tool for improving a learners’ memory (e.g., infographic, animation, video, mind maps and interactive maps, diagrams, charts, photographs, and pictures). In addition, relevant program segments are benchmarks, as Barthes (1977) stated, “Almost all images, in all contexts, are accompanied by some linguistic message. This seems to have two possible functions: anchorage and relay”. Thus, appropriate matching of text and visual material provided a possible and prominent pedagogical effect.

The principle of visualization was developed in the works of such prominent classical educator as Comenius (1697). Pestalozzi also considered visual thinking to be one of the most powerful features of the mind, and believed that imagery was the start of all knowledge (as cited in Webster, 2005). The expediency of using multimedia technologies was also substantiated in the works of modern researchers (Ilhan, & Oruç, 2016; Kilonzo, Sandfort, & Liu, 2016; Tang, 2016).

Setting this principle as being crucial for Internet information was considered appropriate as students’ use of the educational Web resource is neither supervised nor accompanied by teacher explanations.

It was assumed that an effective educational Web resource required the following:

- Appropriate data submission for audio, video, graphic educational materials (and their combinations); and
- A suitable balance of visual and text material to strengthen the educational impact of the resource.

In respect to principle availability and feasibility of education, it was deemed that educational material should be presented gradually and logically. Considering the intellectual potential of learners, their age-related peculiarities, and current knowledge status discerned the following three requirements:

1. Material should be thoroughly planned, divided into completed sections (if it does not contradict the selected educational method), possess the ideological center as well as basic concepts that form the content of the resource. Each information section should be accompanied by a glossary and abstract (commentary). Optimal sequence of educational material presented on the Web page has to be defined, i.e., information text blocks and visual material has to be logically positioned so that they attract the attention of the potential learner;

2. One has to take into consideration the various teaching materials necessary for creating an educational Web resource. An overabundance of material, as well as a deficit, leads to a loss of students’ concentration. Therefore, the aim is to define the optimal quantity of didactic units (such as theorems, methods, rules, and laws) and explain units (properties and characteristics) for the Web resource; and
3. Because the Internet provides extensive opportunities for logical transitions between interconnected blocks of information, one has to define the logic of using links and hyperlinks in the text.

For assessing the effectiveness of using the principle of availability and feasibility of education, the following criteria were selected:

- The complexity of material
- A number of didactic and explaining units collocated to the speed of information processing by a human (e.g., reading 18–45 byte per second);
- The number of hyperlinks in the text; and
- Reference information.

An example application for complexity of material is the Flesh-Kinkaid Score (Venig & Solovyova, 2016).

The principle of humanization of education may be denoted as one that creates user-friendly conditions for students’ education. This principle was substantiated as the fundamental principle for the education environment in the works of outstanding educators of Ancient Rome (Quintilian and Cicero) and later was developed in the works of educators of the Renaissance as Campanella (1981). Modern research also indicates actuality and feasibility of this principle’s application (Zarevski, 2015; Gilad, 2015).

With regards to e-learning, this principle involved several requirements.

The first requirement involved creating accessibility features in the resource for the Internet user. Primarily, this principle interconnects with the peculiarities of how educational material functions in the Internet environment and creates a user-friendly environment. This implied the following:

- Creating the opportunity to work with the source for students with disabilities. In this case, it means designing the version for visually-impaired users;
- Providing an opportunity to connect with the Web source from any device; from smartphones and tablets to laptops and computers (adaptable layout);
- Providing a fast ‘boot’ of the Web page and high downloading speed;
- Securing resistance to erroneous and incorrect user actions;
- Limiting annoying advertising;
- Limiting broken links to pages, documents, and images;
- Using easy formalization of text (font size, line spacing);
- Using high-quality multimedia material (definition); and
- The correctness of text data.

The second requirement related to the influence of e-learning on a student’s personality. The digital material should provoke the feeling of emotional and psychological security in a learner. These are the psychological and pedagogical requirements. The criteria that were distinguished here are the availability of feedback (individual information support) and timely error correction by the Web resource developers in response to users’ complaints.

The third requirement involved the criterion of data update and the manner of its presentation, especially, for assessing the quality of the Web resource. It was important to consider the peculiarities of modern learners’ perceptions and their thinking as a ‘Web surfer.’ Because there is a large amount of educational and other types of material, a learner skims through web pages in the course of two to three seconds to identify whether they will use that specific resource. Therefore, it was necessary to define how the attention span of a student is met in order to choose the most suitable structure of information arrangement on the website. Major requirements for headings, text, and graphics location of the pedagogical design should form the foundation of an educational Web page design.

Another pedagogical principle that was identified is the principle of student’s consciousness and participation. It does not presume the order of information presentation, but rather the way data collection relates to the effectiveness of implementing the four principles described above. Assessment of implementing this principle is possible by evaluating the visiting statistics of the Web source, as well as the target actions on the Web page, such as downloads of videos and audios, and clicking on hyperlinks. Basic parameters of Google Analytics, e.g., the average duration of page views and the
number of downloads can be used to fulfill this task. These indicators would be adapted to the specifics of every web page, for example:

- Average duration of a page view correlated with data size of page contents;
- A number of downloads correlated with data size of the page content.

**Results and Discussion**

The results of analyzing didactic requirements provided a system of digital criteria for assessing the content of an educational Web source. All criteria discerned were systematized into corresponding sub-groups (Table 1).

It should be noted that these criteria reflect the analysis from the perspective of one participant’s educational needs only, i.e. the learner’s. Viewing the Web resource design from the perspective of an educator or developer requires an extra important criterion, i.e., the amount of time or money spent on the development of an educational Web resource.

Source: Author
Conclusion
The major aim of this study was to develop a model to assess the quality of an educational Web resource from the point of view of its main user, the learner. The need for the model emerged because certain criteria had not been considered in previous models. In this regard, some of the assessment-related points have been described in more detail than in the previous models. The present work can be used for discerning criteria that form the foundation of an educational resource. Considering the quality of an educational resource influences the quality of education in general, ensuring Web resource quality is a priority for the educational community.

THE PARTICULARITIES OF (SELF-)EDUCATION OF ‘LEARNING TO LEARN’ IN A PRESCHOOL INSTITUTION
Goda Stonkuvienė

Abstract: This article discusses (self-)education of ‘learning to learn’ in a preschool institution. It emphasizes the particularities of this (self-)education in the context of pedagogues’ experiences. The (self-)education of learning how to learn at a preschool age is an essential foundation for lifelong learning, defined not only in documents of the European Union but also in those of Lithuania and ones regulating preschool education since 2014. This pilot research reveals pedagogues’ experiences in applied education practice, as well as features of the children’s (self-)education in ‘learning to learn’ in a preschool institution. Interviews provide an understanding of pedagogues’ approaches to the structure, planning, and development of the ‘learning to learn’ concept. They also reveal results on how to manage (self-)education, as determined by the children’s individual learning, experiences and abilities, learning topics initiated by them, and the significance of their educational environment. Pedagogues’ preparedness to develop children’s ‘learning to learn’ is expressed by the need for help necessary for them, to strive towards a more successful (self-)education of children’s ‘learning to learn’ in the preschool institution.

UDC Classification: 37; DOI: http://dx.doi.org/10.12955/cbup.v5.1033

Keywords: children’s learning to learn, preschool education pedagogues’ experiences, process of (self-)education of learning to learn, educational environment.

Introduction
The competence of lifelong learning is necessary for a person to develop a meaningful and successful life, and therefore underlines a person’s essential competencies. In accordance with the Recommendation of the European Parliament and the Council on Key Competences for Lifelong Learning (The European Parliament and the Council of the European Union, 2006), the competence of ‘learning to learn’ is described as an ability to learn persistently and successfully, to manage effectively (to plan, organize, and correct) an individual’s own learning independently, as well as in a group. Furthermore, ‘learning to learn’ is regarded a sphere, which, apart from offering new understanding and skills, provides values and beliefs that allow individuals to become more efficient, flexible, and organized with learning in different situations (Hofmann, 2008). The outcome of the learning to learn competence, as the majority of scientists acknowledge, is related to education in early childhood, as, according to Thanassis (2009), the whole education system seems inconceivable without the first step, i.e., preschool education. This first step helps shape a lifelong learning experience, and evidence suggests that important habits and approaches, that are inherent to lifelong learning, evolve at this age. Scientists (Broström, Johansson, Sandberg, & Frøkjær, 2012) note, that learning is a unity of care and education, where the focus is on a child’s welfare and the foundation of lifelong learning. Sprigle (1968) prepared the Lifelong Learning Program, which was created and developed with the assumption that early-age education has to help a child to know how to learn. However, French (2007) argues, that early-age child education is complex, dynamic, and interactive, where knowledge arises through transformed experience. Scientists researching childhood learning (Broström et al., 2012; French, 2007; Mustard, 2006; Smith, Cowie, & Blades, 2003) concentrate on how children participate and become involved in the learning process and with a rich learning environment, where children can investigate, touch, interact with environment, ask questions, raise hypotheses, and develop thinking. During the learning process, children’s relationships with other children and adults, their cooperation, a pedagogue’s responsibility and preparedness, as well as an ability to inspire children to know the world surrounding them, are all necessary. Parents’ involvement in their children’s learning is highly appreciated. In Lithuania, newly prepared documents regulating preschool education (Description of Preschool Age Children’s Achievements, 2014; Methodical Recommendations for Preschool Education, 2015), emphasize children’s learning to learn. These documents also note that a preschool-age child acquires substantial experience, and this becomes the foundation for further learning and undermines the success of lifelong learning. In these documents, learning to learn is described as a wish to learn something and a persistent pursuit of this aim. This is

1 Faculty of Education Sciences and Social Welfare, Šiauliai University, goda.stonkuviene@gmail.com
an ability to set the goals of learning or other activity, to plan how to achieve them, to choose relevant activities, to consider what was successful and what the outcomes of the activity or learning as well as further aims are. These documents oblige pedagogues to rethink in-depth about the available experience, to form a correct approach to learning to learn, as well as to reconstruct educational processes to develop the ability successfully. The above has led to the formulation of the main research questions: what are the pedagogues’ experiences in developing children’s learning to learn in the preschool institution, and what particularities of this development are accentuated. Therefore, the aim of this research is to analyze pedagogues’ experiences to reveal the particularities of learning to learn in the preschool institution.

Data and Methodology
To achieve the research aim, a pilot study was carried out by way of a guided interview approach, which is an appropriate way of approaching subjects on the definition of meanings and situations, as well as reconstructing their experience (Creswell, 2007). Six pedagogues consented in writing to volunteer for the study. To collect the research material, the researchers chose six subjects from a target group of preschool education pedagogues, with no less than 10 years of teaching experience (interval: 10-25 years) and in educating 5-year-old children. The pedagogues selected work in different preschool education institutions of Vilnius city. For the interview, the pedagogues were given five main questions, which covered an understanding of the ‘learning to learn’ concept, planning and organizing of learning to learn, the creation of an educational environment, and aspects of help needed for pedagogues. To collect more in-depth information, during an interview, a researcher would ask additional questions. Interview material was obtained using a phenomenological approach where a researcher seeks to interview a participant for self-expression of the research object (Husserl, 1989; Moustakas, 1994), in this case, their professional experience. Based on the research results and analysis of the content, meaningful categories and subcategories emerged from the ideas expressed by the research participants.

Research Results
In analyzing the answers given by pedagogues about the concept of ‘learning to learn,’ it was noted that their experience differed in how they described the main components (Tables 1-4). The pedagogues’ statements about how they understood learning to learn distinguished the seven subcategories (Table 1). In the concept of learning to learn, ‘formulation of learning aim’ received responses relating to a child’s ability to set and describe learning goals (Table 1). For ‘selection of means suitable for learning’ responses were around a child’s activity to achieve this aim. The pedagogues, while describing the concept of learning to learn, indicated that it is important that children perceive the significance of knowledge, and that this conditions the application of knowledge, that children set the goal on the basis of their own experience. In the subcategory, ‘child’s initiative and independence’ the responses emphasized a child’s initiative for a new experience, independence, and reflection. Some pedagogues’ experiences systematized in subcategory ‘motivation and willingness to learn’ suggested that children’s desire to know is essential while talking about children’s learning to learn and its development.

In analyzing the planning of learning to learn, the study defined five subcategories (Table 2). ‘Integrity of planning,’ revealed an integrated nature of learning to learn, emphasized by the pedagogues, i.e., responses indicated that this ability is developed in different spheres of children’s activities and education (Table 2). The majority of interview participants emphasized ‘targeted planning’ that the pedagogues prepare in advance for children’s learning to learn (Table 2). However, when the pedagogues prepare for a topic (subcategory ‘linking of planned topic to children’s experience’) they relate it to the children’s experience, plan considering children’s and group’s needs, and emphasize a pedagogue’s flexibility in education planning process (Table 2). The pedagogues, while talking about learning to learn from a child’s point of view, emphasized that planned topics and activities are often changed and amended, as determined by the children’s wishes, needs, and situations (subcategory ‘planning considering children’s and group’s needs’, Table 2). In the subcategory, ‘situation determined planning’ the pedagogues’ responses suggested that experience is reflected when a plan foreseen in advance is amended in accordance with unforeseen situation or case (Table 2).

The pedagogues’ responses from experience showed that, in the process of developing learning to learn, the pedagogues mostly emphasized and selected the children’s activity. This highlights that due to their different abilities to learn it is difficult for children to select an activity and that they need help from the pedagogue, who encourages the children to perform this activity further themselves (subcategory ‘need for help,’ Table 3). The pedagogues’ statements emphasize cooperation and that there is learning from each other (subcategory ‘cooperation while learning’, Table 3), the importance of children’s experience-based learning (subcategory ‘experience-based activity’, Table 3), and that there are discussion and reflection of activities performed by the children (subcategory ‘activity discussion and reflection’, Table 3). In the pedagogues’ statements, the children’s abilities to set the
goals were reflected upon (subcategory ‘formulation of learning aim’, Table 3). In the pedagogues’ opinion, positive emotions and encouragement of self-confidence seem important for the children as well (subcategory ‘positive emotions and promotion of self-confidence, Table 3).

</table>

The educational environment has a significant influence in the process of learning to learn. This is indicated by the pedagogues’ responses, as shown in Table 4.

The analysis of interview material revealed the pedagogues’ preparedness to develop the children’s learning to learn. This category can be broken into two subcategories: 1) the need for development and 2) the need for help to be provided for the pedagogue. Regarding the first subcategory, the emphasis is exemplified by these interviewee responses:

- “need to develop both in deepening the perception of the concept of learning to learn and practical aspects of the development of this ability”;  
- “I assess my preparedness as satisfactory”;  
- “I think that I have to deepen the experience in the development of children’s learning to learn, especially, it is difficult to manage educational process conditioned by situations”;
“previously learning to learn was not emphasized in the programme – thus I regularly keep interested in this how to develop this ability”;

“as this sphere of education is newly emphasized in preschool education, in critically evaluating my preparedness, I have to admit that it is necessary to deepen into both theoretical assumptions and especially in practical abilities of children’s learning to learn, as experience is gained while acting and looking for the best means and ways to implement this”;

“I am not fully prepared to implement successfully the requirement to teach children to learn.”

Regarding the second subcategory, ‘the need for help to be provided for the pedagogue,’ the following responses substantiate the case:

• “I would need methodical material about this how to develop children’s learning to learn”;

• “the descriptions of concrete successful cases would help to understand better how to successfully develop children’s learning to learn in kindergarten.”

Discussion

The results of this research distinguished several factors. First, the pedagogues’ experiences of the concept of learning to learn have not been fully expressed and do not reflect the overall perception of structural components of this ability. The scientists researching the concept of ‘learning to learn’ (Hofmann, 2008) emphasize the competencies necessary for an educator to support the process of children’s learning. Therefore, a clear understanding of learning to learn and its achievements determine the ability to develop this competence. The data obtained during the research about the pedagogues’ preparedness to develop the children’s ‘learning to learn’ highlight the need for improvement and help for a pedagogue. The data also provide insights into developing competence to evolve children’s ‘learning to learn.’ Information about the planning stage of the process of learning to learn reveals the pedagogues’ purposeful preparation, as well as the need for change and flexibility in this activity. These responses would be determined by topics initiated by the children’s interest, which depend on their different experiences in learning skills. This status highlights the context of ‘free’
education and reveals the existing expressions of educational interaction between children and pedagogues, as well as emphasizing the exceptional culture of children’s learning to learn. This concept is emphasized in the works by childhood researchers (Seefeldt & Barbour, 1998; Juodaitytė, 2004) and actualizes in-depth studies of pedagogues’ experiences. In organizing learning to learn, cooperation and mutual assistance at all stages of learning to learn are important, as substantiated by the children’s experience that was emphasized by the pedagogues. This amends and influences the change of a pedagogue’s experience. A pedagogue’s role is highlighted by promoting, initiating, and providing assistance to children while learning. The pedagogues’ statements about the development of learning to learn in the educational environment that are favourable for children’s learning to learn reveal controversial aspects and indicate the need for more detailed analysis of this issue.

Conclusion
The results presented in this article reflect the conclusions of a pilot research. The findings will be developed and widely discussed in future research stages, with the aim of examining, in greater depth, the tendencies observed in this research, and to formulate proposals for a more effective development of children’s learning to learn in the preschool institution.

ACCOUNTANT’S PROFILE: PERCEPTION OF STUDENTS AND PRACTITIONERS

Rasa Subaciene,¹ Kastytis Senkus²

Abstract: The profession of the accountant has many aspects. Accountants shape the largest amount of information in an enterprise and play an important role in the enterprise’s activity. This profession is highly regulated, very responsible and usually includes a wide range of topics: including but not limited to different spheres of accounting, formation of accounting policies, or even information system for enterprises. This suggests the need for an investigation into the accountant’s profile, in order to determine the set of features which ideally should be developed for the profession. The purpose of the article is to investigate the accountant’s profile from the perception of students and practitioners. For the achievement of this purpose the following methods were used: a questionnaire-based study, information systematization, comparison, and summarization. The results of the research from the study were used for the evaluation of the profile of the accountant, for the development of the necessary set of features an accountant should hold, and finally, the results may be used for the future assessment of accounting study programs of higher educational institutions.

Keywords: accountant’s profile, features, perception

Introduction

There is no enterprise, institution, or organization where accounting would not be used. Accounting is one of the first systems of gathering information for managing economic activity (Mackevičius, 2004). In any type of business, the existence of the accounting profession is required. The field of accounting is very large and includes but is not limited to: public accountants, internal accountants who work in industrial companies, finance and/or trade, accountants who worked in the government, and accountants as academics (Amilin, 2016). The information given by accounting comprises roughly 60% to 90% of all economic information, which is necessary to plan, analyze, and manage the activity of the enterprise while guaranteeing its continuance (Mackevičius, 2004). Accountants have to be the people who would help the managers of companies to with many tasks including: the introduction of new information on a company’s activity and its control forms in order to increase the responsibility of the employees, and to make management system of the company more effective (Mackevičius & Subačienė, 2016). This leads to the need for an analysis of the accountant's profile, which includes determining its features, and expressing their functions and responsibilities correctly. Although the perception of the accountant's profile may be different and may vary in respect of the students and the practitioners. An analysis of the accountant’s profile in this aspect will give us insights into development into the attributes of this profession.

The purpose of the article is to investigate the accountant's profile in the perception of students and practitioners. For the achievement of the purpose of this study, the following methods were used: a questionnaire-based study, information systematization, comparison and summarization.

Overview of researches on the accountant’s profile

The accountant’s profile was investigated by different authors from various countries in different aspects. Some researchers analyzed emotional and intellectual features of the accountant’s profession and their impact on the development of the career. Amilin (2016) investigated the role of self-confidence in moderating emotional intelligence towards career development of an accountant and made the conclusion that the higher the emotional intelligence of an accountant then the better the efforts for career development in the accounting profession are. The author also provided an opinion, based on his research results, that with good emotional intelligence an accountant is expected to establish good relations with fellow employees, superiors and subordinates so that objectives of organizations can be achieved simultaneously with the development of the careers of the accountants. Also, he states that the research results show that confidence can strengthen the effect of emotional intelligence on the career development of accountants (Amilin, 2016). Interesting results were

¹ Faculty of Economics, Vilnius University, rasa.subaciene@ef.vu.lt
² Vilnius University, Faculty of Economics, Vilnius University, kastytis.senkus@ef.vu.lt
presented Chelariu & Emil (2015), who investigated the psychological profile of professional accountants. They investigated other authors’ researches and stated (Chelariu & Emil 2015), “that 61% of an auditing firms’ partners have the type of personalities, which usually start from abstract concepts and create a general framework for perceiving the world, they do not like detail oriented work, while only 20% of auditing firms’ employees have the same type of personality”. (Chelariu & Emil, 2015).

Authors explained this by the necessity of the auditing firms’ partners to have a broad vision and have abstract thinking because of the need to have skills to solve unstructured problems. Employees of auditing firms do not have such needs (Chelariu & Emil, 2015).

Bogdan et al. (2016) designed the profiles of professional accountants and managers in the perception of master degree students. Scientists revealed three types of account profile: the liberal and independent professional accountant, the statutory professional accountant who is responsible for the compliance with the requirements of legal accounting and financial reporting, and the advisor professional accountant who advises the managers and owners of the company in order to develop the business’s activity and improve its performance. Under the results of the research the authors made the conclusions that the better that professional judgment is, the more the respondent views the accountant as statutory (following rules, regulations and principles). In addition, the authors determined a negative correlation between the professional judgment in accounting and the third profile of accountant – the advisor, signifying that the poorer the professional judgment in accounting, the more the respondent views the accountant as an advisor for the management, in addition, they concluded that none of the profiles were related to the attitude in uncertain circumstances and risk management, nor with creativity (Bogdan et al, 2016).

Researchers analyzed the accountant’s profile in terms of the support it gives to managers to design information on the enterprise for various spheres and policies. Grosu et al. (2014) investigated the accountants’ perception – as providers of the accounting information – in the role of management accounting in Romanian organizations. The research identified the accountants and managers’ perceptions regarding the management accounting information by investigating the accountants’ attitude regarding decision-oriented accounting (Grosu et al., 2014). Cernușca et al. (2015) studied the perception of professional accountants opposite to the managers regarding the approach of developing and substantiating the company’s accounting policies. Len et al (2016) investigated concepts and the content of an accountant professional judgment and proposed a general definition of the professional judgment of the accountant as the application of the necessary skills, knowledge and experience in the context of management, accounting standards, taxation, management accounting, and professional ethics under decision making processes aimed at carrying out accounting tasks (Len et al, 2016).

Lithuanian researchers analyzed the accounting quality in terms of the accountant’s qualification and the mandatory qualifying examination of Lithuanian accountants. Legenzova, Barbrauskaitė (2014) under the literature analysis stated, that the attitude of accounting information users to the enterprise's financial statements and the total accounting information quality depend on the personal accountants’ competence. Besuparienė (2016) investigated the role of the professional accountant in the accounting service enterprise and stated that subjects of legal entities relate accounting quality with the professional accountant and give priority to such accounting service enterprises, where professional accountants provide services. In addition, a professional accountant is expected to give consultations and recommendations for the business (Besuparienė, 2016). Raziūnienė et al. (2012) investigated the conception and attributes of the accounting profession in Lithuania in the aspect of the accounting profession as an element of the accounting system.

So, an accountant’s profile, competence, expected features, and functions were analyzed by foreign and Lithuanian authors. This article presents the investigation of accountant’s profile in the perception of the students and the practitioners.

**Research methodology**

For the investigation of the accountant’s profile a questionnaire was built. The structure of questionnaire is presented in Table 1. The first two parts of questionnaire were prepared for the identification of respondents and enterprises, which they represent. The third and fourth parts – for the determination of tasks, functions, time structure and basic features required by the accountant. The questionnaire was presented on-line on the website: www.apklausa.lt from 28th of February till 7th of
March, for second, third, fourth years bachelor studies’ students, first year master studies’ and doctoral studies’ students, as well as for practitioners of different enterprises in Lithuania.

A Likert scale of 5 points was used for evaluating the features of the accountant’s profession. The features of the accountant’s profession were distinguished according to the proposition of Mackevičiūs, Subačienė (2016). Authors presented 3 groups of features: 1) professional, 2) personal and 3) social. The professional group of features consists of such person’s abilities: to record economic transactions on accounting documents and registers; to prepare financial statements; to form financial accounting policy; to form tax accounting policy; to form management accounting policy; to form an information system for the company; to plan, analyze and evaluate company’s performance; to present the analysis of the results; to support internal control systems; to make decisions; be interested in innovations and changes in regulation. The personal group consists of such features as: responsibility, accuracy, sense of duty, independence, consistency, flexibility, quick thinking. Finally the social group consists of features includes such abilities: to communicate with colleagues and persons from other institutions; to cooperate with colleagues and persons from other institutions; and to work in team. Respondents in addition were asked to indicate other features, which might be important for the accountant’s profile. The survey involved 66 respondents.

Research results

59.7 % of respondents were students. More than half (53.7 %) was students of bachelor studies, 4.5% - students of master studies, 1.5 % - doctoral studies’ students. 40.3 % respondents were practitioners. This number comprises of 3 % of certified accountants, 9 % of chief accountants and 28.3 % different positions of accountants. Regarding the demographic indicators, 55.2 % of respondents were younger than 25 years old, 22.4 % was in range of 26-35 years old, 9 % - in range of age groups of 36-45 and 46-55 years, the rest were older than 56 years. Accordingly, to the age of respondents correlated to work experience with the analysis results showing, that 64.2 % of respondents has less than 5 years’ work experience, 14.2 % - from 6 to 10 years, and 7.5 % from 11 to 20 years. The analysis of respondents’ education shows, that 31.8 % had a bachelor diploma, 29.5 % - a secondary or special education certificate, 14.8 % - a master diploma, 3.4 % - a doctoral diploma and what is interesting 5.7 % of respondents had national and international trainee center’s certificates. The rest of the respondents had college diplomas.

The structure of the enterprise’s category was quite consistent 35.8 % respondents were form small enterprises, quarter were from micro and the same part from large enterprises, rest were form medium enterprises. Enterprises perform in all activity types (according to classification of economic activities), the most popular was financial and insurance activity which made up 20.6 %, the other types of activity varied from 1 % to 7.8 %.

For analysis of types of areas, the accountant should perform all the accountant’s functions which were divided into financial accounting (by spheres), management accounting (by spheres) and other spheres. The results of research show that students and practitioners consider that the profession of accountant as related with financial accounting (mostly with cash accounting, accounting of labor expenses and other financial account spheres), less than with management accounting (cost accounting, budgeting and planning were distinguished). Respondents emphasized financial analysis and internal control system spheres of other activity’s type.

Analysis of distribution of time shows, that 25 % of students presume that communication with clients takes less than 10 % of the whole time structure, 15 % of students think, that it take around 15 %, 13...
% - around 25% and 11% - from 41% to 50% (Figure 1). Rather similarly, the perception of practitioners on the distribution of time for communication with clients – approximately the same part of respondents consider, that communication with clients is at almost the same proportion of time, but generally they consider that for this activity accountants spent more time. Regarding the opinion of students, the communication with persons of other institutions (tax agencies) and enterprises takes from less than 10% (13% of students) to 30% (32% of students), but 59.7% practitioners think, that this activity takes less than 20% of the total time. The tendency of this presumption of consultation/discussion with colleagues is rather similar, except a slight difference in consideration of practitioners, that it takes more time (11% of practitioners defined for this activity less than 10% of time, and 2% of students, but one third of both groups think, that communication/discussion with colleagues takes less than 30%). Regarding the main activity (accounting procedures), the general tendency shows, that students assign more time for it and more time for training (attendance to seminars, courses and similar): 22% of students define less than 10% for training activity and as almost 38% of practitioners consider, that till 10% of time should be distributed for training. Other activity was defined by practitioners as “financial analysis, internal audit / control procedures”, “new ideas implementation, development”, by students - “to think how to improve the financial position of an entity”, “developing the knowledge of accounting by himself”, “reading the articles, increasing qualification”, “investigative interest related to bettering one's technical know how on the accounting profession” or “knowledge and skills”. So, students were more oriented to increase the qualification of the accountant profession, but 51% of students and 66% of practitioners consider, that other activities takes less than 30%.

Figure 1: Distribution of time

Abbreviations: POS - perception of students, POP - perception of practitioners

Source: Authors

Grosu et al. (2014) also evaluated the time distribution of the account’s profession and their research results showed, that accountants’ time for different activities were distributed in such way: for data processing – 25.44%, cost analysis and control – 16.67%, preparation of financial reports – 15.09%, preparation of fiscal reports – 11.75%, ensuring the relationship with banks – 6.31%, legislation study – 15.09%, other activities – 9.65%. Authors stated that preparing the information for external users represents the main objective of the accountants within organizations (Grosu et al., 2014). It is not possible to compare both study’s results, as the information is prepared in different ways.

Table 2 shows that practitioners evaluate accuracy, responsibility as the most important features of the personal group. Students consider these features in a rather similar way, but there were also respondents, who think, that these features may be unimportant. Students define a sense of duty, quick thinking, flexibility and consistency as important features for the accountant’s profession, but practitioners give more attention for these features.

Table 3 shows the results of analysis of features of professional group. It is interesting, that according to students’ opinions all listed features may be evaluated as most unimportant, especially the ability to plan, analyze and evaluate a company’s performance, ability to support an internal control system, the ability to make decisions, be interested in innovations and changes in regulation. Accordingly, about

836
40% of practitioners mentioned features as most important. Practitioners also assess as more valuable almost all the features than students assessed, except for the formation of different accounting policy types and the preparation of financial statements.

Regarding to the analysis of features of the social group results, presented in Table 4, it may be stated that all types of features practitioners assessed as more important than students. Students consider this features’ group as less valuable and important to the accountant’ profession.

General tendency shows that practitioners assess all groups of features as more important and consider that accountants spend more time for communication with clients, while as students are more oriented in increase of qualification. Our research results coincide with the results of the Rumanian researchers, who stated that a more correct judgment is given by respondents who already work in this field and also by the ones that consider that the accountant should be a professional guided by rules, regulations and the main principles of his or her occupation (Bogdan et al., 2016). Bogdan et al. (2016) found out...
that there is a significant correlation between the scale of professional judgment in accounting and the opinion of students regarding the fact that high quality professional judgment is reflected in the preparation of relevant financial information.

Wen et al. (2015) examined “the factors influencing the decisions of accounting students in China concerning the certified public accountant (CPA) designation” (Wen et al. 2015). Authors made the conclusion (Wen et al. (2015), that “students need to realize that accountants are more than number crunchers. Today’s CPAs are engaged in many managerial functions besides bookkeeping: they are actively involved in business development, estate planning, management consulting, retirement and college planning, and investment counseling. It is urgent to educate students and the public about the industry’s changing profile. Finally, universities might partner with accounting firms to provide more internship opportunities” (Wen et al., 2015).

**Conclusion**

The accountant’s profile was investigated by different authors in aspects of this profession’s competences, psychological characteristics, and the functions they have to perform. The perception of students and practitioners on profile of accountant is presented in this article.

The analysis of the questionnaire based study results showed that both groups of respondents assessed financial accounting as the main sphere for performance of an accountant’s functions. Cash accounting and accounting of labor expenses were mentioned as the most important areas of financial accounting. Management accounting was not distinguished as a significant type of accounting for the performance of the accountant’s functions, but cost accounting and budgeting planning spheres were indicated as the most important areas of management accounting. Accounting of intellectual capital was defined as the least significant area of other activities of accounting. The results of analysis of distribution of time show, that practitioners indicate more proportion of time for communication with clients, persons of other institutions, tax agencies, and colleagues, while students suggest that more time may be spent for other activities especially for the development of qualification. Although both groups agree that, the biggest part of time goes to the main activity. The analysis of the features of the accountant’s profession let us state, that practitioners indicate all features of personal and social groups more significant to this profession than students.

REGARDING THE TRANSFERABILITY OF SKILLS AND COMPETENCY AND THEIR DEVELOPMENT IN THE COURSE OF EDUCATION IN MATHEMATICS IN PRIMARY SCHOOL

Peter Petrov, 1 Maria Temnikova 2

Abstract:

Introduction: The building up of transversal competencies and the creation of transferable skills is one of the most important factors for efficient education of mathematics in primary school.

Purpose of study: The purpose of this article is the development of the concepts of transferable skills and transversal competencies, as well as the alternatives for their creation and development in and through the education of mathematics in Grades 1 – 4.

Methods: For the purposes of this study, longitudinal qualitative and quantitative research was applied. The following methods were used: experiment, observation, test, analysis of the content, and mathematical-statistical methodology for data processing.

Findings and results: The percentage of the Grade 4 students who wrongly correlate the text of the mathematical task to a given mathematical model decreased from 42,31% to 3,85%. Also, the percentage of the students who were not able to create a mathematical model decreased from 38,46% to 7,69%. The percentage of the students who correctly created mathematical models increased from 26 % - 38%.

Conclusions: Transferable skills and cognitive transversal competency for processing of information were developed completely.

UDC Classification: 373; DOI: http://dx.doi.org/10.12955/cbup.v5.1035

Keywords: strategies, skills, competences, competencies

Introduction

The transition to a post-industrial and informational society in world scale is characterized with the globalization of the economy and the financial resources, as well as with high mobility of the work force which requires new types of competencies and skills in personal, social and professional aspects. It can be said that the world trends related to the content and the organization of education are: orientation to understanding and rationalization of the knowledge; restriction of the role of the reproductive knowledge; and stimulation of students’ creativity.

Purpose, object, subject and aim of the study

The purpose of the study is to systematize and develop a basic theoretical formulation of transversal skills and transversal competencies. Following this, to create a system and series of mathematical tasks, and to study the level of transversal competencies forming in and through education of mathematics in Grade 4.

The object of the study is the process of education of mathematics in Grades 1 – 4.

The subject of the study is the combination between productive and reproductive strategies, and the related approaches and methodologies of work for development of cognitive transversal competency for the processing of information and the development of transferable skills in the education of mathematics in Grades 1 – 4.

To achieve this goal the following tasks needed to be completed:

1. The theoretical analysis of works of Bulgarian and foreign authors related to the competency approach, competencies, competencies, transversal competencies and transferable skills.

2. To apply problem-productive strategies for the development of technological and methodological systems of work in the education of mathematics.

3. To study the efficiency of the applied problem-productive strategies as part of the methodological system of work in the educational process of mathematics in Grade 4.

1 Trakia University – Stara Zagora, Pedagogy Faculty, pdp@dir.bg,
2 Trakia University – Stara Zagora, Pedagogy Faculty, mpt66@abv.bg
The following criteria were proposed: the knowledge and skills to choose a mathematical model and to work with it; the knowledge and skills to create a mathematical model; the knowledge and skills to bring into proper correlation to the initial one newly received information.

In psychology, pedagogy, and the particular methodologies there is no common understanding in the differentiation between the nature of skills and habits in general. There is a widespread view that the skills represent “knowledge in action” and the habit is an action whose components have become automatic as a result of their multiple repetitions (Andreev, 1987, p.90). On the other hand, the founder of cognitive psychology, Ulrich Naiser, suggested that the cognitive activity of a person is better explained and associated with the process of acquiring of skills. (Naiser, 1976).

Another concept with a strong explanatory function offers the view that “during scrutinizing the process of acquiring the skill to perform certain activity in its entirety, the structure of this skill (this could be painting a picture, singing, drawing, solving mathematical tasks, etc.) often appears to be multicomponent. This will include not only the perception, understanding, and coordination but also the theoretical and the methodological knowledge, creative thinking, and different habits (perceptive, intellectual, and life driving”). (Ylin, 1986, p.139). In this case the issue with the automation of skills is not addressed because the skill as an entire process cannot be automated and habits represent part of the skills.

There are two aspects of understanding of the concept of “skill” – the aspect of action and the aspect of operation. The first one is related to the ability to do whatever action, and the second one the ability to perform certain activities and operations.

Studying the skills to solve mathematical tasks in the aspect of action supposes that the main substance in this skill is the quality and the efficiency of execution of the task. In the same time, automation of this skill is not necessarily an indication for the possession of this ability. These aspects suggest a complicated hierarchy structure involved in the skill to solve mathematical tasks.

Brunner pointed out something very important and namely the fact that “the process of forming of habits and the process of solving of mathematical tasks are very similar in the early age of little children” (Brunner, 1977, p. 272). According to us, this means that the two processes facilitate each other.

The relationship between the skill and the ability to solve mathematical tasks is displayed in the activity “task resolving” where these two features represent the two sides of its effective application. The difference is that the skill to solve mathematical tasks is related mainly to congenital (inborn) qualities. This would assure constant success in one or more activities and can explain the differences in the ease and swiftness in acquiring the necessary knowledge and skills for solving mathematical tasks.

Boris Minchev developed an interesting concept affirming that the transversal function of skills is low due to their locatedness. He based his conclusions on the context nature of the skills, especially the ones that have in their structure multiple components of acceptance and action. This concept in certain respect can be supported by the following fact. Through big scale studies performed during the second half of 20-th century it was found that the memory and perception of high level chess players do not differ from the ones of the ordinary people when they are not in a process of chess playing. “Actually, the general intellect is transversal, i.e. the capability to form skill, but not the structure of the skill itself.” (Minchev, 1991, p.80).

The relationships are oriented to the system of values in life and shall be analyzed as a complex of assessment reasoning and emotional charge directed to the environment – to the nature, to society as a whole, to human relations. Typically, once formed, these relations are very stable.

For the first time in 1996, Bernard Ray (Ray, 1996, p.169) brought up the issue of transversal competencies. He noted that through “his transversal competency a man gives sense to the situation… As a result, transversality can be described as the simultaneousness which exists between multiple situations united by their common sense assigned to them by the subject…” Yana Merdzanova wrote about the existence of two aspects of transversal competency: as function and as intention. “In reality, the competency-function cannot go beyond the specifics but the competency-intention as a point of view, as an approach, as a manner, as a style – it can and it must be pedagogically formed and to be transferred through different ages and activities. This is the sense that every person assigns to the specific situation in which he acts through his narrow competencies”. (Merdzanova, 2005, p. 62)
It is well-known about the existence of four main groups of transversal competencies defined by Bernard Ray: “autonomy and responsibility, communication competency, organizational and methodological competency, and cognitive competency for processing of information.” (Merdzanova, p.165). Transversal competencies as such are universally valid. It seems that during the process of studying the ability and the skills to solve mathematical tasks as integral parts of the transversal competencies, the accent shall be put on their semblance of competency as a style and approach for solving mathematical tasks. The process of “transversing” presumes an active mind and before all, generalization. The last requires the actualizing of existing knowledge, abilities, habits, relations in respect of orientation in a new mathematical task (analysis, abstract thinking), the creation of conditions for qualification (assessment) of certain objects, and the connection of the new mathematical task to antilog ones, as well as summary and generalization. All this represents the foundation of the „actual transversal process.” (Karagyozov, 1984, pp.77-83). The transversion of experience depends on personal subjective qualities like the ability to do wide classification ns, and the ability to participate in “associative games” and flexible thinking. This description demonstrates that the realization of an efficient transversal process would require solving of mathematical tasks representing complicated, repeatable situations.

Transversion is an important psychological pre-requisite for fast and easy acquiring of new knowledge, habits, and skills. It is simultaneously a condition for learning and a result from learning, “a bridge between present experience and newly acquired ones.” (Tsanev, 1968, pp.187-235). The physiological basis of the transversion is the mechanism for relocation or switching over of the relative connection due to mutual influence (not always realized) and the interconnection of one system of temporary nerve connections with another.

It is worth mentioning three circumstances that the possibility for transversion can be explained with: the unity of the brain activity in entirety; the integrity of the person where each particular acquisition of ability and skills has got an effect on the entire system; similar and/or identical elements in different kinds of labour and study; the flexibility of the mind, of the application of the habits, of the dynamic stereotype and its transversing from one area to another. (Dessev, 1996, p.461).

A process for systematic accumulation of educational competences in mathematics is realized in each one of the Grades (from Grade 1 to Grade 4) of the primary school. These educational competencies represent a system of interacting specific mathematical competencies and key competencies. The teachers are of significant importance in this long and complicated process. They are the professionals who shall direct their efforts towards the creation of universal competencies, transversal competencies and transferable skills which will help to avoid the fragmenting of knowledge, in order to create specific competencies not only in respect of that particular subject but also in respect of all other subjects which are being studied.

This work studies the cognitive transversal competency for the processing of information and transferable skill as an object of creative diagnostics.

An education in mathematics in Grades 1 – 4 aiming at creating a competency can be with good quality if this education is cast and developed through the introduction of tactical and strategical studying. This is the reason why these two types of studying are used to achieve the final goal.

During the process of studying existing works related to productivity, productive thinking, and productive activities of the students it was found that there are multiple publications about the subject, for example: Vigotsky. In all the studies, one can clearly identify the connection between the productivity and the aims, the achieved results from the education on one side and the process of achieving these results on the other. In the United States and European countries specialists apply effective productive didactical strategies and approaches towards education. Priority is given to the active studying “through discovering” during the process of the activity.

Two approaches for teaching mathematics in the primary school can be conditionally distinguished. The first approach reflects the traditional education and is of a re-productive nature, offers knowledge prepared in advance which the student must learn and reproduce. The second approach aims at overcoming the re-productivity in the process of education. It activates the mental activity, creativity, active participation, and independence of the students. Jiordan relates this to “studying through discovering” (Jiordan 1995, pp. 114-115) and to “following the spontaneous needs and interests of the
students.” On the basis of these two approaches it is possible to build up two types of strategies: reproductive and productive. A problem-productive strategy: complex technology together with its related methodology of work was built up over the research process. During the application of the problem-productive strategies in the process of solving mathematical tasks, the competency approach was used and the following productive and reproductive methods were combined: variable exercises, creative type exercises, heuristic discussions, comparison, inductive and deductive methods, analytic and analytic–synthetic methods, reproductive discussion, exercises after given sample, demonstration, and observation, etc. During its application in the educational process and based on the options offered by D. Coats and J. Voz (Vitanov, 1999) priority was given to one of the following activities: activities of the students subjected to the study and related to observation and communication during applying of the strategy, practical activities of the students subjected to the study; mathematical research done by the students; and illustrative practical activity of the students during applying of the strategy.

For the purposes of the application of the methodology system of work, a problem-productive strategies series of mathematical tasks were created. Each one of them was related to a separate chapter of the educational content in mathematics and was aimed at acquiring knowledge, the creation of transferable skills, and the building up of cognitive transversal competency for the processing of information. For the creation of the series of mathematical tasks our main standing points were: they are the main tool for the formation of transversal competency, mathematical tasks from different areas were included for the purposes of forming separate parts of the transversal competency; they are mutually complimentary and create complex repeating situation.

Results

During the period 2004 – 2012, research regarding the creation of transversal competencies in the education in mathematics in Grades 1 - 4 was performed (Temnikova, M., Own scholarly essay, 2016). 112 students were subjected to the study. The results regarding transferable skills and cognitive transversal competency to process information are presented in this article.

From one side, the set of tools for diagnostics was created after analysing international projects TIMSS, and PIRLS and PISA as they are leading examples in the area of testing the success of students. From the other side, the state legislation of Republic of Bulgaria and the requirements regarding the education in mathematics in Grades 1 – 4 were also subjected to deep analysis for the purpose. Analysis of the results of the tests from the entry and from the exit diagnostics as well as a comparative analysis of these results was performed. The data from the comparative analysis of the entry and the exit diagnostics related to the knowledge and the skill to select a mathematical model, to create a mathematical model, and to correctly correlate newly received information to initial information, are presented in the below diagrams.

The received data demonstrate the presence of a statistically significant difference between the results received from the entry and from the exit diagnostics of the relative portions of students subjected to the study in respect of knowledge, skills, and transversal competencies. After applying the methodology system of strategies, methods, and procedures the percentage of the Grade 4 students who worked correctly was increased with 34% - 38% on average. The percentage of the students who
didn’t know and failed to correlate the text of the mathematical tasks to a given mathematical model decreased from 42,31% to 3,85%. The percentage of the students who correctly created the mathematical model increased from 26% to 38%. The percentage of the children who did not know and failed to create a correct mathematical model decreased from 38,46% to 7,69%. The level of knowledge, skills and specific mathematical competencies of the Grade 4 students to create and work with a mathematical model increased. The percentage of the children who worked correctly and fully completed the mathematical tasks increased from 38% to 46%. The percentage of the students who did not know and failed to create a correct mathematical model decreased from 42,31% to 3,85%. There were no students who failed to solve five of the tasks included in the exit level test.

**Conclusion**

Based on the results of the research, the following conclusions can be made: transferable skills and the transversal competency to process information are getting developed completely. The Grade 4 students learn to study a group or groups of data, apply different techniques for processing and selection of information, can analyse, compare and synthesize, can decode information, can transfer from one semantic system to another and from the language of the text of the task to the language of mathematics, and can induce and deduce.

The development of the transversality as a characteristic of the skill is not proportional to its efficiency. High transversality of a particular skill could occur in the stage of “advanced beginner” and later be lost in the stage of “expert,” but the efficiency could be greater. In this case it is not appropriate to separate a group of transversal skills as the basis for their classification as it does not have permanent structure. High transversality doesn’t necessarily mean high efficiency. The fact that a particular skill has got higher level of transversality will not authorize the attribution of characteristics like universality and efficiency to it.

It will be more appropriate to talk about transversal competencies (which include skills as well) than about transversal skills. The transversal competencies do not automatically lead to the development of efficiency in a particular activity.
Instead of talking about transversal skills, it will be more appropriate to talk about skill to transverse. Thus we preserve in greater extend the authenticity of the phenomenon that we study.

The form of the mathematical task for the development of a skill to transfer shall impose a complicated situation in closer areas. There are similarities between the approach of imposing a constructive mathematical task and the approach of involving the development of descriptions of the act of solving the mathematical task. Also, there are similarities in the most important specifics of the mathematical tasks like variability, anticipation of several alternatives of the task solution, analysis at the end of the mathematical task, and the offering of several similar approaches for the task’s solution, as well as searching of similarities in the process of their application (open transversality).

RESEARCH ON THE MANAGEMENT SKILLS AND ABILITIES ACQUIRED IN THE MILITARY EDUCATION SYSTEM

Venelin Terziev,¹ Nikolay Nichev²

Abstract: The socio economical changes in the Bulgarian society leave their traces in all spheres of public life and in the military education system in particular. The implemented reforms in the Republic of Bulgaria assign to military higher schools the task to train officers with management skills and abilities at a higher level, ready to solve efficiently complicated and versatile tasks. The specific character of the non combatant officer’s activity, sets increased requirements to their training and assurance of its effectiveness. The non combatant cadet’s management skills and abilities appear to be significant indicators of improving the effectiveness in the military professional training for management activity and developing a readiness for the timely taking of quality management decisions. The research target is the professional military training of the future logistic officers. The research aim is to analyze the acquired skills and abilities in the course of professional military training management and to related to them management effectiveness. The methods of research are: theoretical analyses of the military education literature, inquiry, statistics, substantiation and general conclusions.

Introduction

Contemporary challenges in the system of higher education has led to significant reforms in the educational system in the Republic of Bulgaria. The military education system is not exempt from these changes and the training of officers targeted to the application into practice of the acquired knowledge and skills and to strive constantly for perfection of their professional skills is a topical question. The specific character of the non combatant officer’s activity, sets increased requirements to their management skills and abilities, especially concerning decision taking and management activities.

The management abilities can be inborn or acquired. Logical thinking, the power of observation, concentration ability, perception power and communication skills are inborn abilities. The acquired abilities are: determination, dynamics, reliability, responsibility, persistency, self-confidence, and accuracy.

Quality is a category which describes the characteristics of a particular object. Nowadays this is subjected to serious discussion in the social and economic sciences and is one of the basic concepts, upon which a number of political, management and organizational theories are being grounded.

The ability is the possibility to succeed in a given task or undertaking, a way of self-dependent use of knowledge and concepts, intellectual processes and physical activities for the solution of theoretical and practical tasks.

Management abilities are a combination of the following: meaningful abilities – to perform a certain profession successfully and to contribute to the implementation of a specific activity; competencies for team work, including the skills to communicate, in order to solve different kinds of conflicts; conceptual competences – ability to foresee the future development of the organization and to take the correct strategic decisions; abilities to diagnose and analyse the problems, which creates possibilities to work out various alternatives in decision making; and management competencies.

The management activity of the logistics officer of the troops, compared to the commanders of fighting formations, is more versatile and has peculiarities, which must be taken into consideration in the training process of future logistic officers for the implementation of their professional military activity.

Material and methods

The research work was carried out in the Land Forces Faculty of the Vasil Levski National Military University during the period 2014 – 2016. The research embraces cadets from the specialties “Organization and management of the tactical subdivisions for logistical support” with specializations “Non-combatant troops and fuel and lubrication materials” (FLM) and “Movement and transport”; “Organization and management of the military formations on a tactical level” with specialization “Material resources, movement and transport”. The examined group consists of 49 people, separated into the following subgroups (SG): SG1 - 9 Cadets, SG2 - 6 Cadets, SG3 - 7 Cadets, SG4 - 7 Cadets, SG5 - 11 Cadets, SG6 – 9 Cadets (Table 1).

Source: Authors

The research was carried out in three stages:

- First stage – examination of the literature and selection of the research methodology;
- Second stage – The study was conducted. The empirical information was collected using the inquiry method in the format of a direct group questionnaire, comprising all the members of the examined community;
- Third stage – analysis of the obtained results and the drawing of conclusions.

A methodology for the identification of the personally possessed management competences, their abilities, and the grade of their display was used in the research. The methodology comprised 50 questions, each of them having two possible answers to choose from. Having analyzed the given answers of the examined people, a conclusion is drawn whether they possess the required personal competencies and the skills of a good manager. In accordance with the given key, the total sum of the obtained points is determined. For the evaluation, the following points result is used:

- up to 25 points - incomplete and less pronounced management competencies and skills;
- from 26 up to 35 points – well expressed management competencies and skills;
- from 36 up to 40 points – highly expressed management competencies and skills;
- more than 40 points - authoritarian management style.

Results

The results of the conducted research show that a large part of the examined people demonstrate incomplete or less expressed management competences and skills – 26.5%. The fact, which is disturbing, is that only 8.2% of the cadets possess highly expressed management competences and skills. The main task of the education and training process in the Vasil Levski National Military University is to increase the share of cadets with well or highly expressed management competences and skills. 65.3% of all respondents have shown such competences and skills. The results of the conducted research are shown in Table 2. The percentage of the levels of management competences and skills of the whole group is illustrated in Figure 1. The formation of well and highly expressed management abilities and skills in the students from different years of training in the Vasil Levski National Military University is illustrated in Figure 2.

Figure 1: Percentage ration of the levels of management competencies and skills of the whole examined group

Source: Authors

Figure 2: Results from the examined well and highly expressed management competencies and skills according to curriculum and years of training

Source: Authors

The results show that the decrease of the highly expressed management competencies and skills of cadets during their fifth year of training is compensated by the increase of the share (17%) of the authoritarian style of management.

As a general regularity of all examined sub-groups is the high share of the incomplete and less expressed management competencies and skills. Most probably this fact is due to the preferred subjects for general military and technical training of the military specialty and due to training subjects with emphasized logistic themes and the learning of a smaller number of management disciplines during the civilian specialization.
Discussion

Effectiveness in its common meaning shows the relation of the achieved result to the goal. Effectiveness is connected with the expediency of the activity. The higher the grade of achievement of a goal is, the more effective the activities and undertakings are. According to the Bulgarian legislation, effectiveness is defined as the grade of achievement of a goal, comparing the real and the expected results of the activity. Management effectiveness is the degree of achievement by the manager in the organization implementation of the set-up targets and the solution of related tasks. Management effectiveness is directly connected with the availability of certain management competences and skills. Independence is a cognitive and volitional property, where the ability of the person to plan, systemize, regulate and actively perform his/her own activity, based on a personal life experience, is formed — knowledge in the form of ideas and notions, skills, convictions and habits without any management or direct practical assistance from other persons.

The methodology of Vasiliy Pugachev was used in the Research of Management Effectiveness (Pugachev, 2003). The methodology doesn’t evaluate the management skills of an individual, but his/her practical activity in the role of the manager, as well as management style. The examined person replied to 40 questions choosing from the answers “yes” or “no,” getting one point for each “yes” and zero points for each negative answer. The results of the performed research of the management style of the examined cadets are shown in Table 3.

Source: Authors

The percentage of the management style of the whole examined group is shown in Figure 3. The answers of the responding cadets from all years of training show, that 73% of the students have a highly effective management style, while 27% possess a medium effective one. A good indicator is the absence of students with a less effective management style. The forming of a highly effective management style in the students from different education years in the Vasil Levski National Military University and its development tendency are shown in Figure 4. The analysis of the management competencies and skills shows that the existing system for professional training of the future non-combatant officers allows the formation of appropriate management abilities and skills in the students. It is necessary to direct the efforts of the academic staff at the elaboration of the obtained abilities of the cadets from the specialty “Organization and management of military formations at a tactical level” and the military specialization “Material resources, movement and transport.”

Figure 3: Management style of the examined cadets

Source: Authors
Conclusion

The training of future con-combatant officers for management activity is an integral part of professional military education and is carried out during the whole period of their training. It must take into consideration the specifics of the professional military activity of the future logistic officers. The acquisition of management competencies and skills in the cadets during their professional military training is predetermined by many factors, among which an important place is occupied by the obtaining of knowledge of the management competencies and skills in the process of the professional military training and by the stimulating of the practical training for the improvement of the management effectiveness in order to meet the requirement of the first logistic officer position. It is advisable to direct the efforts of the educative work towards the developing of the obtained management abilities paying special attention to the following competencies: determination, responsibility, persistency, self-confidence and accuracy.

MATH AND ART CONVERGENCE FOR EDUCATION

Michela Tramonti,1 Desislava Paneva-Marinova,2 Radoslav Pavlov3

Abstract: According to worldwide surveys (such as PISA and TIMSS), European students often lack both mathematical and key basic competencies in science and technology. The mean scores for mathematics obtained by students are below the Organisation for Economic Co-operation and Development average (OECD). The learning of the mathematics literacy enables students to contribute effectively in actual society, enhancing their employment prospects. This paper intends to describe an innovative learning and teaching approach, actually in the development phase, in the field of mathematics for 14-16 years old students through the combination of current approaches used in Europe (such as inquiry based learning and technology-enhanced learning) and the Asian one, the Singapore’s method based on three phases, concrete-pictorial-abstract, through the use of artworks. This intends to allow the development of a more effective educational and training environment for teachers and their students who will benefit from the use of more attractive and fun pedagogical tools in the study of mathematics.

UDC Classification: 373, 37.02, 7.063; DOI: http://dx.doi.org/10.12955/cbup.v5.i037

Keywords: mathematics education, learning by doing, inquiry-based learning, arts, technology-enhanced learning

Introduction

The globalized labor world market requires knowledge based on solid basic skills such as literacy in mathematics. For the development of math skills, teaching strategies and practices become primary for educational growth during all the school years. Taking into account the “Mathematics, Science & Technology Education Report” (ERT, 2009), where education has been acknowledged as the cornerstone of Europe’s success and will continue to be a determining factor in the prosperity of Europe’s citizens and economy for the foreseeable future, competency in mathematics, science and technology is becoming more and more fundamental. For Europe as a whole, mathematics, science, and technology education plays a key role in adequately growing the research and development capacity, and ensuring economic and productivity growth that are crucial to Europe’s future competitive position. The learning of the mathematics and science literacy enables students to contribute effectively in actual society, improving their employment prospects.

New strategies for mathematics teaching and learning and the deployment of workable learning methods for a better understanding and creative thinking are required for the engagement of learners in more active participation during the perceiving of knowledge. This paper presents a research model and a technology-oriented solution that could provide a capstone experience in which students synthesize exact precise math principles with arts. Our research aims to investigate and analyse how the combination between meaningful learning and mastery learning produces an increase of motivation and interest for the study of mathematics as to obtain a meaningful improvement in students’ final performances. In addition, since European students often lack mathematical and key basic competencies in science and technology, while the Asian students achieve the highest place in the ranking (OECD, 2014) (Mullis et al. 2012), we also exploit the combination between European teaching approach such as inquiry based learning and the potentialities of Singapore’s method, used in some Asian countries, to improve the performances in math learning. This will allow students to improve and develop their learning skills with a creative and innovative study through an appropriate development of creativity-based approach in learning and problem-solving skills.

Math and Art Convergence

The human body and the related dimensional proportionality have always been among the basic cornerstones in the history of fine arts (Gombrich, 2006). But, in order to be more realistic, they had to also devote themselves to the in-depth studies of geometry, anatomy, and architecture. One of the best

1 Michela Tramonti, PhD student, Institute of Mathematics and Informatics, Bulgarian Academy of Sciences, Sofia, Bulgaria, tramonti.michela@gmail.com
2 Assoc. Prof. Desislava Paneva-Marinova, PhD, Institute of Mathematics and Informatics, Bulgarian Academy of Sciences, Sofia, Bulgaria, dessi@cc.bas.bg
3 Prof. Radoslav Pavlov, PhD, Institute of Mathematics and Informatics, Bulgarian Academy of Sciences, Sofia, Bulgaria, radko@cc.bas.bg
known artists who used mathematics was the outstanding artist Maurtius Cornelis Escher (1898-1972). In arts, we find other examples such as the perspective in painting, the harmonic series in music (Fibonacci numbers), the physics principles in dancing (the symmetry of the body that allows to find the so-called "center of gravity" and so to maintain stability (Maletic, 1987)), etc. In addition, there are numerous examples of art that have evidence of the relation between math and popular culture as well:

- math in popular movies (imaginary travel through the collections of video clips, where math issues are involved);
- math and music (games, where are learning math concepts like patterns, shapes and comparative sizes through guided play as performers);
- math and textile arts (collections of puzzles).

Moreover, there are recent studies on the role of arts in promoting innovations in science (Lamb, 2012; Schwartz, 2015), and the chances to identify “exceptional talent” in children, which shall enable their success in the research and innovation field in future. Amongst such exceptional talents are mathmatic ability, imagination, creativity and problem solving skills by facing math problem with variations. This last element will allow students to reinforce their mathematics knowledge systematically through the concrete phase to pictorial up to reach the abstract of a math concept.

In this context, the use of art in the framework of the proposed research model will let students discover how mathematics and scientific roles have an impact on all aspects of the reality by showing that arts provide innovations through analogies, models, skills, structures, techniques, methods, and knowledge. Laboratories developed in this research aim to provide a virtual space for discovering and enhancing such talents among young people.

Thus, the research aims to test a combination of European and Asian (Singapore’s method) learning methods and teaching approaches in the field of mathematics through the arts’ and the application of technology as described in the paragraph below.

**Didactic framework**

The model proposed in this research work is the result of the integration of the three types of didactical situations identified by Brousseau (2002). Therefore, the learning/teaching situation developed according to the three phases of Singapore’s method applied to the mathematics learning and teaching - concrete, pictorial and abstract phases (Gu et al., 2004; Clements, 1999), will be A-didactical, Non-didactical, Didactical.

In detail, the designed learning environment will be:

- A-didactical, because the students will learn mathematical topics by discovering that different relationships exist among things or math concepts (even if they cannot be so explicit) and by developing, accordingly, problem solving skills yet avoiding just memorizing the solution procedure.
- Didactical, because several worksheets will be prepared for the students before starting the experimentation phase. These will contain instructions to lead the student from the concrete phase to the pictorial, and up to the abstract one.
- Non-didactical, because the teacher will have the function to mediate and support the learning process through the creativity and the imagination of their students. The use of the creativity from students will be free, especially when they will produce their own artworks on the basis of the math concepts studied.

Therefore, considering the Didactics Hexagon proposed by Guy Brousseau (Brousseau, 2002) from the proposed model point of view, the art will be identified as the “context” or better the “milieu” to be used to reach knowledge. Knowledge achieved by students will be “constructed,” implying that students will go systematically through the concrete phase to pictorial up to reach the abstract of a math concept.

This will allow students to reinforce their mathematics knowledge using the specific artworks to develop systems thinking based on applicable knowledge, imagination, creativity and problem-solving skills by facing math problem with variations. This last element is used systematically in Chinese mathematics teaching and it means that even if the mathematics formula/concept to be studied remains constant, the background/the contest or, adopting Brousseau’s term, milieu, referring to them can be
different. In our specific research the artwork, as *milieu*, represents a changeable context in which the students will gain an approach and learn in depth mathematical concepts. Specifically, on the base of the Singapore’s method, students will proceed through the three phases as described below.

Firstly, during the concrete phase of the proposed method, students will learn and familiarize themselves with the specific objects’ construction, e.g. a dodecahedron. Secondly, students will learn to recognize mathematics in the art, working in groups and individually during the pictorial phase. Finally, they will create their artwork starting from the math formula studied.

Moreover, in order to reinforce the learning process during the phases, the technology of modeling programs will be used for objects and the creation of 3D virtual environments (Zheleva & Tramonti, 2015). For this aim, one of the possible technical solutions could be the virtual platform “Math Art Café.”

**Virtual Platform “Math Art Café”**

The platform “Math Art Café” is an example of the virtual environment integrating art and science learning used mainly a communication tool for learning, practicing, and sharing of experiences (Senka, et al., 2016). The platform “Math Art Café” will cover the following virtual components:

- Lab Gates – this area will provide entrances to the virtual laboratory. In these immersive spaces participants acting via their avatars will be able to:
  - a. Create different art performances using their Mathematics and Science knowledge and skills;
  - b. Present their works of art to the other 2D/3D world inhabitancies – exhibitions, theatres, concerts, and other stage performances;
  - c. Receive feedback from the audience by means of textual instant messages (group messages or private ones), voice communications, and non-verbal communications (applauses, avatars’ mimics and gestures, etc.).

- Application Pool – all registered users will be able to publish documents, applications and/or links for downloading applications, which they consider interesting, useful, and cheerful. In this area, the platform users will be able to vote, comment, and evaluate all the published materials;

- Meeting point – a place where users will be able to meet each other, to exchange contact information, and to form groups of interests;

- Agora – a place where users will be able to exchange ideas and opinions concerning the thematic areas of common interest.

The “Math Art Café” will have a wide range of users: teachers and students, artists and scientists, involved in arts and science integration activities, and facilitators such as education planners, public authorities, etc. The target community will have an interest in innovative arts and science representation. The platform is oriented to scientists, artists and teachers leading similar learning projects or have experience in such projects. Learning-by-authoring and doing are base learning methods in this research. The digital art content in the “Math Art Café” will be delivered by the ecosystems for digital cultural assets, digital collections, archives, virtual museums, digital libraries, cultural heritage sites, etc.

The “Math Art Café” platform is in a stage of design and technological development. Applications will be managed as an open source platform, which means, that all references and training/workshop materials will be available to its users for free. No commercial exploitation is foreseen.

**Conclusion**

In conclusion, the research intends to be an actual contribution in the mathematics didactics field due to innovational exploiting of European and Asian (Singapore’s method) learning and teaching approaches combined with the arts. Seen as two sides of the same coin, their combination through “artworks” can enrich both, making young students more familiar with math concepts. Moreover, the above described involvement of technology during the whole learning and teaching approach can amplify, in an effective way, the skills and creativity development.

UNDERGRADUATE HEALTHCARE STUDENTS’ ATTITUDE TO E-LEARNING AT MEDICAL UNIVERSITY - PLOVDIV

Yordanka Tsokova,¹ Tanya Taneva,² Biyanka Tornyova,³ Todor Cherkezov⁴

Abstract: E-learning is seen as a possible solution to the problem of modernization of the university education in response to the changing needs of the society. In undergraduate healthcare training, e-learning is implemented predominantly as blended learning in addition to the traditional classroom teaching. A major factor in the success of e-learning are learners’ attitudes, beliefs and concerns. The aim of the present study was to investigate undergraduate healthcare students’ attitude to e-learning at Medical University – Plovdiv. In this case, e-learning is considered to be electronic educational resources organized as an interactive e-learning unit or course, provided through a learning content management system. The survey was carried out in 2016 through a self-reported questionnaire among 270 first year students from ten healthcare specialties. Participants were asked to express a degree of agreement with nine statements on a five point Likert scale. The influence of gender, age, specialty and previous e-learning experience on the opinion of students was investigated. The results showed that students’ attitudes towards e-learning were positive, but learners were not enthusiastic about it. Genders have different views about e-learning implementation – women are more likely to accept it. The experience first year students had did not allow them to judge if e-learning supports better time-management or life-long learning skills. Students agreed that implementation of e-learning depends on the subjects and there are disciplines that can be provided as distant courses within the learning management system.

Introduction

The rapid development of technologies and their essential impact on almost all human activities change the way we live and work. Institutions of higher education are under pressure to transform to respond to the growing needs of the society. They function in a reality of vast amounts of information, global connectivity and increased mobility. Significant factors imposing change are increasing quality requirements and competition for students. Moreover, the students’ pedagogical characteristics have changed – a generation with cognitive, emotional and psychomotor abilities influenced by gaming and social networking currently sits in the university benches.

Medical schools are not aside from this tendency. They face additional specific issues as changes in healthcare delivery, emerging new medical science areas, avalanche growth of medical information and access to hospital settings that result in a reduction of the time for teaching. E-learning is envisaged as a possible solution. Students are major participants in learning, so the aim of the present study was to investigate undergraduate healthcare students’ attitude to e-learning at Medical University – Plovdiv.

Literature review

E-learning is a response to the problem of modernization of university education in the spirit of educational, technological and economic trends in the global information society (Kirkova-Bogdanova et al., 2016). One of the most productive initiatives related to e-learning is the one in the health sector (Cheng, et al., 2014) due to its advantages, some of which are:

- the educational process is realized through technologies that today’s students are accustomed to and which are a part of their daily lives (Cazan et al., 2016);
- e-learning improves the skill to use information and communication technologies which is necessary for a successful career in healthcare (Abdelaziz et al., 2011, Hegarty & Stewart, 2007);
- e-learning encourages the development of critical thinking, time management skills, self-pacing and self-reflection (Abdelaziz et al., 2011, Williams, et al., 2011).

Institutional rationales for implementation of e-learning are contextualized and specific for each institution (Sharpe et al., 2006).

Different notions and therefore definitions exist for e-learning. Khan considers the concept of e-learning as synonymous to web-based learning (WBL), internet-based learning (IBL), advanced distributed learning (ADL), web-based instruction (WBI), on-line learning (OL) and open/flexible learning (OFL) (Khan, 2005). According to other authors, e-learning is much more than teaching and learning via a computer (Pollard & Hillage, 2001, Ruiz et al., 2006). Apart from access to educational material, it includes management and monitoring of the study process. The learning management systems used today have all functionality to deliver and manage training. After comments, debates and arguments of experts in the field, Sangra et al. (2012) proposed the following definition: “E-learning is an approach to teaching and learning, representing all or part of the educational model applied, that is based on the use of electronic media and devices as tools for improving access to training, communication and interaction and that facilitates the adoption of new ways of understanding and developing learning.”, acknowledging that the definition does not exhaust all aspects of the concept. Medical and health education is traditionally carried out face-to-face. In many countries, including Bulgaria, regulations do not allow distant training in these areas at the undergraduate level. Studies conclude that e-learning is supplementary to university healthcare education (Ruiz et al., 2006), (WHO, 2015). In medical and health education e-learning is implemented in its blended modality (Sharpe et al., 2006) (WHO, 2015) – properly integrated into the traditional face-to-face curricula.

Because of the vague notion of e-learning, we feel it is important to clarify the idea of e-learning behind the present study. For the purpose of this research, e-learning is considered to be electronic educational resources organized as an interactive e-learning unit or course, provided through a learning content management system (LCMS). It consists of passive resources (readings, images, video, etc.), assignments, tests and teacher-students communication. It may be used in class, as well as for self-preparation.

Quite often in planning e-learning more attention is paid to technologies rather to education. Sometimes in our efforts to create a high-tech miracle, we tend to forget the needs and concerns of the participants – teachers and students. The most important issue in the design and implementation of e-learning is the focus on achieving the learning goals by the trainees. The instructional design models (Instructional Design Central, 2012) start with an analysis of auditory. Without students’ understanding, wishes and willingness to be trained by technologies, expensive and time-taking activities for e-learning adoption are not justified. Taking learners’ characteristics, attitudes, beliefs, and concerns into consideration is a major factor in the e-learning success. E-learning in healthcare education has no bigger priority than traditional training, but it should be used as an alternative only with a good understanding of the students’ needs (Lahti et al., 2014). This is the rationale behind the present study.

Information and communication technologies (ICT) have been used for teaching healthcare students in various ways for many years at Medical University – Plovdiv. PowerPoint presentations, electronic materials, video clips, web resources, e-mail are widely spread. In the recent years, new technologies like interactive boards and electronic simulation mannequins have been installed. An e-learning site developed on the basis of LCMS Moodle has been open since 2010 (http://eomk.medcollege-plovdiv.org) as a joint project with “Pastel Studios” software company. A few e-courses with different degree of interactivity for compulsory and optional subjects have been created and used. Research suggests that this form of training is well accepted by our students (Kirkova-Bogdanova et al., 2015), they are satisfied with e-learning because of its advantages and an appropriately designed e-course favors students’ learning (Kirkova et al., 2014).

Data and Methodology
The survey was carried out in 2016 through a self-reported questionnaire among 270 first year students from ten healthcare specialities – nurses, midwives, rehabilators, radio-laboratory assistants, medical laboratory assistants, dental mechanics, health inspectors, pharmacy assistants, medical cosmetics and instructors in nutrition and safety of food. Participants were asked to express a degree of agreement with nine statements, which as in “e-learning” account the e-courses eventually undertaken on the e-learning site or any other similar experience. Students registered their responses on a five point Likert scale from 1, which stands for “strongly disagree” to 5, which is interpreted as “strongly agree.”
The statements included in the questionnaire were:
S1. E-learning is just posting lectures and other readings on the site.
S2. E-learning should be interactive and must provide activities for the students.
S3. To be effective, the e-course should be interesting, friendly with easy navigation.
S4. Some subjects can be learned from a distance on the e-learning site.
S5. E-learning is just a supplement to traditional training.
S6. The extent to which e-learning could be used depends on the subject.
S7. I would prefer to study in an electronic environment because this way I can better manage my time.
S8. I am afraid my computer skills are not good enough to study in an electronic environment.
S9. E-learning in pre-graduate training helps the development of life-long learning skills.
S10. E-learning is not applicable in my specialty.

Students were also asked if they have prior experience with forms of e-learning either during their secondary studies or with the LCMS of the university. Gathered data were processed statistically with SPSS v.19. Students’ agreement with the statements is presented through mean values. Dependencies of students’ attitudes on gender, speciality, prior experience with e-learning and age were analyzed with nonparametric tests of Mann-Whitney and Kruskal-Wallis.

Results and Discussion

Participants were mostly women – 211 (78.15%) to 59 (21.85%) men. The age range is from 18 to 50 years with \( \bar{x}=22.44 \), \( Me=20.00 \), \( Mo=19 \) years.

Students’ attitudes expressed by their responses are described with mean, SEM, STD and mode and presented in Table 1:

Statements S1, S2, S3 investigate students’ impressions and understanding of e-learning. The level of agreement with the first statement \( \bar{x}_1=2.87 \) indicates that though 38.89% show disagreement, many learners cannot decide what e-learning is, taking into consideration the e-courses they have been registered to. Nearly one third (31.11%, \( Mo=3 \)) indicate “neutral”. There is no statistically significant relation between responses to this item and gender – \( p=0.948 \), age – \( p=0.169 \) and previous experience – \( p=0.062 \), but speciality affects students’ impressions at \( p=0.046 \). This can be expected due to unequal distribution of e-courses with various qualities in the specialities.

Students, however, have clear idea about the active nature of this modern educational method and they agree with the statement that e-learning should be interactive – \( \bar{x}_2=3.98 \), \( Mo_2=5 \), given by 48.52%. Answers were not affected by age – \( p=0.907 \), but we found a statistically significant impact of gender – \( p=0.009 \), speciality – \( p=0.012 \) and previous experience – \( p=0.039 \). Women had more accurate judgement – \( \bar{x}_2 \)women=4.07 than men – \( \bar{x}_2 \)men=3.66. Those who have been assigned to e-courses agree to a greater extent about necessity of interactivity – \( \bar{x}_{2 \text{exp}}=4.07 \) than those who have not – \( \bar{x}_{2 \text{noexp}}=3.75 \). The influence of speciality can be explained with the different ratio of men/women and the different number of e-courses available in each speciality.

There was even higher consensus on the third statement – \( \bar{x}_3=4.41 \), \( Mo_3=5 \) – 70.57% strongly agree that factors for the effectiveness of e-learning are usability, friendliness, easy navigation and interest.
Students’ opinion about this e-learning feature did not depend on gender – p=0.070, speciality – p=0.462, age – p=0.360 and previous experience – p=0.361.

Different notions of genders about interactivity are interesting, but we can only speculate about the reasons. Interactivity is a typical feature of e-learning. A quality e-course incorporates various activities for the trainees. This is one way to provide active student-oriented learning. Julie & Fakude emphasize the need for interactive instructional media in the learning environment because of students’ active participation and different learning styles (Julie & Fakude, 2006). However, sometimes when e-learning supports classroom teaching as in our case, a tendency to employ LCMS mainly to publish readings and other passive resources can be noticed (Moule et al., 2011) (Kirkova-Bogdanova et al., 2016), while pedagogical interaction takes place only in class. Unfortunately, not all e-courses in the university platform integrate activities, and this is why students cannot judge about their purpose. Though they do not see many good practices (Kirkova-Bogdanova et al., 2016), trainees are aware of the need for interactivity. As e-learning experience largely determines students’ views (Figure 1), interactivity should be a highlight in planning and developing of e-learning.

Like all young people, our students are acquainted with computers well enough, but technologies are not in the scope of their interests – they have chosen the humanitarian profession of the healthcare specialist. Teachers and e-learning designers must keep the e-learning units as simple as possible in the meaning of computer-students interaction so that students focus on content and make least efforts to cope with the technology.

The next group of statements S4, S5 and S6 identifies the place of e-learning from the students’ perspective. We did not find any statistically significant relationship between students’ reactions to these propositions and gender, specialty, age or prior e-learning experience. The level of agreement with the provoking statement about disciplines that allow distant learning was positive – $\bar{x}_{4}=3.47$, most (38.15%) responded with “strongly agree” – Mo=5. Undergraduate healthcare education in Bulgaria is conducted face-to-face only. The presence on lectures and practical classes in all subjects is compulsory. However, this result indicates that soon policy makers will face the need to reconsider the regulations.

The degree of agreement to S6 was higher – $\bar{x}_{5}=4.10$, 51.11% answered with “strongly agree” – Mo=5, which shows that our students have a clear and realistic judgement that the extent of the e-learning component differs in each subject. There is a common understanding that e-learning is supplementary to traditional undergraduate healthcare education (Rigby, et al., 2012) (WHO, 2015) (Sharpe, Benfield, Roberts, & Francis, 2006). The results of our survey showed that also our students considered e-learning in this manner – $\bar{x}_{6}=3.56$, Mo=5, but they were not unanimous in their thinking – the highest percentage is of those who strongly agree – 29.63%, followed by freshmen, who still have no opinion – 26.67%. In the light of the responses to S4 and S6 we may conclude that to a considerable number of students, e-learning is not compatible with the notion of being only supplemental – it could be a significant and valuable training component in itself (Figure 2).
One of the biggest advantages of e-learning, especially its distant form is its availability, that allows learners to study when and where they wish. This is one of the drivers for the success of e-learning in postgraduate healthcare education (Cheng, et al., 2014). Organization of everyday tasks and time management are crucially important for students to cope with their commitments at the university. This is why we asked our first-year students for a feedback whether e-learning, offered at the university helps them to manage their time better. The results we received were not positive (Figure 3). The average level of agreement with S7 is $\bar{x}_7=2.77$, $\text{Mo}_7=3$. Students’ evaluation did not depend on gender – $p=0.943$, speciality – $p=0.248$, age – $p=0.363$ and previous experience – $p=0.061$. More than a quarter of the investigated students could not judge, and the majority of students did not agree that the e-learning they were exposed to did not contribute to their better time management. The reason for this reaction may be the compulsory face-to-face training that does not allow benefit from the e-learning platform by saving time from non-attendance. Moreover, students clearly indicated, that there were disciplines that can be taught through distance learning.

S9 studies students’ views about e-learning and its connection with long-life learning. The level of agreement is positive – $x_9=3.39$, $\text{Mo}_9=3$. Though 44.36% agree or strongly agree with this position, many of our students – 31.58% – feel that they cannot judge whether e-learning experience at the university may help them to create long-life learning skills (Figure 4). Students’ opinion is not affected by gender – $p=0.512$, age – $p=0.370$ and previous experience – $p=0.505$. Students from different specialties have different notions about this advantage of e-learning – $p=0.008$. Future health inspectors agreed at $x_9=4.05\pm1.026$, while rehabilitators did not consider e-learning experience would influence any future education – $\bar{x}_9=2.74\pm1.109$.

Computer literacy is essential for ICT enhanced training. According to Abdelaziz et al. (Abdelaziz, Kamel, & Karam, 2011) a disadvantage of e-learning is the need for good computer skills. Students should focus on content and not make efforts to study how to work with the computer or the platform. Students in Bulgaria receive good training in ICT in secondary school and healthcare students continue studying informatics at the university. The respondents were not afraid that their computer skills were insufficient for e-learning experience – $\bar{x}_8=2.17$, $\text{Mo}_8=1$. Their self-assessment did not depend on gender – $p=0.145$, speciality – $p=0.180$ and previous experience – 0.410, but there was statistically significant difference – $p=0.019$ in the mean age of trainees, who demonstrate disagreement (64.82%) – 21-22 years and those, who indicate agreement (20.45%) – 24-25 years (Figure 5). We may conclude that inadequate computer skills cannot be an obstacle to implementation e-learning for healthcare students.

The overall students’ attitude to the place of e-learning in healthcare education was in favor of this form of training. The level of agreement that e-learning has no application in their studies was low – $\bar{x}_{10}=2.21$, $\text{Mo}_{10}=1$. The majority of students – 62.41% consider e-learning appropriate, 14.54% - do not. The attitude of the future healthcare specialists to the place of e-learning did not depend on speciality – $p=0.226$, age – $p=0.793$ and previous experience – $p=0.098$. Genders showed statistically significant difference in their views about e-learning application – $p=0.002$ (Figure 6). As about interactivity in e-learning, predominantly male healthcare students found it difficult to decide whether e-learning is an adequate form of training. This might be due to the personal characteristics of men choosing healthcare as a career, but could be a result of that women tend to be more active in internet usage for academic purposes than men (Kirkova-Bogdanova, Tsokova, Taneva, Katsarska, &
Marchev, 2016).

Results demonstrated that students’ attitudes towards e-learning were positive, but learners were not enthusiastic about it. This is confirmed by Stoyanova and Kilova (2016). Research outside Bulgaria also shows a similar tendency (Abdelaziz et al., 2011, Moule et al., 2011).

![Figure 3: Students’ agreement with the statement that e-learning is not applicable in their training](image)

Source: Author

**Conclusion**

The investigation of attitudes of first year healthcare students to e-learning at Medical University – Plovdiv allow the following conclusions to be made.

More than half of the students agree that e-learning is an appropriate form of training in the specialty, genders have different views about e-learning implementation;

The experience first year students have does not allow them to judge if e-learning supports better time-management or life-long learning skills;

Students feel their computer skills are good enough to manage with e-learning, older students express greater uncertainty;

Interactivity, friendliness and ease of use are important e-course characteristics;

Students agree that implementation of e-learning depends on the subjects and some disciplines can be provided as distant courses within the learning management system.

The success of e-learning strongly depends on students’ acceptance and attitudes. E-learning has a future if it is carefully planned and consistent with the requirements of students.

Abstract: Paul Evdokimov endeavored to bring into a secularized and desecrated world the solution of the Russian mystics as a means for transfiguring the bland and gray ‘reality’ of a world focused only on material values in which everything ends now and here without referral to the transcendent. In this mindset, only a different approach will resound in the soul and consciousness of the contemporary person and the old approaches, which appealed to fear and terror, have long lost any power of persuasion. Evdokimov believed that only a God of love could speak to the contemporary world. This paper aims to reveal the details of Paul Evdokimov’s vision and solution for the moral crisis of contemporary society.

Introduction

The works of Paul Evdokimov may be considered prolegomena that contribute to a spiritual awakening, and thus, he may be regarded as an apostle of the contemporary world, especially by youth.

Evdokimov presented, in an almost atheist Western society of deepening moral dissolution, the great themes that constituted Russian Messianism: ‘The Russian Christ,’ ‘the mystical experience of the absolute,’ and ‘the Russian maximalism.’ These illuminate, like similar spiritual beacons in a world influenced by boredom, a world of nonsense and absurdity, founded on profound disillusionment. The disposition of this world is captured in the works of Sartre (1997, p. 319) and Camus (1993, p. 177).

Evdokimov originated from a traditionalist style Russia, where a priest’s word was law with the great dignitaries of the Empire, even with the Emperor, who sought a priest’s advice on crucial political decisions. In contrast, a liberal France with a cosmopolitan Paris today is dominated by a strong individualism that one could say has drifted towards frivolity and recklessness in moral values.

The image of a thinker was once that of a person who risked being ridiculed, ostracized, and banished from the world that represented false emancipation. The interwar period was a time when profound reversals took place in the consciousness of the westerners. As one realm was setting, another was born. The old order fell apart to allow another access. With the vehemence and senselessness of youth, Evdokimov wished to change all existing order from its foundations and generate a new beginning in history.

This paper aims to reveal the details of Paul Evdokimov’s vision and solution for the moral crisis of contemporary society.

The Russian Messianism

The free thinking of Paul Evdokimov makes his ideas difficult to organize. Nonetheless, his thinking was neither incoherent nor scattered. Concepts were united by the recurrence of important ideas and themes. Certain methodological directions for interpreting the works of Evdokimov were needed (Klofft, 2005, p. 70). ‘The Russian Christ,’ ‘the Russian maximalism,’ and ‘the mystical experience of the absolute’ are some of the core work of Paul Evdokimov. Clement (1985) believed that psychoanalysis does not reduce enigmas, but rather because of the mystery of our destiny, people are attracted to God. Psychoanalysis introduced Evdokimov to the great recurrent theological themes in the last years of his life, which Clement perceived as the most prolific: those of the sacrificial love of the Father and “of the smile on the father’s face” on which to contemplate for all eternity (Clément, 1985, p. 106).

A philosopher is a person of equilibrium, a pacifistic and ecumenical spirit. Love and peace cover their entire work. What is striking about Evdokimov’s work is the love for others, of all creation, including demons and saints alike. He also holds an inner hope of universal rehabilitation, of an ‘apocatastasis’, which will emerge at the end of times. He gives the example of saints that would pray for demons. He defines the intense desire to see everyone redeemed, to be in communion with everyone.

1 Faculty of Philosophy and Social Political Sciences, AIC University, Romania, iuliatutuianu333@yahoo.ro
Evdokimov proposed that baptism and catechism, and the liturgy and holy icons, are what build the national ethos, i.e., through introducing Christian values. His Slavic speech had roots in the biblical and liturgical language. The entire Russian culture was permeated by a thirst for the absolute, for the timeless and constant aspiration of the Russian spirit, by the mystical nature. He considered that the essential mystical background of the Russian soul enters into resonance with Orthodoxy, which is the less normative form of Christianity, and expresses very little in concepts. According to Evdokimov (2001, p. 47), “the Orthodox have never had a special affinity for ‘theological sums,’ nor for scholastic systems. Any excessive wording or definition causes an immediate distrust. Orthodoxy does not need someone to phrase; it needs no phrasing.”

Evdokimov considered the mysteries of the church as part of the apophatic regime. He regarded the Fathers of the Church as having a conviction that it was inappropriate to speculate on mysteries, that it was better to contemplate them and be enlightened by their light. The Orthodox spirituality was much more liturgical and iconographic than discursive, conceptual, and doctrinaire (Evdokimov, 2001, p. 47). Evdokimov viewed this as a feature of Eastern theology, which distinguished the Orthodox spirituality from Western theology. Especially, the Russian mystics unlike the theologians of the West insisted on subjective existence, on emotion, and on feeling. Even the metaphysics of Berdiaev (1999) appeared rather like that of Dostoevsky, Kierkegaard, Nietzsche, Pascal, Jakob Bohme, and St. Augustine, i.e., existential metaphysics.

According to Evdokimov (2001, p. 50), the renown Russian ‘maximalism’ is but a desire to transgress limitation and view the abyss of nothingness except the constant and quenchless thirst for the absolute: “For a Russian, the root of the soul, as in Plato, is suspended into infinity. Dostoievski is assertive: without the necessary uniqueness, without eternity, without infinity and without the absolute, sooner or later the Russian man shall refuse the accessory, the temporary, the relative; when in need, he will destroy history and shall willingly throw himself into nothingness.”

Evdokimov linked maximalism to the geography of a steppe projected without limitation in the interior landscape of a Russian soul, resistant to boundaries and compartmentalizations. He also wrote about the ‘apocalyptic mindset’ of the Russians that consists of people’s defiance against the governing spirit, all administration that remains foreign to the soul, and tries to reduce its liberties. This mindset is a manner of being, directed towards daily life and the immanent habits of the Russian spiritual matrix that views all issues through the idea of an end to the purpose of existence.

After baptism, Russian people are self-titled Saint Russia, contrary to all usages. For Dostoievski (2004), the ideal of the absolute is the only force that moves people and expresses the principle of their history. This thinking is not about the actual holiness of the Russians, who could be regarded as one of the greatest sinners on earth due to their excessive, contradictory, and passionate nature. The Russian spirit is illustrated in the novel, The Brothers Karamazov, by their heritage that verges on the pathological, their disposition for the mental malady, and their inner conflicts that lead them into extreme and tense situations (Dostoievski, 2004, p. 126). A great discrepancy grips people of other nations when they direct their focus towards Russia. Although Russians may be considered great sinners, they never appear to lose from their mind and soul their ideal of holiness, which is maximal, endless, and without compromise. The immensity and profundness of the Russian spirit allow them always to be aware of the state they are in. The Russian soul, in its incomprehensible abysses, appears as a deep, insurgent, and threatening sea due to its unpredictability. The Russian imperialism is the worldly, mundane expression of their tumultuous soul, of the deepest anxieties that affect it. In this sense, Russians may be everything or nothing in history, but never in the middle, because this would mean their own annihilation, i.e., suicide. While they are alive, they create upsurge, outbursts, and extreme antitheses with the rational and even-minded Westerners, who could not exist more than a few moments in the carousel of feelings that animates the Russians.

The Actuality of Paul Evdokimov

To the contemporary person, the image of an almighty, tyrannical, and oppressive God has little effect. The image of the divine almightiness has been replaced by the image of a humble God, of the beggar who knocks at the door of our soul. For example: “Here I am! I stand at the door and knock. If anyone hears my voice and opens the door, I will come in and eat with that person, and they with me” (Revelation 3, 20). From the Russians’ point of view, God is the poor and humble brother, the one that is always with the poor, the disabled, and those in pain. In the painting, ‘Christ and Saint Russia,’ by
the painter Nesterov, Christ is depicted surrounded by beggars, the disabled, and the minorities of this world. Evdokimov (2001, p. 53) described how Sojenițin considered that “Russian literature is always pointed towards the ones in pain,” just as Christ who granted mercy to, healed, and comforted them. The mercy of the Russians manifested towards convicts and criminals is well-known.

Evdokimov (2001, p. 54) argued that “Christ is never depicted as a judge, and any human judgment must follow the model of Christ’s love, to look for the Pravda, untranslatable word in which justice is achieved in mercy.” He wrote how the name of ‘Johannine Christianity’ signifies that the divine is never a principle of righteousness or of power, but a fountain of fatherly love.

For many consecutive years, the image of the divine force was overbearing. In this sense, God was everything; a person was nothing before Him. Now, the fear that had followed humans for centuries no longer has an effect, but rather leads to indifference, boredom, and an enormous ‘yawn.’ Throughout history, an individual was subjected to a graphic inferring, that being sinful or not, that the individual would be put through the ‘Caudine Forks.’ Most times, a person was condemned without mercy, without the right of appeal, and this led to hostility towards the Church, followed by indifference, no longer relevant today.

Evdokimov’s emphasis on God’s love for the being, on a person’s unlimited freedom, is striking given he is known for displaying the traditionalist, conservative, rigid character of the Russian Church. This appears to be the influence of the Western spirit; it is unlikely that such a liberal vision originated in Holy Russia.

Evdokimov considers the viewpoint of a young person who is tempted to break the rules to seek solutions. He delves into specific issues, such as abortion, the control of birth, divorce, homosexuality, self-satisfaction, and adultery and prioritizes them according to their gravity. He aims to inject religious concepts into a level of society. He endeavors to institute a Christian society. He understands that all sins, i.e., all failures to meet the divine law, even subconsciously, are a consequence of human weaknesses, since the fall of Adam from heaven’s realm. In other words, people do not sin because they want to, but because they are weak.

Both Russian thinkers and existentialists believe that individuals create their destiny through the choices they make. In both philosophies, the human in flesh and bones, the living, a concrete individual that is subjected to transformation, is considered this way. For Evdokimov, theology was the experimental path to the union of an individual with God. For existentialists, the lived experiences that create the human being are what matter. An individual with a will, affections, reasoning, and instincts, i.e., the individual as a whole, is considered.

Evdokimov wrote how the contemporary person is called to perfection, feeling the calling of God. A recent inquiry in Russia brings attention to Evdokimov’s word as a younger Christian: “Christianity is everywhere, at the heart of existence, in the sacrality of motherhood, in the challenges of daily life, in the gratuitousness of love and friendship” (Evdokimov, 1993, p. 25).

In Evdokimov works, the analogy between the inflexible, rigid Church and the Old Testament becomes clear. With Paul Evdokimov, there comes a breaking point that is the gateway leading to the New Testament. The paradigm of the New Testament is creative and brings content that is completely new in comparison with the Old Testament. Paul Evdokimov is a genius who created a new individual; the Christian of today is different. What might seem a weakness and a fall in religion at first could also be viewed as the reason to consider him a creative genius. In this sense, only faith created in a completely different form might enliven the modern individual. This faith has the power to transfigure the individual. The metanoia of contemporary humans, the change in their absolute assumptions, may only be created in another thinking paradigm (Collingwood, 1998).

The following is a comparison that may seem bizarre but aims to illustrate the wealth in transforming capital of Paul Evdokimov’s works. In traditionalist Russia, religion was governed by the principle of righteousness, which also applied in the Old Testament, and activities were carried out in the classical behavior of the effect following the cause. These were well-established laws where processes were carried out with no element of surprise, unlike quantum physics where the classic laws of physics are questioned, and everything seems possible. In the later, there is the great freedom that is similar to the worldview of the New Testament, which has the principle of love as a foundation. Nevertheless, the New Testament has been forgotten by the official Orthodox Church of Russia, which is ruled mostly
by the principle of righteousness, before the coming of Christ. The statements must be regarded with care in the sense that they bear in mind the spirit of the Old Testament that hovers over the Russian Church rather than the churches doctrine and teachings that belong to the New Testament and are often forgotten. The principle of love for fellow humans is greatly emphasized by Evdokimov in following the line of the great Russian mystics who did not have a strong connection with the official Church, which supposedly built the New Deified Man. Evdokimov mentions the human being who is in various ranks of moral perfection and achieves huge leaps due only to one ingredient, called love, without which the spiritual ascent would be challenging and arduous. With the help of love and sacrifice, individuals are relieved of their sins, they are purified and evolve spiritually. Astonishment emerges because, despite this issue, the Russian Orthodox Church has an entire list of punishments and endless lists of sins, interdictions, and sanctions, that are all expediently applied. With each contact with the church, an individual receives a review that is most often negative. Due to the harshness and opacity of its treatments and methods, the church mostly succeeds in bearing its way. The contemporary atheist society is the result of its techniques, which were considered invincible throughout the previous centuries. The philosopher of the Russian exile understands that the therapy must be changed. The old methods and techniques are outworn and are no longer efficient. Most of the time they exacerbate, similar to obtrusive melodies. The system that drastically penalized all deviations has a church correspondent in psychology, in the image of the sadistic father, i.e., Freud, who was in fear of castration (Freud, 1995, pp. 53–54). The Church was the one that forbade pleasure. A fleshless asceticism was vehemently preached, “at the beginning of the Great Lent, Christians were warned of the fact that the devil does not drink, does not eat, does not marry and nonetheless, he is not less of a devil” (Evdokimov, 2003, p. 59). Evdokimov had the special ability to reduce sexual sin to its true dimensions after it was obsessively hyperbolized and repeated throughout centuries. This mindset reached a hilarious situation during the Middle Ages when serious sins were elevated to a secondary level as a consequence of an exaggerated concern about the sexual sin and subsequently, exposed many details at confession. This discernment of Evdokimov is not about justifying his failing, because he led an exemplary life from a moral point of view, but is the product of his objective, even-minded thought.

Evdokimov (1993, p. 89) refers to an ascetic saying “the sun has never seen me eating, to which another answered that it has never seen me upset.” It is considered that the greatest sin in the eyes of God is hate for one’s neighbor. In this sense, one may love in vain where one cannot love their fellow human beings; any ascension without love is pointless.

The benefits brought by science and technology may contribute toward the spiritual crisis for the contemporary person. The imperfect human being thrown into the world is like a child who runs towards its parent when there are obstacles that the child alone cannot overcome. In some cases, technology and science may provide only a momentary, superficial solution, which leaves the fundamental issues unresolved and offers the contemporary individual a hubris unequaled through time.

Some philosophers consider, that regardless of how emancipated people consider themselves, today, people remain nostalgic about a world permeated by sacredness, a lost paradise, an Eden from which they were banished and continually try to recover (Eliade, 1995, pp. 180–181). That is, it is the essential need of a human being to escape the finite, the quotidian, and the profane. According to Evdokimov (2003), the German philosopher, Schopenhauer, called a human being, ‘a metaphysical animal’, and considered that even the atheist needed an entity superior to the physical world. Thus, regardless of a person’s efforts, they would remain on the material, concrete level, in crowded situations with disease, death, and love, with the appeal of divinity imminent. These Evdokimov (2003) considered brought forward the realization of the Christ-like message in a desecrated, secularized world:

“The great tragedy of our era is neither the pain, nor the misery, or the fear, but the feeling of a huge absence. People and especially youngsters desperately look for something, often going into dangerous lands, where all kinds of servants of the ‘depth’ offer them the most bizarre and dangerous solutions” (p. 6)

Thus, the huge absence felt in this era translates to a lack of true breakthroughs where the moral benchmarks must remain alive, animated by the divine presence because otherwise, they become
meaningless words. One must have an animated connection with ethics or else it becomes a foreign concept where, in a crowded life, choosing between good and evil the formal ethics has no relevance.

Conclusions

Essentially, Christianity is Messianic, revolutionary, and explosive, with people encouraged to observe the Kingdom of Caesar or the Kingdom of God. People are called to be ‘apostles’ that change the world into the Kingdom of God; to sanctify and transfigure it and prefigure it for the next age. The works of Evdokimov bring to light the internalized asceticism of the layperson to which people are called, and that can be achieved in all societies and historical eras. Evdokimov (2004, p.133) wrote that Saint Ecumenius referred to “Emperors due the domination over our passions, priests for the sacrifice of our bodies, prophets nourished with the teachings of the great mysteries.” This is the ideal for a Christian to embody. Saints are used in an endeavor to familiarize the congregation with the qualities of the Kingdom and show how this relates to the individual. Saint Cyril of Alexandria has replaced the Greek dialectics of ‘master’ to ‘slave’ with the dialectics in the Gospel of ‘father’ to ‘son.’ By adoption, Christians are considered ‘all God’s children’ and thus, equal to Him. Sooner or later, the contemporary person, regardless of how emancipated they consider themselves, they feel the nostalgia for divinity, we have in us the longing for the Absolute, as we are bearers of the divine archetype (Jung, 1997, p. 447), which may be activated in us at any moment, like a volcano which was dormant for too long, by being potent, it has accumulated unknown energies and tensions and in one moment it may become active and we may witness an unprecedented burst of the religious sentiment, of the mystical experience. Although Paul Evdokimov did not succeed in instituting a Christian society as he intended through his efforts to bring everyone to God, he managed to attract the attention of the West and the entire world to the Orthodox East. By proposing a solution to the moral crisis with which the contemporary world is confronted, he managed to illuminate a beacon in the tumultuous 20th century, marked by the two world wars and multiple cataclysms.

PUBLIC FUNDING OF ICT IN BULGARIAN SCHOOL EDUCATION (2012-2015)
Teodora Varbanova

Abstract: This article aims to present state policy in respect of the provision of ICT in schools and more specifically – computerized workplaces. The definition of the author for computerized workplaces: desktop, laptop, terminal or (hybrid) tablet. For this purpose, the presented and analyzed data are from the implementation of the Ministry of Education and Science in Bulgaria National Program "Information and communication technologies (ICT) in the schools" for the period: school years 2012/2013, 2013/2014 and 2014/2015. The data are obtained from the Ministry of education and science in February 2015 in response to a request for access to public information by the author. In this article some of the analyzed data give objective information about the state funding for securing computerized workplaces and the total amount of investments, and effectively covered schools, for the survey period.

Introduction
The introduction of new technologies, such as broadband internet and personal devices with access to the global network has had a most noteworthy effect on education. A large number of students are connected to the global network either via computers at home or via personal devices – primarily cell phones with access to the Internet. At present, schools are lagging behind with personalizing education and, more importantly, with providing a computerized workstation for each student. Recent studies pertaining to the use of ICT in schools are:

- The PISA survey in 2012 – Program for International Student Assessment of the Organization for Economic Co-operation and Development (OECD) intended as a periodical standardized assessment of 15-year-old students. This was the first time a computer – based problem-solving module was introduced. According to the survey, an average of 94% of students in OECD countries have computers at home which they also use for educational purposes. An average of 72% use computers at school, yet in some countries less than 50% of students have claimed so. An average of 94% of the surveyed students have at least one computer at home; 93% of Bulgarian students also have at least one computer at home (Petrova, 2013).

- The European Commission’s Survey of Schools: ICT in Education, conducted in the 2011/2012 academic year, which included 31 countries – the 27 EU members, Iceland, Norway, Croatia and Turkey, and a total of 190 000 respondents (teachers, students, principals). The survey defined ‘computer’ as ‘a PC or laptop, netbook or tablet, which is used for educational purposes at school, regardless of whether it is connected to the Internet or not. The survey was aimed at assessing the different aspects of ICT in schools among students in the fourth, eighth and eleventh (general and vocational education) grades.

The purpose of this article is to present the country’s policy regarding the provision of ICT in schools and computerized workstation in particular. The definition of the author for computerized workplaces is: desktop, laptop, terminal or (hybrid) tablet. The data from the National Program “Information and Communication Technologies (ICT) in Schools” for the academic years 2012/2013, 2013/2014 and 2014/2015 of the Bulgarian Ministry of Education and Science will be used for the purposes of this article. The data are obtained from the Ministry of education and science in February 2015 in response to a request for access to public information by the author. This article analyzes part of the data which presents objective information about the financial provision for computerized workstations, as well as the total amount of the investments made, as well as the schools which were and were not covered in the assessed period.

Bulgaria’s place in comparison with other European Union countries
As of now, no information has been released on the actual number of computerized workstations in Bulgarian schools and it is difficult to acquire such data since the presence of a computer does not guarantee that it is being used as a computerized workstation. Before the National Program

1 Faculty of Economics and Business Administration, Sofia University, tedche@hotmail.com
“Information and Communication Technologies (ICT) in Schools” of the Ministry of Education and Science, the only national provision of computers was in 2005-2007 when “more than 65,000 computers” were divided between all Bulgarian schools as a measure for the fulfillment of the National strategy for introducing ICT in Bulgarian schools. Since then, there have not been any centralized deliveries, and it has been up to the schools to decide how much of their delegated budgets should be spent on ICT. Numerous businesses and non-governmental organizations supposedly took up the initiative to give ICT equipment to schools for the period 2008-2012 but there is no consolidated information. The only official information released about the provision of computers in schools is the one from the aforementioned survey of the European Commission Survey of Schools: ICT in Education (European Schoolnet, University of Liège, 2012). Table 1, in which the results for Bulgaria are compared to averaged results for the EU countries, shows the ratio of computerized workstations to 100 students. The EU results show a decrease in the ratio in the higher grades. Even though Bulgaria is significantly lagging behind compared to the other EU countries, the data show a compliance with European tendencies: elementary school pupils have the least access to ICT in schools and students in vocational education have the largest number of computerized workstations at their disposal. Bulgaria rates among the last five countries in the survey, together with Italy, Romania, Greece and Turkey. There are primarily PCs, and the ratio of a student to a workstation connected to the Internet is 1 to 13, the EU standard being 1 to 7. Laptops are a scarcity, with a ratio of 1 to 125. More than 80% of computers are placed in computer labs. As for broadband internet access, Bulgaria is among the leading countries, with a mere 4-5% of students attending schools not connected to the Internet.

8th -11th grade students fall in the scope of the survey which assesses the usage of technology in class (shown in Table 2). Between 65% and 71% of students utilize school computers while between 19% and 22% use personal laptops. The results concerning cell phone usage are most curious, with 40% to 46% having claimed that they use one. Compared to other EU countries, the percentage is significantly higher. Despite the negative tendencies concerning the student-computer ratio, Bulgaria rates high among the countries using ICT at school for educational purposes, particularly via cell phones.

Based on a number of criteria the European Commission Survey of Schools: ICT in education divides schools in three levels of digital provision, defined as follows: the school has broadband connection to the Internet (more than 10 mbps), as well as one of the following: a website, an e-mail for students and teachers, a local web, a virtual educational environment.

- Schools with a high level of digital provision
- Schools with partial digital provision
- Schools with a low level of digital provision that have little or no Internet access

19% of 4th grade Bulgarian schools and 14% of 8th grade Bulgarian schools fall in the last category. Only 11th grade schools are anywhere near close to the average EU levels.
1. National ICT in Schools Program

The data cited above concerns the academic 2011/2012 year. In 2012, a National Program “Information and Communication Technologies (ICT) in schools” of the Bulgarian Ministry of Education and Science was introduced and approved. Its primary aim was to financially aid schools in renewing ICT equipment by “guaranteeing a minimum of technological provision by facilitating each school with computer terminal solutions” (National Program “Information and Communication technologies (ICT) in the schools” for the school year 2012-2013, 2013). In the four years that the program covers, the schools are to utilize the financial aid given and to renovate ICT equipment. As of 2012, the program fixes an opportunity for providing computerized workstations, namely terminal work stations. The program lists the following benefits:

- Obtaining and renovating terminal based workstations is cheaper: one server caters for numerous workstations; the only expenses have to do with renovating only the server since the other components last longer
- The cost of maintenance is lower: this is an important argument when it is taken into consideration the fact that most schools in the country cannot afford the services of professionals and the role of ICT support and maintenance is often taken up by Informatics and/or IT teachers.
- The technology is easily applicable to the learning process.

The criteria the program requires are clear: at least 3 servers per school, or at least one server per 13 pupils, both of which provide a maximum of 39 workstations per school. The budget is 6 500 000 BGN, of which up to 5 000 000 BGN is designated for renovating the present technologies. Each school in the country applies for centralized financing by stating in advance the number of workstations needed and the amount for co-funding. The maximum price per workstation allowed by the Ministry of Education and Science is 750 BGN. Should a school manage to provide a workstation at a lower price, the rest of the money can be used for purchasing more workstations or for other ICT related expenses. The process is completed on a school level but the Ministry of Education and Science provides two specifications for minimal technical requirements for terminal solutions of a high-end and a low-end performance.

During the first year of the program a total of 1168 schools applied. In order to fit the financial restrictions, only 496 schools were approved (see Table 3).

During the second year – school year 2013/2014 – the requirements were slightly altered. Schools which had a pre-existing network received 700 BGN per workstation while schools which required building a network received 750 BGN, and it was expected of the Internet providers to include setting up the network in the final price. Whether a school was approved or not depended on what percentage of the sum they co-funded 836 schools applied and 516 were approved (see Table 3).

During the third year – the school year 2014/2015 – the program was significantly changed regarding ICT equipment. In addition to the initial “terminal solutions,” “personal and portable computers,” tablets and various hardware, such as multimedia projectors, interactive whiteboards and software products were included (National Program “Information and Communication technologies (ICT) in the schools” for the school year 2014-2015, 2015). The maximum price allowed was increased for the following:

- Terminal – 850 BGN (app. 430 EUR)
- Computer – 800 BGN (app. 400 EUR)
- Laptop – 800 BGN (app. 400 EUR)
- Tablet – 500 BGN (app. 250 EUR)
- Projector – 1000 BGN (app. 500 EUR)
- Interactive whiteboard – 1000 BGN (app. 500 EUR)

Each school could apply for additional hardware and software products, again providing exact co-funding. Schools were required to fill out a survey in which they had to sort out their priorities – the priority of each product they were applying for if it were to be bought. Two additional components were added when considering a school:
Innovative capacity of the school, which was defined by the school’s readiness to measure its e-maturity by filling out an international survey conducted by a European Union project.

A school action plan – filled in a form provided by the Ministry of Education and Science.

The final rating was by component and not by school as it has been in the previous two years, i.e. a school could receive funding for some of the components it had applied for but not necessarily for all of them. For the first time there was separate funding for all applied Protected Schools and all the components they applied for were funded. Totally 1171 schools applied in the school year 2014/2015 but only 623 were approved (see Table 3).

The data for the schools which applied and those which were funded by the National program “ICT in schools” give precise information about the interest toward the program - a program which allows schools to facilitate computerized workstations according to the latest educational standards. For the first three years of the programs, which are analyzed in this article, the number of schools is 2479 – elementary schools, secondary schools, high schools, vocational schools, evening high schools and prison schools. Table 3 shows the percentage of schools which took part in the program and were funded compared to the total number of schools in the country for each year of the program.

Taking into account the information in Table 3, the following conclusions can be made:

- Fewer than 50% of all the schools in the country applied for the program. The main conclusion that can be made is that the schools that did not apply is due to lack of delegated budget funding and cannot afford to spend money on renovating or purchasing computerized workstations. IT in secondary schools and Informatics and IT in high schools are compulsory subjects in Bulgarian schools. Since the last national program that facilitated schools with computers was in 2005-2007, it is logical to deduce that obsolete technology is being used in computer labs throughout the country. Even if some of the schools renovated their ICT equipment through special programs or with their own budget, they do not represent 50% of Bulgarian schools. The second, and more unpleasant by far, conclusion is that more than 50% of the schools in Bulgaria are not interested in updating their computer labs.

- Interest in the program significantly dropped in the second year. A logical explanation is that what schools want for technology is different from the pre-defined “terminal solutions”. This is probably why the program was opened for different types of technology in its third year when the number of applicants was the same as the first year.

- Even though the program’s budget of 5 000 000 BGN remained unchanged for the first three years, the number of approved schools increased. Due to increase of co-funding in 3rd year.

- A detailed analysis shows the following:
  - In the school year 2012/2013 the following areas have the highest percentage of approved schools: Shumen (39%), Varna (36%) and Vidin (31%). Ruse (10%), Pazardzhik (8%) and Kardzhali (4%) have the lowest.
  - In the school year 2013/2014 40% of all the schools in the Yambol area were funded, as well as 39% of schools in the Varna area and 30% in the Burgas area.
  - In the school year 2014/2015 42% of Yambol schools, as well as 36% of Sliven, Vratsa and Pleven schools, were funded. Lovech (11%), Veliko Tarnovo (15%) and Vidin (15%) are among the areas which received the least funding.
For the entire duration of the program, 77% of all the schools in the Vratsa area were funded, as were 66% of the schools in the Pleven and Shumen areas. Pazardzhik (26%), Kardzhali (35%) and Stara Zagora (35%) are at the bottom of the rating.

More than 50% of all the schools in 15 areas in the country were funded.

It is important to note that the total number of funded schools does not mean: funded unique schools. 35 schools received funding for all three years of the program. A lot of schools were part of the program for two of the three years. 1227 out of 2479 schools were funded.

**Figure 1:** Schools which took part in the program and schools which did not for the first three years of the program

**Source:** Authors

**Public funding of ICT in school education**

The National program “ICT in Schools” supports schools in purchasing computerized workstations by co-funding. The final sum of a computerized workstation is defined by the Bulgarian Ministry of Education and Science, and each school applies for a number of computerized workstations, stating the percentage of the co-funded sum it can cover. The program provides the rest of the money for any number of schools until reaching the financial limit. For the first three years of the program the Ministry of Education and Science has provided a total of 22 522 849 BGN.

**Figure 2:** Money invested in the National program ICT in schools

**Source:** Authors
As can be seen, there is a sudden decrease in the second year of the program but in the third year there is a pronounced increase. This results from the increase in the budget (courtesy of the Ministry of Education and Science and achieved by using additional unused funds from other programs) and proves that there is more interest in the program when schools have a variety of technologies to choose from.

A detailed analysis shows the following:

- In the school year 2012/2013 schools in the Sofia area (38.41%), in the Targovishte area (38.08%) and the Kyustendil area (37.97%) give the greatest percentage of co-funding. The smallest percentage is in the Gabrovo area (24.52%). 30.24% is the average percentage of co-funding.
- During the second year of the program there is little to no change in the aforementioned percentages. Schools in the Kyustendil area (34.48%) give the greatest percentage of co-funding. The smallest percentage is in the Silistra area (26.77%). 29.45% is the average percentage of co-funding.
- The percentage of co-funding is greatest in the third year, with an average of 37.43%. Schools in the Stara Zagora area contributed 49.24%, a stark contrast with the Pernik area where schools contributed the least – 30.94%.

**Conclusion**

The analysis of the National program “ICT in schools” (2012 – 2015) shows that the program fails to achieve its goals – namely, renovating the ICT equipment, computerized workstations in particular, in all schools in the country for the entire duration of the analyzed period. More than 50% of the schools have not taken advantage of the program in the past three years. Despite the great interest in the program in the first year, applicants decreased in the second, perhaps because of the fixed prerequisite – “terminal workstations”. This called for a change in the conditions – personal computers, laptops and tablets were included in the list of components to be financed. Hardware and software were also included even though they cost money but do not provide new computerized workstations.

Another thing that might have contributed to the failure of the program is the prerequisite for co-funding, because of which only schools with a great number of students and large budgets were able to benefit from the program. Schools with fewer students and thus smaller delegated budgets would have had considerable difficulties for co-funding. If all students cannot have access to modern technology and education, it can be seen as financial discrimination. In order to fix that, in the third year all protected schools who applied were approved, regardless of the percentage of co-funding, but they were only 47.

In the 3rd year of the National program, it remains to be proven that the schools funded have achieved the ratio of 1 computer to 12 students (per computerized workstation) which is a prerequisite of the program since there has been no information about the number of the already available computerized workstations, prior to the National program.

INTERCULTURAL HERMENEUTIC DIALOGUE BETWEEN CHILD AND ADULT IN DIVERSE EDUCATIONAL ENVIRONMENTS: THEORETICAL INSIGHTS

Inesa Vietienė

Abstract: As economic, social, and political conditions are rapidly changing in modern society and the development of information and communication technologies is constantly in progress, attitudes toward children and their education are also transforming. Childhood education takes place in various environments through intercultural dialogue between child and adult, which is often interpreted in the context of communication theory. A dialogue between child and adult is also supplemented and enriched by hermeneutics in various environments. This dialogue enables the disclosure and understanding of the diversity of experiences of child and adult, learner and educator. Hermeneutics provides circumstances for childhood education to be perceived as a multidimensional and unique process. From the hermeneutic perspective, the intercultural dialogue between child and adult focuses on the problem of understanding in which the awareness of the whole, rather than participation and interaction, has particular importance in interpreting one’s own experience and perception.

Keywords: intercultural dialogue between child and adult, hermeneutics, diversity of educational environments.

Introduction

Childhood has a special meaning in today’s society as children are the youngest and most socially dependent social group by age. They are fully dependent on adults who decide on the conditions that affect their life and education.

Modern childhood education, according to Monkevičienė (2009), is perceived as depending ever more clearly on the socio-cultural field between child and family, child and educator, family and educational institution, educational institution and community, child and social, as well as the cultural environment. Therefore, the quality of education is guaranteed by the complete intercultural hermeneutic dialogue between child and adult, and its expressions in various educational backgrounds. Various aspects of this process have been investigated and analysed by a number of foreign scholars from different perspectives (Sotirou, 2012, 1993; Schröer, 2009; Freire, 2009; Tanaka, 2005; Gillett, 2003; Yoshida & Matsumoto, 2002; Schachinger, 2000; Sterfeldt & Mathiasen, 1999; McLaughlin, 1997) and Lithuanian scholars and practitioners (Garšvė, 2014, 2012, 2011; Čičelis, 2013; Lukočiūtė, Mickutė, & Mažeikis, 2009; Mažeikis & Lenkauskaite, 2008; Martišauskienė, 2008; Duoblienė, 2006; Kontautienė, 2006; Juodaitytė, 2007, 2004, 2002; Bitinas, et al., 2004).

As a result of the rapid change of social life, childhood education depends on the mutual intercultural dialogue between child and adult in modern society.

The object of this research is the intercultural dialogue between child and adult in diverse educational environments.

The aim of the research is to reveal the intercultural dialogue between child and adult in diverse educational settings.

The objectives of the research are the following:

1. To provide the definition of hermeneutic dialogue by analyzing scientific literature; and
2. To reveal possibilities of intercultural dialogue between child and adult in diverse educational environments.

Methods

The methods in this research involved an analysis of scientific literature and meta-analysis.

Hermeneutics and Dialogue

Hermeneutics literary means ‘interpretation and understanding’. In philosophy, this concept is treated as a doctrine for the conditions in interpreting meaning and the objects of the interpretation and their meanings (Juodaitytė & Savickis, 2013). According to Heidegger (1988), hermeneutics encompasses the combination of objects interpreted as well as the practical application of interpretation.

---

1 Šiauliai University, Lithuania, inesa.w@gmail.com
Hermeneutics, on the one hand, is educational philosophy, while on the other hand, it refers to the method of education, which may be revealed in various ways, depending on the circumstances. It is the philosophy of understanding that explains the evolution of human understanding. Hermeneutics is focused on the revelation of meaning in the actions of an individual (Garšvė, 2014). Understanding actions and plans is an objective of one of its features. Hermeneutics is based on the objectivity of understanding actions as well as pragmatism and dialogism. Understanding only appears as a result of constant interpretation of experience. Only when a shift from false images to that which are ‘right’ is understanding reached. In this case, ‘right’ understanding is perceived pragmatically as properness and functionality, as opposed to the normal meaning (Mažeikis & Lenkauskaitė, 2008).

Hermeneutics refers to dialogue as providing the possibility for two subjects to communicate. Understanding refers to interpretation and hermeneutics refers to a method to discover conditions in which understanding takes place (Gadamer, 2004).

Dialogue is a phenomenon that enables a person to interpret the world, by instinctively looking for another individual with whom to communicate or transfer past experience, accumulated emotions, render experiences, or express one’s opinion. Dialogue takes place not only verbally, but also through body language, facial expressions, movements, and forms (Čičelis, 2013).

According to Gutauskas (2010), dialogue is an essential part of human existence that has major significance. This concept can be encountered in politics, science, work, meetings, conferences, and daily life. Dialogue is understood as a linking unit that allows people to understand each other better, to reach agreements, and to work together. Dialogue, as a process, is a conversation between two or more people; it is a meeting situation, with physical interaction, and a presence in front of one or more others in which something is discussed. Shared meanings appear in the conversation, as well as the sphere of understanding and agreement. Dialogue involves two or more partners talking, addressing each other, understanding something in a common way and reaching agreement on a subject. In relation to these aspects, dialogue is communication, mutual understanding, and agreement.

Rau (2005) claims that dialogue is a way of communicating that creates conditions for common understanding and gives meaning to human relationships. When writing about cultural dialogue, the author emphasizes the process of dialogue where the participants view each other sincerely. It starts when the feeling of self-esteem and self-respect between them is consciously the same. There is no dialogue between the ‘strong’ and the ‘weak’ participants because the ‘strong’ participant tries to ignore the ‘weak’ one and impose their own worldview on the other. Participants of dialogue need to know who they are, on whose behalf they are speaking, what their story is, and how they are perceived by others. This process is impossible without tolerance, which helps people of entirely different ethnic, cultural, religious, or political origins who want to live together too, not only be together, but also arrive at a mutual agreement in today’s society.

Mažeikis and Lenkauskaitė (2008) noticed that dialogue has a logic of evolution and goes beyond the boundaries of personal attitudes, thus widening the horizons of understanding and explanation. Dialogue in itself, without the recognition of its development and conclusions, is not a sufficient act of understanding, as it is only fulfilled upon recognition. Sotirou (1993) claimed that the most important feature of dialogue is its interpretation, which is analyzed by at least two persons. The author notes that understanding only appears upon partnership and dialogue.

In can be concluded that dialogue is frequently considered in the theory of communication by questioning the ways and forms information is transmitted to find the correct and effective communication potentially. However, dialogue is one of the most universal and interesting experiences. From the hermeneutic perspective, dialogue has become the completion of meaning and the acquisition of understanding rather than the opening of meaning.

**Expression of Dialogue Between Child and Adult in Informal Educational Environment**

Under the current conditions of constant change where one needs to adapt to the post-modern existence, the understanding of childhood requires “the new post-modern knowing and understanding” (Gellner, 1993, p. 93), which can be revealed using hermeneutics. Not only does hermeneutics clarify the meanings of childhood, but it also forms the understanding (Klawki, 1991).

A family is an integral factor of education and the closest environment surrounding the child where his or her attitude towards people, environment, world, and himself or herself is formed. The child’s
features, talents, and preferences come to light, and sense and sensibility are formed. The child gains his or her first experience, first impressions, acquires first knowledge, abilities, and skills in his or her way (Žilionis, 2003; Matulienė, 1997). According to Martišauskiene (2008), the family is the first educator of the child. The child learns many phenomena in the family before he or she starts attending a pre-school establishment. Not only do children gain their first skills, first knowledge and abilities here, but also, they form their emotions and communication experiences here.

Education in childhood centers around children’s social cognitive experience, and children become the context of the constantly evolving social interaction with the environment. Such education is vital not only for the children but also for the family because people perceive it as a dialogue between two cultures (children and adults). Dialogue refers to the development of a joint project in the social life of adults and children, titled ‘here and now.’ People direct it towards solving social tasks essential for the child in the micro-environment, as a habit of solving by interaction between both groups of individuals, namely adults and children who have a different experience. It, thus, establishes their training in solidarity for dealing with human problems. The intercultural dialogue between children and adults (parents) gives meaning to their interconnection (Juodaitytė, 2003).

Glebuvienė, Grigaitė, and Monkevičienė (2002) emphasize that the dialogue interaction between an adult and a child should enable the revelation of the child’s self-image and self-respect. Also, it should encourage harmonious relationships of the child with the environment, the surrounding people, and him- or herself, rather than the child’s cognitive development. According to the authors, the basis for this interaction is the rapid response of the adult to the child’s needs, desires, and requests. This response includes the adult’s constant focus on his or her own activities, provision of circumstances for the child to communicate, the development of emotional contact in recognizing the child, by no way, or rarely, emphasizing the child’s improper behavior.

Therefore, cultural, social, and spiritual development in childhood is relevant in the post-modern society. Hence, it becomes particularly significant in childhood education. The family is the closest environment surrounding the child where he or she learns values, attitudes, and ideals as well as key social competencies and skills. Childhood education in the informal environment takes place by maintaining an open dialogue between the two cultures, i.e., the dialogue between child and adult, where the most important custom is to focus on the child’s experience constantly.

**Expression of Dialogue Between Child and Adult in Formal Educational Environment**

Following the post-modern ideas, education needs an entirely new thinking regarding its theory and the relationship between theory and practice. There is no clear situation, plan, or results in the education process (Fullan, 1998). An undefined movement where the plan is corrected is also possible when the action is already in progress, and the result is not the most important element of this process. The meaning of self-creation is apparent in the post-modern context (Rubavičius, 2003). According to Juodaitytė (2003), reconsidering the complex relations of the child-adult system is possible.

According to Duoblienė (2006), modern childhood education is based on the principle of dialogue by emphasizing the reconsideration of one’s own position and assumptions as well as power games. Where dialogue is based on questions and answers it is important to acknowledge differences and treat each other as partners in achieving equal intercultural dialogue in the education process.

Once education perceives different intercultural experiences, the most common obstacle is the lack of knowledge and inability of participants to accept others. This result creates a dearth of conditions for intercultural dialogue. As noticed by Godon (2004), hermeneutics encompasses three main elements in education that are among the most important factors in educating children when reflecting on different experiences: understanding, personal identity, and learning. It makes it possible to understand and analyze the education of ‘different’ children as well as issues that arise from the absence of bilateral dialogue between the educator and learners. Therefore, hermeneutics in education would serve to help individuals understand the differences between children of varying cultures and for organizing education in a way that the child and the adult are equal partners rather having an inequitable standpoint. Hermeneutics facilitates the change needed in understanding learners and educators in education (Garšvė, 2011; Lukočiūtė et al., 2009).

Intercultural dialogue in a formal education environment facilitates an understanding of differences among educators and learners, i.e., moving away from the educator as the subject and the learner as
the object. Two models were chosen to understand this relationship: The typology of ethnics by Banks (1994) and the model of intercultural sensitivity by Milton Bennett (1993). Both focus on education. The process-oriented model of Bennet (1993) shows how perceiving the cultural identity of other changes the participants and how dialogue creates favorable conditions in education. The process-oriented model also helps structure the educator’s behavior, habits, and relationship with the learner (Freire, 2009). As claimed by Banks (1994), a variety of experiences progress, i.e., interactive education methods are used. These methods include simulation and communication with representatives of another culture for reflection of experiences.

According to Garšvé (2014), education in a formal environment is not static; it is a dynamic process that hermeneutics can enrich. According to the author, education does not reflect superstitions and stereotypes and thus, contains illusions. Hermeneutics focuses on analyzing superstitions, habits, and illusions by trying to perceive them critically instead of rejecting them. It also emphasizes the search and revelation of meaning for participants of education who reflect on different experiences. As well, it emphasizes the importance of the child in formal education, constantly focusing on the child’s experience, and encourages the child to become involved in improving his or her experience (Juodaitytė, 2003).

Hermeneutics, according to Garšvé (2014), is a method for understanding and explaining experience. The explanation of meanings is relatively lively and undefined. The sphere of the hermeneutic strategy is extensive, and it opens broad horizons. The strategy is based on the principle that education is the synthesis of horizons where it is important to hear the voice of another upon an encounter with traditions. The encounter is perceived as one between the individual who knows and the points the individual learns; the learner and his or her object of learning. Knowledge and language play a major role in this synthesis of horizons (Fairfield, 2011).

The role of a hermeneutic educator in formal education encompasses three major layers: a) the change in the position of the educator in the learning process; b) a critical dialogue relationship within the sociocultural, political, economic, and technological environments; and c) the constant need of the educator to learn and improve. First, the hermeneutic educator, the former traditional educator, i.e., the educator as the organizer of education, becomes the assistant of learners and moves towards self-understanding. In this, the educator is an assistant establishing a link between the experiences of learners in order for them to be understood. This relationship is directed towards openness, risk taking, misunderstandings, and surprise, which influence the dialectical link between knowing and otherness. Second, the role of the hermeneutic educator allows use of new information technologies in education, as well as the critical, creative relationship with misinformation, addictions, and social abnormalities (for instance, personal isolation). The role of educator as the interpreter of cultures is paramount. Third, the role of the hermeneutic educator should be based on creative self-education. This can be achieved by focusing on literature, bodily movements, artistic expression, improvisation, to help interpret and develop cognitive abilities to accept the revelation of otherness in the context of existentialism (Garšvé, 2014; Duobliënë, 2006a; Fullan, 1998).

The hermeneutic method explains the multiplicity of human existence in the world as well as the multiplicity of education, and it paves the way to dialogue between ‘I’ and ‘You,’ e.g., the child and the adult. Dialogue makes it possible to gradually overcome miscommunication (Juodaitytė & Savickis, 2013). Hermeneutics involves interpreting and adapting the experience of education and its practical application in a particular context. The educator can transfer an understanding of an object using reflection as well as broaden a previous understanding, since it is constantly improved through reflection (Mažeikis & Lenkauskaitė, 2008).

According to Duobliënë (2006), hermeneutics actualizes the principle of improving interpretation skills in education. The interpretative act is not based on role models; it is a free, playful process that maintains dialogue to achieve a different understanding of reality. There is no final word in such an environment. Dialogue helps avoid obligatory consensus and increases involvement (Mažeikis & Lenkauskaitė, 2008).

Therefore, modern childhood education in the formal environment is based on a principle of international dialogue that is supplemented and enriched by hermeneutics. Hermeneutics creates conditions in a formal environment for childhood education to be perceived as a unique
multidimensional process from the perspective of various cultures in the context of current global developments.

Conclusions
Dialogue is one of the most universal and interesting experiences, established and developed to alter and discover new meanings and to interpret experiences using communication. The hermeneutic dialogue focuses on the problem of understanding, where awareness of the whole, rather than participating and interacting, has particular significance. Dialogue, as the main form of communication between a child and an adult, occurs in various educational environments, both formal and informal, where a constant focus on the child’s experience is considered crucial.

Modern childhood education involves intercultural dialogue, which hermeneutics enriches. Hermeneutics enables the revelation of change in the understanding of child and adult, learner and educator, and reflecting on different experiences. In applying the hermeneutic method, dialogue becomes a scheme of questions and answers where recognizing differences and the treatment of another as an equal partner become important. Therefore, the intercultural dialogue between a child and an adult in various educational environments enables the revelation and understanding of diversity in experiences of child and adult, learner and educator.

MOTIVATING FACTORS FOR SCIENCE COMMUNICATION IN LATVIA

Justīne Vīķe

Abstract: There is a public demand for communication of scientific findings that account for fragmentary expression of activities included in different science communication models. This study identifies factors facilitating the involvement of the scientific community in science communication. The primary data were obtained by a qualitative method of in-depth, semi-structured, expert interviews involving ten representatives of the Latvian scientific community relating to exact sciences, life sciences, and humanities and social sciences. The study distinguishes two categories for engaging the scientific community in science communication: a formally recognized approach and one involving a third party for organizing the communication.

UDC Classification: 316; DOI: http://dx.doi.org/10.12955/cbup.v5.1042

Keywords: Science communication, motivation, public engagement of science.

Introduction

Apart from the traditional responsibility, i.e., the creation of knowledge and education, the contemporary scientific community has several obligations relating to dissemination and sharing of knowledge. These activities include communication within the framework of the scientific community, so that exchange of knowledge is effective. However, one of the greatest challenges of science communication is with the lay audience. Over the last thirty years, science communication has become a topic of discourse in Europe. In this time, science communication has transformed from an initial monolog of the scientific community (informative function) into a dialogue with society, with society a participant of the scientific development. Nevertheless, numerous studies have concluded that in most cases, societies of Europe and the United States of America have no information about scientific discoveries and theories, although their interest in scientific activities is high. This study focuses on identifying factors that motivate the scientific community of Latvia into systematically participating in science communication.

Literature Review

Science communication is continually evolving. As indicated by Massimiano Bucchi (2008, p. 68), “In many countries, and at the European level, funding schemes and policy documents shifted their keywords from ‘public awareness of Science’ to ‘citizen engagement’; from ‘communication’ to ‘dialogue’; from ‘science and society’ to ‘science in society’.” These changes can be divided into three models: the deficit model, the dialogue model, and the participation model, which can coexist as policy instruments and do not exclude each other (Hetland, 2014). As admitted by Jenni Metcalfe (2014), the theoretical models of science communication demonstrate different interactive levels and directions. The deficit model needs the least interactivity between participants, as it involves one-way science communication by the scientific community. The dialogue model facilitates greater interactivity because two-way communication between scientists and society is organized. However, the participation model foresees the highest level of interactivity between participants, because it predicts involvement of all stakeholders in solving and developing a particular issue. Nevertheless, the question of how to motivate the scientific community to participate in dialogue with the lay audience remains open. Several hypotheses for organizing science communication have been proposed. According to Bauer and Jensen (2011), scientists live in a ‘golden cage’ and do not see the necessity (demand) for any involvement in public activities. They considered that activities targeting public participation differ with the type and intensity of approach used by scientists at the center of the scientific world as well as those in the periphery, and public engagement activities result from the institutional hierarchy. This hierarchy is the area of activity of senior participants from scientific institutions. These authors also argue that public participation reflects a model characterized by a particular scientific discipline; that public engagement and intensity in the scientific world has generally increased, and public involvement represents imaginary rather than actual changes in the culture of scientific research institutions. As well, they considered there existed a compromise between the engagement in research and that in pursuing public involvement because scientists who are active in one area will be less active in another. Also, they regarded there existed a compromise between public participation activities and professional growth perspectives, since the activities that are targeted at public engagement do not facilitate the development

1 Rīga Stradiņš University, Latvia, justine.vike@rsu.lv
of a scientific career and the structure of public engagement activities has changed from knowledge distribution (outreach) to dialogue.

As emphasized by Bårstad (2011, p. 18), “Academic culture is to some extent reflected in the scientist's motivations, or the lack of them, to engage in public communication.” To develop the communication between the scientific community and the rest of society, the Royal Society of Great Britain together with Research Councils United Kingdom (UK) and Welcome Trust conducted a study: Factors Affecting Science Communication (The Royal Society, Research Councils UK, Wellcome Trust, 2006). This study identified initiatives for facilitating the involvement of the scientific community in science communication. These initiatives included additional funding for organizing science communication, particularly to cover the costs of working hours of persons involved. The study also found that scientists are willing to participate in science communication events organized by other institutions. As well, they considered that science communicators would attract scientists in the process and support from the management of scientific organizations or structural units would be recognized as a bonus for one’s career. The research conducted by the Royal Society, Research Councils UK, and Wellcome Trust (2006) resulted in the following three recommendations. First, the sponsors of science and institutions organizing higher education should develop a definition and define the goals of science communication and public engagement for a uniform understanding. Second, it is necessary to raise the awareness of young scientists about the involvement in science communication. Third, there is a need to establish agencies organizing science communication that would encourage scientists to participate, mainly for the purpose of centralized coordination of the process.

To facilitate implementation of strategic communication, in the case of Latvia, it is necessary to identify factors promoting the involvement of the scientific community in science communication.

Data and Methodology
The study was based on primary and secondary data. The secondary data involved research and regulatory enactments. Primary data were obtained using a qualitative method of in-depth, semi-structured, expert interviews of 10 Latvian representatives of the science community from fields of exact sciences, life sciences, humanities and social sciences. No limitations of the data collected or its processing were identified during the study. The acquired data were analyzed according to the qualitative method of content analysis. Based on theory, categories were formed in the course of the deductive analysis to reflect factors that would facilitate the involvement of the scientific community in science communication.

Results and Discussion
The Sustainable Development Strategy of Latvia until 2030 (Cross-Sectoral Coordination Centre, 2010, p. 40) addresses the rate of knowledge sharing and availability to the local population, indicating that the outcomes of state-funded research should be made publicly available through the Internet, in addition to that facilitating access to knowledge. What concerns knowledge sharing to lay audience, according to the Guidelines for the Development of Science, Technology, and Innovation for 2014–2020 (Ministry of Education and Science, 2013, p. 27), public presence of science is relatively small because science popularization is not purposefully planned. Thus, the importance of science and technological development as a factor of economic development at the level of public opinion and decision-takers is undermined. It should be highlighted that at the decision-making level particularly the development of science and technology is associated with economic growth, bearing in mind the guiding principle of the National Development Plan of Latvia for 2014–2020 (Cross-Sectoral Coordination Centre, 2012, p.12-13). This guiding principle is ‘Economic breakthrough,’ which is associated with three priorities: ‘Growth of the National Economy,’ ‘Human Securitability,’ and ‘Growth for Regions.’ Thus, the role of social sciences and humanities in Latvia in this period of science commercialization, considering that the Smart Specialization Areas (2015, p.3) defines fields with potential for cooperation between the industry and universities, foresees economic transformation aimed at increasing financial knowledge by investing in research, innovation, and promotional activities. The strategy involves all industry, science and education representatives who create smart specializations in the areas of biomedicine, medical technology, bio-pharmacy, and biotechnology where knowledge is crucial for profitability, as well as involving those providing education on such knowledge (Smart Specialization Areas, 2015, p. 3). The Social Sciences and Humanities (SSH) Ecosystem Analysis (Jaunrades Laboratory, 2016) determines
the need to implement a communication strategy by singling out several target groups. These groups include entrepreneurs, society as a whole, and SSH specialists who are informed of their relevant contribution. By involving them as a target group in the formation of such contribution, the most significant benefit is their mutual understanding, desire to cooperate, and development of common projects (Jaunrades Laboratory, 2016, p. 39). Research projects should include a component of active communication that clearly demonstrates the contribution to a specific target audience or societal group (Jaunrades Laboratory, 2016, p 41). This component could be ensured by SSH representatives. At this point, the question arises as to whether scientists, including SSH representatives, associate themselves with new responsibilities or are informed of such, considering the existing legal basis and societal impetus.

In the study, two categories were identified to facilitate the involvement of the scientific community in science communication: 1) a formally recognized practice and 2) one involving a third party for organizing the science communication. The first category was substantiated by a respondent:

“Lack of formal recognition, in my opinion, is among fundamental hindrances, if science communication were a formally recognized practice, this definitely would be a facilitating factor.”

However, the question of how to introduce this as a formal practice remains open. There were also opposing opinions from respondents, e.g., indicating that science communication should be monitored by the Ministry of Education and Science in Latvia.

“In the absence of good will there must be control, and in the case of Latvia, there is no scientists’ good will to communicate with the society. Maybe that is not because of lack of willingness but rather because of lack of understanding of such a necessity. For example, upon electing in the position of associate professor, assistant professor, or researcher, the criteria assessment form should include a criterion that the outcome of applicant’s research should be discussed not only among specialists but also in public.”

Another aspect resulting from this argument was the raising of awareness regarding the importance of science communication and the stakeholders involved. The average and long-term science planning documents of Latvia do not define the goals of science communication where no educational activities of the scientific community are possible. On the one hand, it is important to acknowledge that, above all, it is necessary to develop an understanding of science communication opportunities for doctoral students who are prospective members of the scientific community. On the other hand, there was the opinion that motivation for the involvement in science communication was not required for the entire scientific community, for example: “This would be excessive. There must be some evaluation, and probably we should highlight issues which are truly outstanding and unique”. Another respondent added that instead of serving the purpose of motivation, it is rather a reminder:

“For the scientists to remind that in the absence of involvement in science communication no funding for future or new research will be available. The public must be informed about research. No additional motivation, for example, in the form of specific funding, etc. is necessary. This is an obligation, and no stimulus is required accordingly.”

In pursuing science promotion, the duty prescribed under the Law on Scientific Activity of Latvia, Article 6, defines general responsibilities of a scientist in Paragraphs 2 and 3 referring to science communication (indicating a one-way communication approach), without public involvement in the creation of new knowledge.

The second category, identifying the participation of a third party in the organization of science communication, was substantiated by respondents’ opinions about educating scientists on the role and goals of science communication and involvement of communication specialists. According to responses to this category, there is a need to involve a third party acting as an intermediary among the scientists and society in general. One respondent noted:

“The larger the gap between public knowledge and that of the scientific community, the smaller the public willingness to support science funding using public taxes. Science communication should facilitate the willingness to obtain education. Scientists are involved in educating the society; perhaps, this is also the only way for ensuring funding for science. At the same time, there must be an audience for such a communication – the society requires critical thinking.”
Concerning involvement of a third party in organizing science communication, the respondents highlighted the problem of Latvia’s scientists having an adverse experience, e.g., occasionally experiencing low standards of journalism with communication media. It should be noted that organizing science communication and being involved in such, or both, requires additional time; as recognized by one of the respondents: “Communication is a joint effort. It is not a one-person show. It requires extra time for both stakeholders: the scientist and the media representative to reach an understanding.” One possible incentive for compensating the time devoted to science communication, as indicated in Survey of Factors Affecting Science Communication by Scientists and Engineers (The Royal Society, Research Councils UK, & Wellcome Trust, 2006, p. 17), is to fund the organization of science communication. However, salary is not always a qualifying factor for the scientific community with the raising of scientific reputation possibly more important.

**Conclusion**

As a result of this study, it is concluded that, in the case of Latvia, the factors that would facilitate the involvement of the scientific community in science communication overall, are a formally recognized and appreciated approach. The assessment distinguished differing positions: starting with the concept of public communication of research outcomes using a selection process to one of communicating all research outcomes to the public where such research was publicly funded. It is emphasized that the level of interactivity needs to be taken into account when assessing the model of science communication. Furthermore, it is recommended that science communication involve a third party to facilitate the awareness of the scientific community about their responsibilities to the rest of society. Nevertheless, it is important for the institutions overseeing science in Latvia to agree upon and communicate to the scientific community the definition and strategic goals of science communication.

INFLUENCE OF THE EU INSTRUMENTS ON HIGHER EDUCATION AND SCIENCE IN BULGARIA

Albena Vutsova

Abstract: The European instruments have started acting adequately in Bulgaria since 1991, when the country was accepted as a member of a number of initiatives and pre-accession instruments were introduced. At a later stage commenced the action of the principal European instruments: the framework programs (1998) and structural funds (2003). They intervened the research and education area as real tools in the late 1990 and are acting up to now, being either options from new programing period of Structural funds functioning or as initiatives of new generation Framework programs (Horizon 2020 and Erasmus+, etc.)

This article considers the positive effects of these instruments in three directions consecutively: Financially, as a source of additional resources; Science Metrics-wise, as a volume of scientific production, created with their financial support, and evaluation of this production by the world scientific community; Other benefits.

The effect of realizations of this instruments has been explored and achieved results have been analyzed as a fundament for further improvement of their effective absorption and bettering the system of research and education.

The European instruments – pre-accession instruments

The European instruments have started acting in Bulgaria since 1991, when the country was accepted as a member of a number of initiatives and pre-accession instruments were introduced. At a later stage commenced the action of the principal European instruments: the framework programs (1998) and structural funds (2003).

PHARE Programme was the first program, applied to Candidate-States for EU membership, in order to prepare their institutions for full membership in the Community. PHARE was directed to almost all sectors of the economy. Later supplemental pre-accession instruments were introduced - the programs ISPA (Instrument for Structural Policies for Pre-accession) and SAPARD (Special Accession Programme for Agricultural and Rural Development). PHARE program began to act in Bulgaria in 1991 with total financial support in the first stage (1993-2001) - Euro 11.0 million. During 2004-2006 Euro 14.0 million were provided to units of the system for the Education activity. As indirect support, according Borras (2012) for the scientific-innovative activities can be considered the development of the National Innovation Strategy, described by Freeman (1995), and the National Innovation Fund to support the innovation activities of SMEs, in a partnership with scientific organisations and universities presented by Bendis and Byler (2009). Total financial value of this scheme was Euro 1,179 million. For the period 2005-2007 the funds, provided to higher education system and Bulgarian Academy of Sciences (BAS) under the PHARE program, were insignificant (1%) relative to the means, provided by the state budget.

Bulgaria joined the TEMPUS program officially in 1991. From the beginning of the action of this program (1990-2006) it has provided the participating countries a total of Euro 300 million. The program had a positive effect with respect to the development of project culture and sustainable partnerships. During the active participation of the country, 1993-2001 (second program period), the universities received Euro 68,930 million. If we compare the data about the support received by the other countries, which were also in the pre-accession stage, Bulgaria ranks a good fourth position after Poland, Romania, and Hungary.

The program Erasmus emphasizes on the university structures and supports the mobility of lecturers and students. Since the beginning of its action in 1987 more than 3 millions of people have used the opportunities for academic exchange. It is a principal instrument for the realization of the educational priorities of the Community. Bulgaria joined the program in 1999. During the first academic year of activity of the ERASMUS program in Bulgaria (1999-2000) only 10 Bulgarian high schools received

1 Prof., Faculty of Economics and Business Administration, Sofia University “St. Kliment Ohridski”, avutsova@yahoo.com
financing for mobility, but partnerships were developed with 42 European universities. The development of the program leads to systematic increase of the funds provided for mobility.

**European instruments used by NMS**

The basic instruments of the harmonization policy are the structural funds – the European Regional Development Fund (ERDF) and the European Social Fund (ESF). The means provided for science and education during 2007-2013 by the structural funds amount to Euro 557,740 million, where these financial resources also include the funds provided for secondary education. The principal measures, supporting higher education and science, are initiated in three of the operational programs – “Development of the Competitiveness of the Bulgarian Economy” Operational program (DCBEOP), “Development of the Human Resources” (DHROP) Operational program, and the “Regional Development” Operational program (RDOP). 120.747 million Euros of the resources for the priority axis 1 (development of the economy, based on knowledge and innovation activities) of DCBEOP is directed to the development of scientific organizations, research and infrastructure, bound to the business and economic development of the country. 8,446 million Euros was provided to support the research infrastructure of scientific organizations - only BAS institutes. Euro 42.825 million or 25.19% of the total Euro 105.386 million support were allocated specifically for innovative scientific activities.

HRDOP has provided directly to its beneficiaries a total of 32.876 million Euros. In the program period 2007-2013 various procedures have been carried out.

RDOP is focused on improving the infrastructure of universities. The funds provided via RDOP (Euro 18.402 million) went to 15 universities only and the actions of the OP have completed entirely. Since these funds were oriented to subjects of higher education, it is considered correctly this amount to be accounted for financial income and indirect contribution regarding the improvement of the educational and research process.

The framework programs for research and innovation are primary instrument of ERA (European Research Area) as per COM (2012) and COMPET 174(2008, May 16). They guarantee the execution of the Community policy in this area. Bulgaria started its participation in the limited activities of the third framework program. In the last program period of the framework programs Bulgaria has received Euro 11.4 per capita. For comparison, the Czech Republic has received Euro 19 per capita, Hungary – Euro 22.2, Romania – Euro 5.6. The average value for the new Member States is Euro 13.5 according to Knee et al. (2011).

The ratio between the amount paid by the country as a member of the EU, and the income from the framework programme for one year shows, that through this instrument the country gets back 4.3% of the “membership fee” Eurada (2014), which is not high, but combined with the resources from other similar instruments, creates conditions for a sustainable synergy.

INTERREG program was comparatively new to Bulgaria. Its beginning was in 2002 as a regional program, operating with financial support from the EU. The participation of Bulgaria in the first period was limited to a number of projects with no leadership. The overall contribution is Euro 10 178 million.

First European program for science and technology COST supports primarily horizontal and coordination activities. During the last several years the financial support, received by Bulgaria for the above mentioned activities, has grown steadily.

**EU instruments - Influence and benefits**

Since the GDP of the country is a fundamental characteristic of the national economy, and the latter in its turn is a reliable financial resource for science and education, a simplified mathematical model for its forecasted development in time has been elaborated.

The expenditure of the government and businesses for research as a percentage of the GDP are illustrated in Figure 1.
The reduction of government expenditure and the sustainable trend with the expenditure of businesses are obvious. The trend of the reduction of the government expenditure must not necessarily fall below 0.15% of GDP, as shown in the graphic, but the sustainable trend of reduction will obviously continue, and without any specific efforts the government expenditure will remain at the current levels. It means that the importance of EU instruments as steady resources are growing.

**Scientometric data and effect**

PHARE and TEMPUS, created the first effective partnerships with European scientific institutions for carrying out joint research, obtaining and publishing of a considerable number of high value results. Bulgaria has tried to use both instruments actively. Greece and Ireland exhibit similar behavior, but they do not combine the two instruments. During the same period the Czech Republic uses the instruments significantly less, and Spain does not use them for this purpose at all probably because the national financing of science in these countries is much better.
Obtaining the right for full access to the Framework programs and the COST program the Bulgarian scientific community became more active. The evaluation in this work covers FPs 5, 6, and 7, since these are the FPs, in which Bulgaria has full access to all types of activities. During each program the scientific community gathered expertise and by also using the opportunities of the other European instruments achieved a synergic effect (such an example was the parallel participation in the COST program, financed via FP). The bibliographic data of Bulgaria are compared to the same reference countries, as above.

The results for FP 5 show clearly, that for Bulgaria all parameters have low values because at this stage the experience was very small. FP 6 observed some positive changes. By a total number of scientific publications Bulgaria prevails over the Czech Republic and approaches the achievement of Austria, i.e., the publication activity is at an acceptable level, especially bearing in mind the above observations. According to this graphic, Bulgaria has improved part of its metrics. With respect to the percentile however (the values are reversed, as pointed out in the note about the network graphics), Bulgaria's characteristic is still the lowest.

**FP 7 influence upon scientific productivity**

With FP 7 the picture changed with respect to some of the characteristics, reflecting the gained experience and created more sustainable partnerships with leading European research centers. The noticeable improvement of the scientometric data was due, to the provision of constant access to Elsevier’s and Clarivate Analytics’ (ex Thomson Reuters) science metric databases. Following long years of practically discontinued conventional library access to scientific literature and information, another, new culture of their intensive use was created, and the Bulgarian scientists joined actively in this efficient avenue of knowledge exchange.

The use of the Internet platforms for scientific information provides an opportunity to trace also any individual publication activity and to produce a ranking of the researchers. An analysis of the bibliometric data shows, that the participants in European projects are among the best and most active researchers in their universities and research centers.
Bilateral cooperation - influence upon scientific productivity

With respect to the Hirsch-index (h), according Toshev 2011, of the number of publications, which according to quote a few authors is a sign of the development of the scientific sector for the period since the beginning of operation of the European instruments to this day, Bulgaria is ranked 21-st in EU-27 with an h index of 154 (for the sake of comparison: Great Britain has 934, and the Netherlands – 636; data SCOPUS, Science in European Union 2013). Lower ranking countries include Romania, Estonia, and Malta.

In the context of Europe 2020 the target is the financing of science to reach 3% of GDP, and, moreover, the prevailing contribution (2/3) is to come from businesses. Exactly businesses finance their own research, which quite often do not lead to publications, but due to the growing competitiveness of the environment – mostly to patents. E.g., only two corporations in Germany (SIEMENS and DAIMLER) invest in proprietary research 5 times more funds, than the financed primarily by the government research organization Max Planck, doing primarily basic research.

Benefits from EU instruments – general, as per SEC (2010) and EUCO 13/10 (2010, June 17)

Under the action of the pre-accession instruments in Bulgaria were created conditions for:

- development and consolidation of the administrative capacity of the government bodies, and educational and scientific institutions, so that the administration to be capable of operating in the EU environment;
- harmonization of the legislation in the higher education and science system, in order to shorten the transition periods according to Simeonova-Ganeva and Ganev (2013);
- progress in the development of institutions, to allow the creation and development of structures, strategies, human and managerial resources for strengthening the economic, social, and legislative capacity studied by Horvat (2013);
- introduction and use of specific instruments, like, e.g., the Twinning initiative, oriented to direct acquiring of good practices and experience in specific directions from similar institutions in the EU. This instrument provides technical and expert support, resulting in increased capacity of the human resources described by Ahrens (2006);
- introduction to specific instruments, complementing the primary ones, like the “Trans-border collaboration” programs, supporting the active development of capacity of the institutions, preparing them for participation in the European programs.

TEMPUS and ERASMUS programs influence the partial restructuring of the higher education system according to Inayatullan and Gidley (2000) as a whole – changes of the general network of HSs, as well as changes in the internal structure of some HSs. Supplemental contributions according to
Jongsma (2002) are: creation of strategic documents for the development of the higher education system based on partnerships; long-term effect in the universities as partners in the knowledge triangle; long-term effect on the internal-institutional structure: chairs, departments, faculties; introduction to internal and national systems for quality assurance.

Thus conditions are created for: higher quality and better efficiency of the educational process, which, in turn, influences the raising of a generation with new knowledge and skills; introduction of the European credit system; introduction of innovative and/or non-traditional methods of teaching and training described by Keegan (1990), which creates opportunities for the development of key competencies in various groups trainers and trainees; consolidation of the social harmonization at various levels;

The accumulation of knowledge as a result of the operation of various types of instruments for science and innovation can be considered also as a specific “warehouse/reservoir” for new knowledge or a “depository”, which according to the World Bank (2003) is a set of the following specific activities: creation of knowledge; application of knowledge; sharing of knowledge with partners and peers by new products and services.

With the creation of innovation products, representing an integrated result of the creation of new or improved processes, products, and services based on new or improved know-how, a positive trend is observed. This is an important result of the action of European instruments, since the innovation product is one of the criteria for a functioning innovation system. For the last 10 years a growth of almost 20% is observed with respect to the registration of trademarks.

Abstract: The present European context challenges us to approach the issues of Romanian dignity, humanity and humanism. The purpose of this essay is to emphasize the interpretative and explanatory dimensions of Constantin Micu Stavila’s philosophical thinking focused on the meaning of life and the human destiny, no less on the significance of the Christian personalism that the Romanian-French philosopher has cultivated it. Some questions arise: What is the role of philosophy and religion in understanding the meaning of life? How do we have to consider the human being and by especially the characteristics defining the Human within the Romanian culture? Trying to provide an honest, coherent and enlightening response, the paper is organized into two parts: 1. The mission of Romanian philosophy – attempting to demonstrate that the Romanian culture is integrating itself in the world-wide one seeing that there is an intimate complementarity of philosophy and religion; and 2. Romanian cultural messianism – developing an interpretation of the Romanian folklore according to the topic of the paper.

Keywords: Constantin Micu Stavila, Romanian humanism, dignity, (the) Human

Introduction
Too little known in the present Romanian philosophical field, Constantin Micu Stavila (1914-2003) was a PhD Professor at the Faculties of Philosophy and Theology in Bucharest (1942-1947). Since 1969 he settled in France where he continued his philosophical activity. We briefly mention some details of his activity related to the French culture and area: between 1970 and 1975, he was a cultural counselor at the Society of French Protestantism, and he taught General Philosophy at the Faculty of Protestant Theology in Paris. He organized the well-known Round-Tables of the American Cultural Centre in cooperation with Paul Ricoeur, Gabriel Marcel, Jean Brun, André Dumas, Octavian Vuiu, Pierre Emmanuel, Jacques Ellul, and Hans-Georg Gadamer. He was a member of the Philosophy Committee at the National Centre of Scientific Research (1975-1980). During his life Constantin Micu Stavila published over 25 books in the fields of philosophy, history, ethics, and social culture.

The mission of the Romanian philosophy
We approach the issues of Romanian dignity, humanity and humanism in the vision of Constantin Micu Stavila using his anthumous and posthumous works published in Romania and abroad, in France, USA, Germany, Italy, and no less his manuscripts of Paris and Bucharest known as “Constantin Micu Stavila in Ștefan Delureanu Fund” including 9,238 pages as well as tapes and rolls.

Usually unnoticed, the difference between the state of a people and that of a nation forces the researcher studying the contemporary social phenomenon to accept and follow it. What do we mean by the fact that people tend to assert themselves as nations? Beyond of “undertaking a missionary vision of creation, people want to “prove freedom and a specific life attitude” (Micu Stavila, 1945a, p.71). We could define the nation as a social community having the conscience of its role in the world and the people as a simple community with the same language, religion and history, on the same territory, but lacking “self-consciousness, lacking the consciousness of the specific mission it would have to fulfil in this world” (Gusti, 1935/1946). Thus, we shall never face a nation as long as communities merely exist, without being enlivened by a vital passion coming from within, “without feeling the vibration of the consciousness of a nation and its mission” (Micu Stavila, 1945a, p.72). All the peoples have a destiny in creation, but we can call nations only those which succeed in representing something in the end, in understanding their destiny, in taking an active part and consciously working. In other words, only those who ignore the material, transitory interests and become aware of their own existence, of what is long-lasting and permanent in them. Consequently, knowing your destiny would be directly involved in the “act by which people would become aware of one another, an act of probing their specific individuality, their spiritual essence” (Micu Stavila, 1945a, p.75). For a people to get to know its destiny it is necessary that endowed human-beings should have the availability and intelligence to read the best hidden and unreached depths of his soul, but also to be able to manifest itself as a nation. This actually means, as a whole, a body enlivened by a single will and a common faith, the only ones which could give a people

1 PhD Student, „Alexandru Ioan Cuza” University of Iași, Romania, fragizaha@yahoo.com
an authentic and personal affirmation of its features. People are free by moving toward a nation status and succeeding to understand what is its own and genuine. Knowing yourself means being free but also going beyond your own limits and accomplishing yourself. Thus, the individual or the people acquire, at the same time with self-consciousness, a dynamic element, a principle of progress and freedom which is precisely the awareness of human dignity. Thus, particular nations change themselves into creators of culture.

Having a clear idea about the features they had been endowed with, the nations consciously take part in the unveiling of their destiny, behaving like beings who know what to want. Starting from this moment only, that nation becomes a culture creator. The human existence is characterized by the fact that it is part of the cultural, spiritual world. None society was deprived of arts or, even more, of religion. Everywhere man undertakes a social activity we notice the need for a spiritual manifestation which is intertwined. The culture is a primordial datum of human life, but the possibility to develop an original, strong and long-lasting culture is possible only for a people that experience a deep messianic feeling, a creative will. Hence, to reaching a cultural achievement remains an obligation for any people; it is a condition of living, a vital imperative. What does it mean to put one people’s desire for creation under favorable conditions? It means to make it become the constant aspiration of the national consciousness, to determine it to identify oneself with the consciousness of a people’s mission, to be part of the nation’s being. Lacking the nation consciousness, a people can’t create, they lose their identity and weakens the historical being, consequently being prone to extinction. In order to settle and maintain culture, a high consciousness of the nation’s mission and human dignity is required. All the energy of a nation keeps its sources in the spiritual resources.

Constantin Micu Stavila believes that the most important function of any people is to make an analysis of the conditions and premises of a spiritual life of the superior human type and to be a forerunner and a revealing actor for the self-consciousness of the nation. For the universal thinking, the highest preoccupation is to discover the hidden premises of man’s spiritual existence of all times and to establish the meaning of his presence in the world. Consequently, for the Romanian philosophy, this preoccupation should be associated to that of seeing if the spiritual premises of the Romanian have a value of universality, if they express the true and constant essence of the man or if they are not only precarious or relative forms of consciousness. Following this path and undertaking such a task, the Romanian philosophy of the future could fulfill two desiderata: to go on the line of the Romanian reality and at the same time, to be in accordance with the special concern of time, namely that of seeing the man as the capital issue of existence.

Concerned with the mission of philosophy, Micu Stavila shows that there is a mistake to drawing slashing lines between religion and philosophy, between science and faith. Science is not content with the mere quantitative gathering of facts, but it searches to explain them, to uncover their reasoning or meaning by means of hypotheses, which are even the result of an act of faith, a leap of reason beyond its limits. The parallelism between philosophy and religion is seen in the fact that religion is interested about the purpose and value of existence, and both of them try to offer answers to human being as regards life, stimulating the aspiration toward perfection and ideal.

The quintessence of the deepest philosophical issue of all times remains the rapport between knowledge and existence, on one side and knowledge and redemption, on the other. The first question man has ever asked himself, for the practice of his knowledgeable activity, was that of knowledge value, of its purpose. But philosophy as science of universality should not leave anything without being studied. Some metaphysical systems – not deprived of mysticism, in agreement with the religious allegory of falling into temptation – pretend that humans, by rebelling, have been taken apart from divinity, thus losing the right to everlasting happiness. If there is a way to have a relationship with divinity, as Micu Stavila states, than it can only be that of the intellect. Without the intellect, none creative activity of spiritual values is possible, nor any means of transcending nature and communicating to pure spirituality, to God. Christianity admits the existence of sin in the world, but it does not attribute the exercise of knowledge to it. The light in which sin is presented by Jesus in his preaches is similar to a greater extent to instinct, to non-reflection, to a blind, non-rational acceptance of life. Getting freed from sin is nothing else but getting free from instinct, by no means from reason. Jesus demands to “renouncing oneself,” not rationality – in the contracted form, rationality means individuality. As an instrument of individual conservation, it serves more to the fight for spiritual survival, in other words, for immortality and not
for physical existence, it tends not only to preserve but also to expand and perfect individuality. Evil is the blind, selfish, brutal existence, lacking knowledge, while good represents the broken existence, enlightened, ennobled and overcome by knowledge.

Between real and ideal, man feels the need to unify these two terms. Revealing for the over-sensitive dimension, ideal to existence, reason will uselessly be denounced as a knowledge function opposed to the spiritual synthesis of faith. Faith separates from reason in the same way as theology separates from philosophy, more precisely: not by the ideas they postulate as the highest ideal to be reached, but by means it conveys in order to reach it. Reason is limited to indicating the existence of the over-sensitivity, the divine, while faith demands getting close to the divine by means of love. Reason can contradict the necessity to love divinity as much or as less as faith can exclude the necessity to understand and rationally comprehend. We can love only what we know and if it seems we love before knowing, that is because the “zeal for knowledge flies more quickly than that of love and it indicates us the reasons for love even earlier than we could have realized it clearly. The love for divinity itself cannot be excluded from this rule and it could have never happened on the absence of some knowledge about the divine being, be it called revelation or in another way” (Micu Stavila, 1943, p.23). Love is the most direct corollary of knowledge, what it does, is only to end a circuit the latter opens. It is the essence of love to overcome any duality and conflict. The consciousness of this fact precedes and justifies the superior, unifying zeal of love. After all, love, as well as knowledge, means being fond of something. In order to know that this something exists, knowledge should have been given from the beginning. This is the reason why faith in God cannot be separated neither by love for, nor by his knowledge. In reality, the scientific and religion fields are co-extensive: knowledge precedes and determines faith, and the other way around is also possible.

**Application: on the Romanian humanism**

By humanism, we usually understand the movement focused on the idea of human being as a central one in the Universe, manifested in Renaissance against the theocentric spirituality from the Middle Ages. The blame casted on the Christian civilization for having disregarded the dignity and the value of the human being is greatly justified by the fact that it uses the thesis which states that the essence of man is touched by evil as a consequence of disrespected divine order. Christianity is responsible for getting down the human being from the pedestal the Greek and Roman civilizations put him on. The latter not only gives the human-being the greatest importance in the world, but also considers him able to share the use of reason together with the gods; man becoming the carrier of political, aesthetical and ethical values. Under the influence of the original sin, the two fundamental human features – ability to learn and to work – are qualified by Christianity as punishment and deficiency. However, the progress made in all fields will give back to the human being the trust in the superiority and dignity of the spirit. In *Oratio de hominis dignitate*, Pico della Mirandola states that the human-being is perfectible, free to create his own destiny using reason, capable of imposing rules on reality and enrich on spiritual level. The man, the only owner of the spirit in the world, regains the trust in the spirit in contradiction to Rousseau’s naturalism, Darwin’s evolution, Haeckel’s biological monism and Marx’s historical materialism that canceled any difference between human beings and other beings.

Still, beside the thesis of the original sin, Christianity also comes with the idea of “rebirth, baptism and repentance, together with the dynamic idea of a new world and a new human-being, once Christ was born, a world free of sin, capable to get accomplished and progress, a man reconciled with Divinity” (Micu Stavila, 1945a, p.4). In fact, the conflict between Christianity and the humanist elements of Greek-Roman culture is fortuitous: it does not exclude, but it involves the trust in man’s dignity. In Europe, the rebirth of humanism is nothing but the rebirth of man in the new Christian spirit. As a novelty, Christianity introduces the concept of transcendent, postulating both an ideal world, essentially and radically different from the limits of the sensitive world, and the idea of Divinity outside the human world, not present and mainly incorporeal. The human being can have access to divinity by means of the ideal, the invisible part which is the basis of spiritual deeds and leads him to his self-accomplishment and frees him from the impulses and desires of the physical world. The antagonism man-world can be felt with such an intensity in the consciousness of the peoples who embraced Christianity and as the Romanian folk lyrics confess: “Should the world be of paper / I would set it on fire when angry / Should the world be a branch, / I would cut it with an axe” (Jarnik & Bărseanu, p.202).
How do we see the Romanian humanism in the historical dispute between Christianity and Classicism and what origin could it have? Together with the philosopher Constantin Micu Stavila, we appreciate that due to the old age of the Thracian culture and the parallel to the Greek-Roman culture, the Romanian humanism is included in the classical sphere. And the twist of the situation operated by Christianity (of which the Romanian people is fully aware) in the religious representations of humanity by introducing the idea of an imperfect world, the conscious – world dualism and antagonism, the concept of human dignity has a Christian origin. The scientific proofs establish not only the existence of a relationship between the main centers in antiquity – Greek and Roman on one side and Thracian on the other – but there is also the possibility of a descent in our classical culture in the part of the latter. In *Die Geburt der Tragödie aus dem Geiste der Musik* (1872) Nietzsche derives the birth of music and the tragedy from Dionysus’s cult, the Greek deity borrowed from the Thracians. The latter also had the first impulse for poetry, in Orpheus, The German researcher specialized in mythology Hermann Güntert insists on the descent of the myth of the savior god of the world from the Thracian religious concept, on its mediating role between Iran, India and Europe in his work entitled *Der arische Weltkönig und Heiland* (1923). Analysing the relations between the German and the Thracian - in *Walhall. Studien über germanischen Jenseitsglauben* (1913) and in *Die Überlieferungen vom Gotte Balder* (1920) - , Gustav Neckel sees the possibility of deriving old religious representations of the Thracian gods. These statements are also supported by O. Weinreich in *Neue Urkunden zur Sarapis-Religion* (1919). Thus, the result of the scientific research brings to light the depth of the relationship between the old elements in our Thracian culture and that Roman-Greek one, but also the contribution of the former in elaborating the classical miracle. Some interesting suggestions regarding the active existence of the relationships between our Thracian culture and the Greek-Roman culture can also be found in our historical literature, underlining the role of a matrix played by the former. Nicolae Densusianu, in *Dacia preistorică*, places the cradle of the Indo-European culture in Dacia, and gives to the Getae culture the role of a constitutive element for the Greek-Roman culture.

The results of the contemporary history research give arguments for the old age of spirituality, implicitly of Romanian humanism, based on the idea that any culture is the basis of the original spirituality and it is fulfilled by the conception about the man and his role in the world. If we understand by humanism the totality of the representations a people might have about the superior human type, we further aim to present in detail the specific way in which the human being is seen and how it is pictured in the Romanian culture, more precisely, in the Romanian folklore. We let the people – by means of the permanent and universal elements of the self-consciousness reflected in myths, proverbs, ballads, legends – to give an answer to the following question: How does the Romanian man perceive and what features give him the quality of a Human Being so as to account for his dignity and humanity? One condition for discovering the truth, scientific and philosophical knowledge and progress usually is originality and personal inventive action, in the philosophy of culture it is needed to go beyond subjectivity and identify itself to the over-individual reality of the national ethos. In the Romanian vision, the human being, a different being in the natural world ranking is endowed with moral and intellectual special traits. “The Romanian does not give the human-being another role but to exteriorize his own humanity and to behave in the world with all dignity, moral eminence of a spirit which loves justice, beauty, love and truth and goodness” (Jarnik & Bârseanu, 1968, p.8). Man’s right to get above the other creatures, to aspire at the cosmic hegemony, consciousness of the human spirit’s responsibility and last but not least, the special message of goodness can be seen from the folklore lyrics: “God, let me be a rainbow/ To go high up to your sky / As I mean no harm”, but also in the Romanian’s refusal to be part of the general pessimism which refers to the evil essence of man. To live according to the spirit, not the natural instincts, remains the religious ideal of the Romanian.

Traits of moral consciousness such as kindness, love, justice and mercy are frequently sung in ballads and folk songs and in the name of the spiritual values, the Romanian rebels against the ignorant, conformist and inert nature of things: “Fight, you heart, / Don’t stay as a bull in the shed. / Go on, fight / Do not stay like the bull in the pond” (Bologa, 1936, p.186). The rebellion against the conservation instinct, the routine and usual things sends to the proclamation of progressive, dynamic, fighting ethics and a life lived dangerously which considers the need for moral perfection above any other material comfort. This consciousness of necessary progress, the superiority of the ideal on the real, of what it could be and should be on what it is, sometimes is rendered in expressions with a deep meaning: “A
man is sad / when his bull goes for a heifer / and his daughters after servants” (Onișor, 1892, p.44). In other words, that imperative on human perfectibility which means the aspiration to getting noble, overcome the existence and not only simply preserving it or even degrading it. The following lyrics also speak about the sense of hierarchy which guarantees perfectibility and losing it is seen as a catastrophe as it influences existence in its mere reason of being: “It is the end of time/ The end of Earth / when the son strikes the father / and the daughter strikes the mother / younger brother hits the older / Younger sister in the older” (Bologa, 1937, p.62). The respect for the idea of “good family” and the sense of hierarchy are an expression of the conviction that life should bring more, not only be lived. Human beings aim to accomplish values and purposes at maximum, due to the qualities of a superior development, imposing himself as a noble man due to his personality and intelligence. To be of good family actually means to fulfill the maximum requirements of human personality. “Say dear to your mum / That I don’t need. / Straws and yellow flowers in the windows / Yellow and white flowers, / I don’t need any of your family / Yellow, white flowers and wormseed, / I don’t need any of your kin” (Bărlea, 1968, p.108).

The moral beauty of the soul, not the material one of the body is seen as important as expressed in the lyrics: “Handsome is not he who lasts / But handsome is he who suits well.”, and this “suits well” refers to what suits good deeds, what entails goodness in life, there is always a moral attitude of the spirit which lies above the physical beauty. As it is right coming from: “Even the ugly looks well / When he walks as it is right” underlines the idea that beauty and ugliness are decided upon moral and not material criteria. As in the conception of the Romanian people, beauty is only a manifestation of goodness, and ugliness the deviation from the condition of humanity – the inherent obligation of man to be consequent to the spiritual human condition, to keep up to the moral demands of social life based on meritocracy and hierarchy. “Man is not ugly for being unpleasant / But he is ugly for being out of order” (Bărlea, 1968, p.306). Deprived of order, of a family, he will also be deprived of the element which characterizes the real human personality, only if he aspires to a continuous development of the spiritual possibilities, only then, a human being will remain a human being. Avoiding the moral desideratum of trying to be better than he is, it deprives the human being from the noblesse which is characteristic to his being. “It is noble that who gets better than himself, that who is capable of going over the limits of his being, continuously searching to be something different and even more than he already is. The proud stillness in self-content feeling is a disqualifying attitude for a human being” (Micu Stavila, 1943, p.12).

The movement toward an area of non-determination, unifying real and possible, usual and ideal, what is and what it should be, is part of the human essence. Only the human being has science, art, religion and morals and can look beyond himself. He feels there is something beyond being and having, something which goes beyond any limit and attribute of existence, something beyond which is pure and virtually to be touched by the nobility of the human spirit and which gives it the real moral beauty and unique presence in the world. Being aware of the imperative of trying to become better, the folk poet blames self-sufficiency, being interested only in the current day, ignoring the ideal and what the individual might become. Avoiding making an effort to discover a new self, in the view of the Romanian people it equals evil, sin; or as Micu Stavila stated: “a selfish appearance of being against the will to self-improvement” (1943, p.13). The Romanian man / woman knows too well that life should not only be lived, but making more noble by sacrificing the current limits of the human being. The imperative prescribed to any individual as a rule of moral behavior by Goethe in Selige Sehnsucht is deeply rooted in his consciousness: “Stirb und werde!” (“Die and become!”). The Romanian people clearly know that ideally, making life more valuable requires an ethics of giving up and away, of sacrifice and that is why they despise a life dedicated to utility and pleasure. They will always prefer to fulfill the essential condition of their spiritual dignity, namely the ability to be a denier of life, that “der Neinsagenkönne” according to Max Scheler in his 1928 Die Stellung des Menschen im Kosmos. The moral ideal of the Romanian lies in looking for danger, hardship, next to giving up frivolous pleasures. Tudor Argehei, in Psalms, underlines the value of pain and effort against philistinism: „In my bowl, as in my thought / I have got used the poisonous taste./ I bathe in ice and I sleep on rock./ Where there is darkness I make sparks,/ Where there is silence I shake the cuffs/ I bring down the door with the chains./ When I am on the peak/ I’m searching for danger./ I choose the narrow path to go ahead/ Carrying the whole mountain on my back“ (Argehei, 1960), in agreement with an anonymous folk song: “The man who is a man / Does not sleep in bed at night,/ Only on dry ground.” (Bologa, 1936, p.99); or: “The young man, who
is a young man? He sleeps on bare ground.” (Jarnik & Bârseanu, 1968, p.382) We cannot speak by far of any inability to adapt to the civilized conditions or primitivism, but about a scale of values and ideals. Keeping awake the competitive force of the spirit gives pride to the man who arduously strives to be a Man. Without the power to say no to the hedonistic demands, the man loses his independence and gains distance to the world, finally reaching freedom. By practicing it – a guarantee of getting above the requirements of necessity – is reached real human dignity. To be free means to appeal as little as possible to the pleasure given by things; an austere life in which the moral and soul demands for knowledge, goodness, beauty, love, in the vision of our people acquires the sign of superiority. The way to perfection requires generosity but also the knowledge to take the best out of himself using the fulfilling power of love. “That my dear brought to me / Sweet milk in bead / And we both ate / And there was still some left / For a bird to eat as well.”

The preference for beauty, the desire to make the useful things pleasant, to give them a meaning, value, spiritual significance is one of the most important features of the Romanian. The tendency to garnish things, to give them a festive look, to make them suitable for contemplation, not only to be useful, that aesthetic drive has been long mentioned as a feature of Romanian spirituality. A constant effort to increase beauty in detail and to change their look into an aesthetic way is nothing but the expression of good will and the generous drive of the spirit scattered around things aiming to enrich and make them much nobler following the model of inner perfection. The one who searches beauty will know how to avoid evil, choosing goodness. “Oh, my God, I expect nothing / But merely what is right and good.” (Jarnik & Bârseanu, 1968, p.199) Because the sense of beauty cannot be detached from the power of love and goodness of the heart, the Romanian will create an ideal world of the art to adjust reality. The aesthetic emotion, a medicine against evil, but also a principle of adjusting existence, might train the soul to serenity, giving the man the power to stand any blow. “God, give only good to those who envy / And me to endure what is rightful for me. / And give them good chance / And to endure what chance is. / Give them as much good as they might want / And I endure as much as I can.” (Bârlea, 1968, p.168)

**Conclusion**

According to Constantin Micu Stavila, we can conclude that the inner features examined above are included in the picture of the Romanian ideal man. Self-control, drive for perfection, an ethics of generosity, modesty, sacrifice and giving away, the cult of goodness, the sense of beauty and the power of love, all under one name which represents Romanian humanity. The key of the Romanian humanism lies in this original attitude – kindness – which is to be understood in terms of the relation between the notions of human being and Romanian, on the one hand, and the word Human as describing the moral endeavor, on the other hand. Still, Romanian humanism is not reduced only to goodness it corresponds to moral features of the human spirit and it also has an intellectual function of knowledge. The Romanian creates a link between the exercise of knowledge and that of moral power. Reason plays a part determined by his inner life as well as by his acts; for example, when he expresses his feelings, he speaks with the whole language of reason. Decency and shame explain the moderating interference of the intellect on feelings. The predilection of the Romanian for a reason goes so far, that its absence is seen as cause for suffering and obstacle which cannot be surpassed in the way to love. “Why are you crying, my sister? / How could I not cry / As I married a dull man” (Jarnik & Bârseanu, 1968, p.171) or: “I liked you for nothing / If you had no mind” (Bibicescu, 1893, p.74). This application gives all the reasons to appreciate the Romanian people as inheriting the noble traditions of the Gets and Thracians, and keeper of the Christian spiritual tradition, with a high moral value of life which should be known and positively included in the cultural heritage. As an active, insurrectional, and creative being, a man / woman is able to change the reality and to shape it after his / her own pattern.

EMOTIONALLY EVALUATING THE ATTITUDE OF CONSUMERS TOWARD SUPERVISION SERVICE

Maija Zakrizevska

Abstract: This study is conducted because organization supervision in Latvia tends to rapidly take its proper place among other professions recognized on the national level and has become an inseparable part of professional activities, in particular in the areas focused on humans, for example: health care, art therapies, social and educational services, and the business environment. Given that the demand for supervisors continues to increase, the purpose of this study is the identification of the popularity and treatment of supervision service by consumers for the subsequent presentation of proposals to the administration of the Business Art and Technologies University RISEBA concerning the popularization of supervision services and improvement towards the Master Program “Management Psychology and Supervision”. 111 respondents participated in the study, including respondents who have participated in supervision (n=47) and respondents who have never participated in supervision (n=64).

The study has led to the conclusion that the attitude of consumers toward supervision is generally positive. Most of the respondents have never been parties to supervision, yet a majority of the respondents would like to experience it. There are statistically significant differences between the attitudes toward supervision in the co-

Introduction

Supervision is developing rapidly in Latvia and every year the Latvian Association of Supervisors certifies more supervisors who will work in various environments, and also as educators, to facilitate development of science in supervision. Three Latvian institutions of higher education offer a Master’s Degree program for becoming a supervisor: The University of Business Arts and Technology RISEBA, Riga Stradins University, and the Latvian Christian Academy. All study programs comply with the standards applicable to the profession however, each of them is different in terms of the content, the degree awarded, and the annual tuition fee. It should be noted that the Latvian Union of Supervisors (www.supervizija.lv) includes 57 certified supervisors, has published three books and numerous articles about supervision, and two doctoral dissertations related to supervision have been defended. The only summarising collection of papers available in Latvian, titled “Supervizija teorija un prakse” (“Supervision Theory and Practice”), has been published (Mārtinsone, 2016). This is because in several professions nowadays, supervision has become a component of the professional practice and also education, whereas there is insufficient information about it in business. This is evidenced by the previously conducted study into the attitude of students and employers toward supervision already (Zakrizevska, 2016), which also explains the topicality of this study. The results of the study showed that, when hearing the words “supervision, supervisor,” many employers have different emotionally evaluating attitudes and, for many of them, these may associate with in-service training, monitoring, and mentoring. It should also be noted that many consumers, including company managers and personnel managers, are still not informed about the actual benefits supervision provides in a business environment.

Literature review

Attitudes of consumers are widely being researched not only in social psychology, but also in business and marketing. This can be seen well in the following papers: Event Marketing and Attitude Changes (Nufer, 2016), Attitude of Latvian Consumers Toward Genetically Modified Organisms (Aleksejeva, 2016), Situational Influences on Consumers’ Attitudes and Behaviour (Foxall, Yani-de-Soriano, 2005), Customers’ Attitude Towards Plastic Money (Jain, 2016).

Attitude is a relatively stable, positively or negatively evaluating response which influences and motivates the behaviors associated with them (Olson, Maio, 2003). It may be targeted at a certain individual or events, at various things as well as at abstract objects, it helps the individual carry out an evaluation of an object or event, adapt to the environment and express their feelings or beliefs to others (Nevid, 2014). Attitude has an evaluating tendency, and it is this evaluating element which distinguishes attitude from belief (Davey G., 2006), which can be measured by contrast signs: good – bad, pleasant –

1 University of Business, Arts and Technology RISEBA, maija.zakrizevska@riseba.lv
unpleasant (Ajzen 2001). Attitude has three dimensions, they show in a wide spectrum the ways attitude may manifest in an individual (Smith, 1947, Rosenberg, Hovland C.I., 1960, Ya Hui, Petty, 2013). The three dimensions (or components) of attitude are formed by cognitive (knowledge about an environment object), emotional (emotional evaluation of the object) and behavioral reactions to an object (purposeful action with regard to the object) (Chaiken S, Pomerantz E.M., Giner-Sorolla R. 1995). Thus, attitude is defined as views regarding the achievement of certain targets, including understanding them, evaluation and a readiness to act (Schwarz, Böhner, 2001). Emotional attitude largely differs from, for instance, cognitive attitude, because it may often not be logical or based on facts. Behavioural reaction, in its turn, may vary depending on the actions of the surrounding people, because the individual may go with the majority and act the way they do despite their knowledge and emotions being in contrast to the behavior. It may be assumed that attitude can also be caused by false knowledge about an object.

Considering that studies of attitude are popular and particularly widespread in business and in science. This study into attitudes towards supervision may the attitudes of consumers towards supervision in all three dimensions (emotional, cognitive and behavioral), which might help to find out not only the emotionally evaluating attitudes, but also knowledge and readiness to use the service of supervision.

The aim of the study is to explore the attitudes of consumers towards supervision in order to give recommendations to the administration of RISEBA University of Business, Arts and Technology to popularise the supervision service and improve the Master’s Degree program “Management Psychology and Supervision.”

The research questions were the following: What is the emotionally evaluating attitude of consumers towards supervision? Are there statistically significant differences in the attitudes towards supervision between consumers with experience in supervision and consumers with no experience in supervision?

A reason for negative attitudes is frequently a lack of information, and it is therefore essential to study the attitudes of consumers and provide consumers with information through the questioning of individual views and values. Communication and types of communication are essential, as they assure positive attitudes among the beneficiaries. The creation of new needs and expectations by justifying it with the benefits to be achieved and assuring, and understanding that change of attitudes may change the current environment. Also, to change the attitudes of consumers it is necessary to understand the individual influencing factors. Change of attitudes may be used to popularise supervision in the business environment, which is a determinant of the topicality of this study.

**Methodology**

All three dimensions of attitude towards supervision are compared in the study: emotional, cognitive, and behavioral the links between each of them. Thus, it is possible to find out the effective attitude towards supervision, what the knowledge of both research samples about supervision is, and what behaviors in association with supervision each of the research samples has, simultaneously finding out whether there are any differences between the results of both samples and what these differences are. The survey consisted of 23 statements which were evaluated on a Likert-type scale with four values. (Likert-type scales)

142 questionnaires were obtained in total, of which 111 questionnaires were suitable for data processing. 31 questionnaires were incompletely filled in and, therefore, were not included in the mathematical and statistical analysis. No supervisors or supervision students were involved in the study.

The survey was completed by a total of 47 respondents who had participated in supervision and 64 respondents who have never taken part in supervision. Most of the respondents were from social work (29%) and the state and local government sector (12%), which totals to 40 %. The next largest group with 21 % is the business sector, 18% represent the sector of education, 8% represent project management, 4% represent psychology, and 18% represent other, unspecified areas. In terms of the length of service, the job experience of 62% of the respondents exceeds 6 years, and this is the majority of the respondents, the job experience of 22% of the respondents is up to 4 years, and, for 16% of the respondents, their job experience is between 4 and 6 years. In terms of the position, 68% of the respondents, which is the majority, do not have managerial positions, while 32% of the respondents do have managerial positions.
The questionnaire of the survey was created on the “webrpoolsurveys” platform and sent out to the respondents electronically as a link. The respondents could complete the survey questionnaire in November and December 2016.

The data collected during the survey were analyzed using Microsoft Excel and IBM SPSS 23.0 statistical data processing software.

**Results**

The data collected during the survey were analyzed using quantitative statistical research methods as well as methods of mathematic statistics to calculate data credibility or the Cronbach’s alpha coefficient, correspondence of the data to normal distribution and determine the central tendency indicators for the data as well as the statistically significant differences.

To verify the credibility of the designed questionnaire regarding supervision, the Cronbach’s alpha (or the Consistency Coefficient) was calculated. It shows whether the statements are adequately and mutually consistent within each particular scale and within the entire survey (see Table 1).

</tbody>
</table>

Source: Author

The aggregate Cronbach’s coefficient alpha for all the dimensions can be rated as very good (see Table 1), which means that the results obtained during the survey are credible and can be used for further data analysis and interpretation.

To determine the central tendency indicators, the Kolmogorov-Smirnov Z criterion was calculated, thus determining the significance of these scales. It shows the correspondence to the normal distribution and also what the methods to be used for the further processing of the data should be. The results of the calculation lead to the conclusion that the significance is below 0.05 for the emotional dimension and behavioral dimension scales, which means that the values of these scales do not correspond to the normal distribution, whereas the significance value for the cognitive scale is 0.200, and it corresponds to the normal distribution.

The survey was completed by the total of 47 respondents who had participated in supervision and 64 respondents who have never taken part in supervision. Since, based on the result of the T-test, the significance for these samples is below 0.05, it is confirmed that there are statistically significant differences in the cognitive or knowledge dimension between the respondents who have participated and those who have not participated in supervision (see Table 2).

According to the Mann-Whitney U test, which was used to study the potential differences between the respondents in the above-mentioned groups (respondents who have participated in supervision and respondents who have not participated supervision), there are no statistically significant differences in the emotional and behavioural dimension (the significance is above 0.05) (see Table 3).

Source: Author

All respondents were asked the question: Do you have a positive attitude towards supervision? The majority of the respondents (79%) have a positive emotionally evaluating attitude towards supervision. Still, 21% of the respondents had a negative emotionally evaluating attitude towards supervision, which suggests certain negative experience in association with supervision (see Figure 1).

The obtained results suggest that attitudes towards supervision are more negative among those who have participated (28%) in supervision (see Figure 2). This might mean negative experience with regard to the supervision service.

The results of the survey show positive emotionally evaluating attitudes of consumers towards supervision and also that supervision is popular among consumers, as 71% of the respondents know what supervision is, 64% of the respondents know where to find information about supervision, and the majority of the respondents (73%) would be able to explain what supervision is if asked by a friend. 42% of the respondents have participated in supervision.

The results of the survey also show that the majority or 63.6% of the respondents claim that they understand the process of supervision; approximately one half or 49% of the respondents have no knowledge about how to organise a supervision session; 85.6% of the respondents are ready to attend a supervision session if necessary, but others would most likely not do it; almost one half or 47.7% of the respondents are not ready to pay for supervisor services as part of their job.

The obtained results show positive tendencies in the development of the supervision service. Although the service is becoming more popular, almost one half of the respondents are not willing to pay for it themselves. This means that consumers have not been made aware of the benefits supervision provides.
Conclusions and Recommendations
The conducted survey is significant for the development of supervision as a sector, and the obtained results show the attitudes of consumers in two samples.

Although the emotionally evaluating attitudes of consumers are generally positive, there is knowledge about supervision and readiness to use the supervision service, consumers are not ready to pay for it and do not know how to organize a supervision session in case it was necessary.

There are statistically significant differences in the cognitive or knowledge dimension between the respondents who have participated in supervision and those who have not participated in supervision, and this suggests that those who have participated in supervision have knowledge about supervision.

When comparing the results of the two samples, i.e., the emotionally evaluating attitudes of the respondents who have participated in supervisions and the respondents who have not participated in supervisions, it can be concluded that those who have participated in supervisions (28%) have more negative attitudes, and this might be suggestive of negative experience with regard to the supervision service.

The obtained results and the conclusions drawn allow to give the following recommendations to the management of the Master’s Degree program “Management Psychology and Supervision” of RISEBA University of Business, Arts and Technology:

Attitudes are related to the experience with supervision one has had. It can be assumed that the consumers who have received the supervision service are not satisfied with it and, consequently, are avoiding or will be avoiding group and team supervisions. Therefore, it is essential to provide a quality supervision service by preparing highly qualified specialists – supervisors.

It is necessary to continue to promote the supervision service in mass media and social networks, laying particular emphasis on the benefits of supervision for employees and managers. For example, by giving interviews and preparing publications for various popular science magazines.

NOVICE TEACHERS’ BELIEFS ABOUT PROBLEM-BASED LEARNING APPROACH, AND TEACHING PRACTICES

Olena Zhukova¹

Abstract: This article presents the results of the pilot study conducted with the aim to examine novice teachers’ pedagogical beliefs and challenges regarding the implementation of a problem-based learning (PBL) approach in the EFL classroom. The relationship and discrepancies between novice teachers’ pedagogical beliefs and actual classroom practices were also investigated. In total, 25 novice teachers of English as a foreign language (EFL) with up to 3 years of teaching experience participated in the study. The data for the present study were collected from face-to-face semi-structured interviews and classroom observations. In total, 25 novice EFL teachers working in Latvian basic and secondary schools agreed to participate in the survey. The finding of the survey suggest that novice teachers’ beliefs are not always reflected in their actual classroom practices for a number of external and internal constraints, such as students’ expectations and perceptions, school administrators’ demands and lack of commitment, context of teaching, lack of professional skills and methodological support, and examination pressure. These findings of the present study might have implications for school administrators, EFL teacher educators, teacher training institutions and the institution that provide teacher professional development courses, as well as for education policy makers and for EFL teachers themselves.

UDC Classification: 37.01; DOI: http://dx.doi.org/10.12955/cbup.v5.1046

Keywords: novice teachers, efl, teacher’s beliefs, problem-based learning, PBL

Introduction

The current study focuses on novice EFL teachers’ beliefs about teaching and learning and about the PBL approach in particular, as well as the novice teachers’ actual classroom practices. Teachers’ beliefs about a problem-based learning approach to EFL teaching include three related components: pedagogical beliefs about teaching and learning, self-efficacy beliefs about the implementation of PBL in the classroom, and beliefs about the perceived value of this approach for student learning. A significant question is, how do teachers’ beliefs about teaching and learning compare with their classroom practices? This question is of great importance because, as Mishra & Mehta (2017:8) put it, “despite what the experts say and believe, the actual implementation of new approaches to teaching and learning in today’s schools and classrooms will be determined by the beliefs and knowledge of the practitioners themselves.” Although a wealth of literature points to the importance of investigating teachers’ beliefs and practices (e.g. Richards et al. 2001, and Fives & Gill 2014) in order to improve teacher preparation and teaching quality, empirical studies on novice teachers’ beliefs about teaching procedures and practices, particularly in foreign language teaching, are limited in Latvia. There is also little research on innovative non-directive teaching methods and techniques to promote 21st century skills in the EFL classroom, and particularly on the implementation of the PBL approach. Therefore, this study seeks to understand the novice EFL teachers’ beliefs about teaching and learning in general and about the use of a PBL approach in EFL teaching in particular compares to what teaching methods, techniques, and approaches the novice teachers actually apply in their practice. Answering this question could help experts and practitioners to understand better what teachers think about teaching in contrast to what they actually do in their classrooms and why.

The article includes the following sections: literature review on novice teachers’ beliefs and problem-based learning approach in EFL teaching, a description of the data and methods used in the study, the results and discussion, and finally the conclusions made.

Literature review

Novice teachers’ preparation, induction, professional development, classroom experiences and practices have received much attention especially in the last years. Recent studies demonstrate that the initial years of teaching determine novice teacher’s future career in that it influence their values, attitudes, professional competence, behavior, and motivation. Some studies also prove that novice teachers are often less effective than their more experienced colleagues due to lack of prior teaching

¹ Daugavpils University, The Faculty of Education and Management, Viņķiņas Str. 13, Daugavpils, LV-5401, Latvia, lerial2@inbox.lv
experience, professional knowledge and skills (Melnick & Meister 2008; Schwarzer & Grinberg 2016). Yet it is unarguable that teachers’ professionalism is the main factor to determine success and failure of education. Along with that, the nature, content, and objectives of education are undergoing dramatic changes recently due to the rapid advances and transformations of the world that we live in today (Misha & Mehta 2017). Many experts in education are highly concerned about the fact that current traditional pedagogical practices, models, methods and approaches have proven to be generally ineffective due to their inability to prepare students for the changes and demands of the 21st century global and knowledge-based economy. It is also true that today’s students are fundamentally different from students in the past; they have different learning goals and require different teaching approaches. Therefore, it is becoming obvious today that in order to be able to face the 21st century challenges, 21st century teachers are required to transform their educational practices, methods, approaches, and roles (Mishra & Mehta 2017; Johnson 2013; Kern 2012). Similarly, education in Latvia is also experiencing an evolutionary transformation and paradigm shift in order to increase its effectiveness and relevance to the needs and requirements of the globalized knowledge-based society. According to the report of the Latvian national center for education, the priority and key objective of the state general education in Latvia is to enhance and facilitate the development of students’ competencies, skills, and experiences that they need to succeed professionally, socially, and personally in today’s increasingly globalized, pluralized, diverse, information and knowledge-based world.

**Teachers’ beliefs**

There has been recently an increasing interest for the study of novice teachers’ beliefs, attitudes, practices, and experiences (e.g. McAninch 2003; Schwarzer & Grinberg 2016; Kersaint et al. 2007; Ingersoll et al. 2014). Teachers’ beliefs, being one of the key constructs in teacher cognition, have frequently been discussed in scientific literature for more than 50 years (Fives & Gill 2014). Many previous studies investigated teachers’ beliefs about the teacher’s and students’ roles, pedagogical practices, instruction, and the ways a certain subject or skill should be taught (Khader 2012; Erkmen 2014; Larenas et al. 2015; Phipps & Borg 2009). According to Kagan (1990), teaching beliefs are “highly personal ways in which a teacher understands classrooms, students, the nature of learning, the teachers’ role in the classroom, and the goals of education” (p.423). Various studies have shown that teachers’ pedagogical beliefs are important for understanding and improving teaching quality, teacher’s education, and the effectiveness. Teachers’ beliefs are considered to guide teachers’ actions, instructional decisions, judgments, and behavior in the classroom. In addition, teachers’ beliefs, attitudes and practices shape students’ learning environment and influence their learning motivation and outcomes (Subramanian 2014; McCoaghan 2008; OECD 2009; Richards et al. 2001; Patch 2008). Pajares (1992) also adds that the investigation of the beliefs of pre-service and in-service teachers should be a focus of educational research since it provides valuable data “in ways that prevailing research agendas have not and cannot.”

Two major opposed types of teachers’ beliefs about teaching and learning philosophy are commonly compared and contrasted in contemporary research, namely, the direct transmission philosophy (also referred to as traditional views or traditional pedagogical practices) and constructivist philosophy or views about teaching and learning (sometimes also referred to as 21st century teaching and learning or non-directive teaching). Direct transmission beliefs about teaching and learning implies that the factual knowledge is presented and conveyed by an active teacher to passive students; the teacher’s role is to transmit the knowledge and information in a clear and structured way, to give student clear problems and provide correct solutions to the problems, to tell students what they should and should not learn, know, memorize, and use, as well as to control the discipline in the classroom. The relationship between teacher and students are typically power-distance or power-based; the learning process is viewed as teacher-centred (OECD 2009; Carroll 2014; Leonard 2002; McCoaghan 2008). Contrastingly, constructivist views imply that a teacher’s role is to co-collaborate, guide, facilitate and coordinate the learning process, while the student’s role is to actively participate in the process of acquiring and constructing knowledge. Students actively create their own knowledge based on their previous and new experience through investigations, questioning, discussing, and reasoning. Students are encouraged to take responsibility for their learning and to choose what they are really interested in, as well to research and develop multiple solutions to authentic problems on their own and in collaboration with others (OECD, 2009; Reevy & Bursten 2015; McCoaghan 2008; Chow et al. 2015).
A number of studies report about the inconsistency between the teachers’ beliefs and their real classroom practices, which is often caused by various internal and external constraints (Erkmen, 2014; Phipps & Borg 2009). The urgent problem here is that, as Park & Ertmer (2007) put it, “encouraging teachers to develop new beliefs and stick with them is difficult.” The authors add that even teachers with a strong set of pedagogical beliefs are likely not to put their beliefs and ideas into practice because of “the conditions of the teaching environment.” Park & Ertmer (2007) claim that even if a teacher has student-centred learning beliefs, he/she may “quickly adopt a teacher-centred approach when faced with an overloaded schedule, lack of administrative support, or other barriers in the classroom.”

**Problem-based learning approach in EFL teaching**

Along with general education transformation, foreign language teaching has been undergoing dramatic shifts over the past few decades (Long & Doughty 2011; Kern 2012; Fleming & Stevens 2014). Problem-based learning (PBL) approach in foreign language teaching is one of the innovative constructivist teaching approaches in language classroom, which was first introduced in several American and Canadian medical universities in 1950s (Mathews-Aydinli 2007). Later PBL approach was adopted in teaching other subjects, including humanities; however, there is very limited research on the use of PBL in teaching language arts (Othman & Shah 2013). Nevertheless, PBL is gradually gaining its popularity among EFL educators nowadays as it has proven to be an effective means for advancing students’ content knowledge and higher-order thinking skills (Mathews-Aydinli 2007; Larsson 2001; Boothe 2011; Othman & Shah 2013). PBL has been defined as “revolutionary and radical teaching approach” (Cheong 2008), “educational reform” (McCaghman 2008), and a “constructivist method of instruction” (Pecore 2013; Subramanian 2014) that involves innovative teaching and learning methods and strategies, including teaching language in context, active and collaborative learning, trans-disciplinary learning, and inquiry-based learning. As Subramanian (2014) notes, the investigation of PBL implementation and effects in the school context is a relatively new topic in literature; however, recently, researchers have stressed the need for more PBL research that examines its effectiveness in the K-12 classrooms.

Barrows (1982) defines problem-based learning as a “learning method based on the principle of using problems as a starting point or stimulus for the acquisition and integration of new knowledge.” PBL differs considerably from the traditional lecture-tutorial approach as it involves a shift from the traditional teacher-centeredness, content-orientedness, knowledge transmission, and student passive learning to the student-centeredness, process-orientedness, knowledge construction, and active learning (Cheong 2008; Tan 2003). Within the problem-based learning, a teacher presents students with a problem to solve in order to engage them in a process that involves objectives, problems, research experiences, solution development activities, discussions, and assessments (Pecore 2013). Being involved in PBL in the EFL classroom, students face a complex authentic problem or an uncertain problematic situation they have to solve by analysing authentic materials and communicating in the target language. The authenticity of the problems and of the materials involved, as well as the integration of current real-life events and situations have a highly positive impact on the students’ motivation and stimulate development of higher-order thinking skills and intellectual processes such as problem solving, critical thinking, analysing, summarizing, hypothesizing, drawing conclusions, questioning, which leads to deeper understanding of the content and “enhanced retention and transferability of information and concepts” (Barell 2006; Williams & Paltridge 2016; Othman & Shah 2013; Larsson 2001). As Mathews-Aydinli (2007) puts it, “second language acquisition research and practice have long recognized the value of classroom interactions for promoting language acquisition, particularly when these interactions involve negotiation of meaning. When there is a focus on real-world issues and problems, the interactions that take place have been found to be more meaningful and authentic than interactions produced during activities such as assigned role plays or repetition of dialogues”. Mathews-Aydinli (2007) also adds that PBL approach contributes to the development of skills for self-directed autonomous learning, allowing students to practically use the skills obtained in the classroom in their lives outside the classroom.

**Data and methodology**

The purpose of the research is to examine novice EFL teachers’ beliefs and actual classroom practices regarding the use of a problem-based learning approach in EFL classroom. Specifically, the research
seeks to answer the following questions: (1) What are novice teachers’ teaching and learning beliefs and what are their actual classroom practices? (2) To what extent are novice EFL teachers comfortable with non-directive student-centred teaching practices and specifically with the PBL approach? (3) What challenges with their role do novice EFL teachers experience in regard to problem-based learning? To address the questions raised in the survey, qualitative data was obtained from face-to-face semi-structured interviews with novice EFL teachers (n=25), and classroom observations were taken. The data were collected between January 2016 and February 2017. Each teacher participating in the survey was observed twice during his/her EFL lesson. All the participants were interviewed orally and individually; each interview was held at school and lasted for 40-60 minutes. This study utilized qualitative data analysis. The interviews were recorded, transcribed, coded and further analyzed using a semantic content analysis method in order to identify categories and subcategories to describe the content (Corbetta, 2007:75). Initially, manual coding of each interview was conducted to identify words and phrases that correspond to the common themes for the purpose of this study. Then the data was analyzed for similarities and differences (research design adapted from Mahfoodh 2011:16 and Erkmen 2014:102-103).

Participants

25 novice EFL teachers, working in 19 Latvian comprehensive schools, agreed to take part in the survey. Table 1 below provides demographic information about the participants of the current survey. The participants were chosen on the basis of representativeness. All of them were teachers of English as a foreign language who have gone through at least four years of formal initial teacher training at a university level. Their full-time teaching experience varied from 4 months to 3 years. At the time of the survey they all worked in the urban public-school sector in either one of two of Latvia’s largest cities Riga and Daugavpils.

Results and Discussion

1. Novice EFL teachers’ beliefs about the nature of teaching and learning and their classroom practices Barell (2006) claims that the frequency and effectiveness of the use of problem-based teaching and learning depends on various factors, including teachers’ beliefs about the nature of teaching and learning. Therefore, the participants were asked first to comment briefly on their views about the nature of foreign language teaching and learning. The study revealed that the majority of the teachers surveyed tend to believe that students have to be actively involved into the learning process and take responsibility for their learning; 78% of the novice EFL teachers affirmed that students’ achievements in language learning and their future success are largely dependent on their commitment, active involvement and participation in the learning process, as well as on teacher’s professionalism. When asked about student motivation, more than a half of the novice teachers pointed to the importance and necessity to create such learning environment where their students feel secure, supported, valued, and respected; according to the teachers, their role is not to force students to learn, but to help them discover their true interests and strengths, boost their curiosity and willingness to learn and create. Additionally, of the 25 novice teachers who took part in the survey, over 80% replied that they find it highly important to meet the diverse learning needs and expectations of their students, although this task is viewed by the teachers as one of the most challenging ones.
Nearly all of the participants declared that they have either mixed beliefs (traditional-constructivist) or constructivist beliefs about the nature of teaching and learning. Only 2 of the 25 teachers considered traditional pedagogical practices to be the most effective for students in terms of foreign language acquisition. However, the lesson observational data demonstrate that novice EFL teachers’ beliefs are not always reflected in their actual classroom practices and that there are differences between the surveyed teachers’ beliefs on the one hand, and their practices, on the other. This goes in line with OECD (2009), Larenas et al. (2013), Rajab et al. (2015), and a number of other scientists’ findings concerning the relationship and discrepancies between teachers’ beliefs about teaching and learning and their actual classroom practices.

Only less than a half of the teachers observed in this survey demonstrated the features of constructivist pedagogical practices, namely, student-centeredness, the use of problem-based learning activities and procedures, such as case studies, inquiry-based learning, etc. The observational data shows that most novice teachers demonstrate the features of more traditional lecture-based way of teaching and instruction, such as summarizing former lessons, homework review, checking the exercise book, presenting new material (facts, grammar rules, etc.), assigning activities, checking the solutions, and asking comprehension questions in every lesson, rather than those of the constructivist teaching. Specifically, the novice teachers, by and large, act as center of attention and provider of information in their classrooms. They typically attempt to control everything that the students do during the lesson. The interviews data also show that a lot of novice teachers report being afraid of losing control in the classroom and struggling with discipline and behavior issues. This might be caused by the novice teachers’ lack of prior teaching experience, lack of self-confidence, and practical skills to cope with challenging situations in the classroom, as well as with their inner need to prove themselves. These findings are consistent with earlier findings of Frederiksen et al. (2011), Wang & Schwille (2008), Melnick & Meister (2008); the researchers claim that novice teachers, especially in their first year of teaching, experience considerable challenges and concerns regarding classroom management, discipline, control over students, time management, etc. mostly due to the lack of confidence, as well as lack of practical experience, skills and knowledge.

Most novice teachers in this survey were likely to provide restricted information and instruct students what to do and what not to do with the information, how to use it, what to memorize and what not to memorize, rather than letting the students independently use information they need to construct their knowledge and understanding in a self-directed and not teacher-directed way. Also, the lesson observations revealed that more than a half of the teachers surveyed tend to use teachers-centred and direct teaching techniques more often. These teachers focus more on providing grammar rules, presenting clearly defined tasks and demonstrating correct solutions. It might be associated with the teachers’ desire to keep the learning process under control ensuring that the learning process is well structured and adherent to the requirements of the curriculum. It might be also because some novice teachers are inclined to largely perceive their students as unmotivated and passive learners therefore the teachers are likely to avoid student-centred and non-direct teaching which gives students more autonomy. Students typically have little freedom to choose the learning tools, information sources and content. Only a quarter of the novice teachers in the study started and finished their lessons by asking for students’ feedback. As to the academic environment of the classrooms being observed in the current study, the novice teachers tend to focus students’ attention mostly on the memorization of different usually unconnected facts and rules. Several teachers, however, tend to focus more on developing students’ language and communicative skills in different contexts taking into account their individual interests.

2. Novice EFL teachers’ beliefs and actual classroom practices in regard to PBL in language teaching

Surprisingly, for 44% of the novice teachers participating in the survey it was quite challenging to provide any sufficient definition to the problem-based teaching and learning approach, therefore they could not answer the question whether they implemented this approach in their teaching practice. However, after being provided a brief explanation of the PBL, the participants were able to comment on their experiences with PBL. Only 7 of the 25 participants (28%) indicated that they try to regularly use this approach in their practice; they also pointed that they would like to apply it more often provided that they have enough time and relevant resources. 8 of the participants (32%) reported that they implement this kind of teaching approach occasionally, and 10 participants (40%) indicated that
they normally use the PBL approach “very rarely” or “never” in their day-to-day practice. Interestingly, that the majority of those surveyed (72%) indicated that they acknowledge the importance of this approach in developing students’ core language competences, information literacy, communicative and other higher-order thinking skills. The novice teachers also generally agreed that the PBL approach, in contrast to more traditional lecture-based and teacher-centred pedagogical practices, has great potential to actively engage students into the learning process and to motivate them to learn. When asked about their beliefs regarding the advantages and effects of PBL for language teaching, the novice teacher commonly concurred that PBL provides students with the opportunity to learn foreign language in context and unconsciously, by fulfilling many other actions in many varied contexts such as searching for information, reading the information, questioning, summarizing facts, discussing results with their peers and presenting them. Furthermore, some novice teachers reported having noticed that “difficult” students are likely to become more motivated if they are provided opportunity to take responsibility of their own learning and make their own decision on what and how to learn. However, the teachers also noted that in the context of their schools non-direct teaching activities such as PBL or project-based learning are very difficult to implement because of various reasons such as the need to strictly control the discipline and follow the curriculum.

3. Challenges with PBL

More than a half of the participating in the survey admitted that they had tried using problem-based activities in their EFL classrooms, but they seemed to be of little effectiveness due to various reasons. Most often the teachers mentioned that (1) it is often difficult to control the students and maintain the discipline in the classroom (2) such activities required too much time for instruction and explanation of tasks and did not give the students sufficient opportunity to practice; (3) such activities might be inappropriate for mixed ability classes and for weak students or for students with lower levels of language skills; (4) it is often difficult to encourage students to use the target language rather than their native language in group discussions. These findings go in line with McCoaghan’s (2008) earlier findings that indicate that teachers’ professional background influences the success and failures with problem-based learning facilitation.

When asked about the major challenges and concerns with the non-direct teaching and the PBL approach in language teaching, the majority of the teachers (80%) especially emphasized the gap between theory and practice. These teachers share the opinion that theoretically today’s pedagogical practices have to be transformed to meet the demands of the 21st century; they also largely agreed that such innovative constructivist pedagogical practices as student-centeredness, mastery-orientedness (rather than performance-orientedness), knowledge construction, student self-directed active learning, as well as the integration of technology in teaching and learning should be predominant; however, practically there are many barriers that considerably hinder constructivist teaching in schools.

Classroom management and discipline problems, lack of school administrators’ commitment and support, lack of professional skills and prior experiences, lack of time, relevant teaching materials, pressure from the school administration and syllabus requirement, as well as poor classroom technical equipment were mentioned the most by the participants as the main challenges in terms of the implementation of PBL in foreign language classroom.

At least 50% of those interviewed indicated that they could not apply some of their pedagogical ideas and beliefs about teaching and learning in their classroom practice for a number of reasons including the contextual constraints and discipline problems in their classes. One of the most commonly mentioned constraints was “students’ expectations.” Some novice teachers claim that their students tend to prefer traditional instructions and activities. Interestingly, teachers commonly refer to students’ unwillingness to accept new teaching methods and techniques, rather than relate their inability to use innovative teaching due to their own lack of appropriate teaching skills and style. Another considerable challenge with PBL is that novice teachers do not feel themselves comfortable with this approach. According to some answers, they feel that they need too much time and effort to prepare for PBL lessons, and they are often afraid of losing control over their students especially in more “difficult” classes. Indeed, previous studies indicate that PBL can be rather controversial and even criticized by teachers, especially by those who successfully implements more traditional pedagogical practices. For example, Larsson (2001) argues that not all teachers feel comfortable with PBL and even those who favor PBL “are sometimes reluctant to implement it because of the tremendous
amount of work involved in fundamentally restructuring a course.” Furthermore, there are also students who are likely to prefer and be more effective learners in traditional rather than in PBL classroom. This assumption is supported by several earlier studies that indicate that while some students benefit from collaborative learning, active discussions and debates, other might have better learning outcomes only when provided with detailed instructions and well-defined assignments (Larsson 2001).

Another considerable concern for the novice teachers in terms of PBL is the pressure of the curriculum and the requirement to prepare students for standardized final exams. This is consistent with the findings reported in literature, for example, by Subramanian (2014), who claims that “pressure from the school district to increase students test scores in standardized tests, changes in the current curriculum, and low expectations in students’ ability and performance discouraged and dissuaded teachers from implementing any innovative reform-based instructional practices like PBL in the classroom”.

A number of teachers also reported about the lack of practical skills and prior experience required to search for relevant materials, as well as to design, plan, and successfully implement the PBL activities in the EFL classroom so that the desired learning outcomes are well achieved. They also added that in theory they are very well informed about the need and importance of innovative pedagogical practices, approaches and techniques; however, in practice and in particular school context it often seems impossible, therefore they have to “obey the rules” and do what they are expected to do but not what they believe should be done in the classroom. These findings are consistent with McCaughan (2008) who indicates that “the transition from traditional teaching to facilitating with a constructivist-like method as a bumpy, sometimes unsuccessful road. When constructivist beliefs are not well enough conceptualized during teacher training, they are subject to erosion during teaching. Although pre-service teachers applied constructivist principles during their teacher education coursework, these principles were abandoned in the first full time teaching job”. Also, the majority (78%) complained about the material shortage and lack of preparation time to design and adapt authentic materials to use them in a problem-based classroom so that they meet various students’ interests and learning needs on the one hand, and curriculum goals on the other hand. A large number of participants admitted that “preparing their student for the final English exam which is highly content-oriented” is the major barrier to the implementation of innovative teaching practices such as PBL. School administrators’ and policy-makers’ expectations from teachers was also quite frequently mentioned constrain in this survey. This is probably due to the fact that in Latvia, teacher’s performance is evaluated largely according to the final exam grades and academic achievements of their students.

Finally, the participants reported that one of the main concerns with the problem-based teaching is that it is difficult to determine the place of the PBL approach and activities in the English language curriculum.

Conclusion

To summarize, the study revealed that most teachers surveyed hold constructivist or mixed (traditional-constructivist) beliefs about teaching and learning. However, the observational data illustrated that most novice teachers in this study largely use traditional lecture-based and teacher-cantered pedagogical practices.

Based on the results, it is clear that on the one hand, almost all novice teachers are aware of the importance to transform today’s education and to use innovative student-centred pedagogical practices; however, at a closer look, it becomes obvious that not all novice teachers are actually prepared or ready to do so due because of a number of factors. Respondents admitted that they often have to choose more traditional forms of classroom practices and instruction which was contrary to their actual beliefs about the nature of teaching and learning. The transition from traditional direct teaching to a non-direct constructivist teaching philosophy might be a considerable challenge for them since most teachers tend to adopt the pedagogical practices that they observed in their early years while being learners themselves and also which they have applied because the traditional school system makes teachers believe that they have to work this way.
Furthermore, the present study revealed that novice EFL teachers require more specific professional training on the use of innovative student-centred teaching methods, techniques and approaches in EFL classrooms.

Although this study involves only 25 participants, and the results cannot be generalized, they might be useful for teacher educators, teacher education and professional development institutions, and school administrators as the study uncovers and provides insight into the realities of novice EFL teachers’ beliefs and classroom practices.

INTERNATIONAL TERRORISM IN THE 21ST CENTURY – 16 YEARS AFTER 9/11 2001

Raluca Iulia Iulian

Abstract: After the end of the Cold War, the new European and global security environment has undergone profound changes. In the new security environment, international terrorism represents one of the main threats at a global level, the others being the proliferation of chemical, atomic, and bacteriological weapons of destruction and organized crime. Terrorism is difficult to define. Although it is an important issue today, there is no unanimously accepted scientific definition. There have been numerous attempts to define terrorism that complement each other. The paper focuses on Islamic terrorism which has undergone a certain evolution over time and has proliferated in recent years. Nowadays, it has some particularities which will be presented in the paper; they reflect the specificity of this phenomenon with a view to understanding its origin, the purposes, and its consequences. Samuel P. Huntington’s theory of the Clash of Civilization and Eric Neumayer and Thomas Plümper’s theory of the Strategic Logic of International Terrorism provide useful explanations. The aim of the paper is to examine the evolution of this phenomenon after 9/11 2001, which represents a turning point in the evolution of international terrorism.

Keywords: security environment, international terrorism, fight against terrorism

Introduction

During the Cold War, which lasted around half a century, at the international level, a Third World War was about to start, with devastating effects on all the States, both the victorious and the defeated ones, for the entire human civilization. After1991, the possibility of confrontation between the two opposing blocks disappeared. Nevertheless, a new threat, with old origins, became an increasingly worrying problem for the European and global security and stability: the international terrorism. At the end of the 20th century and the beginning of the 21st century, the terrorist attacks on the Western world escalated, and their number has increased especially in recent years. The attacks of 9/11 2001 were particularly powerful, and they marked the beginning of a period of intensification of this social phenomenon. Consequently, the U.S.A. and its allies in the Western Europe created the international coalition against terrorism, which seeks to defeat terrorism anywhere on the globe. To this purpose, the military interventions in Afghanistan and Iraq were carried out.

16 years after 9/11, this paper aims to point out the main aspects in the evolution of the Islamic terrorism from 2001 until now and to analyze the reasons why terrorism is the main threat to global security and stability.

Attempts to Define Terrorism

From an etymological point of view, the concept of terrorism comes from the Latin “terror” (“terroris”) which means to “frighten” or to “tremble.” In the Greek mythology, the terror (phobos) and the fear (deimos) were the names of the two horses which drew the chariot of Ares, the God of the war (McInn, 1970, p.25). During the French revolution, an intensification of the “terreur” was noticed. At the end of the 19th century and the beginning of the 20th century the suffix “-ism” was added to the word “terror”; thus, “terrorism” refers “to practice the trembling” or “causing the frightening.”

It is difficult to establish with precision when and where terrorism appeared. The idea of terror is probably as old as the human society. The first who attempted to define terrorism and to regulate it from a legal point of view were the Romans who, in 103 B.C., in Lex Apuleia, called Crimen Majestatis any internal or external action directed against the integrity of the state.

Terrorism is a contested concept and, by its very nature, difficult to define. Throughout time, various interpretations were given. The experts do not agree on one definition. The scholars have not yet reached a commonly accepted definition of this phenomenon. Andrew Silke (2014, p. 5) attempted to explain the difficulty of defining terrorism in the sense of finding a commonly accepted operational definition. There are many national and regional definitions, but there is no universal legal definition approved by the General Assembly of the United Nations. The UN Security Council Resolution 1566,
which was adopted unanimously on 8 October 2004, stipulated that “terrorism is a serious threat to peace,” but it lacks legal authority in international law (UN Security Council Resolution 1566, 2004). Since the United States faced this phenomenon on 11 September 2001, several definitions have been elaborated by its state institutions. In accordance with the definition given by the United States Department of Defense: terrorism is “the calculated use of unlawful violence or threat of unlawful violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious, or ideological” (International Terrorism and Security Research). The FBI considers that “terrorism is the unlawful use of force and violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives” (Ibidem). In the opinion of the Department of State, terrorism is “premeditated, politically-motivated violence perpetrated against non-combatant targets by sub-national groups or clandestine agents usually intended to influence an audience” (Pattern of global terrorism 2002, 2003, April). All these definitions complement each other, and they refer especially to the Islamic terrorism which represents the most flagrant form of terrorism nowadays.

The Islamic terrorism

Islamism is not a theological doctrine, but a concept which has the political use of Islam at its core. Islamism must be differentiated from fundamentalism, which is the desire to return to the basic texts of Islam. It is seen as a crusade against the unfaithful ones. It is meant to carry a religious message. The concept underlying the actions of this type of terrorism is “jihad” or “djihâd.” The Arab word means effort, fight, and punishment (Marcu & Georgescu, 2003, p. 205). It is used in order to express the effort with the aim of acquiring an objective. It also indicates the fight to defend Islam. The translation of “holy war,” which is often given to it, is highly disputed by the Islam representatives. In Arabic, this concept means to make greater efforts in order to reach the reign of God. As a Universalistic religion, Islam must be propagated by the Muslim community on any non-Muslim ground, until it extends to the whole world. According to traditional doctrine, to fight for the djihad is an act of pure devotion (ikhlas) and those who are sacrificed, those who die in this fight become martyrs (shuhada) and they benefit from an immediate place in the Paradise. This obligation is considered the sixth pillar of Islam. The objective is the restoration of the caliphate (symbiosis of the policy and the religious) and the reunification of the Muslim community (oumma).

At the moment, the phenomenon of radical Islam in its fighting form is the most important of all political movements inspired by religion. The terrorist threat represents a new type of threat, which differs from the traditional threat coming from a state or an alliance of states. The enemy was clearly named, “international terrorism,” but, at the same time, it is “not an identified enemy” because it is more difficult to establish it with precision, to detect it, and to envisage its actions.

Theoretical framework

Terrorism is an old, but a very topical phenomenon. There is no theory to explain it in its entirety. The theory of the Clash of Civilizations offers a starting point in the analysis of this phenomenon. Samuel P. Huntington analyzed the international situation after the end of the Cold War and he identified the explicative power of the cultural element in international relations. He estimated that “the most important distinctions among peoples are not ideological, political, or economic. They are cultural” (Huntington, 1996, p. 27). In his approach, “state” is replaced by “civilization.” He defines civilization as “the highest cultural grouping of people, and the broadest level of cultural identity people have,” being “differentiated from each other by history, language, culture, tradition, and, most important, religion” (Idem, 1993, p. 24).

The ideological differences disappeared, but confrontations between civilizations have emerged in the new international context. “In this new world the most pervasive, important, and dangerous conflicts” (...) are “between peoples belonging to different cultural entities” (Idem, 1996, p. 27). Between Islam and Christianity there was “continuing and deeply conflictual relation (...) more often the relation has been one of intense rivalry and of varying degrees of hot war” (Ibidem, p. 209) depending on “demographic growth and decline, economic developments, technological change, and intensity of religious commitment” (Ibidem, p. 211). John Esposito comments, “often found the two communities in competition, and locked at times in deadly combat, for power, land, and souls” (as cited in Huntington, 1996, p. 209).
Eric Neumayer and Thomas Plümper complete Huntington's theoretical framework and offer a theoretical approach to terrorism, the theory of the Strategic Logic of International Terrorism. According to the authors, the “theory builds on the rational approach to identifying and explaining the causes of international terrorism in conflict over political influence” (Neumayer & Plümper, 2009, p.8). A distinction is made between “terror group leaders” and the “followers” which are “the soldiers of the leaders.” The leaders have “a crucial, decisive position in the terror organization. They are the leaders and therefore behave predominantly strategically” (Ibidem). The soldiers “follow specified or unspecified commands, which may include the command of self-sacrifice in a suicide terror mission” (Ibidem, p. 10). Neumayer and Plümper point out that terrorism is not only a conflict between civilizations, but there are also other motivations: “the high strategic value of attacking Westerners” (Ibidem, p. 1) because the “terror leaders aim for political influence in their country or wider region” (Ibidem, p. 12). Thus, the connection between the internal and external policy presented by Bueno de Mesquita (2006, p. 637) in his new theory of international relations is realized.

11 September 2001 - a turning point in the history of terrorism
On September 11, 2001, four coordinated terrorist attacks, led by Osama bin Laden, were made by the Islamic terrorist group Al-Qaeda on the United States. The attacks were particularly destructive: the high cost in human lives (around 6,000 persons died and 9,000 were wounded) and the most significant material loss compared to the previous attacks. The U.S.A. considered that these attacks were directed against the American states because their essential components were concerned: the World Trade Center, a symbol of the economic power, the Pentagon, a symbol of the military force, and the White House, the symbol of the political power. In the case of the previous terrorist attacks the target was the civilian population, not the state.

Consequently, article 5 of the North Atlantic Treaty was invoked for the first time. Until that moment, it had referred to a traditional attack. After September, 11, it was extended to terrorist attacks. This is the first and only time that this article has been invoked until now. The international anti-terrorism coalition was created. The military campaigns in Afghanistan and Iraq took place. These campaigns did not have the expected success because terrorism could not be completely eradicated and democracy established. Instead, Al-Qaeda leader Osama bin Laden was captured in Pakistan.

Due to the European Union countries' participation in the military campaigns mentioned above, the result was a series of terrorist attacks on the European states, the U.S.A. allies in the fight against international terrorism. They targeted the peaceful civilian population. For example, the 11 March 2004 Madrid train bombings killing 192 people and injuring around 2,000; the 7 July 2005 London bombings on underground rail lines and bus when 56 people died and more than 700 were injured; the 21 July 2005 London bombings, with no victims. Other terrorist attacks that took place between 2005 and 2015: the 22 July 2011 Oslo attacks with 77 victims; Charlie Hebdo, the French satirical paper, attacks in Paris on 2 November 2011 and 7-9 January 2015, 14 people were killed, out of which 2 police officers; Toulouse and Montauban shootings on March 11 to 19 2012, London attacks on 22 May 2013, Brussels attacks on 24 May 2014, and Copenhagen attacks on 14 February 2015. (What major terrorist attacks have occurred in Europe in recent years, 2017). The frequency of the attacks has increased especially over the past three years due to the involvement of the Western states in the bombing of ISIS (the self-proclaimed Islamic State) targets in Iraq and Syria. In 2016, there were several attacks: in Brussels (22 March), Nice (14 July), and Berlin (19 December). In 2017, the most severe terrorist attacks in Europe were in Great Britain (March 22, May 22, June 3), Sweden-Stockholm (April 7), France (April 20), Catalonia attacks: Barcelona (16 August), and Cambrils (18 August). Some attacks involved vehicles plowing into crowds (Armed attacks and terrorist attempts committed in Europe in 2017, 2017). Italy has repeatedly been threatened by the ISIS.
In addition to the above mentioned attacks, smaller ones took place permanently in the European Union countries. The organization ISIS claimed responsibility for these attacks. They were directed against the civilian population to intimidate them by terror, and not against the state institutions. There were no motivations declared. The exception is the attack that took place at the editorial office of Paris. Some attacks were carried out on important days for the European civilization: public and religious holidays.

Discussion

Referring to the traditional attack, Carl von Clausewitz considered that the “war is a mere continuation of policy by other means” (von Clausewitz, 1873, chapter 1, para. 24). Terrorism is different from the traditional war where confrontation occurred between two or more visible enemies. Terrorism is an atypical, asymmetric kind of war, with its own specific characteristics. The enemy cannot be identified. It targets the national security of the aggressed states, and it causes material damage and human loss. It has reached an unprecedented peak. Terrorism is a war characterized by the lack of a defined operation theater, by the lack of a delineated battlefield, of some identification means (uniforms), of an ideology, institutions, by the usage of man as a weapon, by the usage of classical or artisanal weapons, by the usage of the surprise factor, rapid, complex and diverse actions, carried out anywhere and anytime, meant to bring terror, the lack of strategic coordination and the maintenance of strategic initiative, and especially, cyber spatiality.

Terrorism is a very complex phenomenon, with violent actions against some precise targets, which, in most cases, cannot defend themselves. It is the weapon of the religious extremist, of the one who intends to kill, to frighten, to dominate by means of terror. Essentially, the terrorism takes the form of a violent act, which often targets civilians, its purpose is political, it aims at publicity, the organization is clandestine, and the acts are likely to have psychological effects.

Terrorism proved to be a new type of enemy, which is very difficult to fight since Western states do not have efficient means to deal with it.

After September 11, the U.S.A. took a number of firm internal measures, and consequently there has been no terrorist attack on its territory since 2001, and those that have been initiated have been detected and annihilated in the early stages. This was possible due to the development of some new, effective anti-terrorist legislation. These measures concerned the internal policy. Regarding the external policy, the U.S.A. launched military campaigns in Afghanistan and Iraq in order to capture Osama Bin Laden and destroy the Al-Qaeda training camps. The immigrants from countries that host terrorist organizations from Asian and African states (Iran, Iraq, Libya, Somalia, Sudan, Syria, and Yemen) were denied access to the United States by the order of President Donald Trump. The disposition was considered undemocratic.

Unlike the U.S.A., the European countries did not take similar measures and, consequently, there was a host of terrorist attacks. Grégoire Lalieu (2016) considers that to avoid repeating attacks “it was necessary to situate the attacks in their political, social and historical context” (to analyze this phenomenon). He estimates “our governments have not done” this. Certain politics elaborated by states led to a series of secondary phenomena which made it easy for terrorists to enter European countries (Among the refugees who entered the EU, terrorists of the Islamic State slipped, 2016).

The instruments which can be used in the fight against international terrorism are diplomacy, criminal law, financial control, military force, and information. All these must act in synergy because, on its own, each of them has severe legislative limitations.

Huntington's theory of the Clash of Civilizations has been confirmed by the events after 1990. The conflicts have arisen between the Islam and the West. According to Neumayer and Plümper’s theory, the terrorist leaders choose their targets for maximum efficiency. On the 11th of September, the target of the attacks was the U.S.A., the only superpower at that time and the symbol of the Western civilization and then its allies, the countries that participated in the anti-terrorist coalition in Syria and Iraq by aerial bombardments.
Conclusion

After 9/11 terrorism is no longer a usual form of terrorism, it is deterritorialized, internationalized, it is fought between an individual or more, and the rest of the world. Terrorism acts by non-military means and unprecedented forms.

Terrorism is a new type of war, therefore one needs to act accordingly by modifying current standards of classic warfare. Some important elements of combating terrorism are: an adequate legislative framework and firm organizational measures. In order to fight this scourge, countries need to change the military strategy and tactics in order to render the fight efficient. In addition, the means which will be used must have antiterrorist specific particularities, as the ones used until now turned out to be inefficient. Apart from technical means, Western countries need to change the ideological approach of this phenomenon. The problem of the fight against terrorism calls for solutions which differ from those used until now, another concept, another strategy. This war against terrorism can take many years, with an uncertain ending.

Unless appropriate action is taken, many innocent people will become victims. Terrorism creates panic among the population, and it disrupts their social and economic life, leading to chaos.

Throughout history, the Western world has faced many unfavorable circumstances but has managed to defeat them. We hope the same thing will happen in the current context through appropriate measures. One solution can be to avoid conflict because it does not lead to anything good and the preference for peaceful cooperation between cultures.

DEVELOPING THE READINESS FOR THE ORGANIZATIONAL ACTIVITY OF THE CADETS
Venelin Terziev,1 Nikolay Nichev2

Abstract: The tasks being solved by the military units, which are part of the Bulgarian Army, require the possession of high-level knowledge and abilities for organizational activity from the newly promoted Logistic Officers. While performing his functional obligations, the Logistic Officer must promptly and thoroughly estimate the received task, duly organize the activity of the subordinated units and personnel and organize the collaboration with the State authorities, with the business, non-governmental and further organizations.

The research target is the professional military training of the future Logistic Officers, while the research subject is the developing of readiness for the organizational activity of the Logistic Officers in the course of their professional military training. The aim of the research is to outline the lines for improving the process of developing of readiness for the organizational activity of the Logistic Officers in the course of their professional military training. The research methods are: a theoretical analysis of the literature for military education and of the standard documents is made in the course of the research; analysis and synthesis of the scope and the contents of the basic definitions, being used in the elaboration; abstraction; conclusion and analogy.

Introduction
The tasks, which are solved by the military units, part of the Bulgarian Army, require from the newly promoted Logistic Officers to possess high-level knowledge and abilities for organizational activity. While performing his functional obligations, the Logistic Officer must promptly and thoroughly estimate the received task and the available forces and resources and must duly organize the activity of the subordinated units and personnel. The specific character of the organizational activity of the Logistic Officers has an effect on the organizing of collaboration with the State authorities, with the business, non-governmental and further organizations.

Despite this, in the Regulation for the state requirements for the regulated profession “Officer for a tactical grade of control” and in the qualification characteristic of the curriculum for Cadets training, it’s paid insufficient attention to the questions for the training of the Cadets from the Logistic specialties for organizational activity. The education is directed towards the realization of the conception for the optimal obtaining of a wide range of competencies in the field of military science, and also knowledge of the activity of the civil, political, socio-economic structures and systems. Its’ aim is to develop knowledge, abilities and moral-volitional qualities, serving as a ground for professional progress, but no strictly specialized training for obtaining of particular abilities for organizational activity is foreseen. (Ordinance on state requirements for acquiring higher education degree „bachelor” in professional fields „Military” in the specialties of the regulated profession „Officer for tactical levels of command”, 2012; Training plans for education on specialty of regulated profession „Organization and management of military units at the tactical level” and military occupational qualification „Officer for tactical levels of command”).

Acts of organizational activity
In the scientific literature, there is no unambiguous definition of the term „organizational activity.” Some of the researchers consider it as an obligatory part of the professional activity of every expert. However this activity is scrutinized in two aspects: on the one hand as a basic professional activity, and in this case, the other activities of the expert are subordinated to it; and on the other hand as equal to the other professional activities, being a connection element of the solving of different professional tasks. Another part of the scientific commonwealth considers the organizational activity to be a function of the management process. The management process wouldn’t be possible without the

1 Venelin Krastev Terziev Professor, Dipl.Eng. Ph.D., D.Sc. (National Security), D.Sc. (Ec.); Vasil Levski National Military University, Veliko Tarnovo, Bulgaria; University of Rousse, Rousse, Bulgaria; University of Telecommunications and Post, Sofia, Bulgaria, terziev@skmat.com
2 Nikolay Bonev Nichev, Colonel Assoc. Prof. Ph.D., National Military University, Veliko Tarnovo, Bulgaria, nicheff@abv.bg
organizational activity, which in the management system is scrutinized as the basis of each management activity or as an independent kind of management activity. The analysis of the functional obligations of a Logistic Officer defines the basic directions of revealed organizational activity in his professional military realization:

- Organization of the training and of the fulfillment of orders, given by the Commander of the unit for logistic support. The single Commander principle and the principle of the fulfillment of the ordered tasks in the Bulgarian Army is a specific sphere of the professional military activity, and in this sense, the Logistic Officer acts simultaneously as a direct executor and as an organizer of the order fulfillment. From the contents point of view, the organizational activity of the order fulfilment consists of: evaluation of the commanders’ decision and of the ground and resulting tasks; evaluation of the required forces and resources for the execution of the task; taking a decision, tasks allocation; issuing of orders to the subordinate; organizing the work of the subordinate for the fulfillment of the given task; control of the execution of the tasks; evaluation of the carried out work and reporting to the Commander about the performance of the given task;

- Organizing the action of the subordinated units, of the military and civilian personnel during the performance of the missions and the tasks of the Bulgarian Army of all kinds of supplies: technical, food, materials, fuels and lubricants, ammunition, transport supplies, construction services, the supply of resources, etc.;

- Organizing the action of the subordinated military and civilian personnel and of the staff from other units during the fulfillment of the given by the Commander of the unit common tasks;

- Organization of the collaboration with the regional and the state authorities, with supply and manufacturing companies, with non-governmental and other organizations for conclusion of contracts for the delivery of defensive articles and for the providing of services aiming to enhance the military profession image and the patriotic education of the population and others;

- Organization of the cooperation between the personnel of the Logistic units and professionals forms the civilian sector for the performance of joint tasks;

- Organization of the professional military training of the subordinated personnel (Med, 2009a, Nichev, 2015).

A conclusion can be drawn from the carried out analysis, that the organization activity of the Logistic Officer in the military units, in comparison to the Commanders of combatant units, is more versatile and possesses a specific, which must be taken into consideration in the training process of the future Logistic Officers for the performance of their professional military activities. The specifics of the organization activities lies not only in its contents but also in its implementation.

Specific of the organization activity

First of all, the command and management of the activity of the Logistic units is awarded to the corresponding Commander of the unit, while the non-combatant officers organize the execution of his orders. Therefore, the organization activity must be aimed at the unconditional execution of the orders and instructions of the direct commanders and superiors and to be implemented strictly in conformity with the requirements of the operative laws, normative documents, methodologies, instructions and etc. In order to avoid the creation of a paradoxical situation, where the orders of the Commander could not be executed, because of the violations of the normative documents, laid down in them, the organization activity of the Logistic Officer ought to be directed towards assisting the Commander in taking a legitimate decision (Todorkov, 1998).

Secondly, the organization activity of the Logistic Officer is clearly regulated in the Decree of the military service, in the corresponding job description and in the orders and instructions, and for these reasons, it’s appropriate to treat each innovation as a way of improving the activity, not as a radical change.

Third, the activity of most of the Officers from the Bulgarian Army and from the structures, which are directly subordinated to the Minister of Defense, is limited in the frames of the military community, while the organization activity of the Logistic Officers comes out of these frames. In order to allow him to perform a big part of the allocated tasks to him, the organizing activity of the non-combatant
of the activity of the Logistic Officer, his organizing action is versatile and has to cover wide ranges, starting from food supplies, the supply of ammunition, technical maintenance, transport, infrastructural maintenance, etc.

Thus, the organization activity of the Logistic Officer comprises the joint organization of the work of many people from different spheres of the military life, the applying of special efforts for the providing of concordance and coordination of the activity of the people and the subordination of its results for the achievement of the basic aim - the logistic support of the military education activity. That’s what makes the organization activity the main service activity, whereas the developing of its readiness in the future Logistic Officers becomes an important goal of the military profession training in the Vasil Levski National Military University.

Developing of readiness for organizational activity

Yury Med defines the готовность of the Logistic Officers to perform an organizational activity as a professional and personal knowledge, comprising motivational, theoretical and practical components. Thereby the readiness appears to be a sub-system of the system of a higher level - preparedness for professional military activity and possesses all properties of the professional qualifications in part, which refers to the application of organization activities (Med, 2009b).

The motivational component of the readiness for organizational activity includes active positive relation to the organization activity and significant personal grounds for the implementation of the organization activity (grounds for self-assertion, for the scare of failure, for the achievement of positive results (Angelov, 1994).

The theoretical component of the readiness for organizational activity comprises the availability of required knowledge for the execution of the basic functions and developing of professional ethical standards for the implementation of organization activity. In conformity with the basic documents, which define the military professional activity of the Logistic Officer, the following belong to the knowledge, required for the performance of organization activities: organization and management of business units and teams, management psychology, pedagogy, deontology, ethics, conflictology, sociology, rhetoric, labor law, healthy and safe conditions of work, etc. The developing of ethical professional norms involves the possession of professional ethics, high moral consciousness, sense of responsibility, realized necessity of enhancement of the professional qualification regarding the questions of organization and management, ability to avoid, and, when necessary, to successfully solve various conflicts, the conscientious attitude to the functional obligations, respectful attitude to the inferiors etc. (Todorkov, 1998).

The practical component of the readiness for organizational activity shows out in the combination of abilities, which are necessary for the future Logistic Officer for the accomplishment of the organization activity of his first officer’s position. The analysis of the possible appointment to first officer’s position shows, that the list of the organization competences, he must possess, is versatile and each possible organization activity reflects in him. This fact gives a reason to unite these abilities into three groups, which are required to the greatest extent for the implementation of the organization activity.

These one are the communication abilities - skills, which allow the Logistic Officer to create his business, professional and personal relations, based on the mutual respect between him and his inferiors, his supreme commanders and chiefs, between him and the representatives of the state and local authorities and of the business, and other people, who are responsible for the logistic support of the military unit; analytical skills - the ability of a person to evaluate adequately his own personal competences and the skills of his inferiors to perform the given tasks, to evaluate the received tasks, to take the best possible decisions, to plan the performance of the tasks, to foresee the end results and the consequences of the taken decisions, to implement the obtained in the Vasil Levski National Military University knowledge for the enhancement of the effectiveness of the activity of the subordinate staff etc.; organization skills - the skills to allocate the obligations, to set out tasks for the subordinate staff,
to secure the performance of the given tasks with the required resources, to organize the actions for the performance of the tasks, to render control and assistance during the execution, to stimulate the inferiors etc.

The developing of such components is carried out during the process of the professional military training of the future Logistic Officers.

The motivational component is being actively developed with the help of the setup system for education work. In the Vasil Levski National Military University all the army rituals and the whole education activity starting from the moment of entering the High School until the ritual for the awarding of the first officer rank are intended to develop in the Cadets the consciousness of the importance and of the particular significance of the chosen profession and to form a sense of national awareness and responsibility.

The theoretical component is formed actively during the learning of the management subjects of the civilian specialty and of the special military subjects. The management subjects of the civilian specialty give the fundamental organization theoretical knowledge, while the special military subjects give the chance of obtaining the knowledge of the structure, algorithm and the special features of the organization work of the Logistic Officers during the peacetime insurance and during the wartime support of the troops.

The practical component is formed during the performance of the tasks of the military training period, of the obligations of the army service and his appointment as a Commander of a Cadets Detachment or as Second-in-command of a Cadets detachment.

The analysis gives a ground to consider the „preparedness for organization activity” to be a goal and a result of the military professional training and a professional personal knowledge, where the organizational functions (motivational component), the level of its learning (theoretical component) and the ability to implement this experience in the future professional activity (practical component) find their reflection.

The developing of readiness for organizational activity in the Cadets during their professional military training is predetermined by many factors, among which a special place is occupied by the specially created for that purpose educational conditions (Med, 2009b). Here belong:

- **developing of a positive attitude to the performance of the organizational activity.** This is achieved with the help of developing sense of initiative, self-confidence in their own competences, responsibility, independence, inclination to reasonable taking a risk, etc. in the Cadets and of realized idea that the organization activity is an important part of the military professional management activity of the future non-combatant officers;

- **Stimulate the obtaining of knowledge and professional ethical standards in the sphere of the organizational activity during the professional military training.** The knowledge of organizational activity mustn’t have just a general theoretical characteristic but must be connected to the appointing to the first officer position and to the performance of particular official obligations.

In order to achieve it, it’s necessary to turn the attention of the Cadets during the process of learning the special military subjects to the interdependence between all components of the organizational activity in the Logistic units and to the enhancement of the confidence in their own organizational abilities.

- **The focused development of the organizational activity aiming to meet the requirements of the first officer position.** In this case, we must have in mind the fact, that it’s impossible to obtain the full range of competencies, which would be needed by the future Logistic Officer in his organizer role. The number of these abilities is huge, and it’s really exceptionally difficult for the Cadets from the Logistic profiles to obtain all of them. That’s why it’s most advisable to develop the relatively independent groups of abilities, which characterize the personality requirements for the future officers and to take into consideration the contents and the peculiarity of the future organization activities. The described communication, analytical and organization skills belong to such groups of competences.

**Conclusion**

As a result of the carried out analysis the following conclusions can be drawn:
1. The organizational activity takes a specific place in the structure of the professional military activity of the non-combatant officers. This place is predetermined by the versatile characteristics of the contents, of the kind and peculiarity of the solved tasks during the performance of their official obligations and represents a necessary condition for a successful official activity.

2. The readiness for organizational activity comprises motivational, theoretical and practical components. The contents of these components ensure the developing of a positive attitude to the organization activity of the future non-combatant officers, obtaining the knowledge of the organization activity and development of the needed organization competencies for the execution of their functional obligations.

3. The developing of readiness for organizational activity during the professional military training of the Cadets is predetermined by many factors, among them an important place is occupied by the positive attitude to the performance of the organization activity; the stimulation of obtaining knowledge and professional-ethical norms in the sphere of the organization activity during the process of the military professional training; purposeful development of the organizational activity in order to meet the requirements of the first officer position.

HISTORIC MOLDOVA. HISTORICAL DISPARITIES, REGIONALISATION AND CROSS-BORDER INTEGRATION

Cristian Ploscaru,1 Ionuț Nistor2

Abstract: This study proposes a theoretical approach to the idea of a platform for research and education on the historical substance of regionalization in Romania, with reference to the case of the historical province of Moldova. Furthermore, to identify the consequences, reactions, weaknesses, opportunities afforded by administrative restructuring from a post-regionalization demographic and socioeconomic viewpoint. An inter-disciplinary analysis – historical, demographic, economic – the traits of a Romanian society stemming from Moldova, the historical dynamics that underpin the modern Romanian state, will provide a picture of the current situation, focused mainly on its causes while trying to find explanations rooted in economic and social behaviours and attitudes which came to define and inform the subsequent development strategy of regionalization, allowing Moldova to play a central economic role in relation to other territories, similar to the role it played in the past two centuries, in the context of European integration strategies, in neighbouring parts of the continent (Republic of Moldova, Ukraine). The theoretical approach involves three components, expanding concentrically: 1) component of knowledge / research; 2) digital platform; 3) e-learning component. The research component seeks dynamic historical development of Moldova, from the time after the Union of the Romanian Principalities until today, focusing on specific regional elements. We will try to identify and analyze the specific features of Moldova, links with other areas of historical Moldavia, as the interaction between them and the Romanian public policy. Within the demographic component, we look at the historical population dynamics of Moldova, including various ethnic and religious communities, rural-urban ratios, social and professional structures. Another issue concerns the economic and comparative analysis in space and time, with respect to Moldova historical economic dynamics parameters - resources, infrastructure, industry, agriculture, trade, transport, etc. Both aspects will be analyzed in correlation with the impact of a permanent political factor, pursuing public policies promoted by the political regimes in their chronological sequence.

Introduction

Our paper, Historic Moldova. Historical Disparities, Regionalisation, and Cross-Border Integration, addresses a topical theme. Our intention is to suggest some directions for research and application of the results in the educational process of our University, integrating other research results into a common platform, accessible to those are interested. Throughout its construction, it will incorporate strong practical objectives. We provide the development of integrated, interdisciplinary research, providing specialist support for the impact of regionalization of Moldova. Furthermore, to identify the consequences, reactions, weaknesses, and opportunities afforded by administrative restructuring from a post-regionalization demographic and socioeconomic viewpoint. An inter-disciplinary analysis – historical, demographic, economic – the traits of a Romanian society stemming from Moldova, the historical dynamics that underpin the modern Romanian state, will provide a picture of the current situation, focused mainly on its causes while trying to find explanations rooted in economic and social behaviours and attitudes which came to define and inform the subsequent development strategy of regionalization, allowing Moldova to play a central economic role in relation to other territories, similar to the role it played in the past two centuries, in the context of European integration strategies, in neighbouring parts of the continent (Republic of Moldova, Ukraine).

The theoretical approach involves three components, expanding concentrically: 1) component of knowledge / research; 2) digital platform; 3) e-learning component. The research component seeks dynamic historical development of Moldova, from the time after the Union of the Romanian Principalities until today, focusing on specific regional elements. We will try to identify and analyze the specific features of Moldova, links with other areas of historical Moldavia, as the interaction between them and the Romanian public policy. Within the demographic component, we look at the historical population dynamics of Moldova, including various ethnic and religious communities, rural-urban ratios, social and professional structures. Another issue concerns the economic and comparative analysis in space and time, with respect to Moldova historical economic dynamics parameters - resources, infrastructure, industry, agriculture, trade, transport, etc. Both aspects will be analyzed in

1 Associate Professor, „Alexandru Ioan Cuza” University, Iași, Romania, cploscaru@yahoo.com
2 Associate Professor, „Alexandru Ioan Cuza” University, Iași, Romania, inistor2001@yahoo.com
correlation with the impact of a permanent political factor, pursuing public policies promoted by the political regimes in their chronological sequence.

Results of the specialized research will be posted on an electronic platform. It will include extensive statistics, demographic and economic graphs and tables that can be accessed and permanently completed by other researchers. The platform will include a forum for discussion in real time, which can be used for organizing workshops, conferences or universities. It allows users to watch not only data (numbers, statistics), but also the performance, according to their own interests, graphs, tables and charts using available infrastructure information. One objective is to achieve interactive digital maps of historical Moldavia, loaded with all collected data and can be accessed for the purposes of space and time comparisons. The platform will host a photo library, a corpus documents, and a bibliography. All information will serve as a basis of support for students and will be used in seminars and supplementary courses, and for the general interest to the public at large.

Methodological observations and historiographical comments
Western research devoted to regional differences in demographic, socio-economic and habitat have a long tradition, their results are used by central governments of the states, and by managers of older or newer companies. We will report on the latest works and initiatives that provide context to our project. In 2008, a report was published by the Center for the Study of Demographic Change in Rostock (Tivig, Frosch, Kühnzopf, 2008, 32) trying to conceptualize and quantify regional changes of the population during 1990-2030 and the risks involved for companies operating in the European Union. There existed major interest, not only from researchers but also from national and European political structures for finding solutions to global challenges and this found expression in the creation of the ESPON 2013 Programme - European observation network on territorial development and cohesion. The program is funded by the European Regional Development Fund, and the purpose is to support development and cohesion policy designed by utilizing: available information, statistics, analyzes and scenarios on territorial dynamics, revealing territorial capital and development potential of regions and larger territories. Under the program, Corrado Bonifazi and Massimiliano Crisci drafted a paper (Bonifazi, Crisci, 2013, 230) whose objectives were to analyze the interaction between the factors of migration, demographic and economic in the last decade in Catalonia, by which to anticipate future interactions, depending on the results of regional projects implemented by EU countries. Study of The Relationship Between Demographic Change and Economic Growth in the EU conducted in 2007 by Prskawetz Alexia, Thomas Fent, Werner Barthel (from Vienna Institute of Demography, Austrian Academy of Sciences), Jesus Crespo-Cuarezma (Department of Economics, University of Innsbruck), Thomas Lindth, Bo Malmberg, Max Halvarsson (Institute for Futures Studies, Stockholm) provides a review of recent literature linking demographic structure growth. Based on data available for the EU in 1950 to 2005, the study is a prospective analysis of future implications of demographic change on economic growth in 2050. The document stresses that demographics may affect productivity through its impact on the economy, investments, human capital formation, technological change, etc., as the economic behavior of people and their needs vary at different stages of life, and changes in the age structure of a country may have significant effects on its economic performance.

Our research uses as point of reference the study The Role of Regional Competition for Demography and Regional Disparities in Germany, published by Florian W. Bartholomae and Alina M. Popescu of the University of the Federal Armed Forces Munich, in which they analyse the regional differences specifically between east and west and the northern and southern regions of West Germany, based on indicators such as natural population growth, fertility rates, migration, etc. Their findings show that demographic aging and population decline have serious consequences for the economic and social development of the country (Bartholomae, Popescu, 2007, 47).

In the United States, there are a number of institutes specially constituted to analyze socio-economic and demographic indicators. Institute for Research on Poverty, University of Wisconsin has developed a database to serve the general public, they store information about the local database, available online for the Midwest region. They include sites containing local statistics and a number of issues related to poverty: basic demographic information, employment, and income, health and mortality, social assistance programs. University of Texas and the Brookings Institution have collaborated to produce a website dedicated to urban poverty, which allows users to visualize poor areas of cities, determined by data provided by the censuses of 1970-2000 and know the economic development of these areas.
Office analysis of economic and social trends of the Iowa State University, collects, analyzes, interprets and disseminates information on social trends, economic and demographic. They created a well-organized site level data for states in the Midwest region.

In our approach, we start with the idea that Romanian regionalization should not widen economic disparities. Social frustrations exist in Moldova and are noticeably reviving in the form of historical justification, particularly in the intellectual and political arena, and more importantly, manifesting in the form of competition for access to scarce resources among sub-regions and counties (Sucava, Neamţ, Bacău, Iaşi, Galaţi). An inter-disciplinary analysis – historical, demographic, economic – the traits of a Romanian society stemming from Moldova, the historical dynamics that underpin the modern Romanian state, will provide a picture of the current situation, focused mainly on its causes while trying to find explanations rooted in economic and social behaviours and attitudes which came to define and inform the subsequent development strategy of regionalization, allowing Moldova to play a central economic role in relation to other territories, similar to the role it played in the past two centuries, in the context of European integration strategies, in neighbouring parts of the continent (Republic of Moldova, Ukraine).

Also, our research and documentary support complex developed from it, will continuously refer to the concept of territorial cohesion, European and national policies essential for regional development that aim at unlocking the potential of regional and territorial capital, in consonance with shared borders, to be seen as opportunities for development, all the while increasing cultural exchanges with neighbouring states. In this regard, the European program INTERREG supported by EPSON, attaches high priority to remote regions in close proximity to borders to other countries, thus affording the Moldovan Republic a unique privilege from both points of view (Scholich, 2007, 2). One of the most challenging and difficult issues related to the concept of territorial cohesion is the related concept of territorial capital, the description, and analysis of which is a central tenet of research. This concept was defined in Territorial Outlook by OECD (2001) on four levels: 1) capital infrastructure and housing; 2) knowledge capital; 3) cultural capital and identity 4) social capital all of which will be approached from a historical perspective, with particular attention being paid to demographic- and economic factors (OECD, 2001, 15). With the some importance are level of education, including literacy, access to various educational stages, the share of specialized elites and orientation, both at the sub-regional level and in terms of ethno-religious communities, historic landmarks and cultural dynamics of identity, their size measurable quantity - Romanian, Russian, Ruthenian and Ukrainian literature etc., media, associations and cultural organizations representing civil society, birth, death, infant mortality, population movements within and outside Moldova historic urban-rural ratio horizon and comparative urbanization policies and their impact etc. Thus, the current territorial capital can be better assessed by reference to its historical foundations, not just theoretical models, often contradicted by reality.

Research undertaken within the project includes both a theoretical component, about the new lines of research in the field, whose findings should be a specific theme and a practical component, the availability of research results, not only for academics but also more especially for the public and private entities involved in projects related to regionalization of Romania to benefit from the database and specialized expertise offered by the project. Regarding the theoretical component, an innovative way to promote the project aims would be by means of scientific benchmarking of aspects of regionalization processes under the influence of new regionalism concept, taken in recent years by the European strategy of integration (Lombaerde, Baert, 2012) and a still has relatively low impact among Romanian research specialists. This new regionalism related methodological model, successfully applied in studies of Western (American and European) should be adapted to the specific requirement of our case (Mansfield, Milner, 1997), (Maatli, 1999), (Herrschel, Newman, 2002), (Telò, 2007). Recent contributions suggest a correlation of economic and financial analysis for regionalization policies regarding the identity of the historical and political traditions of various national states, in order to identify explanations for collective behaviours that can make it difficult or, conversely, can stimulate the process of regionalization (Breslin, Hughes, Phillips, Rosamond, 2004, 10). Another innovative component of the research stems from the fact that regionalization should be understood as a complex response, on the one hand, the internationalization of markets and social division of labour, on the other hand, the political, economic and financial strategies of multinationals – EU policies of multinational companies, banking consortia, etc (Flemes, 2010, 15-29).
In Romania, there does not exist sufficiently rich experience in interdependent and interdisciplinary research on topics such as those undertaken by this project and especially research products often remain confined to academia, without producing tangible benefits to business, the state, and the citizen. This perspective endured many political and ideological constraints, as well as the strict demarcation and teaching of fundamental areas of knowledge (history, economics, geography, sociology), which in part caused parallel discourses, and in other cases (demography) lack of tradition and interference from the communist regime, did not leave enough room for major development. However, experience in the Romanian research is a useful start, especially recent contributions.

The need of justifying the national centralist-state, in democratic or totalitarian form, formed the foundation for the socio-economic, demographic and habitat policy perspective, which was mainly based in the tradition of historical writing. Romanian „provinces,” from a centrist point of view, were often viewed in the same way, from a teleological standpoint. There were, however, especially in the context of the search for a Romanian communal identity, further considerations beyond the Prut and the restructuring of post-December speech, saturated stereotypes, questions of „national project,” a common destiny. Beyond the need to unify in 1859, there were works that have attempted to quantify the costs incurred for Moldova (Ivănescu, Turluc, 2001) and presenting classical works with inexorable process of union of Bessarabia and Bukovina and unification benefits on different levels administrative, fiscal, cultural, studies were soon published noting constraints, differences and sacrifices. Recent studies (Cuşco, 2011, 203-216) on the Romanian state modernization policy of the three southern districts of Bessarabia in the Russian Empire between 1857-1878 and the reaction after 1878, capture a „symbolic issue” between the two countries on several more levels: administrative, economic, demographic. Two state models are at odds with one another, one democratic and the other autocratic, and how to impose their respective vision of a region with economic and trade potential: control of the Lower Danube.

Recent economic and demographic studies have attempted current challenges, realizing interchangeable research products and assuming that productivity, economic efficiency or consumption are expressed by reference to the number of different categories of population size. Concerns in this regard cover both contexts and global perspectives and case studies. A volume published by Bogdan Murgescu is a very useful comparative analysis of socio-economic development on the Romanian and European level, based on the "obsession gaps.” The author tries to explain how these development gaps were built and when these gaps accumulated while providing comparative analysis with other cases on the continent (Murgescu, 2010). The same general ledger and job falls Cornelia Mureşan, a summary of the demographic evolution in Romania, following the structure of the habitat and the urbanization process, sex and age structure of the population, legislation, using log-linear methods in regional chapters devoted to aspects of the demographic regime (Mureşan, 1999).

During the negotiations and discussions that took place in the period before accession to the EU were initiated, several research projects cover all the state of development of Romania in comparison with other EU member states. Through these projects, we remember the one coordinated by Valeriu Ioan-Franc, entitled Dezvoltarea durabilă a României în context European și mondial (Sustainable Development of Romania in the European and global context), conducted under the auspices of the National Institute of Economic Research (Vasile, 2007) Among the initiatives that have sought to integrate the concerns of many researchers interested in social issues and dynamics of change in Romania, can be remembered the coordinated work volume (Iluş, Nistor, Rotariu, 2005). Such researches are focused more on current reality issues and seek to provide a projection of what will be happening in the near future and therefore do not concentrate on the historical aspect, and nor do they analyze the situation in the long term. The research series points is essential to this project from a comparative perspective, the topics and similar case-study tangents are coordinated in the volume by Ioan Bolovan (Bolovan, Paula, 2007) comprising an amount of studies focused on the experience of Transylvania, trying to provide a detached perspective of classical key of the national historiography that treat in many cases, the problems related to the demographic regime of the area in a passionate and ethnocentric way. The work captures demographic change occurring amid world wars, the refugee problem in 1940, returns, and case studies. Marinela Istrate provided an applied study of human geography, examining the role of cities in economic development of Moldova, the role of physical distances and a constraints framework played in shaping the urban settlement network, and how the
centrality determines the characteristics of spatial mobility of population and the development of cities (Istrate, 2008). The two volumes (Jinga, Soare, Dobos, Roman, 2010) deals with a sensitive topic, but important in the economy of the project pronatalist's development under Ceausescu (1966-1989), following its effects and impact on the population and it relates to similar phenomena in other countries in the communist camp, concluding that Romania has applied the most restrictive legislation on voluntary interruption of pregnancy.

Ethno-religious dimension is as challenging and it not be excluded from the sphere of interest of this research. By 1878, between the two world wars and during the communist state report, ethnic minorities have always been formally negotiated with around the policies adopted by the government and the Romanian parliament, and pragmatically at the community level, with local decision-makers. But although the dominant thinking of the Romanian state laws relating to minorities was, until World War II, the acceptance of international provisions, policies unification, centralization and politico-institutional homogenization and economic territories, in 1918 tense situations with minority ethnic dialogue was soon feigned. After 1945, inspired by the practice of the Soviet Union, the communist state under all ideological imperatives, revised its policy towards minorities, creating a new body composed of social classes that transcend ethnic and linguistic borders. Abolishing racial laws adopted after 1938 and building official atheism, in an attempt to reduce the importance of the religious factor in identifying the group, the new „elite” aims to incorporate minority communities in the social and political system of the Communist bill. There was, therefore, a formal integration, symbolic, beyond the means of setting administrative policy towards minorities, but these measures were often perceived as being imposed, and not agreed to, and led to resistance and institutional reluctance, factors promoted by the central and local power in relation to "the others" (Hebrew, Roma, Russians, Poles, Ukrainians, Bulgarians) tacit exclusion policies led to the closure of the key institutions of the Romanian state for the minority. There is an amount of more recent work published volumes of documents and state policies towards Virgil Pană (Pană, 1996), Levente Salat (Salat, 2008), Monica Vlad (Vlad, 2008), Irina Livezeanu (Livezeanu, 1998), Stefano Bottoni (Bottoni, 2010) and serial collective volumes (five in number) coordinated by Sorin Radu, Vasile Ciobanu (Ciobanu, Radu, 2006-2011) and research institutes focused specifically on minority issues as the Institute for Research on National Minorities in Cluj Napoca. Their philosophy is based on organizing and analyzing state policy Romanization of cities and industrialization, made by liberals in the interwar period. Elements of the debate focuses on the economic, administrative and cultural Romanian authorities, objectives seen as necessary Romanian affirmation element in the new provinces, but also some concepts that circumscribe state policy: educational and administrative unification of Romania as a territorial form of integration and homogenization, but not the integration of minorities, racial resorts of state action, the trend of assimilation by the majority of other Romanians.

Conclusions

In conclusion, the objectives of our research are focused on two fundamental aspects - knowledge and communication. The research component is of course primarily dedicated to the subject of knowledge, perspective and interdisciplinary analytical priority, which is subordinated to the collection and processing of a demographic, economic, cultural reference period. The objective is to identify specific features of Moldova, in terms of historical, demographic, and economic and responses / reactions to public policy in different historical stages. Setting these goals assumes the existence of differences in development between Moldova and other historical regions of the country, but also between different sub-regions of Moldova. The public policies of the Romanian regimes between 1859 and 2012 have managed successfully to mitigate these differences. On the contrary, the gap increased and labor migration from Moldova, a national domestic phenomenon before 1989, turned to the West in the context of de-industrialization of the country and EU integration. Component of research / knowledge has a fundamental aim to identify rational, substantiated and reliable answers, resulting in a complex analysis with a solid interdisciplinary and comparative component. To achieve this objective, scientific challenges mainly focuses on the processing of data gathered from their investigation of historical research, and demographic and economic data to be classified and correlated based on a number of specialized criteria that require interdisciplinary efforts. Research in the project, in all its complexity, will lead to some solid conclusions on the human and material potential of Moldova, according to demographic and economic benchmarks correlated quantitatively, following their dynamics in time.
and space, opportunities for regional development and the specific cross-based characteristics of the region and collective behaviours, and vulnerability of the region, as they result from historical experience.

STUDYING MINDSETS OF STUDENTS TO SOLVE PROBLEMS

Tsvetana Kostadinova Antipesheva

Abstract: This theme of solving problems is very actual. Their conclusion begins in school and continues whole life. This presentation consists of an investigation with students about solving problems. During the work the following conceptual basis for research intentions was raised: As a basic conceptual basis in this study the increased interest in psychological approaches such as changes in Bulgarian educational paradigm determine the need for the transformation in education is considered. Conceptually, the reason is the fact that the current situation needs ways which to be found to improve the practical training of young people.

Last but not least, it can be said that modern socio-scientific context puts imprints on attitudes and ways of acquiring the students, the emphasis is placed on the learner as an individual - with specific needs, attitudes and motivation. In connection with the teaching of problem-solving, the following general questions arise: How the students in the program acquire the necessary training? Is it of adequate in their future practical activity? How modern is the current methodology for solving problems and how to update it? What are the new guidelines to improve training in order to solve problems in a meaningful? How to determine the ratio of students to solve problems? There are the conclusions from the results of the investigation.

Introduction

Only the accumulation of knowledge in a discipline is not enough. It is important that the knowledge can be applied in solving various practical tasks. "In applying the knowledge in practice, a rise is carried from the abstract to the concrete. Understanding and remembering are absolutely necessary but not the only precondition for the successful application of knowledge" (Andreev, 1987). Solving problems recreates theory into practice and demonstrates the meaning of the study. In this scientific-practical study, the problem of the attitudes of students learning to solve tasks is examined. Psychological approaches to selection, training, and implementation of rules for solving problems are established. The reflection of the author from his long teaching is used.

A real part

It could be said that the "quality of each product as well as of knowledge, is a function of the quality of the processes that create the product. Only through the optimum management of knowledge and its quality can we be given the correct answer to the questions: "What knowledge is to be produced," "For whom is it to be produced," and "How is it to be produced" (Ivanova, 1994).

This scientific-practical study does not claim to solve all questions but, has the ambition to interpret the survey given to students, which was conducted during the academic work and gives both interesting results and has formed a certain type of thinking.

The purpose of the survey is to establish: what are the attitudes of students to the process of solving problems flowing in classes; what are their attitudes to their own participation in this process as future leaders and representatives of various institutions.

The working hypothesis of this survey can briefly be formulated as follows: We assume that the attitudes of respondents will be changed in a positive way, after passing through a series of trainings for solving problems in different disciplines.

The study was conducted with students majoring in "Technology, technology and entrepreneurship" / TTP / "Business Management" / SU / and "International Economic Relations" / Relationships / first course in the academic year 2015/2016. Their total number is 116. The distribution of subjects was as follows: TTP - 10 T - 82 and Relationships - 24. Consciously freshmen were selected to track their attitudes and presented at the beginning of their training. It would be interesting for them to be tracked down and at the end of their studies. The actual survey focuses on the attitudes of students for the specific type of learning activity.

The attitude towards an object, exploring attitudes to it are binary - "strongly disapprove" - "not approve." Three components have been explored:

1 Faculty of Economics, South-West University "Neofit Rilski", 2700 Blagoevgrad, Republic of Bulgaria, cvetana_anta@abv.bg
Associated with our knowledge of the site;
Related to the emotional evaluation of the site.
Related to the behavior of the object.

Writing on attitudes, we are actually looking at the attitude of the individual and in this sense they are regarded as having a "sustainable latent predisposition of the individual to positive or negative assessment of the object or situation that arises on the basis of life experience, it turns regulatory dynamically organized influence on perceptual, emotional and mental processes and results in consistency of behavior - verbal and non-verbal" (Mitkova, 2010)

Attitudes can be defined as a mental state of the human predisposition to certain activities in certain situations. They can be based on positive or negative views about people, events or processes forming the subject of attitude. The influence of attitudes on the effectiveness of each activity is directed and deep because they are a constructive element of motivation and personal attitude to the action. Attitudes are based on the value system of the individual, his perceptions about themselves and the world. Like most mental phenomena they are dynamic and subjected to change and development that would motivate another similar study.

In the survey, we chose to study six functions of attitudes to solve problems. There is also included the rock of denial for a fuller examination of these attitudes. The questions are covered in full enumeration of possible answers (Piryov & Desev 1981).

1. Cognitive attitude - reflects the attitude of the individual to knowledge that can be acquired. Here it reflects the trend towards deepening knowledge in a professional way. The individual seeks knowledge to make sense of the world around him;
2. Value adjustment - reflects the attitude of individuals towards the realization of values in the working process. Here, it is good for the student to attach importance to the good performance of the team, the standards in the system, and gives a higher sense of their future profession;
3. Material attitude - reflects the material interest of students for participation in his future work purely. The attitude towards material gain applies to comparing their pay with the salaries of others;
4. Ego protecting attitude - reflects the desired future position in the hierarchy of the society. It is part of the reference group, and one has the feeling that was adopted as part of it;
5. Energy saving attitude - reflects the attitude of the individual to retreat and the failure to act. The attitude is passive about investing efforts into action. Lack of enforcement activities on its own initiative;
6. Socially progressive attitude - refers both to career development, i.e., the desire to rise in the hierarchy (even without regard to real possibilities) and projection over other (even without regard to the real achievements) and to the benefits and privileges that a person receives unlike other people;
7. The scale of denial - this scale reflects the existence of resistances, negative attitude of the individual to the job and negative attitude towards the implementation of the tasks in teamwork.
Higher scores on this scale could mean as the entirely negative attitude of the student, and a moment of dis-adaptation. Regardless of the interpretation, obtaining inflated results on this scale, one should address the causes and take appropriate measures.

The proposed functions are the prism through which will be examined the attitudes of students to the process of solving problems. The main allegations are formulated in the form: .................................... , because: In the final version 5 are the formulated statements. Of the surveyed students 78 are women, and 38 are men. Graphically it looks like this: (fig. 1)

<table>
<thead>
<tr>
<th>Figure 1: Ratio women / men</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source: Author</td>
</tr>
</tbody>
</table>
The first question is worded as follows: "I like my chosen specialty because:
1. ... gives me the opportunity to learn many new things.
2. ... the specifics and objectives are important to me
3. ... gives me good opportunities for future payment.
4. ... at future work I could run a team.
5. ... I led without much effort.
6. ... have the opportunity for career development.
7. ... I chose it by accident."

Stratification in these attitudes is as follows: 1 - 39 students, 2 - 34 students, 3 - 7 student, 4 - 10 students, 5 - 5 student, 6 - 18 students, 7 - 3 student. The schedule specified values are distributed as follows: (fig. 2)

![Figure 2: Election of specialty](image)

Source: Author

It is noteworthy that the logical answers to every student are the majority. Visible is the pursuit of knowledge, to the opening of new goals and perspectives.

The second question was: "Solving the problems in the learning process is significant because:
1. ... thus I put into practice what they have learned in lectures.
2. ... learn to seek the most valuable in the taught material.
3. ... at solving practical problems may have an additional charge.
4. ... I could become head of the experimental team.
5. ... guiding his colleagues will leave them to do the job.
6. ... dealing with tasks prepares me for my professional development.
7. ... I do not like the process of solving problems."

These responses from students are the following: 1 - 41 students, 2 - 43 students, 3 - 5 students, 4 - 11 students, 5 - 3 students, 6 - 3 student, 7 - 10 students. Graphically these values look like this: (fig. 3)

![Figure 3: Importance of solving problems](image)

Source: Author
On that graph, it is shown that there are few results. Obviously, students do not associate the process of solving problems in their future career. The case may have its logical explanation. If the exercises are solved "invented" and non-life tasks, their effect would be purely academic. The tasks that are solved with training, an opportunity must be from actual practice. They need to be referred to real objects.

Third question: "The selection and formulation of tasks are important because:

1. I get the opportunity to select tasks in their future activities.
2. I can prioritize tasks to be performed.
3. I can select tasks in their future activities.
4. Every choice is important.
5. Not like to solve problems.

The responses of the students are:

1 - 33 students, 2 - 37 students, 3 - 7 students, 4 - 15 students, 5 - 5 student, 6 - 7 student, 7 - 12 students. The schedule specified values are distributed as follows: (fig. 4)

![Figure 4: Selection and formulation of tasks](image)

Source: Author

The condition of the task and its results correspond to a real practical situation. It should not lead to absurd or unusable results. In the practice of training, most often the given tasks to educational content are selected intuitively. The connections between the elements of the content must be transformed into an adequate system of these tasks. Choosing the type and complexity of tasks and sequence of their placement, the trend towards a gradual complication and promotion of cognitive activity should be optimized. The selection of tasks, the way of putting them, and their analysis helps to see beyond the individual task and to grasp the general way to solve them.

The fourth question is: "The proposed steps for solving tasks help because:

1. Thus the problem is decomposed and easy.
2. Learn to work in stages.
3. Every stage could be well paid.
4. Gives me an opportunity to acquire skills to work in groups performing different stages.
5. Cannot miss any stage if somebody else does the job.
6. Each step brings me closer to my future practical activity.
7. These steps do not help me.

Stratification in these attitudes is as follows: 1 - 45 students, 2 - 31 students, 3 - 4 students, 4 - 20 students, 5 - 3 students, 6 - 10 students, 7 - 3 student. The schedule specified values are distributed as follows: (fig. 5)

![Figure 5](image)
Answer 1 and 2 give 46% of the total. This means that students perceive stages offered as an aid to solve the problem. Breaking the separated parts into tasks whose solution is easier and faster. The end result summarizes the stepwise answers. So many tasks are algorithms, and their decision becomes certain rules.

The fifth question is worded as follows: "I participate fully in the process of solving problems because:
1.… thus I get deeper professional knowledge.
2.… thus appreciate their competence.
3.… the physical benefit of dealing with tasks is great.
4.… in its future shall I set tasks.
5.… prepare for a manager who only puts tasks.
6.… have the opportunity for advancement in the hierarchy after dealing with problems.
7.… I have no choice."

Stratification in these attitudes is as follows: 1. - 29 students, 2. - 38 students, 3. - 7 students 4. - 14 students, 5. - 9 students, 6. - 15 students, 7. - 4 students. The schedule specified values are distributed as follows: (fig. 6)
And here it seems overwhelmingly professional. Students assess their own competence to contribute fully to the work. The important fact is the significance they attribute to their work in the team and their commitment to the event.

**Conclusion**

The conclusions that can be finally drawn are the following:

- The accumulation of knowledge leads to more easily cope with any task;
- There is generally positive attitude towards the process of solving problems both in school and in life;
- Even people with mercantile attitude tend to participate in this process, knowing that they will benefit from it;
- Possible positive change on their own values and attitudes.

MEDICINE AND PHARMACY
THE EFFECTS OF AN INNOVATIVE TECHNOLOGY APPLIED AS VIRTUAL REHABILITATION ON CLINICAL OUTCOMES IN ANTERIOR CRUCIATE LIGAMENT INJURY

Onur Aydoğdu,1 Zübeyir Sari,2 Ufuk Saadet Yurdalan,3 Gülden Mine Polat4

Abstract: In recent years, many different technologies on virtual rehabilitation have been produced and used in research. However, existing studies are limited because most of them focus on the balancing ability of the elderly or studied stroke patients with same systems. Thus, it is necessary to investigate the effects of a new virtual rehabilitation system in patients with Anterior Cruciate Ligament (ACL) Reconstruction. The purpose of this study was to investigate the effects of a virtual rehabilitation system using a MarVAJED® system which provides visual and auditory stimulus aimed at educating and controlling the joint proprioception, range of motion, pain intensity, and knee swelling in individuals with an ACL injury. A total of fifteen patients with ACL reconstruction participated in this study. In addition to conventional physiotherapy, a virtual rehabilitation treatment was applied with visual and auditory stimulus for a total of eight weeks, three sessions per week. There were statistically significant improvements in measures of proprioception, range of motion, pain intensity, and knee swelling between pre- and post – treatment (p<0.05). We concluded that this new VR system known as MarVAJED effectively treat ACL patients by improving proprioception, range of motion, and by decreasing pain intensity, and knee swelling.

UDC Classification: 617.3 ; DOI: http://dx.doi.org/10.12955/cbup.v5.1047

Keywords: Innovative Technology, Rehabilitation, Physiotherapy

Introduction

Knee joint injuries are common in activities of daily life as well as in sports activities. Anterior cruciate ligament (ACL) injuries are one of the most common knee injuries (Lange et al., 2015; Tichonova et al., 2016). ACL injuries do not recover spontaneously because of poor vascularization of the injured ligament. Therefore, when individuals injure their ACL, they should often take comprehensive rehabilitation (Takata et al., 2017).

Various treatment protocols after cruciate ligament injuries for rehabilitation have been studied, which focus on open versus closed chain exercises, early versus delayed weight bearing status, use of brace post operatively, accelerated versus non-accelerated rehabilitation, supervised versus home-based rehabilitation along with strength training, balance training, and criteria for return to play (Priyanka et al., 2017). Due to new trends, to accelerate recovery, innovative technology should be made an integral part of ACL rehabilitation.

Improvements in technology have made virtual rehabilitation popular and available in various rehabilitation systems. Virtual rehabilitation systems play an increasing role in rehabilitation. They provide an interactive environment and increased motivation for patients during the session (Ferreira et al., 2016). Virtual rehabilitation may be an appropriate device because it allows the clinician visual and auditory feedback to train their patients. In addition, it is possible with virtual rehabilitation to manipulate the environment that would be impractical or impossible to create in the real world (Gokeler et al., 2016).

In recent years, many different technologies on virtual rehabilitation have been produced and used in research however, existing studies are limited because most of them focus on the balancing ability of the elderly or studied in stroke patients with same systems (Park et al., 2015). Thus, it is necessary to investigate the effects of a new virtual rehabilitation system in patients with Anterior Cruciate Ligament (ACL) Reconstruction.

The purpose of this study was to investigate the effects of a virtual rehabilitation system using the MarVAJED® system which provides visual and auditory stimulus aimed for educating and controlling the joint on proprioception, range of motion, pain intensity, and knee swelling in individuals with ACL injury.

3 Marmara University, Faculty of Health Sciences, Istanbul, Turkey, ufukyurdalan@hotmail.com
4 Marmara University, Faculty of Health Sciences, Istanbul, Turkey, guldenpolat2002@yahoo.com
Methods

A total of fifteen patients with ACL reconstruction participated in this study. In addition to conventional physiotherapy, a virtual rehabilitation treatment was applied with visual and auditory stimulus for a total of eight weeks, three sessions per week.

Visual and auditory stimuli were applied via the MarVAJED® system which was developed by Marmara University, Department of Physiotherapy and Rehabilitation with the aim of educating and controlling the joint as a virtual rehabilitation system.

Before and after intervention, proprioception was measured with a Biodex System Pro 4 Isokinetic Dynamometer (Sadeghi et al., 2017), the range of motion was measured with a universal goniometer, pain intensity was measured with a Visual Analogue Score (Huskisson, 1983), and knee swelling was measured with a tape measure (Jakobsen et al., 2010).

The study was planned as a clinical study and ethical approval was obtained from the Marmara University Faculty of Medicine Clinic Researches Ethical Board.

MarVAJED

MarVAJED is an innovative device that allows continuous evaluation of the deviation angle of 0.10. The device allows evaluating different measurements such as: goniometric and proprioceptive assessment and changes of range of motion during physical activities. It also has a virtual rehabilitation application with visual and auditory stimulus. MarVAJED operates under both a direct and a smart phone system. The device includes the following components:

(1) Software and Smart Phone Panel – The android software had been specifically and exclusively designed for the purpose of the device and measurement control. The main role of the software is to control the values and direction of knee deviation, record and archive the patients’ data, together with the results of repeated measurements (Figure 1).

(2) Device – The device consists of two parts: an upper and a lower which connect to each other and a smart phone via Bluetooth (Figure 2). It is possible to assess all directions of movement in almost all joints: flexion – extension, abduction – adduction, and internal – external rotation in the joint of shoulder, elbow, wrist, hip, knee, and ankle. In addition, patient data are stored in a database in the smart phone. Following the measurement, it can be easily exported to the PC with a desired format such as excel, pdf, etc.

Statistical Analysis

All statistical analyses were performed using the software IBM SPSS Statistics version 11.5 (IBM Corporation, USA), with a P value <0.05 considered statistically significant. All numerical data were expressed as mean ± standard deviation. Data obtained from patients before and after treatment were assessed by using the Wilcoxon Signed Test.
Results
The study included 2 females (13%) and 13 males (87%). A total of 15 patients completed the study (Table 1), SD: Standard deviation. There were statistically significant improvements in measures of proprioception, range of motion, pain intensity, and knee swelling between pre– and post–treatment (p<0.05) (Table 2). We encountered no adverse effects of our device in our trial.

Discussion

The study investigated whether our innovative device – MarVAJED, providing a virtual rehabilitation system with visual and auditory stimulus aimed for educating and controlling the joint has beneficial effects on proprioception, range of motion, pain intensity, and knee swelling in individuals with an ACL injury. To our knowledge, this is one of the first clinical trials to determine the effects of virtual rehabilitation on patient outcomes in patients with an ACL injury.

The results of our study showed that the MarVAJED innovative device system used as a virtual rehabilitation decreased the pain intensity, and knee swelling in patients with ACL reconstruction. This clinical trial confirmed the hypothesized advantage of virtual rehabilitation in patients with ACL reconstruction.

Conclusion

We concluded that this new VR system known as MarVAJED effectively treated ACL patients by improving proprioception, range of motion, and by decreasing pain intensity, and knee swelling. Integration of technology into rehabilitation programmes may enhance assessment and rehabilitation. New technology systems may be more effective in increasing quality of life of patients.

DETERMINATION OF SOME ELEMENT CONCENTRATIONS OF FIRST INFANT MILK FORMULA AND HEALTH RISK ASSESSMENT

Funda Demir,1 Meral Yildirim,2 Nevin Karamahmut Mermer,3 Emre Moroydor Derun4

Abstract: Breast milk is suggested as the best method for baby nourishment by The World Health Organization (WHO, 2003). However, in some cases, breastfeeding is not possible due to different metabolic reasons. In such cases, an infant formula that is similar to the breast milk content is designed to meet infant nourishment requirements during the first 6 months after birth. It is important to know the content of infant milk formula for a baby’s health. The purpose of this presented study is to determine the elemental (Fe, Cu, Al, Cd, As, Ni, Ba) contents of the four different brands of first infant milk formula sold in the Turkish markets. Elemental contents of samples were identified by Inductively Coupled Plasma Atomic Emission Spectrometer (ICP-OES) after a microwave digestion process. Target hazard quotients (THQ) of analyzed elements were calculated and risk analyses were conducted. According to the results, the hazard indexes (HI) of infant milk formula samples were founded as less than 1 and all samples were included in the low risk group.

UDC Classification: 66.03; DOI: http://dx.doi.org/10.12955/cbup.v5.1048

Keywords: Infant milk formula, element content, ICP-OES, hazard index.

Introduction

Optimum nutrition and good feeding have a significant role in the determination of infants' health, growth and development. Healthy infant nutrition prevents some chronic diseases and reduces infection risks in adults (Michaelsen et al., 2003). Breast milk is suggested as the best method for baby nutrition by The World Health Organization (WHO), but it is not adequate or possible in some cases such as metabolic reasons or increasing nutritional requirements (Mehrnia & Bashti, 2014). In such cases, baby milk formulas which are designed and marketed for feeding to babies are used and they show similar characteristic to breast milk (U.S. Department of Health and Human Services). Infant milks are classified based on nutrient content and numbered according to month. 1st (first infant milk), 2nd (follow-on milk) and 3rd (growing up milk) numbers of milk are suitable for 0-6, 6-9, 9-12 months old babies respectively.

Toxic elements can be taken into the human body in various ways from the atmosphere or foods and they may pose health risks especially for infants. Many developmental problems are directly related to exposure to them. Because of this reason, it is important to know the content of infant milk formula. The elemental contents of milk formula and their influence on baby health is a curious issue (Mehrnia & Bashti, 2014).

Infant milk contains various elements (essential and non-essential) of Fe, Cu, Al, Cd, As, Ni, Ba. There are lots of effects of these elements found in the content of infant milk on the health of a baby. Al, Cd, As, Ni, and Ba are non-essential elements that may cause negative effects on the baby body. Aluminum (Al) damages nervous and skeletal system and causes Parkinson’s disease and Alzheimer’s disease at a later age (Sipahi et al., 2014; Yalcın et al., 2014). Cadmium (Cd) shows the toxic effect on kidneys and causes bone demineralization (Sipahi et al., 2014). Arsenic (As) is a human carcinogen and causes skin, lung, and bladder cancer (Hong et al., 2014). Ba causes gastrointestinal disturbances and muscular paralysis (Yalcın et al., 2014). Nickel is a known as immunotoxic, neurotoxic, carcinogenic agent so Ni intake shows the toxic effect on the health (Das et al., 2008). Iron (Fe) and Copper (Cu) are essential for human life however, they can show toxic effect at high concentrations. Iron poisoning is a common toxicological effect seen in young children (Boyle, 2016).

There are several literature studies about elemental contents of baby food. Mehrnia et al. (2014), determined four toxic elements (Cd, Ni, Mn, Pb) in the different type of baby food and estimated the daily intakes of toxic elements for children. Odhiambo et al. (2015), determined Cd, Al, Pb, and Ni content in milk infant formula which sold in the Kenyan market. Ljung et al. (2011), studied several elements in breast milk, infant formula, and rice-based baby food. Tripathi et al. (1999), investigated Zn, Cu, Pb, and Cd content of milk and milk products.

1 Yildiz Technical University, Istanbul, Turkey, demirfunda1@hotmail.com
2 Yildiz Technical University, Istanbul, Turkey, meraly@yildiz.edu.tr
3 Yildiz Technical University, Istanbul, Turkey, nevinkaramahmut@hotmail.com
4 Yildiz Technical University, Istanbul, Turkey, moroydor@yildiz.edu.tr
The aim of the present study is to investigate and compare the concentration of Fe, Cu, Al, Cd, As, Ni, and Ba amount of 1st number infant milk formulas sold in Turkey. The health effects of these elements in an infant body were also investigated and the health risk was determined.

**Materials and methods**

**Preparation of the Infant Milk Samples**

Infant milk samples were obtained from the local market in Istanbul, Turkey. Samples were prepared for ICP-OES use by a microwave method.

In this method, 0.1 g of infant milk powder was digested with 10 mL of HNO_3 (65% Nitric acid, Merck KGaA, Darmstadt, Germany) in a microwave digestion system (Berghof MWS 3+) (Figure 1), using the digestion program specified in Table I. The digested and cooled solutions were diluted to 50 mL with distilled water. ICP-OES was used for the analysis of the resultant solutions.

Table 1: Operating conditions for the microwave digestion system

**Preparation of the Calibration Sets and Elemental Analysis of the Samples**

Calibration sets were conducted by using Al, As, Ba, Cd, Cu, Fe, and Ni standard solutions which are obtained from Merck Chemicals (Merck KGaA, Darmstadt, Germany). Inductively coupled plasma-optical emission spectrometry (ICP-OES) is a widely used technique which can determine trace-level element composition and it has a high sensitivity for detecting elements (Sivakumar et al., 2014). In this technique the emission spectra of a sample are used to determine and quantify the element, therefore, excitation and/or ionization of the sample is ensured at the high temperatures (Hou & Bradley, 2000).
The Perkin-Elmer Optima 2100 DV model ICP-OES equipped with an AS-93 autosampler was used in the experiments (Figure. 2). Measurement conditions were adjusted to a power of 1.45 kW, plasma flow of 15.0 L min⁻¹, the auxiliary flow of 0.8 L min⁻¹ and nebulizer flow of 1 L min⁻¹.

Calculation of Estimated Daily Element Intakes
The estimated daily intake of elements (EDIs) was assessed using the daily food consumption of an infant, element concentration, and body weight. The following equation is used in the calculation (Islam et al. 2015).

\[ EDI = \frac{FIR \times C}{B_w} \]  

(1)

Where \( C \) is the average concentration of elements in infant milk samples (mg/kg), \( FIR \) is the daily food consumption (g/day) and \( B_w \) is the body weight (kg). The average weight \((B_w)\) and food consumption amount \((FIR)\) of 0-6-month-old babies are calculated as 5 kg and 120 g, respectively according to the literature study (Sipahi et al., 2014) which indicated the mean weights of 0-2, 2-4 weeks and 2, 4, 6 months old infants. The average concentration of elements \((C)\) are given in Table 2.

Health Risk Calculation
The health risk factor related with infant milk consumption is calculated by using the following Equations (Islam et al., 2015; Shaheen et al., 2016).

\[ THQ = \frac{EFr \times ED \times FIR \times C}{RfD \times B_w \times A_f} \]  

(2)

\[ HI = \sum_i^n THQ_i \]  

(3)

Where \( THQ \) is the target hazard quotient, \( FIR \) is the rate of food consumption (g/person/day), \( RfD \) is the oral reference dose, \( BW \) is the average body weight and \( AT \) is the average lifetime (70 years). Exposure frequency \((EFr)\) (180 days/year) and exposure duration \((ED)\) (6 months) were calculated according to 6 months value because of the using 1st number infant milk which consumed by 0-6 months infants in the experimental. The RfD values of Fe, Al, Cd, Cu, As, Ni and Ba are set to be 0.7 (Wu et al., 2016), 1 (Yu et al., 2015), 0.001, 0.04, 0.0003, 0.02, 0.2 mg/kg/d (Shaheen et al., 2016).

Results and discussion
Analysis Results
Elemental analysis results of samples are given in Table 2. The element with the highest concentration among the analyzed elements is Fe (max 41.35 ppm) and followed by Al (max 7.98 ppm). Cu (max 0.36 ppm) and Cd (max 0.25 ppm) contents of the analyzed samples are considerably lower than Fe and Al contents.

b.m.l. below measurable levels

Source: Authors

The concentration of non-essential elements of As, Ba, and Ni are below the measurable levels in all infant milk samples. For S1, Cd and Cu content cannot be detected when Cd and Cu contents are measured between 0.05-0.25 ppm and 0.32-0.36 ppm, respectively. The Al contents are varied between 5.88 and 7.98 ppm when S1 contains the highest Al amount. The highest Fe and Cu contents are determined for S3. Figure 3 (a) and Figure 3 (b) show the comparison of Fe-Al elements and Cd-Cu elements contents for all samples, respectively.

Figure 3: The comparison of Fe-Al elements (a) and Cd-Cu elements (b) contents for all samples

Calculation of Estimated Daily Elemental Intakes and Health Risk Assessment

Estimated daily elemental intakes (EDI) of essential and non-essential elements were calculated by using Equation (1). Calculation results for each element were given in Table 3.

Equation (2) was used for calculation of THQ values. The trends of THQ values for Fe in the samples are in order to S3>S2>S1>S4 and for Al in the samples are in order to S1>S2>S1=S4. The lowest THQ values are obtained for Cu and the THQ values of Cd element change between 0.0042-0.0211.

Taking the four samples into consideration, Equation (3) was used to estimate the total health risk index (HI) value caused by Fe, Al, Cu, and Cd. The risk assessments of metals taken with infant milk formula consumption were calculated to be within safe limits (THQ<1) and the HI values (sum of individual metal THQ) were calculated in this study.

According to the results of the risk analysis of the elements for 4 samples, the hazard index is found to be less than 1 which is calculated for a 120 g consumption of infant milk and therefore these milk powders have been included in the low-risk group.

Source: Authors

In Figure 4, the health index of first infant milk formula is shown. The highest HI value was obtained for the S2 sample (Figure 4a) which was followed by S4, S3, and S1, respectively. As seen in Figure 4b, the main reason of the high HI values was the Cd content of samples.

### Conclusion

Contents of some essential (Fe, Cu) and non-essential elements (Al, Cd, As, Ni, Ba) in infant milk samples sold in the local market in Istanbul, Turkey were measured in the present study. The amounts of Fe were significantly higher than other elements in all samples and this is followed by Al, Cu, and Cd respectively. After that, EDI, THQ, and HI values are calculated for the selected infant milk samples. THQ values are estimated for each element and hazard index is determined by using total THQ values of each element that belong to per samples.

The risk groups of samples are classified according to HI values. HI values higher than 1 represents the high-risk group. In the same way, the samples that have a HI value less than 1 are in the low-risk group.

Based on HI values of these elements all analyzed infant milks are in the low-risk group. In conclusion, there is no health risk for the examined infant milks in terms of their elemental compositions.

HEALTH-RELATED QUALITY OF LIFE AMONG DISPENSARY OBSERVATION PATIENTS WITH CHRONIC ILLNESS IN BULGARIA

Teodora Dimcheva,1 Boryana Levterova,2 Desislava Bakova,3 Nonka Mateva4

Abstract:
Introduction: The prevalence of chronic non-communicable diseases (NCDs) worldwide acquires epidemic dimensions. In Europe, five nosological groups (diabetes mellitus, cardiovascular disease, cancer, chronic respiratory diseases and mental disabilities) constitute 77% of NCDs and cause about 86% of deaths in the region.

Objectives: This study aimed to assess the quality of life in patients with chronic non-communicable diseases under dispensary observation.

Methods: The pilot cross-sectional study was performed among adult with chronic diseases in primary care practices in the Plovdiv district (the second largest in Bulgaria) from May to June 2013.

Results: A total of 200 adults with chronic diseases participated in the study. The mean age was 55.6 years (range 25–95, standard deviation (SD) 16.9). The most common chronic diseases in our study were cardiovascular 51% (ischemic heart disease, hypertension, etc.), followed by endocrinology diseases (23%). There was statistically significant differences in the assessments of "general health" in different groups of participants by gender ($\chi^2 = 16.65$, $P <0.002$), age ($\chi^2 = 12.57$, $P <0.05$) and social status ($\chi^2 = 28.54$, $P <0.0001$).

Conclusion: The subjective assessment of health is a factor that has a strong impact on the quality of life of patients and is an important component in evaluating the effectiveness of provided health care for patients with chronic non-communicable diseases.

UDC Classification: 614.4
Keywords: Health Related Quality Of Life; Chronic Non-Communicable Diseases (NCDs); Bulgaria

Introduction
The prevalence of chronic non-communicable diseases (NCDs) worldwide acquires epidemic dimensions. The most common NCDs are cardiovascular diseases, cancer, chronic respiratory diseases and diabetes mellitus. According to the World Health Organization (WHO) - ¼ of them occur in low- and middle-income countries, and over 16 million people are getting sick before the age of 70 (WHO, 2014; Lim et al., 2012).

Chronic diseases are defined as "diseases of long duration and slow progression" (WHO, 2008) or "conditions or symptoms that once acquired cannot be removed after 3 months or more" (Goodman et al., 2013).

In Europe, five nosological groups (diabetes mellitus, cardiovascular disease, cancer, chronic respiratory diseases and mental disabilities) constitute 77% of NCDs and cause about 86% of deaths in the region (Busse et al., 2010). Bulgaria is not an exception to this alarming trend. In our country, NCDs cause 80% of deaths with diseases of the circulatory system being the most prevalent (67.5%), followed by malignant neoplasms with (15.1%), diabetes mellitus (8.3%) and others (Mateva & Nonchev, 2015).

Health is the most comprehensive basic category in medicine and healthcare. The WHO defines health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" (Official Records of the World Health Organization, no. 2, p. 100, 1948). In recent years WHO could add this definition the person's ability to maintain "productive socially and economically life" (Nutbeam, 1998).

The concept of Health-Related Quality Of Life (HRQOL) and its determinants have evolved since the 1980s to encompass those aspects of overall quality of life that can be expressly indicated to affect health. On the individual level, HRQOL incorporates physical and mental health perceptions and their correlations such as health risks, functional status, social support, and socioeconomic status (CDC,
2000). On the community level, HRQOL includes community-level resources, conditions, policies, and practices that impact a population’s health (CDC, 2000; Dimcheva et al., 2015). Health-related quality of life representing a person’s subjective assessment of their sense of well-being and ability to perform social roles has been well accepted as a health indicator in medical interventions or health surveys. The HRQoL of patients with a single chronic disease has been explored in primary care (Fortin, 2004).

The implementation of appropriate tools for assessing the quality of life can find those areas of health NCDs which require closer scrutiny from health professionals. Instruments to measure QoL have the potential to identify specific and common unmet health needs of the population level (Levetorova et al., 2014).

The aim of this study was to assess the quality of life in patients with chronic non-communicable diseases under dispensary observation in Plovdiv, Bulgaria, through an original questionnaire.

Material and Methods
A pilot cross-sectional survey, including the original questionnaire, was performed among adults with chronic diseases in primary care practices in Plovdiv district (the second largest in Bulgaria) from May to June 2013.

We selected patients from the primary care practices under contract to the Regional Health Insurance Fund Plovdiv. Inclusion criteria in the study were: age over 18 years old and subject to dispensary chronic non-communicable diseases according to Ordinance № 39 for prophylactic examinations and dispensary/ 16.11.2004 Ministry of Health of Bulgaria. An exclusion criteria included: patients with cognitive damage and inability to self-complete the questionnaire.

Additionally, 12 medical experts with extensive experience in the care of patients with chronic disease completed an open ended questionnaire in which they listed items that have a significant impact on the quality of life of patients with NCD; the importance of each item was ranked on a five point scale where 1 was the least important and 5 was the most important. Interviews with 16 patients with chronic disease were carried out (two focus groups of eight patients each) which supplemented the list of items for the initial questionnaire. We constructed appropriate questions for each item identified for the questionnaire, and specified response options using five point scales, ranging from the worst (1) to the best (5) possible function. The final questionnaire included 54 items divided into several groups. The study was approved by the Research and Ethics Committee of the Medical University–Plovdiv. The study was in compliance with the Declaration of Helsinki. After informed consent was obtained, all participants were given the questionnaire and questions on socio-demographic information (age, sex, and ethnicity, level of education, employment status and marital status) and type of chronic disease.

Statistical analyses was performed using the SPSS 17.0 software (SPSS, Inc., Chicago, IL). Statistical significance was set at p value < 0.05 for the data analysis.

Results and Discussion
Of the 200 patients recruited, 97 agreed to participate, representing a response rate of 48.5%. Fifteen questionnaires were deleted because some data was missing. Among the 82 eligible respondents, 75.6 % were women. The mean age was 55.6 years old (range 25–95, standard deviation (SD) 16.9). The characteristics of the sample are shown in Table 1.

All patients had a confirmed diagnosis, according to the International Classification of Diseases (icd-10) and were liable to dispensary surveillance.

The most common chronic diseases in our study were cardiovascular diseases (CVD-ischemic heart disease, hypertension, etc.), followed by endocrinology diseases. This is consistent with the data that Bulgaria has the highest incidence and mortality of CVD in Europe (60% of all deaths in our country are the result of stroke and coronary heart disease) (Mateva & Nonchev, 2015; Finegold, Asaria & Francis, 2013).

In Bulgaria dispensary observation is a method for actively monitoring the dynamic impact on the health of pregnant women and patient groups especially with chronic diseases. This is a method of
active search, dynamic monitoring, diagnosis and rehabilitation, medical and social adaptation (Dimcheva & Mateva, 2015). The implementation of these health activities provides guaranteed access to each insured person a volume of preventive actions aimed at early detection of risk factors for developing the disease, early diagnosis of the disease and timely referral for treatment in order to prevent permanent damage or an unfavorable outcome. These activities are consistent with the objectives and priorities of the Bulgarian health policy implemented by the Ministry of Health aimed at improving the health status of the population and reducing morbidity and mortality by strengthening health promotion, and the primary and secondary prevention of diseases (Ministry of Health, promulgated in State Gazette number 106 of December 3, 2004; Levterova et al., 2013).

Source: Authors

The original questionnaire is using the traditional five-Likert scale from "excellent" to "very bad" for "general health". Analysis of the responses showed that the majority of respondents accepted his/her condition as "good" - 55% (41) and 22% (16) as "bad". The distribution of answers by nosological groups is given in Figure 1.

Figure 1: The assessment of "general health" depending on chronic disease

Source: Authors
There were statistically significant differences in the assessments of "general health" in different groups of participants by gender ($\chi^2 = 16.65$, $P < 0.002$), age ($\chi^2 = 12.57$, $P < 0.05$) and social status ($\chi^2 = 28.54$, $P < 0.0001$).

The analysis of the data by using a questionnaire showed that age, gender, and social status are important factors affecting self-esteem "general health." This fact allows for the creating of a specific profile of patients and their needs using appropriate approaches to health education (Arnold et al., 2004).

The difference in quality of life between the sexes is well expressed in this study - female individuals have worse QoL. This is consistent with the reported gender differences in QoL in the general population and in studies involving patients with chronic diseases (Fayers & Machin, 2013).

**Conclusion**

There are a few studies on the Health-Related Quality Of Life of patients with chronic diseases in Bulgaria, which seriously limits the possibility of an objective assessment of the effectiveness of medical and medico-social assistance for these patients. Health-related quality of life is a measurable element and for quantifying of its objectification different scales may be used (Garratt et al., 2002; Bradley, 2001).

Subjective assessment of health is a factor that has a strong impact on the quality of life of patients and is an important component in evaluating the effectiveness of provided health care for patients with NCDs. Data reported by the patients is important for health professionals as feedback on the care. Patient-reported health assessments results offer a great potential for improving the quality and outcomes of health services.

Analysis of the results from the measurement of quality of life in patients with NCDs can be used to determine the priorities of health and social policies in these groups of people which could lead to better medical care and improve the quality of life in patients with NCDs. Integrated measurements of quality indicators will provide a comprehensive assessment of the management of NCDs. Introducing these innovations in health policies will improve health care and reduce the clinical and financial burden of these diseases.

SID: EPIDEMIOLOGY, INFANT PHYSIOLOGY AND SALIVA ASPIRATION

Sigitas Chmieliauskas1,2, Sigitas Laima1,2, Karolina Ginčienė1,2, Gerda Andriuškevičiūtė2, Meda Sutkevičiūtė1, Monika Stančiukaitė1, Jurgita Stasiūnienė1, Algimantas Jusulaitis1

Abstract: A sudden infant death syndrome (SIDS) is diagnosed in the case of a sudden and unexpected death of an infant during sleep and where an autopsy shows no obvious pathological lesions or injuries. Although literature indicates a wide range of risk factors, there is no single opinion on the specific cause of SIDS. This paper describes a study of 191 infant deaths in which the State Forensic Medicine Service established 29 SIDS cases. Microscopical and histological results of samples taken from sections of the respiratory system reveal serous fluid in the alveoli and change specific to asphyxia in all autopsy cases of infants diagnosed with SIDS. The risk of SIDS is highest in infants aged 1–4 months. Salivary gland secretion increases with the development of infant physiology, and this increase coincides with infant teething. However, in this phase, an infant’s swallowing reflex is still to form completely. Findings suggest that the serous fluid found in the alveoli was from the salivary glands, and thus, saliva aspiration may be associated with infant deaths due to SIDS.

UDC Classification: 616-008; DOI: http://dx.doi.org/10.12955/cbup.v5.1050

Keywords: SIDS, salivation, asphyxia, sudden death

Introduction

Sudden infant death syndrome (SIDS) is a postmortem diagnosis for an infant, usually less than a year old, who dies suddenly and unexpectedly of natural causes during sleep with the reason indeterminable by an autopsy (Gilbert-Barness & Debich-Spicer, 2005). In the USA, the incidence of SIDS reaches 1.2 birth cases, but overall, it ranges from 0.046 to 6.7 cases per 1000 births (Sharma, 2007). About 90–95% of SIDS deaths occur in infants under six months of age, but according to different sources, the highest mortality peak is between 1–4 months (Janette & Marshall Haith, 2009; Moon, Darnall, Goodstein, & Hauck, 2011). In most cases, death occurs between midnight and 9 am. (Gilbert-Barness & Debich-Spicer, 2005). Epidemiological studies have shown that SIDS cases increase during the winter months and they occur in male infants more often. According to the statistics, SIDS befalls more frequently on infants of a lower socioeconomic status, with young and unmarried women of poorer education, and on infants whose mothers took drugs before and during pregnancy. The risk of SIDS increases with prone sleeping position, bed sharing, hyperthermia, and hypothermia (Sharma, 2007).

Data and Methodology

In the period of 1995–2015, the State Forensic Medicine Service (SFMS) studied cases of deaths among children under 2-years old. The sample number was 191 with 15% (n = 29) diagnosed with sudden infant death syndrome, acute respiratory and cardiac disorder, and unspecified acute cardiac disorder. The Shapiro-Wilk normality test was used based on the data distribution according to the normality law. A 95% confidence interval and a significance level (p-values) of 0.05 were chosen. Samples to determine levels of ethyl alcohol were collected from all infants and for drugs, psychotropic agents, and other highly active substances from 59% of infants.

Infant sleeping positions were examined to identify the various SIDS risk factors and prevention models.

Results and Discussion

In the studied cases, 14% (n = 27) of the reported deaths due to SIDS occurred in hospital (Figure 1) with the majority 83% (n = 158) occurring at home (Figure 1). Overall, 52% of the studied SIDS cases were male infants, and 48% were female (Figure 2).

The youngest infant diagnosed with sudden infant death syndrome was a 1-day old child and the oldest 2-years old. The median age was two months, with the mean 3.9 ± 5.7 months (p < 0.005; Figure 3).

The tests to determine the level of ethyl alcohol and other substances in samples showed negative results in all cases. The autopsies revealed traces of a foamy, pink liquid at the bifurcation of the trachea. Histological examination showed a mucous secretion present at places in the larger bronchi with eosinophilic masses (in parts with a yellowish-brown color) and extra mucus and desquamated bronchial epithelial cells in bronchial lumens. The lungs were of average elasticity, full-blooded, swollen, with uneven tissue airiness and focal swelling of hyaline membranes in several alveoli. Other findings included a bronchial epithelial desquamation in the lumen at places, serous fluid with little erythrocyte addition in the alveoli, and minor focal intra-alveoli swelling. Such an image dominates among cases of SIDS. A similar representation was observed in the infants who had died from asphyxia due to blockage of the airways (nose and mouth) and compression around the neck.

The Postmortem Examination

Although this topic is widely analyzed in the literature, and great deals of potential risk factors are provided, the findings of this study were inconclusive in determining the cause of SIDS. However, based on the literature data and the findings of the micromorphological and macromorphological examinations carried out by the State Forensic Medicine Service on respiratory system samples taken from the study cases, the cause of SIDS may relate to saliva aspiration. Especially, the excretion of saliva starts at about six weeks and increases with teething, coinciding with the age observed for most of the infant deaths attributed to SIDS, i.e., one to four months (Figure 3).

Infant Teething and Salivation

Infant teething starts around the age of 3–4 months (Castiglia, 1992; American Academy of Pediatrics, 2013). The study of Memarpour, Soltanimehr, and Eskandaria (2015) analyzed the most common symptoms that occur at the beginning of teething. The study, which included 254 children, found that the most common symptoms include salivation (92%), sleeping disorders (82.3%), and irritability (75.6%; Memarpour, Soltanimehr, & Eskandarian, 2015). During the first months, infant salivary glands secrete a small amount of saliva. Salivary gland secretion begins to increase from about six weeks (Nicory, 1922). There are three major pairs of salivary glands (parotid, submaxillary, and sublingual salivary glands) and about 700–1000 small salivary glands, which are located in the oral cavity and pharynx. All salivary glands begin to develop between 6-10 weeks of embryogenesis. The amount of all glandular secretion is about 0.3–0.5 ml min⁻¹, and at maximum stimulation, this quantity can reach 1.5 ml min⁻¹ (Heinrich & Johannes, 2014). Parotid salivary gland secretion accounts for 20–25% of the total saliva amount; submaxillary salivary glands, 65–70%; and sublingual and small salivary gland secretion, 5% each (Ekberg, 2012; Leung & Pion Kao, 1999).

Examination of salivary gland excretion has revealed that higher excretion occurs in the afternoon than in the morning (Ekberg, 2012). In addition, Ekberg (2012) observed more saliva being released in winter than in the summer. Salivation can occur not only because of salivary hypersecretion, swallowing disorders, but also because of teething, central nervous system disorders, mental retardation, gastroesophageal reflux, drugs administered, and congenital genetic diseases. Small salivation is a relatively frequent phenomenon for infants and is considered normal until 18–24 months (Lakraj, Narges, & Bahman, 2013). As infants’ mouths are often open, their front teeth not yet fully grown, and a well-balanced swallowing reflex yet to form a little later, an elevated salivation in infants is common and is particularly striking in 5- to 6-month-old children (Leung & Pion Kao, 1999). Only 18- to 24-month-old children learn to swallow with lip closure (Arvedson, 2006).

Swallowing

Despite the swallowing reflex forming in the fetus during the fourth month of prenatal development, the central nervous system does not develop until after birth, with mutual relations of the cortex and lower centers developing until the child is about one-year old (Rodier, 1994). The cortex begins to dominate in the central nervous system at about the fourth month of life when the conditional reflexes begin to form. One such reflex is mature swallowing (Campbell, 1971), which consists of a conscious oral-preparatory phase, i.e., conscious oral, pharyngeal, and esophageal phases. Infant swallowing does not involve conscious oral or oral-preparatory phases, and thus, infant swallowing of liquids differs from adult swallowing (Stevenson & Allaire, 1991). This development of conditional reflexes protects an infant from choking and aspiration on saliva. During the period when an infant’s liquid swallowing reflex is not sufficiently formed and salivary excretion is elevated, the risk of SIDS is the greatest.

Infant Aspiration and Laryngospasm

While an infant is sleeping, the non-swallowed saliva accumulates in the mouth which it can potentially leak into the respiratory tract and cause choking, aspiration, and laryngospasm. Dysphagia is a common cause of infant aspiration. Aspiration can be caused by stomach content regurgitation, a foreign body, or saliva entering the respiratory tracts. The aspiration of a large amount of substance into the lungs (macroaspiration) can cause a mechanical obstruction or aspirational pneumonitis, which provokes a severe hypoxia. Microaspiration irritates the upper respiratory tract and can trigger a reflex action that induces laryngospasm or bronchospasm (Mohan, 2002). Infants are characterized by an autonomic imbalance and increased parasympathetic activity in the larynx. Therefore,
laryngospasm is more common among infants than adults (Campbell, 1971). Glottis closure is a protective respiratory tract reflex which occurs after contraction of internal laryngeal muscles to avoid aspiration (Ikari & Sasaki, 1980; Gavel & Walker, 2014). In the case of increased salivation, a sleeping infant with a partly formed swallowing reflex will have saliva entering the respiratory tract. The irritation of the vagus nerve receptors located around larynx could trigger a reflex action where the inner laryngeal muscles would contract and initiate laryngospasm causing asphyxia.

**Infant Sleeping Positions**

Various authors unanimously agree that the risk of SIDS is highest when an infant is placed in bed in a prone position (Moon & Fu, 2012; Scragg & Mitchell, 1998; Oyen, N., Markstad, T., Skaerven, R., Irgens, L. M., Helweg-Larsen, K., Alm, B. B., et al., 1997). Research suggests that sleeping in a prone position causes the autonomic cardiovascular system control to change, especially in infants of two-three months of age, and limit brain oxygenation (Moon & Fu, 2012). Lying in the prone position causes the respiratory tract to compress; making it difficult to breathe and apnea develops (Scragg & Mitchell, 1998). In 1999, the study examined laryngeal chemoreflex, which is a protective respiratory tract reflex. The study revealed that during sleep an infant lying in the prone position breathes and swallows less frequently than when lying on the back (Jeffery, Megevand, & Page, 1999). In addition, after salivation increases saliva enters the nostrils of an infant lying in the prone position, which triggers a diving reflex that induces apnea, bradycardia, and arrhythmias (Campbell, 1971). Given these reasons, infants should not be laid in the prone position, but whether sleeping on the back or the side is safer remains unknown. Many authors argue that a child placed in the side position can easily turn to the prone position (Scragg & Mitchell, 1998) and believe that the position of laying on the back has the lowest risk for developing SIDS. Despite the position of sleeping on the side not being as safe as sleeping on the back, the risk of SIDS is deemed significantly lower in this position than in the prone position. Also, where an infant is laid on the side, caregivers should ensure that the child’s hand is stretched out in a forward position to reduce the probability of an infant rolling into the prone position (American Academy of Pediatrics, 2005).

**Conclusion**

Information in the literature and results of microscopical and histological respiratory system investigations of infants who died of sudden infant death syndrome indicate traces of serous fluid found in the lungs of the study cases to be salivary gland secretion, i.e., saliva, which has entered the lungs during the infant’s sleep. Possibly, incomplete development of the swallowing reflex and increased salivation contributes to sudden death by asphyxia. However, accepting this theory requires additional research. For example, in the case of a sudden infant death of a sleeping baby, a histological examination of the respiratory system during autopsy is recommended. After detection of serous fluid, a saliva S-amylase qualitative analysis (S-AMYL) would confirm whether this fluid is a salivary gland secretion, which could lead to an infant’s asphyxia.

MICROcirculatory Disorders in Women with Polycystic ovary syndrome

Daniela Koleva,1 Mariana Batzelova,2 Julia Nikolova,3 Maria Orbetzova4

Abstract: It is believed that microvascular dysfunction plays a major role in the development of insulin resistance (IR). Performing nailfold capillaroscopy with evaluation of microvascular parameters in women with polycystic ovary syndrome (PCOS) would undoubtedly be helpful for the investigation of novel pathophysiological mechanisms in IR occurrence. The aim of the present study was to compare the values of microvascular parameters between PCOS patients and clinically healthy women and to assess its relationship with clinical and metabolic parameters in the PCOS women. Our study included 21 PCOS patients and 22 clinically healthy women (controls). Nailfold capillaroscopy was conducted and the following parameters were assessed: arterial limb diameter (d art), venous limb diameter (d ven), top diameter of loops (top d), length of loops, d art/d ven ratio, d ven/d art ratio, number of capillary loops (n cap), number of abnormal loops (% abn cap) and a presence of perivascular diapedesis. Weight, height, fasting plasma glucose (FPG), immunoreactive insulin (IRI), lipid parameters, total testosterone, systolic (SBP) and diastolic blood pressure (DBP) were measured in the PCOS women. Body mass index (BMI) and homeostasis model of insulin resistance index (HOMA-IR) were calculated. We found significantly higher values of age, BMI and % abn cap in the women with PCOS as compared to the controls. Interestingly, % abn cap showed a negative correlation with age. Furthermore, an inverse association between top d and the values of SBP and DBP was established. We determined a positive correlation between the presence of perivascular diapedesis and the values of FPG, HOMA-IR and testosterone. As a conclusion, the higher % abn cap in the PCOS women might be an early pathophysiological sign of microvascular dysfunction. The positive correlation between perivascular diapedesis and the degree of IR, hyperglycemia, and hyperandrogenemia shows the existence of a chronic low-grade inflammatory process in PCOS.

Keywords: capillaroscopy, microvascular dysfunction, insulin resistance

Introduction

Polycystic ovary syndrome (PCOS) is a condition that represents a specific prototype of metabolic syndrome (MS) among women at reproductive age. Patients with PCOS are characterized by typical clinical features of hyperandrogenemia and their metabolic status often includes android type of obesity, glucose tolerance disturbances, atherogenic dyslipidemia, and hypertension. Several studies have shown that PCOS women have a greater risk of developing type 2 diabetes mellitus (TDM2) as well as a low-grade chronic inflammatory process leading to endothelial dysfunction and coagulation and/or fibrinolysis abnormalities (Teede et al., 2010; Koleva et al., 2016). It is known that microcirculation consists of terminal arterioles, capillaries, and venules. The main functions of the microcirculation are: 1) to accomplish the exchange of nutrients, oxygen, and hormones between plasma and tissue fluid; 2) to minimize the fluctuations in the hydrostatic pressure at the level of capillaries; 3) to adjust the peripheral vascular resistance, respectively the blood pressure (Muris et al., 2013). Certainly, the maintenance of normal microvascular function is important for the regulation of tissue homeostasis and arterial blood pressure (Levy et al., 2001). It has been found that microvascular dysfunction might cause disrupted glucose tissue utilization (Clark et al., 2003; Serne et al., 2001; Wallis et al., 2002) and peripheral vascular resistance (Antonios et al., 1999), resulting in the development of IR and arterial hypertension (AH). It is believed that microvascular dysfunction might be a possible cause for the occurrence of metabolic disorders in individuals with obesity and insulin resistance syndromes. Undoubtedly, there is a deficiency of data concerning microcirculatory characteristics in women with PCOS. This was the reason for us to conduct a study which aimed to compare the values of microvascular parameters between women with PCOS (a representative model of IR syndrome) and clinically healthy women and to assess its relationship with clinical and metabolic parameters in the PCOS women.

4 St. George’s University Hospital, Clinic of Endocrinology and metabolic diseases, morbetzova@abv.bg
Materials and methods
The present study was conducted in the Clinic of Endocrinology and Metabolic Diseases at “St. George” University Hospital, Plovdiv. It comprised of 21 young PCOS women (mean age 25.7±4.08 years and mean BMI 30.78±8.08 kg/m²) and 22 clinically healthy women (mean age of 21.9±4.10 years and mean BMI 23.9±6.10 kg/m²), serving as a control group.
Nailfold capillaroscopy using capillaroscope model JH1005, PRC was conducted in the Department of Physiology at Medical University of Plovdiv. Each woman was examined after 20 minutes rest in a room with normal temperature (20-22°C). Visualization of the capillaries was realized after placing a drop of cedar oil on the nailfold of the fourth finger of the patient’s both hands. The following microvascular parameters were investigated: arterial limb diameter (d art) µm, venous limb diameter (d ven) µm, top diameter of loops (top d) µm, length of loops µm, d art/d ven ratio, d ven/d art ratio, number of capillary loops (n cap), number of abnormal loops (% abn cap) and a presence of perivascular diapedesis.
In all the PCOS women the following measurements and laboratory tests were performed: weight, height, fasting plasma glucose (FPG), fasting immunoreactive insulin (IRI), total cholesterol (TC), HDL-cholesterol (HDL-C), triglycerides (TG), total testosterone, systolic (SBP) and diastolic blood pressure (DBP). Venous blood samples were taken after a 12-hour overnight fast and were sent to Central Clinic Laboratory at "St. George “University Hospital.
Insulin was tested using a commercial kit for quantitative determination of immunoreactive insulin on the basis of microparticulate immunoenzyme analysis (MEIA) on an AxSYM system (ABBOTT, USA) with the following characteristics: sensitivity ≤ 0.8 mIU/ml; inter-assay variation, CV% < 2.9; intra-assay variation CV%<5.3. Serum glucose levels were determined by a standard GOD-POD method. TC was determined by ChOD, PAP; TG by GPO, PAP, and HDL-C by MgSO4-dextran SO4 precipitation, Schneiders Analysers; Netherlands test; Delta Kone Autoanalyzer.
Systemic blood pressure (SBP and DBP) was measured using a sphygmomanometer. The diagnosis of PCOS was made according to the Rotterdam criteria (Rotterdam ESHRE/ASRM-Sponsored 2003), when the two of the following three features were present: oligo- and/or anovulation, clinical and/or biochemical signs of hyperandrogenism, and polycystic ovaries on ultrasound examination (the presence of ≥ 12 follicles measuring 2-9 mm in diameter and/or ovarian volume > 10 cm³).
The statistical analysis was performed by SPSS version 21.0 for Windows. A comparative analysis of clinical, anthropometric and microcirculatory parameters was performed among the studied groups of women. The results are presented as mean±SD. Pearson (r) and Spearman (rho) correlation coefficients for assessing correlations among the parameters were used.

Results
Table I presents clinical, anthropometric and microcirculatory characteristics in the studied groups of women.
Interestingly, % abn cap showed a negative correlation with age (r= -0.567, P=0.043). Furthermore, an inverse association between top d and the values of SBP (r= -0.610, P=0.017) and DBP (r= -0.581, P=0.037) was established.
We determined a positive correlation between the presence of perivascular diapedesis and the values of FPG, HOMA-IR and testosterone (Table 2).

Discussion
Our results showed a higher percentage of abnormal capillary loops (elongated capillaries, increased tortuosity) in PCOS women compared to that in the clinically healthy women. A presence of perivascular diapedesis was found in 22.2 % of the PCOS women. A positive correlation between perivascular diapedesis and the values of FPG, HOMA-IR, and testosterone was determined.
Leukocyte extravasation, also known as diapedesis, is the process of leukocytes movement out of the circulatory system towards the locus of tissue damage or inflammation. Leukocyte extravasation is most commonly observed in post-capillary venules, where haemodynamic shear forces are minimized. This process consists of several steps, namely: 1. chemotraction; 2. rolling adhesion; 3. tight adhesion and 4. endothelial transmigration. Apart from an acute inflammatory disease, leukocyte
extravasation might be perceived as a sign of chronic low-grade inflammation (Anderson and Anderson, 1976).

Our results showed the existence of an inverse relationship between the top d and the values of SBP and DBP. This correlation may explain the pathophysiological mechanism of the development of arterial hypertension.

In general, arterial hypertension is characterized by both functional and structural microvascular changes. First, the mechanisms regulating vasomotor tone are considered to be abnormal, leading to enhanced vasoconstriction or reduced vasodilatation. Second, decreases in arteriolar diameters and increases in the wall-to-lumen ratio of small arteries have been demonstrated (Levy et al., 2001; Houben et al., 1995). Furthermore, a reduction in the density (rarefaction) of arterioles, venules, and capillaries can be observed in different vascular beds (Houben et al., 2005).

Endothelial dysfunction in hypertensive patients might be explained by the presence of suppressed vasodilator response and altered capillary activation under the influence of endothelium-dependent typical vasodilators (acetylcholine) as well as shear stress itself (Serne et al., 2001). Recently, several researchers in this field have described the occurrence of a disrupted insulin-mediated NO-dependent vasodilation in various models of hypertensive animals (Debbabi et al., 2006; Eringa et al., 2004). In addition, hypertension is characterized by a parallel increase in the production of the biological constrictive agents such as endothelin-1 (ET-1) and angiotensin II (Ang II) (Li et al., 2010).

Microvascular dysfunction may be secondary – due to permanently increased levels of blood pressure (Serne et al., 2002), as well as primary - representing a cause, not a consequence of hypertension. Microvascular disturbances may occur at a very early stage in the development of hypertension. Changes in the capillaries (similar to those described in the already established hypertension) can also
be observed in patients with prehypertension or in normotensive individuals with a familial predisposition to the development of hypertension (de Jongh et al., 2004).

Pazos-Moura et al. (1990) conducted a study including 15 healthy individuals and 16 patients with TDM2 (a model of insulin resistance syndrome). Direct intravital microscopic examination of nailfold capillaries was performed in all the studied subjects. The results showed an increased number of enlarged capillaries in the TDM2 patients as compared to the controls. Besides, capillaries with nodular apical elongations were found only in the TDM2 group. In addition, capillary blood flow velocity (CBFV) was measured during rest and after the release of 60 s arterial occlusion. In order to assess the autoregulatory capacity the investigators determined peak CBFV after occlusion and time to reach it in single capillaries. The values of mean resting CBFV were not statistically different in the two groups but mean peak CBFV post occlusion was found to be significantly lower (controls: 1.49±0.14 mm/s; T2DM: 0.93±0.13 mm/s, P<0.05) and mean time to reach it significantly prolonged (controls: 8.9±0.6 s; T2DM: 18.0±1.9 s, P<0.05) in the diabetics compared to the controls.

In a study of Kraemer-Aguir et al (2008) 36 subjects with MS (National Cholesterol Education Program-Adult Treatment Panel III criteria) (10 men/26 women, 38.8±7.9 years, 35.8±4.9 kg/m²) with normal glucose tolerance (American Diabetes Association criteria) and 16 controls (11 men/5 women, 33.6±8.4 years, 23.9±3.6 kg/m²) were studied using nailfold videocapillaroscopy. Afferent, efferent, and apical capillary diameters; functional capillary density; red blood cell velocity (RBCV) at baseline; and RBCV (max) and time to reach it during postocclusive reactive hyperemia after 1-minute arterial occlusion were measured. Subjects with MS had smaller afferent, efferent, and apical diameters (4.2 [3.8-4.2] vs 5.6 [4.65-6.25] mum, P<0.001; 4.8 [4.2-4.8] vs 6.2 [5.6-7] mum, P<0.001; and 5.2 [4.8-5.55] vs 7.4 [6.2-8] mum, P<0.001); lower functional capillary density (7.28 [6.37-9.10] vs 10.4 [9.1-11.8] capillaries per square millimeter, P<0.001), RBCV (0.62 [0.57-0.65] vs 0.79 [0.76-0.89] mm/s, P<0.001), and RBCV(max) (1.14 [1.12-1.21] vs 1.57 [1.45-1.62] mm/s, P<0.001); and longer TRBCV(max) (10.0 [10-11] vs 4.5 [4-6] s, P<0.001) compared with controls. Tha data show that microcirculatory dysfunction was associated with BMI.

A study of Lakhani et al. (2005) aimed to assess microvascular function in 12 PCOS women and 12 age-matched controls. The investigators conducted observation of forearm skin microvascular erythrocyte flux responses to cumulative doses of 1% acetylcholine (Ach) and 1% sodium nitroprusside (SNP), using laser Doppler imaging. Basal microvascular perfusion was found to be comparable in the two groups of women. However, the increase of skin microvascular perfusion in response to Ach was blunted in the PCOS women (P=0.018). Furthermore, peak Ach-induced erythrocyte flux was less in the PCOS patients (125.1±21.7) than in the controls (200.8±28.5). Additional covariance analysis determined that the aforementioned effect was unrelated to differences in BMI or serum testosterone, but IRI might be a weak confounder. As far as the response to SNP was concerned, no differences were found between the PCOS and the control groups. The authors concluded that the study was the first demonstration of the presence of microvascular endothelial dysfunction (an inhibited vasodilatory response to Ach) in women with PCOS.

Hyperandrogenemia is a typical endocrine feature of PCOS. It had been proved that testosterone could influence vasocontractile responses impairing endothelium-dependent relaxation (Adams et al., 1995; Hutchinson et al., 1997) in hypercholesterolaemic rabbits and monkeys. However, more recent studies have suggested that the vascular effects of testosterone might be more complex. It was found that acute exposure even to low doses of testosterone might significantly potentiate endothelin-1-induced vasoconstriction in porcine coronary artery rings (Teoh et al., 2000). This effect was insensitive to flutamide (an androgen receptor antagonist) and was not blocked by de novo protein synthesis inhibitors, suggesting that it was not mediated via the classical androgen receptor influence on gene transcription. Nevertheless, this fact does not detract from the possibility that the diminished ACh-induced microvascular perfusion response seen in the aforementioned study of Lakhani et al. (2005) resulted, at least in part, from the elevated levels of androgens in women with PCOS. ANCOVA was used to test the effect of testosterone on the difference in ACh-induced erythrocyte flux between the control and PCOS groups. The testosterone-adjusted erythrocyte flux difference remained significant, suggesting that the effect of PCOS on ACh-induced microvascular blood flow was not related to differences in serum testosterone between the controls and the PCOS women.
We may suggest that microvascular dysfunction in women with PCOS can be explained primarily with the accompanying obesity, not with the presence of hyperandrogenemia in PCOS, which was confirmed by the study of Ketel et al. (2008).

**Conclusion**

The higher % abn cap in the PCOS women might be an early pathophysiological sign of microvascular dysfunction. The positive correlation between perivascular dialedasis and the degree of IR, hyperglycemia, and hyperandrogenemia shows the existence of a chronic low-grade inflammatory process in PCOS.

COMMUNICATION BETWEEN NURSES AND DEAF PEOPLE IN HEALTH INSTITUTIONS

Marija Ljubičić,1 Sanda Zubcic,2 Sonja Sare3

Abstract:
Introduction: Upon arrival into a health institution, a deaf person is exposed to a higher stress level. They are at risk of receiving inadequate health care and health-related information due to limitations in communication between the deaf person and the health care workers. Despite the awareness of the presence of communication difficulties, research about the ways of communication between nurses and deaf people hasn’t been sufficiently presented. This article focuses on the ways in which nurses and deaf people communicate, the difficulties in communication arising from that; emotional reactions and nurses’ interest in the manual alphabet and sign language, and the perception about the need for an interpreter of sign language in a health institution.

Objectives: The primary objective of this cross-sectional study is to examine the difficulties in communication upon a deaf person’s arrival into a health institution.

Methods: The original paper-and-pencil questionnaire for nurses includes questions about the communication problems upon the arrival of deaf people into health institutions. Differences between study variables were assessed for significance using the Mann-Whitney U test and Kruskal-Wallis test. The associations between variables were explored using Spearman rank correlation coefficients.

Results: The results show that 65% of the nurses think that the communication problem is strongly pronounced as the problem is the inability of deaf people to respond when called (65%) and difficulties in understanding (40%). The interest of nurses for problems of deaf people affects the manifestation of difficulties and the understanding of messages. The most frequent way of communication is showing (95.1%) and writing (62.5%). There is no significant difference in relation to age ($p=0.103$, sex ($p=0.473$), level of education ($p=0.901$) and the length of service ($p=0.062$).

Conclusion: The obtained results show how pronounced the communication difficulties between nurses and deaf people are. An interpreter in a health institution is necessary for effective communication. There is a high priority need for quality education of nurses about the ways of communicating with deaf people.

UDC Classification: 616-01; DOI: http://dx.doi.org/10.12955/cbup.v5.1052

Keywords: deaf people, nurses, communication, health institution

Introduction
Hearing impairment is the most common sensory disorder (Adib-Hajbaghery & Rezaei-Shahsavaro, 2015; Bennion & Forshaw, 2013). The term “hearing impairment” or “hearing loss” means loss of function of varying intensity to all parts of the ear and the auditory pathway (Ljubičić, 2014). This impairment is the result of an illness or an injury ear canal and drum, middle ear, inner ear or of any localization of hearing aids. Because of limitations or barriers, people can be disabled in performing daily activities that are considered normal. (Mattjus, 2012). Depending on age, the level of development and the acquisition of speech, we can divide people with hearing impairment into prelingually and post-lingually deaf people (Ljubičić, 2014).

Communication problems are the most evident problems of these people. Due to difficulties in communication and the inadequate support of the environment, deaf people can feel excluded from the environment they live in (Hersh, 2013). Disrupted social interaction and social isolation are very common due to the feeling of discomfort of people because they believe that they have heard something wrong or to have talked about a wrong topic. The person can have emotional difficulties, be suspicious, frustrated, and angry due to the inability to hear (Ljubičić, 2014).

Upon arrival into a health institution, a deaf person is exposed to a higher stress level. They are at risk of receiving inadequate health care and health-related information because of limitations of communication between the deaf person and the health care workers (Chowdhry, Padhi, Mohanty, & Biswal, 2016). Both, deaf persons and nurses face problems with information transfer, and the dissatisfaction of the deaf people and their family members. This results in different emotional reactions for deaf people and for nurses. The impossibility to hear a message, to respond, the lack of understanding of the staff, and numerous other problems can intensify communication problems and

increase the sense of social isolation (Ljubičić, 2014). Also, the nurses encounter difficulties since there are sometimes different distracting factors that interfere with the communication process. The limited ability of deaf people to communicate and the not-providing of appropriate feedback from the nurse can negatively affect the active cooperation of the deaf person and the successful implementation of health care (Hornakova & Hudakova, 2013).

There are four different ways of communication for deaf people: writing, lip reading, the manual alphabet, and sign language. (Ljubičić, 2014). A successful transfer of messages to deaf people depends on the methods of communication of the nurses. Most deaf people use lip-reading, speech or writing. Deaf people, who use writing, ask the nurse to write down the question, as well as to explain the orders they have received in writing (Ljubičić, 2014).

The effective communication between nurses and deaf persons is an essential element of nursing care, yet nursing education in how to communicate with deaf people is insufficient. The current nurse education in this field is mostly informative, which doesn't contribute to the development of competencies that are necessary for everyday practice. Nurses often communicate inappropriately, and lack the knowledge and skills to understand the communication needs of deaf person (Dickson & Magovan, 2014). It is possible to look for reasons in the non-everyday need, the insufficient connection between theory and practice, but also in the insufficient sensitivity rising not only in general, but also in the scientific community for the needs of deaf people.

In order to minimize communication problems on both sides, it is necessary to elaborate in detail educational programs for nurses, with the emphasis on communication with deaf people. This is primarily important because the nurses are in a continuous contact with deaf people upon their arrival to a health institution and they can help to assure that deaf people receive proper quality care. Using good communication, nurses can provide effective health care for deaf people. (Newton & Shah, 2013).

Despite the knowledge of the presence of communication difficulties, the research about the ways of communication between nurses and deaf people is not sufficiently presented. Also, even less presented are studies of the factors that complicate and/or don't allow for effective information transfer. Although practical experiences confirm the described issues, there is only a small amount of research to agree with this notion.

The aim of this study is to examine the frequency of encounters of nurses with deaf people; the ways of communication between nurses and deaf people, the difficulties in communication; emotional reaction and interest of nurses for the manual alphabet and sign language, as well as the perception of the need for an interpreter of sign language in a health institution.

Methods

Design and instrument

This is a cross-sectional study. The original paper-and-pencil questionnaire includes 30 items in total, divided into the before-mentioned groups related to communication and 4 particles of general data. The general data has been collected by entering the numeric value (age and the length of working experience of the respondents and by circling the offered answers (sex and the level of education). In specific data, the respondents indicated their level of agreement with statements using a Likert scale from 1 (completely disagree) to 5 (completely agree). We asked nurses about the ways and difficulties in the communication with deaf people (inability of deaf people to respond when called, understanding instructions and messages, and the lack of visible signs for deaf persons); emotional reactions of nurses when encountering the problem in communication such as concern, inconvenience, insecurity and anger. The statements include ways of communication with deaf people: showing, writing, speech, and the perception about the manual alphabet, sign language and an interpreter in the institution. This study was approved by the Human Research Ethics Committee General Hospital. Before filling out the survey, subjects were told about the purpose of the study; they were assured that the study was voluntary and that their responses would remain anonymous. Upon providing consent, subjects filled out the survey in individual cubicles to ensure privacy.
Participants
The participants were 40 licensed nurses from 4 medical departments in one hospital in Croatia. Most of the participants were female (95%), and 5% were male. The average age of the respondents was 36.9 (SD=8.59; 95%CI=34.13-39.62) years, the age range varied from 24 to 62 years. The average length of service is 16.3 (SD±8.56; 95%CI=13.38-18.86) years; the range was from 3 to 42 years. The level of education attained was high school for 80% for the nurses and university for 20%.

Data analysis
The collected information has been processed with the MedCalc Statistical Software version 14.8.1 (Ostend, Belgium; 2014). The descriptive statistics include the distribution of frequencies, measures of central tendency and dispersion of results. The differences between variables were assessed using the Mann-Whitney U test and Kruskal-Wallis test. The associations between variables were explored using Spearman rank correlation coefficients. In the mentioned processing, values p<0.05 have been considered as statistically significant.

Results
In the analysis of the frequency of encounters of nurses and deaf people, the nurses declare that they are not often able to communicate with a deaf person in 62.5% of all answers, 20% can't assess it and 17.5% of them often communicate with deaf people. The encounters of nurses with deaf people is does not occur often (M=2.28; SD=1.06; 95%CI=1.94-2.61).

In the analysis which age group has the most encounters with deaf people, it can be noticed that it is mostly nurses with 6 to 10 years working experience, but the obtained difference in ranking of higher values is random, a statistically significant difference (p=0.210) hasn't been established.

There is no significant difference in age (p=0.232), sex (p=0.400) and level of education (p=0.561). Even 27.5% nurses are unable to immediately estimate that a person has a hearing impairment, 25% cannot assess it and 47.5% can immediately assess that a person has a hearing impairment (M=2.70; SD=1.20; 95%CI=2.32-3.08). In order to improve message transfer, 87.5% of nurses ask the deaf person to write down what they need (M=4.00; SD=0.91; 95%CI=3.71-4.29).

Despite that, 47.5% of nurses emphasize that they need a lot of time to understand what a deaf person wants (M=3.10; SD=1.22; 95%CI=2.71-3.49). In 87.5% of the answers the nurses state that they don't have an interpreter when in contact with a deaf person (M=4.48; SD=1.11; 95%CI=4.12-4.83).

Results show that 65% of the nurses think that the communication problem is strongly pronounced immediately upon the arrival of a deaf person into the health institution. One of the problems stated in 65% of the answers of the nurses is the inability of deaf people to respond when called upon their arrival to a health institution. Regarding the understanding of messages, 40% of nurses think that deaf people have difficulties in understanding the messages. On the other hand, 57.5% of nurses emphasize that they understand the message from a deaf person. In 77.5% they think that they are trying to listen to the end in order to better understand the message of a deaf person. 55% of the nurses emphasize the lack of visible signs that could make the moving around of the deaf people in the health institution easier.

As the main problem in the communication of nurses with deaf people, the nurses cite the inability to understand a deaf person (37.5%). In solving these difficulties, the nurses show patience (77.5%) and interest in the problems of the deaf (67.5%). According to the results in 67.5%, there is eye contact between nurses and the deaf people.

A lack of interest for the issues of deaf people is present with 30% of the nurses and a lack of patience 17.5%. However, middle values on the Likert scale show a low level of anger (M=1.63; SD=1.10; 95%CI=1.27-1.98), impatience (M=1.93; SD=1.25; 95%CI=1.53-2.32) and the lack of interest is around (M=2.25; SD=1.41; 95%CI=1.80-2.70). When meeting the problem of difficult communication with deaf people, 60% of the nurses feel concerned, 55% uncomfortable, 30% insecure, 10% angry. The results show middle level concern (M=3.08; SD=1.37; 95%CI=2.64-3.51), insecurity (M=3.10; SD=1.55; 95%CI=2.60-3.60), and inconvenience (M=2.68; SD=1.31; 95%CI=2.26-3.09).

In examining the causes of possible communication problems, it can be seen that the interest/lack of interest of the nurses for the problems of the deaf people strongly affects their patience at work, and it
intensifies communication problems and the possibility for a deaf person to better understand the message (Table 1).

It can be noticed that when it comes to difficulties in communication, male nurses feel more uncomfortable, worried and angry, while female nurses are more insecure. There is no significant difference in emotional reactions depending on age, sex, and level of education.

The communication between nurses and deaf people happens through showing (95.1%), then through writing (62.5%) and then through speech (50%). The manual alphabet (20%) and sign language (12.5%) are less common ways of communication used by the nurses. Descriptive measures of ways of communication are shown in Table 2.

According to the opinion of 30% of nurses, the communication with deaf people happens in the same way as it does with other people, while 60% don’t agree with that statement. There is no significant difference in relation to age (p=0.103), sex (p=0.473), level of education (p=0.901), and the length of service (p=0.062).

The analysis of the perception of knowing the manual alphabet and sign language of deaf people shows a frequency of positive opinion, 62.5%. In addition, 67.5% of the nurses would like to attend a course of sign language (M=3.78; SD=1.23; 95%CI=3.38-4.17). In order to improve the communication with deaf people, an interpreter is needed in a health institution (M=3.93; SD=1.21; 95%CI=3.54-4.31). Descriptive measures of all difficulties in communication are shown in Table 3.
The connection between the perception of the nurses about the needs of these ways of communication and the willingness to attend a sign language course has been examined. The result of the Pearson coefficient ($r=0.323$) shows that the nurses who emphasize the necessity of this knowledge are also willing to attend a sign language course. The percentage of this common variations is in average 10.4% which is the coefficient of determination ($p=0.042$).

There is no difference in age, sex, level of education, or length of service on the ways of communication, emotional reactions, and the perception of the presence of an interpreter in an institution.

**Discussion**

When a nurse in a health institution meets a person with hearing impairment, efficient, mutually clear and understandable communication becomes a problem.

In this research, the perception of difficulties in the communication between the nurses and deaf people is significantly pronounced. The difficulties include the lack of response of deaf people when being called and the lack of understanding of messages. This research shows that the nurses mostly communicate with deaf people by showing and writing, but can't clearly assess if the deaf people have understood their message. It is interesting that some of the nurses claim to use sign language in communication, although the practical experience shows that the knowledge of sign language isn't spread among nurses. The nurses state that deaf people don't have an interpreter provided. The initiative usually comes from the deaf person. A feeling of discomfort and insecurity indicates a need for education about the ways of communication with deaf people in order to reduce the difficulties and to develop a better communication at mutual pleasure. The age, sex, level of education, and the length of nurses’ service has no significant effect on the way of communication, emotional reactions and the perception of the need for an interpreter in a health institution.

Studies show that the hiding of the disability by the person with hearing impairment, the exposure of the staff to stress at work and a poor communication among the staff, as well as inadequate education and the lack of skills are the main factors for communicational problems of people with hearing impairment upon arrival to a hospital (Adib-Hajbaghery & Rezaei-Shahsavarloo, 2015; Pribanić & Mlčković, 2012). For nurses, communication with deaf people is difficult, and they sometimes need more time for the application of nursing intervention (Mattjus, 2012). The time needed for communication with deaf people is often limited by other demands the nurses have to fulfil, and considerably affects the way of communication. Due to a lack of time, the nurses sometimes avoid direct communication and they communicate with a deaf person through an intermediary, mostly a family member (Hemsley, Balandin, & Worrall, 2012). Using family members can cause problems for patient confidentiality or in protecting the patient from dispiriting information. In a situation when they are insecure or when they haven't understood what the nurse had been saying, deaf people can

feel uncomfortable to ask more than once to repeat the comment or the question. Moreover, difficulties in communication can result in dissatisfaction with the quality of health care (Barnett, Kuol, & Coppola, 2014).

Limitations in communication can result in the lack of understanding of the patients’ needs and a wrong assessment about patients’ intelligence (Helder, 2012). Also, a significant percentage of nurses in this research are patient during the communication, but feel worried, uncomfortable and angry when they are not able to understand a deaf person.

In communicating with deaf people, nurses and other healthcare workers often apply paper writing and lip reading. They assume that this way of communication is most effective. However, this communication is insufficient, often inadequate and ineffective (Kauenburg, Fellinger, & Fellinger, 2016). The data of researches show that deaf people can effectively recognize only 20% to 30% when lip reading or reading from the face (Pribanić & Milković, 2012). „Lip reading” is actually a way of guessing of the content of the spoken message according to the picture it makes on the lips and the face of the interlocutor (Kauenburg et al., 2016; Pribanić & Milković, 2012). Lip reading and note writing are often ineffective ways of communication with the deaf and the difficult of hearing patients (McKee, Moreland, SR., & Zazove, 2015).

Deaf people often have difficulties in communication when seeking health services due to insufficient knowledge of communicational needs and ways of adjustment to the situation (Pribanić & Milković, 2012). A lack of visible signs of deaf people while moving around in a health institution contributes to that.

Deaf people are aware of the difficulties they have in verbal communication, due to an unclear articulation and a lack of language competence. They have difficulties in situations when the nurses don't know them and/or when they lack experience with deaf people. In addition to the difficulties in direct communication with the nurses, the biggest problem for deaf people arises in waiting rooms when being called (Pribanić & Milković, 2012). It often happens that a nurse fails to recognize that it is a deaf person, they call the person and only when the person sees that nobody is answering, they realize it has been their name that was called. The difficulty is even bigger, when they call the people over the counter or the PA system or when the nurse is wearing a mask over the face (Pribanić & Milković, 2012). In this research, the difficulties of the deaf are recognizable by the nurses. Nurses state that deaf people are not responding and hardly understand instructions.

Ineffective communication leads to a lack of understanding, wrong information and frustration with people with hearing impairment. This results in different reactions, for example some deaf people simply give up seeking for clear information, others express their rancor in an unpleasant way. A negativistic or angry behavior with a simultaneous projection of the mentioned onto the staff is also possible. Such reactions don't have to be observed in the context of neurotic, pathological reactions, but as a normal response to a stress situation (Ljubičić, 2014).

Deaf people prefer going to that health staff who is patient, understanding and who understands the person regardless of the distorted speech and who knows the basic rules of communication with a person with hearing impairment (Hersh, 2013; Preminger, Oxenböll, Barnett, Jensen, & Laplante, 2015). They are satisfied when a nurse patiently listens and when, by asking additional questions, she looks for clarification of what hasn't been understandable due to bad articulation, speech or pronunciation or for the purposes of complementing (Pribanić & Milković, 2012). Some research confirms that the communicational barriers caused the non-acceptance of health recommendations and the lack of understanding of the situation they were in (Sheppard, 2014).

Since the nurses in this study show patience and interest in the problems of deaf people, it can be assumed that they show a significant level of empathy and sensibility for the needs of these people. The sensibility of the nurses is also confirmed by the interest in the manual alphabet or sign language. If the nurses knew the manual alphabet or the sign language, they could more easily communicate with a deaf person. This is why such a way of communication is important in health institutions, especially in combination with lip reading and nonverbal forms like facial expressions and body movements (Pribanić & Milković, 2012).

The possibility of having an interpreter in a health institution is another useful way of overcoming communicational and social difficulties of deaf people, but also of the health staff during their contact
with them. In spite of disability rights laws and the UN Convention on the Rights of Persons with Disabilities, in many countries hospitals have no common practice to provide professional sign language interpreters. This would not only affect the improvement of the quality of communication, but also the improvement of the health care for deaf people. However, sign language in healthcare institutions is still difficult to apply. Such problems are noticed even in countries where deaf people have the legal right to effective communication when they come to health institutions (Kauenburg et al., 2016). When it comes to deaf people, the possibility to hire an interpreter of sign language in a health institution is rarely used (Pribanić & Milković, 2012). Only 20% of deaf people use the service of an interpreter upon arrival into a health institution (Pribanić & Milković, 2012). The reason could be the unavailability of the interpreter. Together with the deficit of interpreters, the unsolved problem of the payment of the service of a professional interpreter is one of the most significant problems (Pribanić & Milković, 2012). Since it is a situational need, it is possible to conclude that it would be necessary to develop translation services that would, depending on the circumstances, secure an interpreter during the care for a deaf person (Pribanić, 2012; Steinberg, Wiggins, Barnada, & Sullivan, 2012). On the other hand, an interpreter is not continual with deaf person and it can also cause difficulties in communication. For instance, a deaf person can suffer from pain because nurse cannot understand his message and the interpreter of a deaf person is not present (Gichane, Heap, Fontes, & London, 2017). There, where the translation services aren’t developed, the hospital can look for the services of an interpreter through an agency. These services are being used if it is known that a deaf patient is going to be observed, as well as when it is completely clear that an interpreter would not only make the communication easier, but also more effective and pleasant (Pribanić, 2012). Most of the nurses in this research support the presence of an interpreter of sign language in a health institution because it can positively affect the process of message transfer. Mauffrey et al. emphasize that deaf people want to receive information in their own language. Health providers who use sign language or sign language interpreters are important for understanding deaf people’s needs (Mauffrey, Berger, & Hartemann, 2016). Nurses need to have special communication skills when working with deaf patients and to become aware of the specific communication form to provide inclusive and safe health care (Stephan & Pinilla, 2014). However, studies show that nurses are lacking in knowledge and skills which are needed for quality communication with deaf people and patients with hearing impairments (Adib-Hajbaghery & Rezaei-Shahsavarloo, 2015; Mattjus, 2012). In addition, studies show that an appropriate education about communication skills with deaf people would improve the nurses’ knowledge and eliminate most of the communicational problems (Adib-Hajbaghery & Rezaei-Shahsavarloo, 2015; Pribanić & Milković, 2012; Velonaki et al., 2015).

Considering that different circumstances which can affect the process of communication, the role of the nurse upon the arrival of deaf people to a health institution, and in the integration and inclusion in society is extremely important. Only through clear and comprehensible communication, the contents and messages become understandable to a deaf person (Radibratović, Milutinović, & Sindik, 2013). Effective communication makes nurses feel better during communication with patients with hearing impairments (Mattjus, 2012). Also, deaf people feel better because they have a feel of comfort and safety during health care (Mattjus, 2012). If a deaf person has understood the messages and is able to be independent because of the clear and comprehensive information, then integration and inclusion will be possible.

The limitations of this research include predominantly female nurses at the hospital. The small number of male population was insufficient to be an example with statistical significance for emotional reactions and possibly other significant factors. The participants were not followed longitudinally during their education for nursing care for deaf persons to determine the consequent change in attitude. It is necessary to include more than one hospital and health institutions on the primary level, since the deaf population often visits family physicians.

**Conclusion**

The nurses confirm that while communicating with deaf people, they mostly use showing and writing. The need for knowledge of sign language is also connected with the initiative to attend additional education. An interpreter in a health institution is necessary for effective communication. Signs that would make the moving around of deaf people in a health institution easier should be visible and available for deaf people.
There is a priority need for better nurse education on the ways of communicating with deaf people. This would significantly contribute to the raise in the quality level of health care, but also the inclusion and the social integration of deaf people in society.

**KNOWLEDGE OF HEALTH EFFECTS OF DIETARY FIBRE AMONG NURSES AND THE GENERAL POPULATION IN CROATIA: COMPARATIVE ANALYSIS**

Marija Ljubicic, Marijana Matek Saric, Katja Curin, Raquel P. F. Guine,

**Abstract:**

Introduction: Nurses play diverse roles in educating patients about a healthy diet and in promoting healthy eating habits, through their conversations with patients and families and through their work providing enteral and parenteral feeding to critically ill patients. Given the position of nurses as key providers of dietary guidance, and given the health benefits of dietary fibre, we wanted to assess the level of fibre-related knowledge among nurses in Croatia.

Objectives: The primary objective of this cross-sectional study was to compare knowledge between nurses and the general population from Croatia about the health importance of consuming dietary fibre.

Methods: Knowledge from 369 nurses and 727 residents from the general population about fibre was assessed using a validated survey developed by the CI&DETS Polytechnic Institute, Viseu, Portugal. Differences between nurses and the general population were assessed for significance using the Mann-Whitney U test and the Kruskal-Wallis test, while associations between study variables and knowledge were explored using Spearman rank correlation coefficients.

Results: The level of knowledge among nurses and the general population in Croatia about dietary fibre varies from «undecided» to «partial knowledge». No association was observed between nurse education level and either general knowledge about fibre or knowledge about the health benefits of fibre intake. No significant differences were observed between nurses and the general population in general knowledge ($p = 0.894$) or in health-related knowledge ($p = 0.578$).

Conclusion: The results suggest the need for updating and expanding nursing curricula. The similar level of knowledge between nurses and the general population about dietary fibre indicates the need to strengthen nurse education and training in the areas of diet and diet therapy in Croatia. Given the role of nurses as diet educators and advisors, this may help improve the quality of health care.

**UDC Classification:** 616-01; **DOI:** http://dx.doi.org/10.12955/cbup.v5.1053

**Keywords:** knowledge, dietary fiber, nurses, general population.

**Introduction**

Public health campaigns and interventions designed to promote healthy behaviors such as diet often assume that if people know what is good for them, they are more likely to act in their own best health interest (Worsley, 2002). However, although knowledge about diet is indeed a predictor of healthy food consumption, it is not the only predictor (Worsley, 2002). Consumption of healthy food in general, and intake of dietary fibre in particular, also depends on knowledge, habits, motivation, personal characteristics and hedonistic orientation. This has important implications for health professionals, whose mission is to promote positive health behaviours through effective education, counselling and awareness-building.

Numerous studies have demonstrated the health benefits of dietary fibre, including its ability to prevent and treat various diseases (Fuller et al., 2016; Galisteo et al., 2008; Hajishafiee et al., Esmaillzadeh, 2016; Ismaiel et al., 2016; Kunzmann et al., 2015). Dietary fibre can be defined as edible parts of plants that are not digestible in the small intestine and so are not absorbed there, but that are partially or totally degraded in the large intestine by intestinal microflora (Guine, Martinho, Barroca, & Viseu, 2014). Main sources of dietary fibre are vegetables, fruit, grains, legumes and seeds. Daily intake of 25 g of dietary fibre is important for optimal functioning of the intestines, and daily intake above this amount can reduce the risk of many chronic diseases (Slavin, 2013; Yang, et al., 2015).

Knowledge about the health effects of fibre, daily intake requirements and methods to monitor fibre intake is crucial for nurses to provide effective care to patients with high comorbidity burdens. Indeed, nurses play diverse roles in educating patients about healthy diets and in promoting healthy eating habits, through their conversations with patients and families and through their work providing enteral and parenteral feeding to critically ill patients (Green & Jackson, 2002; Lazarou & Kouta, 2010). Nurses are able to identify health gaps in patient knowledge and behaviour or lifestyle, and they can...
react accordingly. In fact, they are well-placed to design research to examine these health gaps and develop solutions for them (Brotheton et al., 2013). Florence Nightingale emphasized the role of diet in patient recovery, and the important role of nurses in supporting proper diet (Yalcin et al., 2013). Nurses are frequently called upon to act as dietary consultants, offering patients information about diet and about healthy food selection (Henning, 2009), as well as monitoring patients’ food intake and eating habits. These duties come in addition to the routine duties of care such as administering treatments, monitoring vital signs and conducting other interventions (Yalcin et al., 2013). Education provides the foundation for a nurse to plan, provide and evaluate dietary care (Green & Jackson, 2002).

We are unaware of published studies assessing knowledge about dietary fibre among nurses, and it appears that in Croatia, no study has been published on nurses’ knowledge of diet in general or of fibre in particular. Research into such knowledge levels may generate key insights for improving systematic training and education of nurses. Given the position of nurses as key providers of dietary guidance, and given the health benefits of dietary fibre, we wanted to assess the level of fibre-related knowledge among nurses in Croatia and compare it with the level of knowledge in the general population. We examined both general knowledge about fibre and specific knowledge about the demonstrated effects of fibre on human health. In light of the research literature from other countries, we hypothesized that nurses in Croatia would show higher levels of knowledge than the general population. The results of our study may help guide the strengthening of dietary training at all levels of nursing education and training, which in turn may improve the ability of nurses to prevent and treat disease through diet therapy.

**Methods**

**Design and Samples**

In this cross sectional study, the level of knowledge about dietary fibre was assessed using a validated survey developed by the CI&DETS Research Centre at the Polytechnic Institute Viseu in Portugal (7). The survey contains questions about demographic characteristics as well as about knowledge of sources of dietary fibre, recommended daily intake and effects of fibre intake on particular diseases. They were asked about health knowledge i.e. the influence of fibre on the risk of cardiovascular disease, hypercholesterolemia, diabetes, obesity, constipation, carcinoma of the colon or breast, vision problems and vitamin and mineral deficiency.

This study was approved by the Human Research Ethics Committee of the General Hospital, Home Health and Nursing school. Aims of the study were explained to all participants and they were assured that participation was voluntary and anonymous. Upon providing consent, respondents filled out the questionnaires on their own and handed them in by placing them in a marked box.

**Participants**

A total of 1,096 respondents, comprising 369 nurses and 727 residents from the general population, were surveyed on the coast of Croatia. Nurses were from three health centres and one nursing school, all located in Zadar County, Dalmatia. Respondents were 69.7% female (764) and 30.9% male (332). Among the respondents in the general population, 57.3% (417) were female and 42.6% (310) were male; the corresponding proportions among nurse respondents were 94.0% (347) and 5.9% (22). The preponderance of female nurses contributed to the high proportion of females in the overall sample.

An urban environment was the living situation for most respondents from the general population (551, 77%) as well as for most nurses (268, 74.4%), while 165 (23%) respondents from the general population and 92 (25.6%) nurses lived in a rural environment.

Average age of respondents was 38.9 years (SD 12.3; 95% CI 38.2-39.6), ranging from 18 to 77 years. Most respondents from the general population and most nurses had a secondary school education.

**Measures**

Respondents indicated their level of agreement with statements about fibre using a Likert scale from 1 to 5: 1–completely disagree; 2–disagree; 3–neither agree or disagree; 4–agree; 5–completely agree. These levels of agreement were then transformed into levels of knowledge, such that responses of 5 indicated complete knowledge; 4, partial knowledge; 3, indecision; 2, partial lack of knowledge; and 1, complete lack of knowledge. Levels of agreement with questions formulated in the negative, such that 5 indicated complete agreement with an incorrect statement, were recoded before calculating level
of knowledge. As a result, levels of knowledge always indicated correct knowledge. Levels of knowledge were converted to percentages by multiplying central values by 20 (1 = 20%). Test reliability was good (Cronbach’s α = 0.775).

Data analysis

SPSS 22.0 (IBM, Armonk, NY, USA) was used to generate descriptive statistics about the results (frequency distributions, central tendency measures, dispersion measures) and to perform inferential statistical analysis to assess influences of sex, age, living environment and education level on knowledge about dietary fibre. Test reliability was assessed using Cronbach’s alpha, and results were tested for normal distribution using the Kolmogorov-Smirnov test. This test indicated a skewed distribution, so inter-group differences were assessed using the non-parametric Mann-Whitney U and Kruskal-Wallis tests. Associations between study variables and knowledge about dietary fibre were explored using a Spearman rank correlation analysis. For all statistical analyses, the threshold of significance was defined as p < 0.05.

Results

The survey asked respondents about their knowledge of recommended daily intake of dietary fibre and the presence and abundance of fibre in various foods and ability of dietary fibre intake to help prevent certain diseases. The median central value for level of knowledge of the various items ranged from 3 to 4 (interquartile range (IQR) 1 to 2) for the general population and for nurses. Relatively strong variability (Vq 0.33) was observed among both group on items asking about the presence of dietary fibre in foods of plant or animal origins. Both groups showed low variability in knowledge on all items related to the health effects of dietary fibre, with Vq ranging from 0.00 to 0.20. Average levels of general knowledge about fiber in percentages ranged from 58.9% to 83% for the general population, and from 61.4% to 82.1% for nurses, and 57.6% to 82.0% for nurses and from 58.9% to 79.3% for the general population for the health importance of dietary fibre.

Possible associations were explored between general knowledge about dietary fibre and several sociodemographic factors: age, sex, education level and living environment. Among nurses, those aged 36 to 45 showed significantly higher general knowledge than other age groups (p = 0.013). No other significant associations were observed. None of the sociodemographic factors appeared to significantly influence levels of knowledge about the dietary effects of fibre intake.

Among respondents from the general population, general knowledge was significantly higher among those living in urban environments compared to those in rural environments (p = 0.002), among those with higher education levels compared to those with less education (p = 0.042) and among women compared to men (p = 0.022). No other significant associations were observed. The only significant association identified between level of knowledge about health effects of fibre and sociodemographic factors was sex, with women showing significantly higher health-related knowledge than men (p = 0.004).

Respondents from the general population with higher education levels showed significantly higher levels of knowledge about the presence of dietary fibre in whole grain foods (1.6%, r = 0.13, p = 0.001) and unpeeled fruit (0.5%, r = 0.08, p = 0.045), and about the influence of fibre intake on the risk of bowel cancer (0.6%, r = 0.08, p = 0.032). No significant association was observed between education level and knowledge level on the other items.

Among nurses, those with higher education levels showed significantly higher knowledge levels about the presence of dietary fibre in whole grain foods (1.2%, r = 0.11, p = 0.035) and about the influence of fibre intake on the risk of certain diseases (1.9%, r = 0.14, p = 0.007), constipation (1.6%, r = 0.13, p = 0.016) and specifically the risk of bowel cancer (2.1%, r = 0.15, p = 0.005) and breast cancer (1.2%, r = 0.11, p = 0.039).

In both groups, significant associations were identified between general knowledge about dietary fibre and knowledge about its health benefits (Table 1). Education level was associated with level of general knowledge among respondents from the general population, but it was not associated with general or health-related knowledge among nurses.
The general population showed higher knowledge about the absence of dietary fibre from foods of animal origin, and about the ability of dietary fibre intake to prevent and treat certain diseases in general. Nurses showed higher knowledge about the ability of dietary fibre intake to prevent and treat obesity, constipation and breast cancer in particular (Tables 2). No other differences in knowledge between the two groups were observed on other items.

Aggregating responses on all items about general knowledge of dietary fibre or on all items about health-related effects of fibre intake indicated higher levels of both types of knowledge among nurses than among respondents from the general population though the differences were not significant (Table 3).

Discussion
Motivated by the large number of studies demonstrating the positive health effects of dietary fibre in the diet therapy of many diseases, we set out to assess the levels of knowledge about fibre in general and its health benefits in particular among nurses and the general population in Croatia. Our results indicate that although nurses often recommend consuming fibre to treat conditions such as constipation, they have substantial gaps in knowledge about the effects of dietary fibre intake on health. Indeed, we found that nurses had nearly the same level of knowledge about dietary fibre as the general population. At the same time, nurses showed higher levels of specific knowledge about the influence of fibre intake on constipation, obesity and carcinoma of the colon or breast. Levels of knowledge in both groups varied substantially.

In our research and other studies, a high proportion of nurses have limited knowledge about diet therapy and about sources of soluble fibre and other foods that can prevent or treat certain diseases (Park et al., 2011). However, our finding that nurses showed higher levels of specific knowledge about the influence of fibre intake on constipation, obesity and carcinoma of the colon or breast likely reflects their formal education and previous experience. Our finding of similar knowledge points to inadequacies in nurse knowledge, which can negatively affect patient care. Studies in different countries point to deficits in dietary knowledge among not only nurses but other health professionals as well in South Korea and Australia (Kowanko et al., 1999; Park et al., 2011; Schaller & James, 2005); Denmark, Sweden and Norway (Mowe et al., 2008). In addition, the inadequate number of dieticians and nutritionists in the health system means that nurses often shoulder the responsibility of dietary advisor (Brotheton et al., 2013). However, nurses lack the necessary dietary education to offer optimal guidance and advice to patients (Henning, 2009; Kowanko et al., 1999; Yalcin et al., 2013). Nursing curricula include diet as only a small part of the wider spectrum of nursing areas, which is inadequate for satisfying patient needs in practice (Green & Jackson, 2002; Kowanko et al., 1999). This lack of dietary knowledge makes it difficult for nurses and other medical staff to identify malnourished patients and correctly calculate a patient's energy requirements. These deficiencies may contribute to the risk of complications and prolong patient stay in hospital (Mowe et al., 2008).

Studies demonstrate that nurses are best positioned to provide patients with all necessary information about diet (O'Mahony et al., 2011; Yalcin et al., 2013). Analysis of nursing experiences indicates that patients frequently ask them to provide dietary information. Studies show that nurses are in constant contact with patients and continuously communicate with them (O'Mahony et al., 2011) and often receiving dietary questions from patients, but nurses are often busy with other tasks, such as documentation and medication (Eide et al., 2015). Nurses accompany patients throughout their health care to prevent and treat disease, so their knowledge about diet and dietary fibre is key to successful diet therapy, which is an essential part of a patient's non-pharmacological treatment (Rodrigues-Fisher, Bourguignon, & Good, 1993). Nurses require a certain level of dietary knowledge to advise patients about choice of foods, meal sizes and meal schedules, all of which play an important role in diet therapy. Numerous studies underscore how important it is for a nurse to understand diet and the influence of specific ingredients in food on health (Brotheton et al., 2013; Kowanko et al., 1999; Park et al., 2011; Yalcin et al., 2013), as well as to be able to assess nutritional patterns according to Marjory Gordon (Gordon, 2011). However, studies show that nurses often lack this necessary knowledge and rarely document assessments of diet status, energy intake and body mass indexes (Kim & Choue, 2009; Persenius et al., 2008). Instead, nurses tend to note only the appearance of difficulties such as nausea, vomiting, reduced mobility or eating ability; assessment of diet status is usually limited to addressing patient concerns about specific types of foods (Persenius et al., 2008). This incomplete dietary assessment can lead to incorrect estimation of dietary needs, which can negatively affect patient recovery.

Our findings are consistent with literature showing that, even though nurses and physicians emphasise the importance of diet in medical care, and even though patients expect to receive relevant dietary information from their healthcare providers, the reality is that healthcare workers often feel poorly equipped to offer dietary guidance (Adams, Kohlmeier, Powell, & Zeisel, 2010). One study even found that physicians knew less than their patients about some dietary topics (Lazarus, 1997).

Several studies have shown that nurses as well as other health professionals often have insufficient dietary knowledge (Adams et al., 2010; Lane et al., 2014; Lazarus, 1997; Mowe et al., 2008; Warber,
et al., 1997; Yalcin et al., 2013). Park et al found that although most nurses are aware of the need for diet therapy, they have limited knowledge about low-cholesterol diets, sources of soluble fibre and specific foods that can help prevent disease (Park et al., 2011). Those authors concluded that nurses, had weak knowledge about clinical aspects of diet. This suggests that medical staff pay insufficient attention to diet, despite the fact that diet therapy is an important part of patient care.

Education appears to be more important than experience in providing good dietary care to patients: studies have shown that experience is not a predictor of dietary knowledge, and that less experienced nurses can showed greater knowledge than their more senior colleagues (Crogan & Evans, 2001). However, in our study, we observe a significant association between education level and knowledge about dietary fibre. Numerous studies concluding that higher education level among nurses is associated with greater dietary knowledge (Yalcin et al., 2013), and that they need education in the areas of diet therapy and many other diseases (Bjerrum et al., 2012; Crogan et al., 2001; Endevelt et al., 2009; Warber et al., 1997). We suspect that this discrepancy reflects the relatively high proportion of nurses in our sample with secondary education, as well as the relatively low levels of knowledge among university-educated nurses in our sample. On balance, the literature suggests a positive effect of education on knowledge about dietary fibre. Therefore, our results and those of others highlight an urgent need to update and expand content related to diet and diet therapy in the nursing curriculum (Boaz et al., 2013; Mowe et al., 2008; Park et al., 2011; Yalcin et al., 2013).

Studies examining questions of nurse knowledge and experience should be careful to distinguish between the two, which the literature often associates or even treats as equivalent. The two concepts are not necessarily inter-related: studies show that experience in the absence of specific education may not increase the level of knowledge about diet (Crogan et al., 2001; Yalcin et al., 2013) or dietary fibre.

Despite the strengths of the present study, including its relatively large sample, good test reliability, and analysis of different types of knowledge about dietary fibre, the work has some limitations. The survey did not collect data that would allow us to determine the percentage of respondents from the general population who might be more likely to know more about dietary fibre than others, such as scientists, physicians, and nutritionists.

Furthermore, the strong influence that nurses exert on patients' attitudes toward diet and healthy behaviours means that adequate dietary knowledge is crucial. The results of the present study, together with numerous studies from other countries, suggest the need for curriculum reform at all levels of nursing to strengthen knowledge of diet, diet therapy and health benefits of dietary fibre.

Conclusion

While the nurses in our sample showed a certain level of knowledge about the influence of dietary fibre intake on prevention and treatment of certain diseases, on the whole the nurses showed levels of knowledge about dietary fibre similar to those in the general population. This is troubling because nurses, given their role as diet educators and advisors, should know more about the subject than their patients. These results suggest the need for updating and expanding nursing curricula in the areas of diet and diet therapy.

ACCESSIBILITY AND AVAILABILITY OF PHARMACEUTICAL CARE IN COMMUNITY PHARMACIES IN THE SLOVAK REPUBLIC. AN EVIDENCE-BASED STUDY FROM 1998 TO 2014

Ivona Malovecká, Daniela Mináriková, Zuzana Haramiová, Viliam Foltán

Abstract: Community pharmacies are one of the parts of health care system and contribute to the public health and health promotion. Currently ongoing changes affect the functionality of the whole health care system. Current health care system is very sensitive to any change that might influence the wide range of parameters in the provision of pharmaceutical care. The number of pharmaceutical care providers particularly is a crucial parameter that should constantly be monitored and analyzed, especially in relation to demographic and geographic characteristics. The total number of community pharmacies, population to pharmacy ratio, and area to pharmacy ratio represent some of the parameters used for the evaluation of pharmaceutical care efficiency and are vulnerable to changes with powerful regulatory potential. In 1998, there were 952 community pharmacies in the Slovak Republic, the population to pharmacy ratio amounted to 5 552 and the area to pharmacy ratio amounted to 52.5. Gradually, the number of community pharmacies has increased and in some regions redoubled. This has resulted in a decline of population to pharmacy ratio and area to pharmacy ratio in all regions of the Slovak Republic (p<0.05). The most meaningful change in the development trend of the selected ratios occurred in 2005 (p <0.05). The number of community pharmacies culminated in 2012 (1612 community pharmacies: 3352 population to pharmacy ratio and 30.5 area to pharmacy ratio). In 2014, the Slovak Republic had 1598 community pharmacies, 3394 population to pharmacy ratio and 30.8 area to pharmacy ratio. The accessibility and availability expressed by the number, ratio and location of pharmacies in the Slovak Republic is perceived positively. The concerns regarding the economic stability of pharmacies and also long-term maintenance of the current accessibility and availability of pharmacies are presented.

UDC Classification: 614.2

Keywords: community pharmacy, pharmaceutical care, population to pharmacy ratio, area to pharmacy ratio

Introduction
Pharmaceutical care in the Slovak Republic is considered to be one of the main pillars of healthcare. It ensures availability of medicines, medical devices, dietetic food and supplementary products for a minimum of five days a week. Furthermore it provides expert consultation on the appropriate application of medicines (Clifford et al., 2006) and dietetic food, appropriate application of medical devices (Cain et al., 2001), efficient disease prevention (OLoughlin et al., 1999), nourishment and a healthy way of life.

In all countries of Europe, the pharmaceutical care is provided either through regulated or deregulated systems. The character of the pharmaceutical care provider regulation influences community pharmacies in terms of accessibility, availability, quality and economic stability. Pharmaceutical care in a regulated system is characterized by governmental jurisdiction of the community pharmacy foundation that results in adequate accessibility and availability of pharmaceutical care. Moreover, the pharmaceutical care is evenly distributed between municipalities, particularly between urban and rural regions. Nordic countries, for example Norway, Sweden et cetera, have a deregulated system of pharmaceutical care. It has led to an escalation in the total number of community pharmacies and principally to their disproportionate allocation in the state territory (with a higher number of pharmacies located in the cities and a lower number of pharmacies in the countryside). The accessibility and availability of pharmaceutical care (especially the availability of medicines) have gotten worse especially in rural areas (Westerlud and Bjork, 2006).

The deregulated system of pharmaceutical care interferes with property rights via lack of ownership standards and creates structures of pharmaceutical care providers such as pharmacy networks and vertical integration; where large international companies own wholesale pharmacy chains that often control the pharmaceutical market (Vogler et al., 2012). This may affect the availability of medicines in pharmacies, and likewise the patients’ overall satisfaction with provided pharmaceutical care. Accordingly, the existence of policies describing the availability of medicines in stock (FIP/WHO,

2 Faculty of Pharmacy, Comenius University in Bratislava, Slovak republic, minarikova@fpharm.uniba.sk
3 Faculty of Pharmacy, Comenius University in Bratislava, Slovak republic, haramiova@fpharm.uniba.sk
4 Faculty of Pharmacy, Comenius University in Bratislava, Slovak republic, foltan@fpharm.uniba.sk
2012) and the time necessary to acquire medicines (existing in Austria, Denmark, Finland, Norway, Spain and other countries) help prevent medicine shortages and shorten patient waiting times (Vogler et al., 2012).

Current legislation in the Slovak Republic, unlike in the past, does not restrict the acquisition of a license for provision of pharmaceutical care services to any demographic and geographic requirements and therefore the Slovak Republic belongs to countries with deregulated systems of pharmaceutical care providers.

The accessibility and availability of pharmaceutical care can be characterized not only by the number of community pharmacies but also by other derived parameters, such as the population to pharmacy ratio, area to pharmacy ratio, the number of pharmacists per 100 000 inhabitants (OECD, 2015) and others. However, the long-term evaluation of these data is rare in many countries. Similarly, the assessments of external factors on the development trend, and the most significant change in the development trend, are often not paid enough attention from the scientific community.

Data and methodology

Research Goal

The present study completes the limited data by the assessment of selected characteristics of community pharmacies in the time span of 17 years (1998-2014), focusing on the development trend type and the most significant change in the development trend.

Set of evaluated data

The set of evaluated data contained information about all community pharmacies providing pharmaceutical care services to the general public.

Date Set Source

The data on the number of community pharmacies, population and area surface during the years 1998-2014, were drawn from the “Datacube” database managed by the Statistical Office of the Slovak Republic.

Methods

For assessing the significance of the development trend non-parametric Mann-Kendall test and Fisher test for classical linear regression were used. For testing the most significant change in the development trend nonparametric Pettitt test was used. Subsequently, descriptive statistics was used to describe the results, which are presented in tables.

Processing software

The collected data were entered and edited in Microsoft Excel. Mann-Kendall’s, Fisher’s, and Pettitt’s tests were performed using the R statistical software (R Core Team, 2015).

Outcomes of assessment

Outcomes of the assessment are presented as two ratios: the population to pharmacy ratio and the area to pharmacy ratio. The population to pharmacy ratio expresses the number of inhabitants per community pharmacy and the area to pharmacy ratio represents the area per community pharmacy in square kilometers.

For the purposes of the present study, provision of pharmaceutical care was narrowed to only public pharmacies and branches of community pharmacies. The common term "community pharmacy" is used to refer to both of the above-mentioned health care facilities.

Results

Descriptive characteristics of community pharmacies

The smallest number of community pharmacies (952) and the lowest population to pharmacy ratio (6154 inhabitants) were in the year 1998, the lowest area to pharmacy ratio in 2002 (78.5). The number of community pharmacies had increased gradually over the evaluated time period and reached the maximum of 1618 community pharmacies in 2012. Concurrently the population to pharmacy ratio decreased to its minimum of 3406 inhabitants and the area to pharmacy ratio to its minimum of 29.5 square kilometers in 2010.
The population to pharmacy ratio: 1998-2014

Development trend of the population to pharmacy ratio

Regional level

The population to pharmacy ratio on the regional level assessed by the Mann-Kendall’s test and Fisher's test showed a statistically significant decreasing development trend in all eight regions of the Slovak Republic (p <0.05) (Table 2).

State level

The population to pharmacy ratio assessed by the Mann-Kendall’s test and Fisher's test showed a statistically significant downward development on the state level (p˂0.05).

Change in the population to pharmacy ratio development trend

Regional level

The most significant changes in the development trend of population to pharmacy ratio assessed by the Pettitt’s test at the regional level occurred predominantly in 2005; and in two regions in different years (2003 in Trnava region 2006 in Nitra region). In all regions, the change in development was statistically significant (p <0.05) (Table 3).

State level

The most significant change in development trend of population to pharmacy ratio assessed by Pettitt’s test state level occurred in 2005 (p <0.05).

The area to pharmacy ratio in the time span 1998-2014

Development trend of the area to pharmacy ratio

Regional level

The area to pharmacy ratio at the regional level assessed by the Mann-Kendall’s test and Fisher’s test showed a statistically significant decreasing development trend in all eight regions of the Slovak Republic (p <0.05).

State level

The area to pharmacy ratio assessed by the Mann-Kendall’s test and Fisher’s test showed a statistically significant downward development at the state level (p<0.05).

Change in the area to pharmacy ratio development trend

Regional level

The most significant change in development trend of area to pharmacy ratio, assessed by the Pettitt’s test, at the regional level occurred in 2005; in two regions in different years (2004 in Trnava region and 2006 in Nitra region). In all regions, the change in development was statistically significant (p <0.05).

State level

The most significant change in the area to pharmacy ratio development trend at the state level, assessed by Pettit’s test, occurred in 2005 as well (p <0.05).

Discussion

Since the regime change in 1989, the health care has passed several significant changes in numerous key areas. Among the most important are the regulations of ownership, demographic and geographic criteria of community pharmacies establishment, and price regulation, which significantly influenced the number of community pharmacies, as well as the availability and quality of pharmaceutical care services. The initial period characterized by a small number of pharmacies (952 in 1998), with a high number of inhabitants per community pharmacy (approximately 5454 inhabitants) and a large area per community pharmacy (approximately 52.1 square kilometres) has been replaced by the growth phase, during which the number of pharmacies almost doubled in some regions. At the same time, the number of inhabitants per community pharmacy and the area per community pharmacy has decreased in all regions of the Slovak Republic (p <0.05). This development culminated in 2012 when the number of pharmacies peaked. According to the Statistical Office of the Slovak Republic, that year pharmaceutical care was being provided by 1618 community pharmacies (with a 3352 population to pharmacy ratio, and a 30.5 area to pharmacy ratio). In 2014, at the end of the assessed period, Slovak Republic had 1598 pharmacies, an average of 3394 inhabitants per community pharmacy and an average of 30.8 square kilometers area per community pharmacy.

In the Slovak Republic, similarly to other European countries without regulatory criteria, new community pharmacies have been established predominantly in larger cities (Wagner et al., 2009). According to the study of Martins et al. (2015), focusing on selected European countries, certain criteria for the establishment of a community pharmacy exist in 17 of the 19 European countries assessed. Nevertheless, despite the absence of these criteria in the Slovak Republic, the formation of new community pharmacies has been observed even in smaller towns and villages. Hence, the inhabitants have an accessible pharmacy available within a maximum of 25 minutes (Skybová and
In England, 89% of the population has access to a pharmacy within 20 minutes (Todd et al., 2014).

The number of pharmacies differs from country to country. According to OECD, there is a significant difference in the number of pharmacies per 100,000 population between countries. Countries such as Spain and Japan have a high number of pharmacies per 100,000 population (47.2 resp. 45.0 pharmacies per 100,000 population), while in countries such as Israel and Denmark the number is very low (6.0 and 3.9 pharmacies per 100,000 inhabitants respectively) (OECD, 2015). The Slovak Republic reaches 36.8 pharmacies per 100,000 inhabitants, which places it between Ireland and Poland, and far above the average of 25 OECD countries (25.1 pharmacies per 100,000 population). Differences between countries in the number of pharmacies can be explained among other reasons by different regulatory criteria as well as more or less actively scheduled tasks of the government, compensation models used in the country, ways of medicines distribution and other factors. For instance, drugs can be issued to patients not only in community pharmacies but also through hospital pharmacies (permitted in the Slovak Republic), or directly by doctors (prohibited in the Slovak Republic). Currently, approximately a third of the European countries have access to medicines limited exclusively to community pharmacies (Todd et al., 2014).

Conclusions

Nowadays, the accessibility and availability (expressed by the number and location) of pharmacies in the Slovak Republic is rated positively. This is due to more even population distribution in comparison to some other countries. There are, however, present some concerns regarding the economic stability of pharmacies, and also long-term maintenance of the current accessibility and availability of pharmacies. In this context, the intention of the analyses of the current status and development of pharmacies is beneficial since it provides a wider and original view of the development of pharmacies from 1998 to 2014. Evaluation of similar character has not yet been published in the Slovak Republic. The assessed areas should be further monitored and evaluated, and the baseline analysis should be expanded and evaluated in greater depth. All analyses, their outcomes, subsequent follow-up and additional activities, however, should be aimed at maintaining and improving the accessibility and availability of pharmaceutical care services for patients.

Abstract:
Introduction: Various biomarkers are used to evaluate the severity and prognosis of community acquired pneumonia (CAP).

Objectives: To study and compare the prognostic value of MR-proADM, PCT and CRP in predicting the severity and outcome of CAP.

Methods: A prospective cohort study of 92 patients hospitalized with CAP in the Clinic of Pneumology and Phthisiatrics of MHAT “Saint Marina”–Varna in 2015 was conducted. The biomarkers were measured on admission. Midregional pro-adrenomedullin (MR-proADM) and procalcitonin (PCT) were measured by standard ELISA, and C-reactive protein (CRP) was determined by latex-enhanced immunoturbidimetric assay. CAP severity was assessed by CURB-65.

Results: Patients were on average 59.2±16.8 years of age; 68.5% of them were male. The in-hospital mortality rate was 7.6%. The three biomarkers MR-proADM, PCT and CRP were significantly higher in non-survivors compared to survivors (0.91±0.045 ng/ml vs. 0.39±0.269 ng/ml, p<0.01; 2.14±0.60 ng/ml vs. 1.12±0.68 ng/ml, p<0.01 and 215.12±96.39 mg/L vs.175.74±221.5 mg/L, p<0.05 respectively). In patients who needed intensive care, the biomarkers were also significantly higher than those in patients treated in the general hospital unit (0.50±0.336 ng/ml vs. 0.41±0.284 ng/ml, p<0.05; 1.92±0.76 ng/ml vs. 1.15±0.70 ng/ml, p<0.05 and 221.98±100.34 mg/L vs. 165.31±122.84 mg/L, p<0.05 respectively). MR-proADM and PCT showed a moderate correlation with the CURB-65 (r=0.33, p<0.01 and r=0.30, p<0.05 respectively). CRP did not correlate with the CURB-65 (r=0.10, p>0.05).

Conclusion: MR-proADM, PCT and CRP were significantly higher in non-survivors and in patients treated in the intensive care unit. MR-proADM and PCT showed a moderate correlation with the CURB-65, while the correlation coefficient for MR-proADM was higher. CRP did not correlate with the CURB-65.

Keywords: MR-proADM, PCT, CRP, CAP, prognosis

Introduction

Various biomarkers are in use for evaluation of the severity and prognosis of community acquired pneumonia (CAP). Some of them, such as C-reactive protein (CRP) and, in some hospitals procalcitonin (PCT), are used routinely in clinical practice, but others, such as pro-adrenomedullin have been recently studied in an attempt to find better prognostic tools in CAP. CRP was discovered in 1930 by Tillet and Francis. It is an acute-phase protein, which is an early and sensitive, but nonspecific marker of systemic inflammation. It is synthesized mainly by hepatocytes under the influence of IL-6, IL-1 and TNFα (Clyne et al., 1999). Apart from its increase during infection, its level is also increased in autoimmune diseases, trauma, tissue necrosis and malignancy. PCT is the precursor of the active hormone calcitonin. It belongs to CALC-1 – gene family. It was discovered in 1975 by Moya. Its levels begin to rise within 2 hours after bacterial infection which makes it an earlier marker than CRP. It reaches a peak-concentration at 12 hours and has a half-life of 24 hours (Meisner 2000). Interferon gamma, which is produced in response to viral infection, blocks PCT synthesis. Therefore, its levels do not rise in viral infections. These reasons make it a reliable marker for the etiologival distinction between viral and bacterial infections and for the need of antibiotic treatment. Therefore, it would be capable of preventing antibiotic overconsumption (Christ-Crain et al., 2006). Its levels are particularly elevated in bacterial sepsis. Besides sepsis, its levels also rise in pneumonia, acute inhalation poisoning and other severe infections such as pancreatitis, appendicitis, burns, heat stroke, multiple trauma, surgeries (Becker et al., 2010).

Compared to CRP, it is a more specific marker for a bacterial infection. Adrenomedullin was first discovered in 1993 by Kitamura, and was initially isolated from pheochromocytoma (Kitamura et al., 1993). Similar to procalcitonin, it belongs to CALC-1-gene family. It is a peptide consisting of 52

aminoacids, mainly produced by cardiovascular tissue, but also by the adrenal medulla, lungs, kidneys, neurons. It is one of the most potent endogenous vasodilators. Its levels rise in the syndrome of systemic inflammatory response due not only to infections, but also to burns, trauma, traumatic shock, pancreatitis (Ueda et al., 1999). Its direct measurement is difficult because of its short half-life (22 minutes), due to binding to plasma proteins and technical difficulties. For practical purposes a part of the molecule of its precursor known as midregional pro-adrenomedulin (MR-proADM) is used. It has no biologically active properties, but according to its levels, the levels of adrenomedullin can be judged. In healthy individuals, the typical values of MR-proADM are 0.10-0.64nmol/L without difference between the sexes (Morgenthaler et al., 2005).

Objectives
To study and compare the prognostic value of MR-proADM, PCT and CRP in predicting the severity and outcome of CAP.

Methods
A prospective cohort study of 92 patients hospitalized in the Clinic of Pneumology and Phthisiatics of MHAT “Saint Marina”– Varna in 2015 was conducted. The biomarkers were measured on admission. MR-proADM and PCT were measured by standard ELISA, and CRP was determined by latex-enhanced immunoturbidimetric assay. CAP severity was assessed by CURB-65. Data were analyzed with SPSSv20.0. We used comparative and correlation analyses. Quantitative variables were reported as mean values and standard deviation (mean ± SD), and the qualitative variables were presented in number and relative proportion (%).

Results
The patients were on average 59.2±16.8 years of age; 63 (68.5%) of them were male and 29 (31.5%) were female. 22 patients (23.9%) were treated in the intensive care unit (ICU). 7 patients (7.6%) died during hospital stay. Characteristics of the group and the mean values of the three biomarkers are shown in Table 1.

Source: Authors

We compared the levels of the three biomarkers in non-survivors and survivors and found out that they were significantly higher in deceased patients. MR-proADM in non-survivors was 0.918±0.045 ng/ml versus 0.397±0.269ng/ml in survivors, p<0.001. PCT in non-survivors was 2.14±0.60ng/ml versus 1.12±0.68 ng/ml in survivors, p<0.001, and CRP was 215.12±96.39 mg/L in non-survivors versus 175.74±221.5mg/L in survivors, p<0.05). Figure 1 a, b and c

In the patients who needed intensive care, the three biomarkers were also significantly higher compared to those of the patients treated in the general hospital unit. MR-proADM in the patients treated in ICU was 0.509±0.336 ng/ml versus 0.414±0.28 ng/ml in the patients of the general hospital unit, p<0.05. PCT in the patients treated in ICU was 1.92±0.76 ng/ml vs. 1.15±0.70ng/ml in the patients of the general hospital unit, p<0.05. CRP in ICU patients was 221.98±100.34 mg/L vs. 165.31±122.84 mg/L in the patients of the general hospital unit, p<0.05.
We examined the mean values of the three biomarkers in the severity groups according to CURB-65 and established that MR-proADM and PCT increased significantly with the increase of the severity of CAP. No elevation of CRP was found with the increase of the severity of CAP, assessed by the CURB-65 (see Figure 2 a, b and c). We also established that MR-proADM and PCT showed a moderate correlation with the CURB-65 score (r=0.33, p<0.01 and r=0.30, p<0.05 respectively). CRP did not correlate with the CURB-65 score (r=0.10, p>0.05).

Discussion

Our study found that the levels of the three biomarkers were higher in deceased patients compared to survivors. Other authors also reported higher levels of MR-proADM in non-survivors (Christ-Crain et al., 2006; Huang et al., 2009; Suberviola et al., 2012). Higher levels of CRP and PCT in non-survivors were reported in many publications as well (Chalmers et al., 2008; Krüger et al., 2010; Menéndez et al., 2009). We think that these higher levels of the biomarkers may be linked with the more severe systemic inflammatory response of the deceased patients. We also found significantly higher values of the three biomarkers in the ICU patients. Other authors have also established the ability of MR-proADM to predict the need of intensive care. Renaud et al., for example, found significantly higher values of MR-proADM in patients with severe early pneumonia (Renaud et al., 2012). PCT is also able to predict the need for intensive care (Ramírez et al., 2011). Therefore, we consider that biomarkers can be used not only as mortality predictors, but also as predictors for the need of intensive care. Our study showed an increase in MR-proADM and PCT in high-risk groups according to CURB-65. Our data are consistent with the results of other authors, who have also observed such an increase in high-risk groups (Christ-Crain et al., 2006; Lacoma et al., 2014). Huang et al. established that elevated MR-proADM levels correlate with increased severity of CAP assessed by PSI (Huang et al. 2009), and Krüger, established that PCT levels increased with the severity of CAP assessed by the...
modified CRB-65 score, while there was no such increase in CRP (Krüger et al., 2008). We also did not find the elevation of CRP associated with the increase of the severity of pneumonia, as CRP did not correlate with the CURB-65 score. Therefore, we regard the other two biomarkers as better predictors of pneumonia severity compared with CRP. We found a moderate correlation of MR-proADM and PCT with CURB-65. Some authors have found better coefficients of the severity scores, for example, Bello established the correlation coefficient of MR-proADM with CURB-65 to be r=0.561 (Bello et al., 2012). We believe that the lower correlation coefficients established by us are most likely due to the relatively small number of studied patients, most of which fell into the low-risk groups according to CURB-65. This may be considered a limitation of the study. A number of authors have established a superior prognostic accuracy of MR-proADM compared with PCT (Christ-Crain et al., 2006). In our study, we have also found a slightly better correlation coefficient of MR-proADM with CURB-65 compared to that of PCT, as both markers showed moderate correlation with the severity.

**Conclusion**

MR-proADM, PCT and CRP were significantly higher in non-survivors and ICU patients. MR-proADM and PCT showed a moderate correlation with the CURB-65, as the correlation coefficient for MR-proADM was higher. CRP did not correlate with the CURB-65. Biomarkers provide fast and reliable information to physicians about the severity and prognosis of pneumonia and can help them to take correct treatment decisions. They should therefore be included in the risk stratification of patients with CAP as predictors of severity and poor outcome.

THE ROLE OF CIRCADIAN RHYTHMS AMONG MEDICAL STUDENTS IN TIME MANAGEMENT ORGANIZATION AND ACADEMIC ACHIEVEMENT

Yuliya Modna,1 Bernadette Scott2

Abstract: Time management is one of the biggest problems of medical students. In this study, we examined the circadian rhythms of medical students and factors which may affect academic performance: perceived stress, sleep quality, time management. Students answered a Morningness-Eveningness questionnaire, the Time Management Personal Assessment questionnaire, the Pittsburgh Sleep Quality Index (PSQI), and the Perceived Stress Scale questionnaire. The correlation (R=0.87) between chronotype and GPA (P<0.001) showed a higher GPA in students with morning chronotypes. The PSQI analysis demonstrated 47% of the students had poor sleep quality; a correlation (R= - 0.56) between the PSQI and GPA (p< 0.04), supporting a link between higher GPA and good sleep. Results also showed a correlation (R=0.59) between time management and GPA (p< 0.01), implying that the students with excellent time management skills (17%) had excellent GPAs. Chronotypes, quality of sleep and time management, influence GPA and can be used as a guidance tool for academic advisors.

UDC Classification: 612/159.91; DOI: http://dx.doi.org/10.12955/cbup.v5.1056

Keywords: Circadian rhythms, time management organization, medical students

Introduction

Time management is one of the biggest problems of medical students. Good time management skills such as setting goals and monitoring the use of time can facilitate productivity and minimize stress, contributing to work effectiveness, maintaining balance and academic success (Al Khatib, 2014). Balduf (2009) recognized that poor time management skills can affect academic achievement negatively. Britton and Tesser (1991) found that the undergraduate students identified time management as their most pressing problem, which lead to anxiety, stress and poor sleep habits, and have a damaging effect on health and performance (Schneiderman et al., 2005). Not all time management methods work for everyone; (it depends on individual circadian rhythms (chronotypes). Understanding which circadian type is predominant in the body can help to assess what schedule is best. Laboratory studies which were conducted among medical students by Medeiros et al. (2001) showed that the irregularity of the sleep-wake cycle, the sleep deprivation, and internal desynchronization could be causing increased stress, and the stress could be influencing students’ academic performances. Our body has daily rhythms of hormone concentrations, core temperature, and the sleep-wake cycle, all of which have wide spread effects on the function of the entire body (Saper et al., 2005). This rhythm is known as the circadian rhythm and is controlled by an internal body clock. Widely acknowledged individual differences in circadian rhythms, commonly called morningness and eveningness, indicate preferences associated with morning or evening activities. A morning chronotype is often awake between 6 AM and 10 PM and is most energetic in the morning. The evening chronotype is often awake between 9 AM and 1 AM and is most energetic in the afternoon and in the evening (Allebrandt et al., 2014). Studies conducted at the University of Zurich led by Steven Brown (Roenneberg, 2012) showed that the natural biological rhythms of 50% of participants in the study were more or less out of step, and these participants often reported suffering from problems of insomnia or insufficient ability to concentrate on a task. Liaghatdar et al. (2016) also described the sleep-wake rhythm and internal rhythm of the body as having an effect on the cognitive activities of people and different people show different performances at different hours of the day. So everyone's body clock is not the same, therefore some difficulties synchronizing natural rhythms with daily plans can exist. Unfortunately, society is still organized to fit the early chronotypes for the people who prefer to work beginning early in the morning. Due to this mismatch between internal (circadian) and external (social) times, the people suffer from chronic sleep deficiency, which, in turn lead to stress, anxiety, and poor sleep habits (Van Dongen and Dinges, 2000). To solve this problem, following individual circadian rhythms and creating individual schedules is needed.

The present study was carried out to estimate the circadian rhythms of medical students and assess the correlation between their academic performance and chronotypes, sleep quality, and individual

1 Trinity School of Medicine/ Saint Vincent & the Grenadines, ymodna@trinityschoolofmedicine.org
2 Trinity School of Medicine/ Saint Vincent & the Grenadines, bscott@trinityschoolofmedicine.org
subjective perception of stress. The purpose of the study was to use the results as a tool to help in the organization of student time management.

Material and Methods
The subjects were seventy-seven medical students of Trinity School of Medicine (TSOM) with mean age of 24.7 years (SD=2.3), 33 male and 44 female. All students involved in this study had a similar academic load. Participation in the study was voluntary, and informed consent was obtained from all participants. Students who did not give consent and those who filled the questionnaire incompletely were excluded from this study. As variables, the chronotype, time management personal assessment, quality of sleep, and individual subjective perception of stress were analyzed. Student responses were linked to grade point average (GPA). Students were asked to answer the Morningness-Eveningness Questionnaire (MEQ) to determine their individual chronotypes. This MEQ (Horne and Ostberg (1976) consists of 19 items allow for the classification of objects into five types reflecting the student preference for morning or evening orientation. Scores for them are interpreted as follows: 16-30 - extreme evening type; 31-41 – moderate evening type; 42-58 – indifferent type; 59-69 – moderate morning type; and 70-86 extreme morning type. Student time management was assessed via the scores of on Time Management Personal Assessment questionnaire (Britton and Tesser, 1991). This questionnaire includes 25 items which are scored by the following scale: 2 for “Always,” 1 for “Sometimes,” 0 for “Never.” These data are interpreted as follows: 45-50 points - excellent time management skills; 30-44 points - time management is fairly well but should use the guide to increase the skills; 0-30 points - time management skills should be improved. The quality of sleep was assessed via their score on the Pittsburgh Sleep Quality Index (PSQI) questionnaire (Buysse et al., 1989), which consisted of 10 questions related to their normal sleep habits. Sleep quality was considered bad for individuals who obtained a score higher than 5. The Perceived Stress Scale (Cohen et al., 1983) was used for an evaluation of the level of stress. This scale includes 10 items and uses a 5 point rating scale ranging from 0 to 4: 0 – never; 1- almost never; 2- sometimes; 3- fairly often; 4 - very often; items 4, 5, 7, and eight are reversed scored). Data obtained were interpreted regarding the following scale: 0-13 - low-stress level; 14-26 - moderate stress level; 27- 40 - high-stress level.

Results and Discussion
Chronotype distribution showed that the majority (55%) of students had an indifferent type, 22.5% had a moderate morning type, 12.5% had a moderate evening type and 10% had a definite morning chronotype (Figure 1). This distribution is most likely due to an attempt to synchronize natural rhythm with an academic schedule.

![Figure 1: Distribution of chronotypes among TSOM students](image)

We also found the correlation (R=0.87) between chronotype and GPA which was significant (P<0.001), showed a higher GPA among students with morning chronotypes (Figure 2).
This indicated that the students with evening chronotype were maladapted for academic achievement whereas students with morning chronotype were adapted. One of explanation this finding may be “a synchrony effect in individuals” (May et al., 1998) suggesting morning-type individuals perform better at cognitive tasks in the morning and vice versa for evening-type individuals. This effect is based on cortisol levels which increased earlier and have higher amplitude in morning chronotypes than in evening chronotypes; therefore, morningness-oriented students reach their peak performances in the morning hours and eveningness-oriented students have a peak performances in the afternoon (Hasher et al., 2005). Liaghatdar et al. (2016) conducted research among medical students and concluded that evening students experienced academic failure in difficult courses, which required a more cognitive performance so there was a proposal to change the class hours of difficult specialized courses to the middle of the day. Enhancing the understanding and remembering abilities of morning and evening people were studied, and results of this study showed that immediate memory of morning people had a better performance in the early hours of the day and that of the evening people had a better performance in the evening hours (Song et al. (2000). In our research, we also studied the sleep quality of the TSOM students. The PSQI analysis showed 42% of the students had poor sleep quality. In addition, a correlation (R= - 0.56) was found between the PSQI and GPA (p< 0.04), supporting an association between higher GPA and good sleep (Figure 3).
Hence, sleep deprivation affects eveningness-oriented students accompanied by academic difficulties. This might be explained by increased sleepiness and tiredness of evening students due to an early beginning their academic day, which creates some problems in adjusting to the schedule in medical school (Gau et al., 2004). There was no significant relationship between GPA and perceived stress level (p>0.7). This suggests a stress factor is a part of students’ life. Stress in academic situations can have both positive and negative consequences. Misra and McKeen (2000) suggested classifying stress as “unfavorable stress,” which is associated with an inhibition of students’ academic performance due to suppression of the learning process, and as “favorable stress,” which creates a sense of competence and enhanced learning capability. We also found a positive correlation (Figure 4) (R=0.59) between the GPA and time management (p< 0.01), implying that the students with excellent time management skills (17%) had excellent GPAs. Those with poor skills (14%) had worse GPAs. However for 69% of the volunteers, guidance is needed to increase skills, and as a result, it can increase the GPA. This explains why a majority of the university students complaining about running out of time when asked to do a certain task, they get frustrated because they are not able to complete the task before the deadline because they cannot manage their time. In turn this increases the level of ‘unfavorable stress’ which adversely impacts the GPA.

Conclusion

- Evening chronotype, poor quality of sleep, bad time management skills were significant negative predictors of the grade point average (GPA) among medical students.

- Therefore, for the improvement of GPA in medical school students should:
  1. Consider personal circadian rhythms during the planning of study day and strive to improve their time management skills.
  2. Understand the important role of sleep and naps during their academic life which provide short/long term recovery and increase the level of energy for a productive learning process. Sufficient hours for the day /and night sleep must be scheduled daily.

- In addition, medical universities should try to adopt the schedule of exams and learning activities to accommodate circadian rhythms of the students. The most difficult subjects and exams should be conducted between 10-12 am when the alertness is high for all circadian rhythms.

PREVENTION OF RISK FACTORS OF CARDIOVASCULAR DISEASE IN NURSING

Mária Novysedláková,1 Róbert Šeliga2

Abstract:
Introduction: Cardiovascular disease, in terms of its frequency, the severity of organ damage, and the consequences for the health of the population constitutes one of the most pressing problems of our population. The prevention of subsequent coronary events and the maintenance of physical functioning in such patients are a major challenge in preventive care. However, many patients opt for a change in their lifestyle, some with the support of a health professional.

Objective: This empirical survey focuses on the knowledge of respondents about preventing cardiovascular disease. Statistical methods determine the differences between males and females in attending preventive check-ups, understanding and observing risk factors in their lifestyle, and having an interest in changing their lifestyle.

Methods: The survey uses a non-standardized questionnaire. Apart from demographic data, the questionnaire had 10 items assessing the respondent’s knowledge of risk factors for cardiovascular disease, 10 on lifestyle and attitudes to the change in lifestyle, and five regarding their interest in education about the subject. Exploratory data includes answers from 70 respondents, who were outpatients in a general practitioner’s department. Of these, 32 are males (46.0%) and 38 are females (54.0%). Results of the survey are analyzed using the Chi-Squared test.

Results: Fifty-four of the 70 respondents (55.7%; 20 males and 34 females) undertake preventive check-ups at the general practitioner’s department at least once in two years. No significant differences present between males and females in attending preventive check-ups ($\chi^2 = 3.455; df = 1; P = 0.05$) and in showing a willingness for a lifestyle change ($\chi^2 = 1.789; P = 0.05$). However, based on the given data, a significant difference presents between males and females regarding proper regime observance ($\chi^2 = 18.651; df = 1; P = 0.05$). For example, females know the observance of a healthy diet is necessary for preventing ischemic heart disease ($\chi^2 = 20.124; df = 1; P = 0.05$).

Conclusion: The study shows that the difference between males and females is significant regarding their understanding of risk factors related to lifestyle and proper regime observance. Thus, education could lead to reducing or eliminating such risk factors. Prevention of risk factors is complex and lifelong. Under conditions of the Slovak health service, registered nurses are responsible for the education of patients.

UDC classification 615.8: 314.11; DOI: http://dx.doi.org/10.12955/cbup.v5.1057

Keywords: Cardiovascular disease, risk factors, lifestyle, nursing.

Introduction
The frequency of cardiovascular disease and subsequent severity of organ damage and other population health consequences constitute some of the most pressing problems for our population (Studenčan, 2006). Cardiovascular disease contributes to 53% of total mortality and is a major cause of the shorter life expectancy evident in Slovakia. On average, the share of the total number of deaths in 2011–2014 attributed to cardiovascular disease was approximately 52–55%. From the number of people who died from circulatory diseases, 15.8% were younger than 65 years, with every three premature deaths of men accounting for one death of a woman (Report on the State, 2015).

Literature review
Diseases of the circulatory system occur 3–4 times higher in males than females. Though, with age, the incidence of coronary heart disease increases for both males and females with post-menopausal females displaying the same incidence as males. Given the prevalence of the disease, it is necessary to devote considerable effort towards its prevention, with early recognition through commencing pathological processes. Today, risk factors for coronary heart disease can be divided into two main groups:

- Uncontrollable, depending on age, gender, and genetic factors; and
- Influenced, by high LDL cholesterol to low HDL cholesterol, smoking, diabetes, obesity, physical inactivity, mental stress, increased blood pressure, and alcohol.

Their treatment, according to Riečanský (2009) is carried out on several levels:

1 Catholic University in Ruzomberok, Faculty of Health Care, Slovak Republic, maria.novysedlakova@ku.sk
2 Catholic University in Ruzomberok, Faculty of Health Care, Slovak Republic, robertselaiga@centrum.sk
Halting or slowing the process of atherogenesis through an appropriate intervention using diet, physical activity, no smoking, and administration of appropriate medicines. Diet should include plenty of vegetables and fruits, fish and poultry, and exclude foods that are rich in cholesterol and saturated fatty acids. For obese individuals, it is indicated for the reduction of body weight. Also important is reducing the consumption of alcoholic beverages and improving blood flow to the ischemic heart muscle by administration of appropriate medicines.

Preventing the possible closure of the vessel by a blood clot through administration of drugs that inhibit blood clotting.

Mechanical treatment of coronary arteries through angioplasty or Cardiac revascularization with health-promoting behaviors, for research purposes, integrated into an individual’s lifestyle.

The role of nursing is to influence the health of the population from early childhood to advanced age. An individual’s behavior, according to (Štejfa et al., 2007, p. 242), depends on various factors:

Individual knowledge, skills, and personal motivation; Factors of the microcosm in which the person lives, e.g., family, friends, financial conditions and social background; and Macrocosm factors that advise the economic and political system, government organizations, national and cultural traditions, communication media, and finally, world globalization.

The ability to understand, predict, control, and change the behavior of an individual regarding their health remains problematic. Health-supporting behavior, for research purposes, is integrated into the lifestyle of an individual (Mendes, 2011).

The prevention of subsequent coronary events and the maintenance of physical functioning in affected patients are a major challenge in preventive care (Ades, 2001). Particular attention should be paid to the elements of a can use numerals for these numbers as this makes them consistent with the others in this paragraph.

Some major risks are modifiable in that they can be prevented, treated, and controlled. There are considerable health benefits at all ages, for both men and women, in stopping smoking, reducing cholesterol and blood pressure, eating a healthy diet and increasing physical activity (Alina, 2013).

The nurse is important in educating the population about health matters. A nurse helps individuals to change behavior by providing ongoing support for information, advice, and lessons, as well as assessing the motivations of their actions and behavior (Novysedláková, Hudáková, & Kozáková, 2015). Strengthening health is characterized as ‘behaviors’ that pursue a certain goal and progresses to health promotion as a process of increasing the ability of people to influence and improve their health. The aim of this survey is to establish whether respondents understand the risk factors of their lifestyle and about cardiovascular diseases and preventive measures that lead to their reduction or total elimination. Statistical methods are used to determine the differences in attendance of preventive checkups, the knowledge and observance of risk factors of lifestyle, and the interest to change lifestyle based on gender.

Data and Methodology

Exploratory data were obtained from 70 outpatients in a general practitioner’s department. Respondents were classified by gender, age, and the presence of a minimum of one risk factor for cardiovascular disease. From a total number of 70 respondents, there were 14 of the age 18–30 years (27.9%), 20 of the age 31–45 years (28.9%), and 36 respondents of 46 and more years (50.9%). Altogether, 32 male (45.8%) and 38 female (53.9%) participated in the survey. Adjusting for education showed there were 10 respondents with primary education (13.8%), 42 respondents with secondary education (60.1%), and 18 respondents accomplished university education (25.7%). The survey was carried out using a non-standardized questionnaire. Apart from demographic information and data about blood pressure, body weight, and height, it contained ten items for assessing knowledge of risk factors for cardiovascular disease, ten for lifestyle and the attitude towards changing lifestyle, and five regarding respondents’ interest in education about the subject.

The survey was carried out from December 2012 to January 2013 in a general practitioner’s outpatients’ department of a non-state health institution.
Results of the survey were statistically evaluated using the chi-squared test using Microsoft Excel version 2013 with the add-on function, CHINV, which calculates the inverse of the right-tailed probability of the chi-square distribution. At 5% level of probability, the critical $\chi^2$ for one degree of freedom (df) was 3.841, as determined using the CHINV.

Our hypothesis: In these files, there is a significant difference (chi.q>chi.q.crit) between male and female in the measures taken to reduce cardiovascular disease. Critical differences between men and women were regarding attendance for preventive check-ups and proper regime observance to reduce cardiovascular disease.

**Results and Discussion**

Regular fifty-four respondents of the total 70 (55.7%) at least once in two years. The chi-squared result was 3.455 (df: 1; critical value: 3.841) (Table 1), there was no significant difference between men and women based on the collected data in participating in preventive checkups.

We present other survey of results. Eleven respondents (15.7%) indicated that they would be at risk of cardiovascular disease; 17 (24.3%) chose more likely than not; 30 (42.9%) could not assess either way; 5 (7.1%) were convinced they were less likely to be at risk; 3 (4.3%) answered that they were not at risk of cardiovascular diseases occurring; and 4 (5.7%) were being treated for cardiovascular disease at that time. Twenty respondents (28.6%) answered they knew of the medical examination for which they were entitled under the terms of a preventive checkup; while 25 respondents (35.7%) were unaware, and 25 respondents (35.7%) relied on the decision of the general practitioner.

Cardiovascular disease occurred in the family of 37 respondents (52.9%). It did not occur in 20 respondents (28.6%), and 13 respondents (18.6%) did not know about the occurrence of cardiovascular disease in their families. For changes in lifestyle for cardiovascular risk were motivated 43.9% respondents.

Preventive checkups are itemized in Act N°577 of 2004 of the Statute Book on Health Care Extent. Although health insurance companies completely finance them, the majority of people do not complete their check-ups. The Act on Health Care Extent lists 15 different preventive check-ups.

According to the statistical data of health insurance companies, female, in general, are more disciplined than men in completing the checkups. Women in the productive age range of 35–45 years appear to approach preventive checkups most responsibly. People with higher education also complete them more often. The majority of the population, however, does not feel obliged to complete such.

According to Framingham (2002, pp. 3068–3072), the risk of ischemic heart disease occurring at age 40 years is 21% for a male and 20% for a female. Prognostication is serious for a population with risk factors. The incidence of diseases of the circulatory system are 3–4 times higher in males, than in females. With age, the incidence of coronary heart disease increases for both male and female. After menopause, female suffer the same incidence as male. For the working-age population, coronary heart
disease is a recognized disability, but significantly more so for male than female (Report on the State, 2015). Individuals with relatives displaying pre-existing ischemic disease (male < 55 years, female < 65 years) have an increased risk of developing coronary artery disease and should have their risk factors evaluated (Riečanský, 2009). Family and personal history fall into the category of ‘uncontrollable’ risk factors. It is also likely that intra-uterine effects on the fetus such as smoking or inadequate maternal nutrition during pregnancy may be significant. The family history of male under 55 years of age and female under 65 with premature ischemic cardiovascular disease is an independent risk factor (Štejfa et al., 2015).

Regarding knowledge about risk factors for coronary heart disease, the chi-squared result was 18.651 (Table 2) and higher than the critical value at the 0.05 probability. Thus, there was a significant difference between male and female in this respect.

The survey results, that describe lifestyle of respondents. Of the total number, 22 respondents (31.4%) smoked cigarettes. Three respondents (4.3%) smoked 0–5, nine (12.9%) 6–10, three (4.3%) 11–15, and five (7.1%) more than 15 cigarettes daily. Thirty-three respondents (47.1%) participated in sports activities in their free time. Twenty-eight respondents (40.0%) were aware of the dietary intake suitable for reducing the risk of cardiovascular disease, and 21 respondents (30.0%) mostly knew. A body mass index higher than 29 was determined in (41.4%) of respondents.

There remains a risk for heart disease in Slovak population. It was found that, regarding the four most serious risk factors, 25% of the population show no risk, more than 33% display one, 25% two, 8% three and 1% all four factors. According to the Social Insurance Agency in Slovakia, the leading cause of disability in 2016 regarding civilization diseases result from unhealthy lifestyles and diets, lack of exercise, and stress. This is reflected particularly in male, in whom up to 15% of disability cases is caused by diseases of the circulatory system. In general, the risk of ischemic heart disease is higher in male than in female, mainly in male at a younger age; male in middle age already have a high occurrence of the main risk factors. More often they suffer from an abdominal type of obesity and metabolic syndrome. Health consultations first visited 1590 smokers, of which 598 were male and 992 female. Of these 1590 smokers, 22% of the highest smoking prevalence was in the age group 20–24 years in the male or 25–34 years in female. In the ages, 25–64 years, optimum weight occurred in 35.1% of male and 43.2% female. Overweight and obesity was observed in 64.6% of male and 54.9% female (Report on the State, 2015). The difference in the incidence of coronary artery disease decreases with change in lifestyle away from high consumption of cigarettes, alcohol, and oral contraceptives, and the changing role and position of women in modern society (Riečanský, 2009, p. 71).

For lifestyle measurements, the chi-squared result was 20.124 (Table 3), which is greater than the critical value of 3.841 for the 0.05 probability. Hence, the result is statistically significant. The given
data was significantly higher among female, who know observance of a healthy diet is necessary for the prevention of ischemic heart disease.

Regarding interest in changing lifestyle, the chi-squared results of 1.789 (Table 4) was less than the critical value for a 0.05 probability. Thus, there was no significant difference between male and female. Interested in changing their current lifestyle were thirty-six respondents (51.4%), 29 responded (41.4%) they were more likely to than not, five responded (8.0%) they could not assess it.

The number of deaths from injuries increases with age, up to the age of 64 years. This occurs mainly at age 15 years, where death among boys and male is 3–6 times higher than girls and women for higher-risk models in their behavior.

Slovakia may obtain representative data on the prevalence of both risk factors in repeated screenings of population health, under the World Health Organization, Program of Countrywide Integrated Noncommunicable Disease Intervention. This data is a national study of health surveillance for the years 1993, 1998, 2003, and 2008 that uses international criteria. The European Health Examination Survey (EHES) Act 2011–2012 is a product of the activities of counseling centers for the protection and promotion of health (referred to as ‘health counseling’) within the framework of individual interventions of clients interested in their health (Report on the State, 2015). Primary efforts focus on the control of reversible coronary risk factors atherosclerosis. Clients are to avoid smoking and
commence effective control of hypertension, diabetes, and hyperlipoproteinemia. Modifying lifestyle involves a change in eating habits, increasing physical activity, and easing mental stress by practicing relaxation techniques. An ideal approach is a comprehensive one that deals with all risk factors (Ades, 2001). Changing dietary intake, introducing regular physical activity, and converting to non-smoking will reduce cardiovascular risk in the adult population by as much as 30%, and significantly improve an individual’s control over developing heart and blood vessel diseases (Riečanský, 2009, p.71).

This research examining the differences between males and females found that it was difficult to separate innate types of behavior from learned or to understand the extent to which stereotypes affect the perception of individuals and the behavioral or cognitive differences between the sexes. The research shows that compared with existing similarities between males and females the extent of these differences is minimal (Gender Differences, 2010, pp. 42–51). Changes in the lifestyle of a patient with ischemic coronary or other atherosclerotic disease depend on his or her willingness to modify his or her behavior. Many patients choose to make a change in their lifestyle and often with the support of a professional health worker or family.

Conclusion

Research results revealed significant differences between male and female knowledge of lifestyle risk factors and proper regime observance. Results of scientific research indicate that with a change towards nutrition, regular physical activity, and non-smoking, the risk of cardiovascular disease in the adult population could reduce by 30% and thus, help control the advancement of cardiovascular diseases. Human health and behavior cannot be separated. Since many of the current generation of citizens are prone to illnesses from an improper lifestyle, a change towards healthy lifestyle habits and shifts in behavior can have an immense role in health protection. A greater emphasis on studying human behavior towards health would help improve overall public health. The nurse who achieved a professional qualification for a medical occupation, apart from tending care, assists in protecting, supporting, and maintaining health along with specialized functions in the sphere of health education and instruction and research connected with providing health care.

PAIN MANAGEMENT IN GERIATRIC PATIENTS AND THE ROLE OF THE NURSE
Diana Paskaleva,1 Maria Semerdjieva,2 Stoilka Tufkova3

Abstract:
Introduction: The role of the nurse for pain management in geriatric patients is not only for the administration of painkillers prescribed by a doctor. It also includes timely information about it, accurate assessment of its extent, which facilitates the physician’s diagnostic actions, rapid intervention and control of the syndrome, in order to achieve the ultimate goal of improving the quality of life of geriatric patients.
Purpose: We set a goal to investigate the opinion of geriatric patients, and if the pain syndrome is positively affected by the nurses in inpatient care.
Materials and methods: The study includes an anonymous survey of 392 patients aged over 65 years who received treatment in the inpatient department.
Results: It was determined that sex factorial signs P<0,01 ($\chi^2 = 10,63$) and age P <0,001 ($\chi^2 = 18,29$) are expressed according to the management of pain during hospitalization.

UDC Classification: 613.9. DOI: http://dx.doi.org/10.12955/cbup.v5.1058
Keywords: geriatric patient, pain syndrome, nurse

Introduction
Pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage, or described as such. Pain is always subjective and every individual gives his own interpretation of it. It can be classified according to the duration, the etiology, and according to the prognosis. The most common complaint among geriatric patients is pain. The diseases that are most prevalent in geriatric patients are cancer, diseases which affect the musculoskeletal system, and chronic diseases occurring with severe pain (AGS Panel on Persistent Pain in Older persons, 2002). Geriatric patients are often misunderstood because of the pain (Gloth, 2001). The consequences can have a negative impact on the health and quality of life of older people which leads to depression, anxiety, social isolation, cognitive impairment and sleeping problems. (Cavalieri, 2002) (Ferrell, 2001). Medical professionals contribute towards good practices of pain management.
The nurse is the main purveyor in the system of care for anesthesia, not only giving proper information and direction, but for also applying painkillers on time. Effective pain assessment is a prerequisite for proper planning of activities and proper behavior that the nurse should have. During the assessment she must obtain information from the patient and their relatives, which will help her to understand their feelings. The obtained information is necessary for planning and evaluating the strategies to help to cope with the pain syndrome in a timely manner. (Toncheva, 2005)
The author's team of M. Popov, B. Davidov and M. Marinov after a review of literature on the opinions of the patient from hospital services concluded that “the patient is subject to their needs, rights, feelings, satisfaction and dissatisfaction” (Popov M., 2000)

Purpose: We set a goal to investigate the opinion of geriatric patients, and if the pain syndrome is aided by the nurses in inpatient care

Materials and methods: The study includes an anonymous survey of 392 patients aged over 65 years who received treatment in the inpatient department.
The survey was made using the method of an interview, and given the peculiarities of the research contingent. The study covered all University and General Hospitals in Plovdiv.

Results: After statistical processing of data we concluded the following:
The study found that in the majority of patients (62.6%) the pain syndrome during the time period of hospitalization was completely controlled. Half of the remaining respondents (24%) received partial responses, and only 9% of patients clearly had no relief to the pain syndrome. It is noteworthy that 4% of the surveyed geriatric patients could not judge and give a definite answer to the question of- is there

1 Faculty of Public Health, MU-Plovdiv, Bulgaria, paskaleva_1975@abv.bg
2 Faculty of Public Health, MU-Plovdiv, Bulgaria, msemerdjieva@abv.bg
3 MU-Plovdiv, Bulgaria, tufi_med@abv.bg
a positive effect of the applied treatment or even a temporary response in view of the complexity of the used anti-viral therapy (Figure 1).

![Figure 1: Mastery of the pain process according to the patients](image1)

Source: Authors

The conducted statistical analysis confirms the alternative hypothesis, that gender is in strong correlation with the management of the pain during hospitalization $P < 0.01$ ($\chi^2 = 10.63$) (Figure 2).

![Figure 2: Correlation between gender and management of the pain syndrome](image2)

Source: Authors

It is noteworthy that in both sexes there is a high percentage of positive responses to pain relief - 54.50% for men and 68.80% for women. Moreover, the women’s sample had less than 4% show an inability to decide.

Most likely, we associate this with the greater female emotional state and the constant active search for comprehensive medical care and adequate treatment.

There is a correlation between age and management of the pain syndrome $P < 0.001$ ($\chi^2 = 18.29$) (Figure 3).

Advancement of the age of patients over 65 years and the presence of concurrent somatic diseases, often several such as: atherosclerosis, transient cerebral circulation disorders and a number of others, suggest that geriatric patients cannot accurately assess and give a clear assessment of the effectiveness
of controlling the pain syndrome - 28.70%. The percentage of respondents from both age groups with definite negative response is also not that small – 18.80%.

Figure 3: Correlation between age and management of the pain syndrome

Source: Authors

Discussion

The obtained results are revealing. According to the ethical code of healthcare professionals the nursing profession is based not only on humanity and compassion, but also on professional competence. Data show that nurses have a deficit in knowledge about management of pain syndromes. Barriers to medical staff for effective pain management are an inadequate assessment and judgment of the same, not reporting by patients, atypical manifestations of pain in the elderly.

Very important is the skillset a nurse should have when working with people experiencing pain, and that makes it necessary to be well aware of the phenomena (symptoms and behaviors) that can help them in the process of identifying, planning, and assessing the condition and actions that need to be taken. Some authors define a cyclic nature of the pain-related phenomena that can be schematically presented (Figure 4).

Figure 4: A cycle of pain related phenomena

Source: Authors

Effective pain assessment is a must for proper planning of activities and adequate actions that needs to be taken by the nurse. In the evaluation process, the nurse has to get information from the patient and potentially their relatives, which helps the nurse understand the patient’s feelings. The information received is necessary for planning and evaluating assistance strategies (Figure 5).
Conclusion

Pain management for each patient, incl. the geriatric ones is a result of complex factors, in which the physician and the nurse actively participate. Timely information from the nurse about the presence of pain and a proper assessment of its extent especially in the elderly, contribute to rapid pain management, and this is a prerequisite for improving the quality of life of geriatric patients.

LASER STOKES-POLARIMETRY OF THE ERYTHROCYTES SUSPENSION AT COMORBID COURSE OF CORONARY ARTERY DISEASE, DIABETES MELLITUS TYPE 2 AND ANEMIA

Nataliia Pavlyukovich,1 Oleksandr Pavlyukovich,2 Marta Garazdiuk,3 Oleg Wanchuliak,4 Oleksandr Garazdiuk5

Abstract:
Introduction: Investigation of the rheological properties of the erythrocytes is one of the crucial issues in the pathogenesis of most diseases of internal organs. Changes in the morphological structure of the red blood cell membrane serve as an early diagnostic criterion of coronary artery disease, diabetes mellitus type 2 and anaemia, thus a search for modern methods of investigation which can be used for early detection of erythrocytes membrane disorders is of great importance. Methods of laser polarimetry of the erythrocytes suspension smear are crucial in this area.

Objectives: Investigation of the possible structural changes of the erythrocytes membranes in patients with coronary artery disease, diabetes mellitus type 2 and anaemia of different degrees of severity.

Methods: For the objective assessment of the structural state of erythrocytes membrane laser polarimetry of the red cell suspension smear was applied. Set of the statistical points of the 1st-4th grades was calculated and their effectiveness in the early pre-clinical detection of the erythrocytes membrane disorder was established.

Results: Images of the erythrocytes suspension samples, registered in the co-axial and crossed planes of the polarizer and analyser transmissions, regardless of the investigated group, are coordinating heterogeneous. However, obvious signs of the changes of the images structure depending on the presence and type of pathology are not visually detected. As the basis of an objective approach, a statistical analysis with histograms of the coordinate distributions of the random variables and a statistical calculation of the statistical points of the 1st-4th grades should be used. All statistical points, which describe the coordinate distributions of the various parameters of the Stokes vector, have individual sets of values and may be used for the differential diagnosis of the coronary artery disease, diabetes mellitus type 2 and anaemia.

Conclusions: Interconnections between the values of the sets of the statistical points of the 1st-4th grades, which characterized coordinate distributions of the intensity, azimuth and ellipticity of the polarization of the erythrocytes suspension laser images of the elderly and senile patients with comorbidity were established by means of laser polarimetry. The most sensitive were asymmetry and kurtosis, which can be used for early detection of the erythrocytes membrane disorder when routine methods of its visualization and estimation still are not able to be applied.

Introduction
Laser radiation during interaction with biological tissue (BT) can be absorbed and dissipated. Ushenko et al. (2007) found that each of these processes has some information on the micro- and macrostructure of the biological environment. According to Ushenko and Bachynskiy (2007), modelling the structure of the BT is based upon the idea that it is a two-component structure that consists of:

- optical-anisotropic component – the matrix predominantly formed by the fibrous tissue components (collagen fibers, proteins, fibrin fibers, etc.). This component is able to change the main parameters of the laser radiation during its passage through the layer of BT;
- amorphous component – the components of BT, which has no fibrous structure. The latter is optically neutral, i.e. one that does not change the basic characteristics of the beam of laser radiation while passing through BT.

The possibility of usage of the laser polarimetry methods for objective assessment of the erythrocytes’ membranes is caused by the presence in their architecture the significant part of the specific protein structures which, in its turn, are anisotropic from the optical point of view, that is, they are able to change the properties of the laser radiation during its passage through BT. Protein components of the

erythrocyte membrane, unlike lipid, have the clear complicated hierarchical structure due to their complex level of organization.

It is known by Korin, et al., (2007) and Steiner et al., (2009) that spectrin of the erythrocyte membrane has a penta- or hexagonal structure, which is formed by the tetramers of its molecules, that are linked to short actin microfilaments on both ends. It was shown by Krylov et al., (2010) that spectrin cytoskeleton of the erythrocyte maintains the definite form of the cell, therefore structural change in the ordering of the molecules can serve as a prerequisite change of the morphological structure of the erythrocyte membrane and the resulting disorder of its functional properties.

Aim: to investigate possible structural changes of the erythrocytes membranes in patients with coronary artery disease (CAD), diabetes mellitus (DM) type 2 and anaemia of different degrees of severity by means of laser polarimetry methods.

Material and Methods of Investigation. 88 patients with CAD, DM type 2 and anaemia, hospitalized to the cardiological department of the Chernivtsi Regional Hospital for War Veterans, were under investigation. They were randomized into subgroups according to the comorbid pathology: I – CAD patients with concomitant DM type 2 (n=12), II – patients with CAD, complicated by concomitant anaemia and DM type 2 (n=76). The control group for comparative studies comprised 12 patients with CAD without comorbid pathology.

For the objective assessment of the structural state of erythrocytes membrane, laser polarimetry of the red cell suspension smear was applied. Scheme of the optical laser polarimeter is presented in Figure 1.

**Figure 1: Optical laser polarimeter**

1 – He-Ne laser; 2 – collimator; 3, 5, 8 – quarter-wave plates; 4 – polarizer; 6 – object of investigation; 7 – object glass; 9 – parser; 10 – CCD camera; 11 – personal computer

Irradiation was conducted by the beam (Θ=104 mkm) of the He-Ne laser (1) with a wavelength λ=0.6328 mm. With the help of the polarizing film (quarter-wave plate and polarizer) different states of polarization of the illuminating beam were formed. Polarization images of the layers of the erythrocyte suspension (6) were formed in the plane of the light-sensitive pad (800x600) of the CCD camera (10) through the object glass (7), the resolution of which was sufficient for the measurements in the size range of structural laser images of the erythrocytes suspension (2-2000 microns).

To assess coordinate distributions of the random variables their histograms were used; after that we calculated a set of the statistical points of the 1st-4th grades.

**Results of the Investigation.** To determine the main 2D-parameters of the Stokes vectors distribution in the plane of the laser image of the erythrocyte suspension we determined the value of the Stokes vector of such images by means of six measurements of the intensity in case of the following polarization filtering conditions using a polarizer-analyzer.

The plane of the polarizer-analyzer transmission on the angle Θ=0º was oriented and intensity distribution I₀(m×n) of the laser images was measured (Figure 2). Then the plane of the polarizer-analyzer transmission on the angle Θ=90º was changed and coordinate intensity distribution I₉₀(m×n) of the laser images was detected (Figure 3). Based on the definition of the Stokes vector S we established its first parameter S₁ which characterized the full intensity I according to the following ratio – S₁=I₀+I₉₀ (Figure 4).
After that the plane of the polarizer-analyzer was oriented on the angle and coordinate distribution of $I_{45}(m\times n)$ of the erythrocytes suspensions laser images was measured (Figure 5). Later on, the plane of the polarizer-analyzer transmission on the angle was changed and coordinate intensity distribution $I_{135}(m\times n)$ of the red blood cells polarization images was measured (Figure 6). According to the ratio $S_3 = I_{45} - I_{135}$ the $S_3$ Stokes parameter was found which characterized the azimuth distribution of the laser images polarization (Figure 7).

To measure the fourth parameter of the Stokes vector $S_4$ quarter-wave-length plate was installed in the way of the laser beam, so that the axis of its maximum speed was oriented at the angle of 0° to the plane of the probe laser beam polarization. The plane of the polarizer-analyzer transmission was oriented on the angle and the coordinate intensity distribution of the right-circulating polarized light was measured (Figure 8).

Finally, we oriented the plane of the polarizer-analyzer transmission on the axis of the maximum speed of the quarter-wave-length plate on the angle and measured the intensity distribution of the left-circulating polarized light (Figure 9). According to the ratio coordinate distribution of the fourth parameter of the Stokes vector $S_4$ of the red cell suspension laser image was calculated (Figure 10), which described the birefringence of the biological layer of the erythrocytes suspension.
Having analyzed the images of the erythrocytes suspension samples, registered in the co-axial (Θ=0º) and crossed (Θ=90º) planes of the polarizer and analyzer transmissions, we established that all of them, regardless of the investigated group, are coordinating heterogeneous (Figure 11).

Red blood cells contained optically anisotropic areas of the substance, which were visualized in the form of the enlighten areas in the crossed polarizer and analyzer (Θ=90º). However, obvious signs of the changes of the images structure depending on the presence and type of pathology were not visually detected.

According to the above-mentioned facts we aimed at the determining of the objective (quantitative) criteria for the differentiation of the patterns of the polarization-inhomogeneous laser images and search for possible connections between the changes in the red blood cells structure and investigated comorbidity.

As the basis of such objective approach statistical analysis with histograms of the coordinate distributions of the random variables and statistical calculation of the statistical points of the 1st-4th grades was used. Figure 12 shows the coordinate (1, 3, 5) and probability (2, 4, 6) distribution of the values of the parameters of the Stokes vector $S_{1,3,4}(m \times n)$ at the points of the erythrocyte suspensions laser images of the patients of the control group. The obtained results clearly visibly represent the coordinate heterogeneous and individual types of the histograms of the distribution of the values of intensity ($S_{1}(m \times n)$), azimuth ($S_{3}(m \times n)$) and ellipticity ($S_{4}(m \times n)$) of the polarization of the erythrocyte suspensions laser images of the patients of the control group.
To have the quantitative criteria to characterize such complex images, we calculated a set of statistical points of the 1\textsuperscript{st}-4\textsuperscript{th} grades in the statistically significant groups according to the known algorithms. Average values of the obtained parameters and ranges of their difference within the control group are given in the Table.

Table 1: The set of statistical points of the 1\textsuperscript{st}-4\textsuperscript{th} grades of the coordinate distribution of Stokes vector parameters of the patients with coronary artery disease with comorbid diabetes mellitus and anaemia

Analysis of the results revealed that all the statistical points of the 1st-4th grades, which described the coordinate distributions of the various parameters of the Stokes vector, had individual sets of values. Thus, we found the evaluability of the statistical parameters to distinguish the intensity, azimuth and ellipticity of the polarization of the red cell suspension laser images.

Figure 13 demonstrates that coordinate distributions of the Stokes vector parameters $S_{i=1,3,4}(m \times n)$ of the polarization-inhomogeneous image of the erythrocyte suspensions layer of the patients with coronary artery disease and comorbid diabetes mellitus type 2 are different from the previously analysed (Figure 10) — the spread of the random values of the polarization azimuth $S_{i=3}(m \times n)$ and ellipticity $S_{i=4}(m \times n)$ is gradually decreasing. This results in the decreasing of the variance $\sigma$, and, conversely, increasing of the asymmetry $A$ and kurtosis $E$.

| Figure 13: Coordinate and probability structure of the Stokes vector parameters $S_{i=1,3,4}(m \times n)$ at the points of the erythrocyte suspensions laser images of the patients with coronary artery disease and diabetes mellitus type 2 |
|---|---|

It was established that a set of the statistical points of the 1st-4th grades, which characterized the coordinate distribution of the Stokes vector parameters of the polarization-inhomogeneous images of the erythrocyte suspensions samples of the patients with coronary artery disease and diabetes mellitus type 2, the following differences compared with the same parameters of the samples of the control group are typical: medium $M(S_{i=1,3,4})$ — approximately unchanged; variance $-\sigma(S_{i=1,3,4})$ — decreased 1,36 times, $\sigma(S_{i=3})$ — 1,29 times, $\sigma(S_{i=4})$ — 1,86 times correspondently; asymmetry $-A(S_{i=1})$ — increased 1,63 times, $A(S_{i=3})$ — 1,30 times, $A(S_{i=4})$ — 1,36 times correspondently; kurtosis $E(S_{i=1})$ — increased 2,09 times, $E(S_{i=3})$ — 1,18 times, $E(S_{i=4})$ — 1,08 times correspondently.

The results of the laser polarimetry of the red blood cell suspension smears of the patients with CAD, DM type 2 and moderate anaemia are illustrated in Figure 14. It was found that the values of the statistical points of the 1st-4th grades, which characterized the coordinate distribution of the Stokes vector parameters of polarization-inhomogeneous images of the erythrocyte suspensions samples of
the patients with CAD, DM type 2 and moderate anaemia, differed statistically from the similar parameters of the samples of the control group (Table): medium $M(S_{i=1;3;4})$ – approximately unchanged; variance $\sigma(S_{i=1})$ – decreased 1.58 times, $\sigma(S_{i=3})$ – 1.28 times, $\sigma(S_{i=4})$ – 2.17 times correspondently; asymmetry $A(S_{i=1})$ – increased 7.56 times, $A(S_{i=3})$ – 2.8 times, $A(S_{i=4})$ – y 2.0 times correspondently; kurtosis $E(S_{i=1})$ – increased 10.62 times, $E(S_{i=3})$ – 1.20 times, $E(S_{i=4})$ – 2.11 times correspondently.

**Conclusion.** Thus, interconnections between the values of the sets of the statistical points of the 1st-4th grades $M; \sigma; A; E$, which characterized coordinate distributions of the intensity $S_i(m \times n)$, azimuth $S_3(m \times n)$ and ellipticity $S_4(m \times n)$ of the polarization of the erythrocytes suspension laser images of the elderly and senile patients with comorbidity were established by means of laser polarimetry. Methods of the laser polarimetry of the red blood cells smear with the following analysis of the statistical points of the 1st - 4th grade might be used for early diagnosis of the structural and functional changes of the erythrocytes in patients with a combined course of coronary artery disease, diabetes mellitus type 2 and anaemic syndrome, especially at pre-clinic stages.

CLASSIFYING THE SENSITIVE TYPE OF PATIENTS WITH A WEB BASED UNIT IN INFORMATION SYSTEMS FOR DOCTORS PRACTICING CLINICAL HOMEOPATHY

Zhivko Peychev, 1 Antonia Yaneva, 2 Sava Petrov, 3 Stela Peycheva 4

Abstract: In pathogenic experimentation in homeopathy on healthy volunteers, some individuals develop stronger reactions than others, i.e. they show more symptoms of the same biologically active substance. They are defined as sensitive type (ST) individuals. The aim of this work is to create a web-based module for determining ST patients in the homeopathic information system. Material and methods: We carried out an analysis of test questions relating to the definition of ST patients from a specialized homeopathy manual (Horvilleur, 2003). For the development of a web-based GUI, we used Oracle APEX. Results: For the implementation of the software module of ST and the disclosure of its features an electronic questionnaire was developed, containing 533 test questions. Processing the responses from the test allows the programming module to indicate one of 20 medications for ST patients in a specific clinical situation. Conclusion: The module for determining ST patients helps the doctor practicing clinical homeopathy to significantly shorten the time for prescribing the medicament for the terrain treatment in primary care.

JEL Classification Numbers: I100; DOI: http://dx.doi.org/10.12955/cbup.v5.1060

UDC Classification: 614.2

Keywords: sensitive type, clinical homeopathy, information systems.

Introduction

A homeopathic medical history contains information about the current, past and atopic diseases of the patient, of its behavioural effects, morphological signs, disease trends, modalities and related features that allow homeopathic doctors to detect a drug, i.e. most similar (Balzarini et al., 2000; Clausen et al., 2010; Siqueira, et al., 2016).

In modern society, web-technologies are becoming increasingly important (Clausen et al., 2014; Liberati et al., 2015; Murugesan et al., 2016; Teixeira, 2013). Currently, their effective use has become a critical success factor. Their use in homeopathic medicine helps at a great extent the specialists in search of a personal drug (P-drug) for a particular patient. The idea of developing an online poll to determine the sensitive type (ST) patients in the information system arose from the need to reduce the time to perform this process. In creating the survey was used the competence of experts in the field of homeopathy with many years of practical experience and poll issues of the specialized family guide to homeopathy (Horvilleur, 2003). The present work presents a web-based test to determine the ST patients introduced in the information system.

Aim

The purpose of this work is to create a web-based test in the homeopathic information system determining ST patients. Allowing for the minimization of errors in processing the results, as well as the time taken to calculate them.

Material and methods

Establishing the program module is implemented in two stages: first – analyzing data from a family guide to homeopathy (Horvilleur, 2003) and second – developing an online questionnaire by Oracle APEX, followed by creating an algorithm for finding the drug in accordance with these data.

Results

For the software implementation of the ST module and the disclosure of its features we developed an electronic poll containing 533 test questions that the patient should answer with “Yes” or “No.” To introduce the poll, we prepared data for import into a table format using MS Excel.

1 Medical University – Plovdiv, Bulgaria, Faculty of Public Health, zhpeychev@meduniversity-plovdiv.bg
2 Medical University – Plovdiv, Bulgaria, ayaneva@meduniversity-plovdiv.bg
3 Medical University – Plovdiv, Bulgaria, Faculty of Medicine Section Endocrinology and metabolic diseases, spetrov@meduniversity-plovdiv.bg
4 Medical University – Plovdiv, Bulgaria, Faculty of Dental Medicine, angelova_stela@abv.bg
The implementation of the electronic poll put into the system follows the following algorithm (Figure 1):\(^5\)

![Software algorithm to determine the ST patients](image)

The answer of the questions provides information on specific morphological features, individual behaviors and typical disease trends of the ST patient. The system displays the result on the basis of which the doctor prescribes the medicine for the ST, i.e. prescribing appropriate terrain treatment.

As a result of the established algorithm for ST patients, we practically tested the module created by a clinical case: A 51-year-old woman in perimenopause reports an irregular monthly cycle over the past year. Frequent fits of warm waves and blood pressure fluctuations, sleep disturbances, confusion and intolerance to the surrounding people. Refuses to carry out hormonal replacement therapy for climacteric. Prefers to use homeopathy as a safe therapeutic method for warm waves and climax.

In the specific clinical case, the patient responds positively to 8 of the questions. The data are presented in Table 1:

<table>

Test data for a sensitive patient type are reflected in the web based information system, and as a result, the system outputs the homeopathic drug data presented in Figure 2:

\(^5\) Software algorithm to determine the sensitive type patients
As a leading drug the system lists Lachesis mutus, because the identification of a patient of Sensitive Type is performed in three sets of criteria. They are morphological features; behavioral reactions and disease trends.

The peculiarities of the morphological feature are: female patients, in menopause with a characteristic marbled face, violet red nose, dark red or violet lips.

Analysing the behavioral responses we found female patients prone to jealousy, mistrust, alternating volubility and depression again. Disease trends: during climacterium, capillary brittleness and mar; painful hemorrhoids are relieved by bleeding. Different phobias occur, such as fear of death, fear of falling asleep, fear of poisoning, pathological jealousy and sighs; intolerance to everything that tightens. Secondly, the system specifies Argentum nitricum (13%), and Sulfur in third place, based on a history of hyperemia and diseases of the cardiovascular system, the locomotor system and the skin.

**Discussion**

ST patients to a given substance are individuals who in pathogenic experimentation exhibit more symptoms than others and in carrying out the therapy are in need of a lower dose of the drug compared to the others (Horvilleur, 2003). There are three characteristics of the ST patients: similar morphological features, similar nature, and related pathological trends. The history and clinical patient data used until now, make the right choice of the homeopathic treatment difficult and slow. We offer a computerized-testing system that speeds up the process and ensures a high degree of similarity in the choice of treatment. The benefit of an information system for determining the ST consists in the fact that the clinician is oriented quickly in the choice of drug and can predict the development of the disease process. The manifested morphological and characterological features and pathological history of the patient directly to a particular drug. Since the phenotype of the individual is the visible part of its genotype, which determines the “terrain,” we can predict the disease progression and can use drug with a preventative role in disease trends of the individual. Some authors exaggerate the importance of the concept of the sensitive type. For example, Kent – the founder of classical homeopathy puts emphasis on the psychological nuances of the patient than on the real existing disease trends as a result of which a number of inconsistencies in the treatment occur (Jouanny et al., 1998).

Homeopathy is a sophisticated form of personalized medicine – treatment of a specific patient with his individual reactions to the disease factors. Each person responds to the disease in its own way depending on the immune system or their genetic predisposition to one or another disease. Therefore, every person has a kind of “terrain,” within which occurs the influence of environmental and genetic heredity (Germonpre et al., 2000).
“Terrain” is a basic concept in homeopathy, which combines data for a constitutional type, chronic way of reaction and a sensitive type. Each of these elements has its own subspecies. The constitutional type has four subtypes depending on the content of minerals in the body: carbon type, phosphorus type, fluorine type and a sulfur type. The chronic way of response is divided into: psoric, tubercular, sycotic and luetic type. About fifty prototypes of the ST are described. Three sets of criteria are used to identify the specific ST – morphological features, behavioral responses and disease trends. The ST is the basis of the so-called “homeopathic typology of personality” which is linked to a strictly defined homeopathic medicine (Bule et al., 2007). The ST is changeable and rarely remains the same during the whole lifetime of men. Virtually, pure ST does not exist, but rather there is a dominant type with features added from other types and constitutions, which from informational point of view makes their identification difficult.

**Conclusion**

A module for detecting the signs of a Sensitive Type of patient has been created to provide homeopathic physician with information on adequate terrain treatment in acute and chronic pathology. The module helps the doctor practicing clinical homeopathy to significantly shorten the time for prescribing the medicament for the terrain treatment in primary care thus ensuring effective use of a Physician’s resources in the diagnostic and healing process.

A RARE COMPLICATION OF BCG IMMUNOTHERAPY

Entela Kolovani,1 Ergys Ramosaço,2 Rovena Byku,3 Najada Çomo,4 Rezart Xhani,5 Ervin Rrapushi,6 Dhimiter Kraja7

Abstract: Intravesical Bacillus Calmette-Guérin immunotherapy is an effective agent for superficial bladder carcinoma. The main adverse effect of this treatment is cystitis. Arthralgia and migratory arthritis occur only in 0.5% of patients. Reiter syndrome is a very rare complication that can occur after intravesical apply of Bacillus Calmette-Guérin Immunotherapy. We report the first Albanian case of a patient who developed Reiter’s syndrome following intravesical Bacillus Calmette-Guérin. Diagnose of Reiter’s Syndrome was clinically based, excluding every other reason that could have caused it. Treatment was made with non-steroid and steroid anti-inflammatory drugs, followed by a full recovery result. Even though Reiter's Syndrome is rare, but significant complication of BCG immunotherapy, it’s important to identify it in time, in order we to offer an adequate treatment.

UDC Classification: 616-001/-099; DOI: http://dx.doi.org/10.12955/cbup.v5.1061

Keywords: Bladder carcinoma, BCG immunotherapy, Reiter’s syndrome, diagnose

Introduction

Bacillus Calmette-Guérin (BCG), a live attenuated strain of *Mycobacterium bovis*, is the only agent approved for primary therapy of carcinoma in situ of the bladder. BCG therapy also reduces the risk of recurrence and the risk of progression in patients with high-grade non–muscle invasive bladder cancer (Syelvester et al., 2002).

Intravesical BCG is used as first-line therapy for carcinoma in situ of the urinary bladder. BCG therapy showed a complete response rate of 60-68% (Syelvester et al., 2002; Barmoshe et al., 2004). Persistent disease after a complete course of therapy is cause of concern (Herr et al., 1989).

However severe side effects continue to be reported in the literature. The most frequent local side effects are: cystitis in 35 % of cases, bacterial infections in 23.6 % of cases and macroscopic hematuria in 22 % of cases (Brausi et al., 2014). Fever and general malaise are the most frequent systemic side effects (Decaestecker et al., 2015).

The relationship between BCG and its side effects can be made easily, if clinical manifestations occur shortly after the administration of this therapy. Mild and short arthralgias, without consequences, occurs regularly during a BCG course. Reiter’s syndrome is a very rare adverse side (Salorta et al., 1996; Pancaldi et al., 1993; Palnaes Hansen et al., 1997; Hogarth et al., 2000; Murata et al., 2004). Reiter’s Syndrome is clinically presented with triad of symptoms: urethritis, arthritis and conjunctivitis. Diagnose must be done clinically; it’s very difficult to confirm diagnose by a specific test. This is important for not delaying treatment.

The aim of this article is to describe the first Reiter’s Syndrome Albanian case following intravesical BCG immunotherapy.

Material

We report the case of a patient who developed Reiter’s syndrome following intravesical BCG installations.

Case report

A male 39-years old patient, resident in Tirana, presented at Infectious Diseases Clinic, University Hospital Center of Tirana on June 13, 2016 with a 10 days history of dysuria, urethral discharge, high fever, bilateral red and itchy eyes and arthralgia including the left knee and talocrural joints. No previous rheumatologic disease was reported by the patient.

7 Infectious Diseases Clinic, University Hospital Center “Mother Teresa”, lulikraja@hotmail.com
On December 2015 he was firstly diagnosed with bladder carcinoma (high grade papillary urothelial carcinoma. The cancer was grown in the inner lining of bladder into the lamina propria and there was no evidence of muscularis propria invasion, lymph nodes or any other organ – T1, N0, M0). He had received weekly six intravesical installations of BCG and 3 months later he started the three weekly maintenance immunotherapy of BCG.

On the day of the third installation, he did not perform immunotherapy and was hospitalized in our clinic. On examination he had swollen painful joints, especially of genus and talocrural (fig 1) with limited movements and bilateral conjunctivitis (fig 2). He had no signs of urogenital lesions.

On blood tests we noticed leucocyte count of 14900/mm$^3$, E. Coli was grown in urine culture, urethral smear and STD tests were negative, Interferon gamma was negative also. Inflammatory tests were high erythrocyte sedimentation rate (ERS) 40mm/h, fibrinogen 736 mg/dl, C-reactive protein (CRP) 92 mg/dl. His left knee was presented with effusion on ultrasound. Diagnose was based on clinical manifestations, rheumatologist also confirmed it.

Initially we started treatment with NSAIDs and antibiotics (ciprofloxacin), but symptoms persisted, so 5 days after we started steroids (prednisolone). He was not put on therapy with anti-tubercular drugs. His conjunctivitis and urethritis were resolved 5 days after, and his arthritis after 20 days of treatment.

**Discussion**

Intravesical BCG is used as first-line therapy for carcinoma in situ of the urinary bladder. Cystitis, bacterial infections and macroscopic hematuria are the most common adverse effects that accompany
this treatment. More undesirable side effects are uncommon and include granulomatosis prostatitis, which can be an asymptomatic finding in 20% to 30% (Spence et al., 2006). Reiter’s Syndrome is a very rare complication that can be seen during this treatment. The syndrome developed after the third to eighth BCG intravesical administration, with conjunctivitis, aseptic urethritis and polyarthritis (Murata et al., 2004). Our patient developed Reiter’s syndrome on week third, 2 weeks after he restarted immune therapy with BCG, as a maintenance treatment, after he had performed successfully first six weeks therapy.

He interrupted therapy after the third application because he demonstrated bilateral conjunctivitis, swelling of genus and talocrural articulations. The presence of large joint oligoarthritis, urogenital tract infection and uveitis characterize Reiter's syndrome as a clinical subtype of reactive arthritis (Selmi et al., 2014). The diagnose was supported epidemiologically (a live attenuated strain of Mycobacterium bovis was intravesical instilled), clinically (triad of symptoms: nongonococcal urethritis, inflammatory arthritis, conjunctivitis) and laboratorically with high inflammatory tests (ESR, CRP), which later return to normal range when the inflammation subsided.

There is no confirmatory laboratory or radiological test that can confirm diagnosis. In addition, there are also differential diagnoses of gout, gonococcal urethritis and psoriatic arthritis that must be excluded. In our case the syndrome was diagnosed based on consultations with rheumatologist.

Cessation of the intravesical BCG immunotherapy in these cases is perhaps the most important treatment together with medications aimed for symptomatic relief (Keng Lim Ng et al., 2017). Treatment of Reiter’s syndrome usually revolves around providing symptomatic relief and this includes bed rest, NSAIDs, and eye ointments. Non-steroid and steroid anti-inflammatory drugs are effective in the majority of the cases with the recovery within 2 and 6 months, respectively of 70% and 93% of the patients (Bernini et al., 2013). These general symptomatic measures often will provide the remission of symptoms.

Initially our patient started treatment with non-steroidal anti-inflammatory drugs. On fifth day of the therapy, no improvement of signs and symptoms was seen. Then we continued treatment with prednisolone. Corticosteroids improved conjunctivitis and urethritis in five days, and arthritis in 3 weeks. Occasionally, steroids with or without isoniazid or rifampicin may be started if the symptoms prolong or worsen (Murata et al., 2004). There is no consensus for antibiotics use, but the urine culture of our patient was positive and E. Coli was grown, so we used Ciprofloxacin for 10 days. Our patient remained asymptomatic, without medication during last year of follow-up.

Conclusion

The side effects can occur at any moment from the first instillation to the last one. This makes the diagnose easier for the cause effect relationship is more evident. Even Reiter’s Syndrome is a quite rare complication of BCG treatment, it must be considered in order we to be in time for early diagnose and treatment of the patient.

CERVICAL BRUCELLOSIS, WITH OR WITHOUT BONE INJURY

Ergys Ramosaço,¹ Entela Kolovani,² Arben Rroji,³ Dhimiter Kraja⁴

Abstract: Brucellosis is a zoonotic infectious systemic, endemic in Albania, which is accompanied by multi-organ involvement. A common complication is also the vertebral affection. Manifestation in the lower lumbar spine is frequently seen, while cervical involvement is more rare. Diagnose of vertebral involvement is difficult because of non-specific clinical symptoms. We present two cases of cervical brucellosis, with various cervical injuries. Spondylodiscitis with epidual abscess were the cervical manifestation in the first patient, which is very rare and a serious complication and the second patient had epidual involvement without spondylodiscitis. The Rose Bengal, Wright test, ELISA were positive for both patients. The cervical injury was confirmed with MRI exams. After prolonged combination therapy with cervical immobilization, the follow up evaluation demonstrated resolution of the cervical injury. Because vertebral destruction is in the base of this complication, early diagnosis of vertebral brucellosis is important to prevent serious morbidity, if diagnosis and treatment are delayed. Standard Brucella tube agglutination (Wright) test is the primary test and should be performed as a first step in the differential diagnosis of spondylodiscitis. An MRI is recommended for early diagnosis of spinal involvement. Medically treatment of cervical brucellosis has a good prognosis with early diagnosis.

UDC Classification: 616-001/-009; DOI: http://dx.doi.org/10.12955/cbup.v5.1062

Keywords: Brucellosis, cervical, diagnose, early, treatment

Introduction
Brucellosis is an endemic zoonosis in Albania. Microorganisms that most often can cause human brucellosis are B. Abortus, B. Melitensis and B. Suisus. Brucellosis is more prevalent in rural areas of Albania, being an occupational disease of veterinarians, farmers, hunters. The incidence in our country is high, the reason is connected even with the fact that 60% of people live in rural zones. Spondylodiscitis is a frequent complication, as a result of an Brucella infection. Estimates of the incidence of spondylitis range from 9% to 31% (Colmenero et al., 2008).

While lumbar spine involvement is the most common, cervical involvement is a rare, but more severe complication, accounting for 8.3% of cases of spondylodiscitis in a recent study. Recovery is observed in 60-90% of patients, with specific treatment (Tekkôk, 1993).

Spinal pain is a frequent complaint of today. It can be the only manifestation of vertebral brucellosis, making the diagnose difficult and delayed.

The aim of this study is to present the importance that Brucella etiology has for cervical diseases and for the early treatment of local damages.

Material
We present two different cases of cervical brucellosis, with various cervical injuries.

Case 1
A 55- year old male patient, a farmer, presented at our hospital. His symptoms were night sweats, headache, neck pain extending down the back, and myalgias, especially in the right arm. On examination, we revealed neurological deficits as paresis and functional disabilities of the upper extremities, with limited movement of the arm because of pain.

Laboratory results showed an erythrocyte sedimentation rate (ESR) of 39mm/h, a leukocyte count of 14.100/mm³ with81% neutrophils and 19% lymphomonocytes, a haemoglobin level of 13.3 g/dL and a platelet count of 238 000 /μm³. Liver function tests were normal and lactate dehydrogenase 158 U/L.

Blood urea, creatinine, total bilirubin and electrolyte levels were normal. Blood cultures were negative. There was an increase in C-reactive protein (CRP) to 33.42 mg/L and fibrinogen was 588 mg/dL.

Wright agglutination test was positive (1:640 I.U/ml). Brucella infection was confirmed with another test. ELISA was positive for Brucella IgG antibodies (16.6 U/mL). Cervical magnetic resonance
imaging (MRI) confirmed the C3-C4 spondylodiscitis and the existence of a minimal inflammatory paravertebral involvement, epidural abscess and medullary compression. (Fig 1).

The patient started treatment with oral doxycycline, 100mg 2 x day, oral rifampicin 600mg daily and intramuscular gentamicin 240 mg × day. The doxycycline and rifampicin regimen continued for a period of 12 weeks, while gentamicin was discontinued after 2 weeks. Cervical immobilization was applied.

Forty days after admission, the patient was discharged free of symptoms with amelioration of the neurological signs. The laboratory tests on his discharge were normal, including ESR and CPR.

Case 2

The second case was a female patient 67–year old, retired, living in village. She presented with a high fever (39-40°C), that had started 20 days previously and neck pain, without neurological deficits.

Laboratory results showed an ESR of 54 mm/h, a leukocyte count of 9.600 / mm3 with 66% neutrophils and 34% lymphomonocytes, a haemoglobin level of 10.3 g/dL and a platelet count of 281 000 /mm3. Liver function tests were normal and lactate dehydrogenase 280 U/L. Blood urea, creatinine, total bilirubin and electrolyte levels were normal. Blood cultures were negative. There was an increase in C-reactive protein value to 128.8 mg/L.

Wright agglutination test was positive (1:1280 I.U/ml). ELISA was positive for Brucella IgG antibodies (13.4 U/mL).

The Cervical MRI confirmed the soft tissue inflammation at the level of C5-C6 vertebrae and epidural inflammatory involvement (Figure 2). The regimen treatment was the same with the first patient. One month after admission, the patient was discharged free of symptoms and the laboratory tests were normal, including erythrocyte sedimentation rate and PCR.

Discussion

Brucellosis is one of the zoonosis with high incidence in Albania. History of brucellosis in Albania begins in 1925 with the diagnosis of several people affected by brucellosis in the south of the country. In 1935, the disease was confirmed also in some goats in the Permet district (Eltari, 1981). However, brucellosis appears to have been endemic to Albania since medieval times. Anthropological analysis of skeletal remains from the ancient Albanian city of Butrint, have confirmed the occurrence of brucellosis in recovered human bone (Motulo et al., 2012).
During the following forty years, 1960 to 1990 strict measures were taken to limit the infection in cattle and small ruminants in our country. In 1989, the country was declared free of bovine brucellosis and the infection in small ruminants had a very low prevalence in the few flocks in the south of the country (Ilirian et al., 2004). During 1990-2010, there has been reported a significant increase of the prevalence of brucellosis in Albania, which has influenced a great number of cases and the variety of complications, including those of bones. In Albania, an incidence of 25 per 100,000 inhabitants was reported in 2008 (Mariani et al., 2014). Musculoskeletal involvement typically occurs in men over 40 years of age. The lumbar spine is the most affected, followed by thoracic and cervical spine (Young, 2010, Doganay & Aygen, 2003). The incidence of spinal brucellosis is highly variable (2–54%) (Colmenero et al., 2008, Pourbagher et al., 2006, Mousa et al., 1987, Alp & Doganay, 2008). Involvement of the cervical region is in both our cases. The rate of isolated cervical spondylitis was reported to be 1.2-4% in some studies (Kurtaran et al., 2008, Zormpala et al., 2000).

Muscle, joint and bone pain, and sometimes neurological symptoms (power loss, paraesthesia, paraparesis) can be the manifestation of the musculoskeletal involvement (Young, 2010). Spondylodiscitis is a very insidious disorder, not always accompanied by specific signs. In patients with brucellar cervical spondylodiscitis, back pain has been the presenting complaint (Colmenero et al., 1996). For this reason, in the endemic areas of brucellosis, patients that present with back pain must be examined for Brucella spondylodiscitis also. The back pain was the presenting symptom of our first patient and in the second, it was neck pain.

The diagnosis of spinal brucellosis is the first step to ensure proper treatment. Despite the fact that the diagnosis of cervical brucellosis is not easy, it is very important to initiate specific treatment. Laboratory results alone are not efficient in establishing a correct diagnosis. The standard Brucella tube agglutination (Wright) test is the primary test and should be performed as a first step in the differential diagnosis of spondylodiscitis. Nevertheless, there are seronegative cases, false positive results that have also been reported in the literature (Ulu-Kilic, 2013). In our two cases, the etiologic diagnose was determined by the tube agglutination (Wright) test and serologic test ELISA for Brucella.

The reproduction of Brucella bacteria in cultures taken from appropriate samples is a criterion to diagnose spinal brucellosis. This examination was not performed, because it was refused by both patients. However, serological tests are particularly useful in spinal brucellosis, diagnoses and reducing the need for invasive procedures (Erdem et al., 2015).

MRI remains the gold standard for early diagnosis of spinal involvement. Because bone remodeling can progress slowly, radiographic changes might not be easy to differentiate from those of degenerative disease (al-Shahed et al., 1994). Also, MRI is the method of choice for the assessment of
the disease and follow-up of spinal involvement (Resnick, 1995). When neurologic complications are apparent, the evolution of local spine damages is attended by MRI (Irmak et al., 2004). The diagnose of cervical involvement and its local extension was made by spinal MRI in both cases. This examination was also performed after treatment to follow the effectiveness of it.

Medically treatment of cervical brucellosis has a good prognosis with early diagnosis. No antibiotic combination was proven to be superior, but 14 different regimens were used in the series studied (Pappas et al., 2004). The combination of doxycycline, rifampicin and an aminoglycoside, for two weeks, followed by doxycycline and rifampicin, for 8-10 weeks is the most effective regimen (Madkour et al., 2001). Therapeutic failure and relapse are still reported with this regimen (Ariza, 1985).

The two criteria of anti-brucella treatment efficacy are: first, a normal temperature after the first week of it and second, a normal CRP level within the first month (Ulu-Kilic et al., 2013). Treatment should be continued until the ESR decreases to normal levels and radiological recovery is maintained (Tekkök et al., 1993, Ural et al., 2013). By the end of medical treatment of the two patients, a normalization of ESR and a radiological recovery were evident.

Surgical treatments are performed in cases with neurologic complications, as spinal instability or progressive spinal cord compression (Solera et al., 1999, Samra et al., 1982). None of our patients underwent surgical treatment. Cervical immobilization was applied successfully in our first patient.

Conclusions
Brucellosis is an endemic disease in our country; it is because of that those patients with cervical vertebrae lesions must also be tested for Brucellosis. Early diagnose and treatment will diminish the possibility of serious complications that accompany vertebral involvement and mostly, a total recovery of bone damage. The standard Brucella tube agglutination (Wright) test should be performed as a first step in the etiologic diagnosis of spondylodiscitis. An MRI is recommended for early diagnosis and follow-up of spinal involvement.

DYNAMIC CHANGES OF SOME ANTHROPOMETRIC INDICES OF THE NEWBORN CHILDREN IN PLOVDIV FOR A PERIOD OF 70 YEARS (1939 – 2009)

Daniela Ivo Taneva

Abstract:
Introduction: The periodical tracking and comparison of the physical development indices give an idea of the dynamics of the acceleration and the efficiency of the social and medical events for a protection of maternity.

Aim: Tracing the accelerative changes of the newborn Bulgarian children for 70 years.

Materials and methodology: The study is retrospective longitudinal research and includes the period 1939 – 2009. The initial information of the last survey was obtained at the Clinic of Obstetrics and Gynaecology at University Hospital St George – Plovdiv for the period 1 Jan 2009 – 31 Dec 2009. For the statistical processing is used variation analysis.

Results and discussion: The dynamic changes of two anthropometric indices are traced – height and body mass. There are two periods in the survey. The first, a 46-year period, is characterized by an apparent increase in the values of the two indices until 1975, inclusive, after which the acceleration rate gradually slows down. During the second ten-year period, 1985 – 1995, there is a sharp decrease in the height and the body mass of the newborns, as their values are back to the level of 1946–47. The authors relate this negative tendency with the economic situation in the country, with the progressive impoverishment of the population, with the unemployment and the uncertainty in the future. In the last period, 1995 – 2009, there is a slight increase in the values.

Conclusions: This survey is the most extended study of the physical development of the newborn children in Bulgaria. The accelerative changes in the basic indices for physical development start in the antenatal period. The social factors are the basis for acceleration.

UDC Classification: 308; DOI: http://dx.doi.org/10.12955/cbup.v5.1063

Key Words: acceleration, new-born, body mass, height, dynamic changes.

Introduction
The periodical tracking and comparison of the physical development indices give an idea of the dynamics of the acceleration and the efficiency of the social and medical events. The in-depth literature review made possible the registration of several longitudinal surveys of the basic physical development indices of the newborn children. The longest survey was conducted in the Soviet Union and includes a period of 45 years (Novikov, 1981), in Japan – 26 years (Kazny, 2004), again in Russia – 15 years (Tretyak et al., 2005) and in Greece – 20 years (Karanica, 1999).

The tracking of the core anthropometric indices – height and body mass, of the newborn children in Plovdiv, includes a period of 70 years – from 1939 until 2009. The first study was conducted by Todor Zahariev in 1939 (Zahariev, 1968), (Zahariev, 1969), followed by a number of studies by I. Dimitrov, including the period from 1975 to 1995 (Dimitrov & Cochev, 1981; Dimitrov, 1990; Dimitrov, 1997) and by D. Taneva (Taneva, 2008).

Essential for the science of the physical development is the studying of the causes and the forms of the accelerated physical and neuropsychic development of children (Zeltser, 1978; Vlastovskii, 1988; Koleva, 1985; Volkova, 1988).

The aim of this study is to monitor the accelerative changes of newborn Bulgarian children for 70 years.

Methodology. In its nature, the study is a retrospective longitudinal research. In the statistical processing are used variation analysis and analysis of the dynamic changes.

The initial information about the physical development of the newborn was obtained at the Clinic of Obstetrics and Gynaecology at University Hospital St George – Plovdiv, for the period 1 Jan 2009 – 31 Dec 2009. The study, like all previous studies, does not include the prematurely born and born within multiple pregnancies. The accepted criteria for fetus maturity are body mass 2 500 g and height 45 cm (Koleva, 1985).

Results and discussion. Historically, the study includes several periods. The first one started before the beginning of World War II and includes the first years after the war, characterized by economic

---

1 Medical University – Plovdiv, Bulgaria; Faculty of Public Health, taneva.daniela@abv.bg
crisis and a sharp decline in the standard of living. Economic stabilization represented the second period. The third period - the second half of the 80s and the first decade of the “democratic” transition, was associated with a sharp decline in the standard of living, irrational and inadequate feeding and with chronic psychoemotional stress. The last period – the first years of the 21st century was characterized by gradual improvement of the socioeconomic conditions in the country (Volkova, 1988).

The analysis of the data in Table 1 allows the tracking of the changes in the basic anthropometric indices influenced by the socioeconomic and psycho-emotional factors. The established changes in the height and the body mass in both genders of the newborns are in a certain dependency of the variations in the observed periods.

Source: Author

As was mentioned before, in the first period there are two sub-periods. The first one includes the first two studies of T. Zahariev (Zahariev, 1968; Zahariev, 1969). The difficult social status in the first year after WWII results in a statistically significant reduction of the height and the body mass of both sexes compared to the study 1939-40 - 0.01 > P < 0.001 (body mass u = 3.49 (boys) and 2.90 (girls), and height u = 4.55 (boys) and u = 3.00 (girls)).

It takes only one year (1946-47) to bring the values of the monitored indices to the initial level (P > 0.05). According to many authors, the psycho-emotional factors have a significant role, which in this case is the peace (Novikov, 1981; Karanica, 1999; Zahariev, 1969; Koleva, 1985; Dimitrov, 1997).

Interesting is the comparison of the data from the survey of 1985-86, with the survey of T. Zahariev for 1944-45. In the 40-year period, noticeable accelerative changes have occurred: the body mass of the boys is bigger with 283 g and of the girls with 283 g. The height in both genders has increased with 1.2 cm. The differences are significant – P < 0.001 (body mass: boys u =11.65, girls u=5.99 and height: in
both genders 13.34). The positive accelerative changes in this 40-year period are a result of the stable socioeconomic status of the population, as well as the development of the healthcare system in the country, more specifically in the area of the maternity health care.

Impressive is the fact that the speed of the accelerative changes in this period is characterized by a tendency towards gradual slowing. Although the height of the children had increased with 0.4 cm – boys, and 0.3 cm – girls for a very short period of two years (from 1944-45 to 1946-47), the growth in both genders is only 0.1 cm in the last 10 years (1975-76 - 1985-86) of the sub-period. A significant delay is registered in the increase rate of the body mass. In the last period is recorded a similar slowing of the growth of the body mass and the height also in Moscow and Almaty (Volkova, 1988). A number of authors say that the gradual slowing of the acceleration rate is related to the improvement of the living conditions (Kazny, 2004; Karanica, 1999; Dimitrov, 1990; Vlastovskii, 1988; Koleva, 1985). When studying the interrelation between the acceleration processes and the material prosperity, Zeltser notices that the acceleration is much stronger in individuals, whose development has been impaired due to various influences (Zeltzer, 1978).

After 1985 the economic status of the population starts to decline, and after 1990 the adverse effects in the public and personal life have worsened. The results of these events are negative acceleration changes in the newborn children. The average value of the body mass of the boys decreases with 345 g compared to 1985 and is the lowest value registered in the 70-year period. The body weight of the girls has declined with 122 g compared to 1985 and is at the level of 1946-47. The inter-group comparison between 1985 – 1995 shows that the differences are statistically significant Р<0.001, with values of the criteria for normal distribution u = 12.51 for boys and u = 4.74 for girls. The height of the boys has decreased with 1.47 cm compared to 1985, and like the body mass is the lowest for the 70-year period. The height of the girls has declined with 0.90 cm, and like the body mass is at the level of 1946-47. The changes in the height have been confirmed with the alternative hypothesis – P <0.001 (u = 14.70 for boys and u = 9.57 for girls).

The hypothesis that the gradual improvement of the socio-economic conditions in the country after 1998 will result in positive acceleration changes in the newborn children compared to the preceding period was confirmed in regard to their body mass, more noticeable at boys, less at girls – Р<0.001 (u = 4.13 girls and u = 2.49 boys). With the height, another observed anthropometric index, the negative tendency continues at girls, in 2009 it is with 0.47 cm less than in 1995. With boys, there is stabilization with a slight increase of 0.17 cm.

The in-depth analysis of the observed anthropometric indices shows that negative changes in the physical development of the newborn children in Plovdiv are a result of the decreased relative share of the larger fetuses (see Table 2 and Table 3). Throughout the whole first period, except for 1944-45, there is a clear tendency of increasing the share of the newborns with body weight above 3 500 g. With boys, the range is between 23.0% in the pre-war year to 54.9% in 1985; it represents an increase of 31.9%. With girls, during the first survey, the share of the newborn above 3 501 g is 15%, to reach 41.8% in 1985. In the period 1985 – 1995 the body mass of the newborns with weight above 3 500 g decreases by 23.4% with boys and by 16.7% with girls (see Tab.3). As already mentioned, in the last period 1995 – 2009, there were some positive changes in the body mass, but with boys, it is still close to the values of 1946-47. With girls, the change is much better and is at the level of 1965-66.

Conclusions:
1. This survey is the most extended study of the physical development of the new-born children in the history, not only in our country but according to the literary sources, for the last 70 years in the world.
2. The dynamic changes in the height and the body mass of the newborns in the different sub-periods allows to categorically confirm the thesis that the accelerative changes start in the antenatal period.
3. The survey allows the assertion that the accelerative changes in the ontogenetic development are based on social factors.

THE IMPACT OF PHARMACEUTICAL CARE ON IMPROVING THE QUALITY OF LIFE IN PATIENTS WITH ALLERGIC RHINITIS

Anna Todorova,1 Antoaneta Tsvetkova,2 Silvia Mihaylova,3 Kalina Andreevska,4 Antonia Kondova,5 Mariana Arnaoudova6

Abstract:
Introduction: Allergic rhinitis (AR) is a chronic disease with great social and economic impact that is largely undiagnosed and inadequately self-treated. Healthcare professionals such as pharmacists play a key role in recognizing and assessing the severity of AR, dispensing of OTC drugs, counseling of patients and in severe cases, referring them to health care specialists for further treatment.

Objective: This study explores the impact of pharmaceutical care and patient counseling on the self-management of seasonal AR.

Methods: The participating pharmacists follow the stepwise algorithm of ARIA (Allergic Rhinitis and its Impact on Asthma) Pharmacist’s Guide. The effectiveness of the specialized pharmaceutical care is assessed by the changes in patients’ quality of life (QOL) before and after the provision of patient counseling and pharmacist monitoring on patient self-management. The quality of life is measured with the help of the generic tool 12v2 SF.

Results: As a result of the provided pharmaceutical care, the analysis indicates improvement of all assessed aspects of patients’ QOL. The analysis shows that the better scores of the indicators Physical functioning, Vitality, Physical health and Mental health are not accidental; rather, they are in a statistically significant correlation with the provided pharmaceutical care.

Conclusion: The study highlights the need for professional patient counseling and the education of patients to perform adequate disease management and improve their quality of life.

Introduction

Pharmacists act as intermediaries between physicians and patients in ensuring effective prevention and treatment of chronic diseases. Pharmaceutical care encompasses patient counseling, disease prevention, monitoring, and evaluation of the treatment (Dessing, 2000). We should emphasize that the pharmacist’s role is to assist patients in self-treatment with OTC drugs only when disease control is achievable. The collaboration between patients, pharmacists, and physicians aims at establishing the optimal therapy and managing good disease control.

Literature review

AR is a chronic disease with great social and economic impact due to numerous factors: its high prevalence, the disease-related impairment of patients’ quality of life, patients’ inability to perform various professional and academic activities, the economic burden of AR, and its comorbidity asthma and other allergic diseases (Baiardini et al., 2006, Bousquet et al., 2008). The contemporary holistic approach to socially significant chronic diseases encompasses not only the medical treatment, but also the management of disease symptoms, prevention of disease complications and improvement of the quality of life of patients (Meltzer et al., 2012).

AR is largely undiagnosed and inadequately treated, thus being a predisposing factor for the subsequent development of asthma (Pawankar et al., 2011).

To prevent disease progression, the World Health Organisation (WHO) launched various initiatives for health education and provides recommendations for the treatment of AR through ARIA guideline. (Allergic Rhinitis and Its Impact on Asthma). In compliance with ARIA guidelines pharmacists, being the most accessible health care professionals, have to identify allergic rhinitis, assess the symptom

severity, and provide patient counseling while dispensing OTC drugs when disease control is maintainable. (ARIA Pocket Guide for Pharmacists, 2003).

According to the disease severity and symptom frequency, ARIA guidelines classify AR as intermittent or persistent. Depending on the severity of the disease and the extent to which it affects the quality of life of the patient, AR is classified as mild or moderate/severe (Brozek et al., 2010). ARIA classification reflects patient’s condition and is the determinant factor for the selection of the therapeutic regimen and the assessment of the maintained disease control (Pawankar et al., 2011). The stepwise approach that pharmacists need to adopt in the selection of alternative pharmacological treatments and patient counseling according to the AR type is part of the algorithm developed by ARIA (Fig.1).

![Figure 1: Pharmacists’ selection of allergic rhinitis treatment](source: ARIA Pocket Guide for Pharmacists (2003))

According to ARIA and WHO, disease control in patients with AR can be maintained through patient education, health promotion and disease prevention (avoidance of specific allergens or triggering factors), a healthier environment, and drug therapy and immunotherapy (Allergic Rhinitis and Its Impact on Asthma). The role of the pharmacist is directed towards improving public health through the promotion of a healthy lifestyle (Guidelines on Good Pharmacy Practice, 2009). As health care professionals, pharmacists do not simply handle and dispense medications, but they also provide valuable information about the disease symptoms that can be subject to self-medication, potential adverse drug reactions, contraindications, and special treatment of patients with chronic diseases. (Tsvetkova et al., 2015).

The objective of the study is to analyze the results of pharmaceutical care provided to patients with allergic rhinitis who practice self-medication by monitoring as well as evaluate the quality of life before and after the intervention of the pharmacist.

**Data and methodology:** Pharmaceutical care was provided in compliance with ARIA guidelines for pharmacists, including individual training, patient counseling at the dispensing of appropriate OTC products, monitoring the effectiveness of the treatment, and in cases of no positive treatment outcome, referring the patients to a physician.

The effectiveness of the pharmaceutical care was analyzed by assessing the quality of life in patients before and after the provided consultation and the treatment monitored by the pharmacist.

The study was conducted in community pharmacies in the city of Varna. Pharmaceutical care was provided to patients with AR who sought professional advice at the corresponding pharmacy, self-medicated with OTC drugs, and followed no therapy regimen prescribed by a physician at the time of the study.

The study spanned over the pollen season (from March to June) when the acute phase of the disease was more likely to be triggered.
The survey participants were adults 20 to 45 years of age. This specific age group has the highest morbidity rate, and therefore it was in the focus of our study.

The patients’ quality of life was assessed with the help of the generic tool SF12 v2 (the shorter version of SF 36). SF-12v2 Health Survey is a questionnaire validated for Bulgaria, intended to assess the physical health, the mental health, and the social functions within a 4-week recall period. SF-12v2 is a health survey, consisting of 12 questions that address eight domains in order to evaluate the physical and mental health of patients and their social functions. It provides two composite scores which assess the physical health and the mental health. The SF-12V2 questionnaire is based on the data obtained from the Quality Metric 2009 Norming Study conducted in the USA in 2009 by The National Research Corporation (NRC). It served as a basis for the scale used in this survey. The norm for the studied health composite summaries was set at 50 points with a minimum value of 20 pts. and a maximum value of 80 pts. The higher the score, the better the quality of life.

After a prior consent and instructions on how to fill out the questionnaire, participants replied in writing to self-assess their quality of life.

The study used a Student’s t-test for assessing the statistical significance of the results obtained after the provided pharmaceutical care. Hypothesis testing was performed with a significance level set at 0.05.

**Results and Discussion:** The baseline survey involved 71 patients with pronounced AR symptoms seeking medical advice in the pharmacy. A follow-up survey of patients QL was performed after the provided pharmaceutical care, including patient counseling and patient education, dispensing of the appropriate OTC product, and health status monitoring in accordance with ARIA algorithm. The follow-up SF12v2 test involved 63 patients. Eight of the baseline participants dropped out from the follow-up test because they did not meet the survey inclusion criteria and were referred to a medical specialist by the corresponding pharmacist.

The summarized results of the assessment of the Physical Component Summary (PCS) and the Mental Component Summary (MCS), before and after the provision of pharmaceutical care, compared to the norm are presented in Figure 2 and Figure 3.

<table>
<thead>
<tr>
<th>Figure 2: Summary results before the provision of pharmaceutical care.</th>

<table>
<thead>
<tr>
<th>Figure 3: Summary results after the provision of pharmaceutical care.</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Figure 3](source: Authors)</td>
</tr>
</tbody>
</table>

In 66% of the respondents in the baseline test, the Physical Component Summary is within the norm and for the remaining 34% it is above the norm. Highly prevalent are the patients (92%) whose mental
wellbeing is below the norm in the survey scale. The mental health is within the norm in only 8% of the respondents.

Following the provided pharmaceutical care, the Physical Component Summary (PCS) scores better; it is within the norm in 59% of the respondents and above the norm in the remaining 41%. Impressive is the improvement of the Mental Component Summary (MCS) - it is below the norm in only 63% of the patients, which is a 40% decrease in comparison with the baseline test. The share of patients (24%) with MCS within the norm is increasing. In the follow-up test, the MCS score is above the norm in 14% of the patients, whereas there were no patients registered in this category during the baseline test.

Figure 4 displays the share of patients that are at risk of depression before and after the provision of pharmaceutical care correspondingly.

<table>
<thead>

</tr>
</tbody>
</table>

The general population norm for high-risk patients was set at 20% by the Quality Metric 2009 Norming Study, the primary goal of which was the development of representative norms for survey tools such as the SF-12V2 questionnaire.

The baseline test results show that 74% of the respondents are at risk of depression. As a result of the provided pharmaceutical care, there is a significant decrease of 43% in the share of patients that are at risk of depression; the total share falling to 31%. In the baseline test, the depression risk indicator was 54% above the general population norm, whereas in the follow-up test, it declines to 11% above the norm. The comparison between the baseline and the follow-up survey shows that the provided pharmaceutical care resulted in a remarkable decline of 50% in the share of patients who are at risk of depression. Other studies have found that symptoms such as mood swings, anxiety, and depression are much more frequent in patients with allergic rhinitis than in healthy controls (Cuel et al., 1999). A previous research on the QOL in patients with seasonal AR who resort to self-medication has found that symptoms of AR and the disease-related complaints are risk factors for the emotional well-being, social functioning, and mental health of AR patients (Todorova et al., 2015).

Figure 5 shows the comparative analysis of the results from the tests conducted before and after the provision of pharmaceutical care.

All indicators for physical, psychological, and social health score higher in the QL follow-up survey. Most pronounced is the change in the Vitality indicator with an increase of 11 points. The increase in the rest of the indicators is within the range of 3-5 points. The results are similar for the BP, GH, and SF indicators (a 3-points increase) and for the PF (a 5-points increase). The higher score of the Vitality indicator in the follow-up test evidences the QL improvement associated with the provided pharmaceutical care. We assume that patient-centred care and effective communication between pharmacists and patients enhance the adequate self-treatment and improve patients’ mental and physical wellbeing.
The statistical significance of the improvement data in the QOL indicators as a result of the provided pharmaceutical care is analyzed and the results are summarised in Table 1.

Source: Authors

According to the null hypothesis, the changes are due to random processes alone. The alternative hypothesis states that there is a statistically significant difference, and the changes are consequent upon the pharmaceutical care. The Hypothesis testing was performed with a significance level set at 0.05.

The analysis shows that the improvement in the composite scores for physical health and mental health (PCS and MCS), as well as in the Physical functioning indicator and in the Vitality indicator is not a random process. There is a statistically significant dependence of this improvement on the pharmaceutical care provided according to ARIA algorithm. The statistically significant improvement in the PCS and MCS in patients with AR highlights the need for patient training and specialized pharmaceutical care.

Low public awareness of allergies as serious chronic diseases has been identified as a major health issue. Patients suffering from respiratory allergies are not fully aware of the importance of the allergies and the complications associated with the disease progression. Patients, especially those with milder forms of allergies, tend to adapt to their condition or resort to self-medication without consulting a physician (Bousquet, Cauwenberge, Khatlave, 2003). According to data published, just 45% of patients with allergic rhinitis in Europe seek medical advice or treatment (Canonica et al., 2007).
Patient education and environmental control measures are effective mechanisms for AR management. Self-monitoring and deliberate avoidance of triggering environmental factors are the first steps towards the control of respiratory allergies. Studies examining the impact of patient education and specialised pharmaceutical care indicate better QL and fewer disease complications in patients who have been subject to pharmaceutical care and have participated in specially designed educational programs.

The optimal therapeutic regimen is a multifaceted process. Its efficacy depends on the adequate selection of drugs, drug dosage and treatment duration, which is accomplishable only with the participation of a health professional. We should be aware that a common behaviour pattern of patients with diagnosed AR is to resort to self-treatment with no prior medical consultations or allergy tests. Notwithstanding the improvement in patients’ QL, their attention should be drawn to the fact that pharmacotherapy is effective for treating only the symptoms of the disease. In no way can pharmacological treatment affect the cause and the disease triggering factors. The contemporary approach to disease treatment requires an unambiguous proof of the allergic nature of patients’ complaints and allergen detection. The effective management of socially significant chronic diseases should address not simply the disease symptoms, but the cause and the triggering factors as well.

Conclusion

Timely treatment of AR should be considered a crucial component of asthma management and an essential part of the disease control and prevention. The study confirms the belief that AR constitutes a serious threat to patients’ wellbeing. The effect of the pharmaceutical care provided in compliance with ARIA guidelines indicates that pharmacists can successfully enhance the adequate self-management and improve the QL in patients with intermittent and light persistent AR.

Pharmacists are a valuable resource that can be managed more effectively to make their unique contribution in protecting and enhancing public health and wellbeing even better.

NEOPTERIN AND RECURRENT SPONTANEOUS ABORTION (RSA): THE EFFECT OF CELLULAR IMMUNE SYSTEM ACTIVATION ON SUBSEQUENT PREGNANCY

Songül Ünüvar¹, Zübeyde Tanrıverdi²

Abstract:
Background: Recurrent miscarriages are common complications in pregnancy. Neopterin is one of the immunologic biomarkers of several diseases related to activation of the cellular immune system. RSA is associated with immune system related abnormalities.
Objectives: We aimed to investigate the effectiveness of neopterin levels in the early diagnosis of RSA.
Methods: Eighty RSA patients and forty-three healthy controls were included in the study. The neopterin concentrations were determined by the enzyme-linked immunosorbent assay (ELISA) method. For the statistical analysis, Mann-Whitney U test and Pearson correlation test were used the; p<0.05 was considered statistically significant.
Results: Serum mean neopterin levels were 16.47±0.095 nmol/L in RSA group and 6.14±0.041 nmol/L in control group, respectively. Compared to the control group, a statistically significant increase (p=0.0183) in the serum neopterin levels of the patients was observed. There was a negative correlation between serum neopterin level and age in both the control (R=0.0774, p=0.6236) and RSA groups (R=0.1415, p=0.2089). However, this correlation was not statistically significant (p>0.05).
Conclusions: With overstimulation of interferon-γ (INF-γ) during pregnancy, the production of neopterin increases by monocytes/macrophages. The measurement of neopterin levels in the serum contributes to the early diagnosis of pregnancy losses.

UDC Classification: 615.4; DOI: http://dx.doi.org/10.12955/cbup.v5.1065
Keywords: Pregnancy, neopterin, INF-γ

Introduction
Two types of pregnancy loss have been described, namely sporadic and recurrent pregnancy loss. Recurrent pregnancy loss is observed at a rate of about 1%, while the rate of sporadic pregnancy loss is reported to be higher (25 to 50%) and is mostly observed to develop in association with chromosome abnormalities during advanced age pregnancies (Rai & Regan, 2006). RSA is one of the most common complications of pregnancy and adversely affects many pregnant women (Smith & Cowchock, 1988). RSA is defined as the occurrence of three or more failed pregnancies between the last day of menses and 20th week of gestation, or fetal rejection less than 500 g of fetal body weight (Rai & Regan, 2006; Strobino & Warburton, 1995; Kwak-Kim et al., 2000).

Factors associated with pregnancy loss include disorders related to genetic, hormonal, metabolic, or uterine anatomy, infections, environmental and occupational exposure (lead, mercury, ethylene, oxide, radiation), and personal habits (alcohol consumption and cigarette smoking), thrombophilia or the immune system (Kwak-Kim et al., 2000; Pandey et al., 2004). Immunological mechanisms are suggested to play a role as a possible explanation for pregnancy losses, in the absence of identification of any of these etiologies (Bellingard et al., 1995).

Neopterin is secreted from T-lymphocytes through the GTP (guanosine triphosphate) cyclohydrolase I enzyme by overexpression of IFN-γ from activated monocytes, macrophages, and dendritic cells. The activity of this enzyme is greatly increased by IFN-γ and other cytokines (Milich et al., 1995; Fuchs et al., 1992; Muller et al., 1991).

Neopterin Levels in Subsequent Pregnancy
Study Groups
A total of eighty women with a history of at least three abortions of unknown etiology which occurred during the first trimester were included in the study. The control group consisted of forty three healthy women. The mean age of the RSA group was 29.11±0.07 (year), whereas that of the control group was 31.18±0.19 (year).

¹ Faculty of Pharmacy, İnönü University, Malatya, Turkey. songul.unuvar@inonu.edu.tr
² Faculty of Pharmacy, İnönü University, Malatya, Turkey. zubeyde8644@gmail.com
All individuals in the control group were thoroughly scrutinized about their health status. This study was approved by the Institutional Ethics Committee and conducted in accordance with the principles of the Declaration of Helsinki. A written informed consent was obtained from each participant.

Neopterin Measurement

Blood samples were collected into 10 cc biochemistry tubes for biochemical and histological tests required for routine follow-up blood sampling. Blood samples were collected into heparin-containing vacuum tubes and centrifuged at 3,500 rpm. Supernatants were collected and stored at -20 °C. Serum neopterin levels were measured using the ELISA (DRG Diagnostics GmbH, Germany) method. Neopterin concentrations were expressed in nmol/L.

Statistical Analysis

Statistical analysis was performed using the SPSS version 11.50 software. Descriptive data were expressed in mean±standard error (SE). The Mann-Whitney U test was used to compare two independent groups, whereas the Pearson correlation test was used to analyze possible relationships between the variables. A P value of <0.05 was considered statistically significant.

Discussion

The elevated serum concentrations of neopterin have been demonstrated in various infections (malaria, measles and septic shock), chronic inflammatory diseases (Crohn disease, ulcerative colitis) and autoimmune disorders (rheumatoid arthritis, thyroiditis), cardiovascular diseases, malignancies and organ transplantations (Muller et al., 1991; Fuchs et al., 1993; Eisenhut, 2013; Yanchun&Zhidong, 2011). Neopterin is a sensitive indicator of cell-mediated immune activation (Eisenhut, 2013; Yanchun&Zhidong, 2011; Huber et al., 1984). Neopterin levels can be used as an indicator in the assessment of immunogenic stimulations induced by the fetus and placenta during pregnancy since its production reflects cellular immune response (Munn et al., 1998).

The mean serum neopterin level was 16.47±0.095 nmol/L in the women with RSA and 6.14±0.041 nmol/L in the control group, indicating statistically significantly higher levels in the women with a history of RSA (p=0.0182).

In addition, we found a negative correlation between the serum neopterin levels and age both in the control group (R=0.0774, p=0.6236) and in the RSA group (R=0.1415, p=0.2089) (Figure 1). However, this correlation was not statistically significant (p>0.05).

Figure 1. The distribution of neopterin concentrations according to the age.

Source: Author

A healthy pregnancy is characterized by depression of cell-mediated immune response in addition to an increase in humoral immune response (Kaleli et al., 2005). The production of Th2 cytokines by decidual T-cells contributes to the progress of pregnancy; however, the excessive increase in Th1 response poses a risk for the survival of the fetus. The predominance of Th1 may be associated with pathological conditions such as RSA and preeclampsia (Kaleli et al., 2005; Lin et al., 1993).

Women with recurrent pregnancy losses and/or inadequate implantation have been reported to possess significantly increased peripheral blood Th1 cells compared to normal fertile women. Increased
proinflammatory cytokines have been suggested to play an important role in recurrent pregnancy losses (Kwak-Kim et al., 2000). Excessive activation of Th1 cytokines and natural killer (NK) cells has been reported to be the most important alloimmune cause of RSA (Pandey et al., 2004). NK cells in the uterine mucosa have been reported to contribute to the cytokine response at the maternal-fetal interface. This cytokine response is generally caused either by type Th1 (interleukin 2, INF-γ and tumor necrosis factor alpha (TNF-α) production) or type Th2 (interleukin 4, 6 and 10) cells. A normal pregnancy may be the result of Th1-type cytokine response. On the other hand, women with a history of RSA present with a predominantly Th1-type response during embryonic implantation and during pregnancy (Rai & Regan, 2006; Piccinni et al., 1998).

Many studies have been conducted which suggest that complications of pregnancy which lead to disorders of placentation such as preeclampsia and fetal growth retardation are associated with increased decidual cellular immunity (Erkenekli et al., 2015; Bartha &Comino-Delgado, 1999). About 20% of pregnancies result in spontaneous abortion. About 60% of spontaneous abortions are due to genetic, infectious, hormonal and immunological factors. Under certain conditions, the immune tolerance mechanism may be impaired and the fetus immunologically rejected. The effect of immune mechanisms is also associated with the gestational period during which the abortion occurred. During preimplantation and until the end of implantation, cell-mediated immunity is said to be responsible for early abortion. Immunocompetent decidual cells or cytokines have been reported to be responsible for these immunological mechanisms (Giacomucci et al., 1994). The production of IFN-γ activates decidual macrophages, causing injury by stimulating the production of nitric oxide and TNF-α, which cause apoptosis and inhibit the secretion of granulocyte macrophage colony stimulating factors from the uterine epithelium. Th1 cytokines, which are secreted as a result of IFN-γ activity, result in the termination of pregnancy through embryo and trophoblast toxicity. As a result, during RSA, paternal lymphocytes immunotherapy is thought to have a beneficial effect on the provision of specific and non-specific T-cell suppression. The risk of the next pregnancy loss is approximately 24% in women with a history of two abortions, 30% after the third, and 40% after four abortions (Regan et al., 1989). There is a possibility of RSA in women with previous live births. History of previous delivery is an independently associated indicator of the result of the next birth. The risk of abortion increases after each consecutive pregnancy loss and the prognosis worsens with increased maternal age. In advanced age pregnancies, the risk of abortion increases with the decrease in the number and quality of oocyte present. The risk is higher particularly in women over the age of 35 (Green-top Guideline, 2011).

Women with RSA were found to have local and systemic immunological changes when compared to women with normal pregnancy. Implementation of immunological tests to these patients would be beneficial during the appropriate period of pregnancy (Pandey et al., 2004; Magid et al., 1998).

Conclusion

In conclusion, evaluation of neopterin levels with routine clinical tests during pregnancy would contribute to the prognosis. The measurement of neopterin levels in body fluids using the ELISA method is rare in the clinical practice. The addition of neopterin measurement to routine clinical laboratory practice may contribute to early diagnosis of diseases.

EFFECT ASSESSMENT OF A COGNITIVE TRAINING PLATFORM IN HEALTHY OLDER ADULTS

Antonia Yaneva¹, Nonka Mateva²

Abstract: Cognitive interventions, especially cognitive training, may improve cognitive functions in healthy older adults. Computerized cognitive training platforms offer several advantages over traditional programs for cognitive training and stimulation. The focus of this article is the methodology of the studies that apply a particular online training program. We investigate the effectiveness of several studies for cognitive training in healthy elderly people and evaluate reported outcomes and potential bias and what factors determine, influence or contribute to the positive or negative results. The post-intervention scores demonstrate that computerized cognitive training may enhance some cognitive functions and the overall cognitive status but there is need for additional research to prove its effectiveness.

Introduction

The ability of people to perform different cognitive tasks decreases with age. This may be due to normal aging or an indication of the onset of dementia or mild cognitive impairment (MCI). Cognitive decline leads to deterioration of the quality of life of these patients as well as difficulties or inabilities to perform activities of daily living. Currently, there is no cure for Alzheimer's disease and it is necessary to look for alternative methods to prevent and mitigate the consequences of the occurrence of this type of impairment. Many studies have shown that cognitive rehabilitation can prevent cognitive decline and even delay the onset of dementia (Papp et al., 2009). In one classification, cognitive interventions are grouped into 3 categories – cognitive rehabilitation, cognitive stimulation and cognitive training (CT) (Clare et al., 2003). CT is defined by Martin et al. (2011) as “an intervention provided structured practice on tasks relevant to aspects of cognitive functioning, using standardized tasks” and “intended to address cognitive function and/or cognitive impairment directly.” Based on this and other similar definitions, Gates & Valenzuela (2010) determined that cognitive training is a specific form of cognitive intervention that aims to stimulate residual neuroplasticity in normal aging adults as well as those with mild cognitive impairment and Alzheimer's disease. In addition, they underline the increasing popularity of computer-based platforms that have the potential to produce more effective results on both general cognition and specific cognitive domains. Another systematic review (Kueider et al., 2012) investigated the efficacy of computer-based cognitive interventions and emphasized that they have significant advantages over traditional programs. Computer-based cognitive interventions offer the opportunity for personalized training taking into account the individual needs of the patient and allowing to focus only on those areas that need improvement. These programs are a much cheaper alternative that suggests much wider spreading among the elderly.

Cognitive training platforms

Recently, commercial cognitive training platforms have been becoming very popular. The most well-known among them are Posit Science, CogniFit, Cogmed, Brain Age, My brain Trainer, Dakim and Lumosity. Despite the fact that these programs are available, easy to use and could be adapted to different types of users, there is insufficient evidence for their clinical validity. A review of Shah et al. (2017) assesses the number and quality of studies that evaluate the empirical relevance of these platforms for cognitive function in healthy elderly (Shah et al., 2017). They group trials into three categories - I, II and III, level of evidence using PEDro scale (Physiotherapy Evidence Database scale) for randomized clinical trials. This scale consists of 11 criteria and helps to establish the validity of a randomized control trial (RCT) and if there are enough statistics that explain results. (Pedro et al., 1999). The authors have identified 2 programs with a level of evidence I - Posit Science and CogniFit.

CogniFit training program

CogniFit is a program designed specifically for the effective training of a variety of important cognitive skills. It covers a wide range of abilities, such as: visual search, time estimation, naming, categorization, visual short term memory, auditory short term memory, location memory, spatial orientation, planning, ability to inhibit planned action, speed of reaction and hand-eye coordination. Initially, CogniFit evaluates the starting point for each user and on the basis of this information it designs an individual training program. The training itself consists of tasks to be worked on for about fifteen to twenty minutes, three times a week. The software measures the person's progress and provides feedback on ongoing performance. (www.cognifit.com) (Breznitz)

Objective

The purpose of this review is to evaluate the effectiveness of cognitive training platform CogniFit in healthy older adults. Therefore, studies examining computer-based cognitive training are analyzed with regards to training effectiveness. Our goal is to assess the reported outcomes and potential bias and what factors determine, influence or contribute to the positive or negative results.

Methodology

Criteria for studies selection

This review focuses on RCTs for which adequate information was provided. The selected studies must be published and presented in a journal article. The participants must be over 50 years of age, healthy older adults with no diagnoses of dementia or Alzheimer’s disease. The studies have to describe computer-based cognitive training interventions that targeted specific cognitive domains, or the overall cognitive status improvement. Control groups are defined as no training and the participants included receive no-cognitive training or stimulation. The studies must report participants’ performance both in the beginning and at the end. The pre- and post-tests are evaluated regarding their relevance. To identify the appropriate studies, a search in healthcare databases was initiated using the following keywords: “cognitive training” or “cognitive stimulation” or “cognitive training platforms” or “CogniFit” and all terms are searched in the fields Title, Abstract and Keywords. The healthcare databases PubMed, Scopus, Web of Science and Springer were searched.

Results

We identified 29 articles that met the above-mentioned keywords criteria. Three of the studies were selected for inclusion in this review. These studies presented RCTs with healthy older adults with no diagnosis of dementia or MCI (Bellotti, 2014; Peretz et al., 2011; Stern et al., 2013). They included pre- and post-intervention tests of cognitive status and provided sufficient statistical data for the effect assessment of computerized cognitive training platform CogniFit. Over 26 studies were excluded because they focused on participants with multiple sclerosis, intellectual or developmental disabilities as well as older adults with insomnia (Haimov & Shatil, 2013; Siberski et al., 2015; Shatil et al., 2010; Cimermanová & Ram, 2013).

Design of the studies

All studies were randomized-controlled studies as per the inclusion criteria of the present paper. Two of the studies had one control group that used classic computer games or games that are especially designed for the study but have no cognitive training purpose (Bellotti, 2014, Peretz et al., 2011). One study included 4 groups – the first group was engaged in cognitive training, the second in mild aerobic training, the third in the combination of both and the fourth was not involved in any training but the patients included in it were engaged in book-reading activities (Stern et al., 2013).

Patient recruitment

The participants were healthy volunteers and some of them owned personal computers and the ability to use them. Individuals with corrected vision below 20/40 and impaired hearing as well as those with a history of clinical stroke or head trauma were excluded. Other exclusion criteria were alcohol dependence, any neurological diseases as well as the use of drug that could influence cognitive functions.

Test for baseline evaluations

Several neuropsychological tests were used for the evaluation of patients’ performance before and after the training. Three of the studies used Mini-Mental Status Exam (MMSE) for the exclusion criteria. The
test consists of 11 questions with a total score of 30 points. Results close to 0 indicate a significant cognitive deficit and those close to 30 - the absence of dementia or cognitive impairments (Folstein et al., 1975). Two other tests, Trail Making Test (TMT) and Digit Span (DS), respectively, are used to measure executive functions such as complex visual-motor conceptual screening and test the working memory (Bellotti, 2014).

In addition to the above mentioned neuropsychological tests, the Schedule for the Evaluation of Individual Quality of Life (SEIQoL) was also used, which allows people to assess their quality of life by identifying the priority domains of life and also measure their satisfaction from each of them (O’Boye et al., 1993).

In order to evaluate the overall level of intelligence of the participants, the TONI-3 - Test of Non-Verbal Intelligence was used. This test is suitable for children over 6 years of age to adults 89 years and 11 months old and is a tool that assesses the cognitive function, capacity and abstract thinking of people with serious language problems. The test is well suited not only for English speakers but also for people who do not understand spoken or written English, either for cultural reasons or due to a trauma, a disease, or a disability (Brown, 2003).

An important part of the implementation of the CogniFit platform for cognitive training is the neurocognitive evaluation that is done before and after the intervention with the CogniFit Neuropsychological Evaluation. It consists of 15 tasks measuring multiple cognitive functions such as working memory, divided attention, planning and hand-eye coordination. The difficulty of the cognitive tasks involved in the cognitive training is adapted in accordance with the results from this assessment.

Duration of interventions
The training sessions lasted from eight weeks to 16 weeks, 3 times weekly, 20-30 min each session.

Efficacy
To evaluate the effect of the platform for cognitive training, mixed-effects models are used and Cohen’s $d$ is calculated for the effect size between the two compared groups and within each group.

In the study of Peretz et al. (2013) the cognitive training group was compared with the control group that was engaged in playing classic computer games in order to evaluate eight cognitive domains: Focused attention, Sustained attention, Memory recognition, Memory recall, Visuospatial learning, Visuospatial working memory, Executive functions, Mental flexibility. The overall cognitive effect was presented in both groups. The within-group comparison shows that while in the group of cognitive training, an effect was observed in each of the 8 domains. The effect in the control group was only in 4 cognitive domains - Focused attention, Sustained attention, Memory recognition and Mental flexibility. Regarding the within-group differences, a borderline significance was found in the overall cognitive score. There was a highly significant improvement in the cognitive training group as compared to the control group in 3 domains: visual-spatial working memory, visual-spatial learning and focused attention. The effect was not significant in the 5 remaining domain, although the trend was in the same direction (Peretz et al., 2011).

The study of Bellotti (Bellotti, 2014) also showed improvement of working memory and executive function tasks for cognitive training group compared to the control group which completed a TV-based program of personally benefiting activities. A positive effect is also reported in the within-group comparison. The cognitive training group showed significant improvement on both the Digit Span Test and the Trail Making Test. Cohen’s $d$ calculated for those abilities fell in the small to medium range -0, 40 to 0, 58.

Cohen’s $d$ is used when interpreting the effect of an intervention. Cohen’s $d$ is the difference between the average scores on pre- and posttests firstly for the cognitive training group and then for the control group. Scoring was small or weak at $d = 0.20$, medium at $d = 0.5$ and large $d = 0.8$ (Cohen, 1977).

In the study (Stern et al., 2013) there were 4 groups of participants. The effect of the training platform CogniFit was evaluated using The General Linear Model for Repeated Measures (SPSS v.18). In both groups, for cognitive training, and for cognitive training and physical exercises, a significant improvement in several verbal and nonverbal cognitive skills was reported: Hand-Eye Coordination, GVM (working memory and long-term memory), Speed of Information Processing, Visual Scanning, and Naming. Cohen’s-, calculated for these improvements revealed medium-size ($d=0.6$ or $0.7$) or large-
size effects (d=0.8). In the cognitive training group significant improvements were found at the end of the study in terms of Divided Attention, Avoiding Distractions, Hand-eye Co-ordination, Naming, Speed of Visual-Spatial Information Processing, Visual Scanning, and Global Visual Memory.

**Conclusion**

Computer-based platforms may provide objective data on patients’ performance during the training. The studies included in this paper provide information and evidence that regular mental stimulation could result in improved cognitive ability. We suggest that relatively small improvements are due to duration of the study. But none of them reported if the acquired skills are sustainable and how long this effect lasts. Personalized and dynamically adapted cognitive training regarding individual capacity indicates a positive effect compared to computer games where the effect is haphazard, not so good or missing. In addition, combining cognitive training with physical activities would significantly increase the cognitive benefits compared to cognitive training and physical training separately.

NATURAL SCIENCES AND ICT
Abstract: Business applications are difficult to use for the average user. An adaptive user interface improves employees' productivity and is presented as a solution to this problem. However, developing user interfaces that are adapted to the needs and culture of the enterprise is time-consuming and expensive. We developed a software prototype for generating adaptive user interfaces that makes this process less time-consuming and more efficient. We propose an extension to the Cameleon Reference Framework project by Information Society Technologies, on the implementation level by adding an additional step for defining the Area of Business Operations. That way the prototype can extract business tasks for the selected industry therefore, presenting to the developer a more intelligent selection of predefined tasks. In this article, we also present a programming approach for transforming a task model, as defined by the ConcurTaskTrees notation, into an abstract user interface.

Keywords: adaptive user interfaces, ConcurTaskTrees notation, abstract user interface, usability

Introduction

An adaptive user interface is defined as a user interface that is aware of the context of use and is capable of (automatic) changes according to the context (W3C Incubator Group, 2010). The context of use consists of the users, their tasks, the equipment (hardware, software, materials), as well as the physical and social environment in which the product is used according to ISO/IEC 25063:2014. One of the approaches for building adaptive user interfaces is model-based user interface development (Criado et al., 2010; Taktak et al., 2016; Akiki et al., 2016). In this approach models of high abstract level are defined which helps designers specify and analyze interactive software applications from a semantic point of view rather than focusing on the implementation. The aim is to increase the level of abstraction in a way that different adaptations could be easily applied on the different abstraction levels. The final goal is to produce a user interface that is capable of automatic change according to user skills, abilities, needs and environment (Pavlov, 2014; Pavlov et al., 2016).

The Cameleon Reference Framework (CRF), developed in a project by Information Society Technologies, defines four levels of abstraction in the UI development cycle (Calvary et al., 2003): Task and Domain, Abstract User Interface, the Concrete User Interface, and the Final User Interface. The final report from the W3C Incubator Group concerning this project is to start standardization in the area of Model-Based User Interfaces with the following work items: Unified Reference Framework for MBUI - A W3C recommendation that will formalize the CRF; Task, AUI and CUI meta-models’ recommendations and other (W3C Incubator Group, 2010).

The first level in the development life cycle in the CRF is Tasks and Domain. In this step the logical activities that the users should perform to achieve their goals are defined. The next level is Abstract User Interface which is a formal platform-independent description of a user interface without details of the visual layout or behavior of the system (Constantine, 2003). The next level - Concrete User Interface is platform-dependent expression of the UI and defines more concretely what visual components should be used. The Final User Interfaces consists of the source code and it can be interpreted or compiled. CRF is used as a base for developing model-driven interactive systems (Blumendorf et al., 2006; Wu and Hua, 2013; Akiki et al., 2016).

We have developed a software prototype for generating adaptive user interfaces extending the Cameleon Reference Framework’s four levels of UI development cycle. As the prototype is designed for building user interfaces for business information systems, we propose a modification to the CRF on the implementation level by adding an additional step for defining functional areas of operations (Figure 1). That way the prototype can extract business tasks for the selected industry, therefore presenting to the developer a more intelligent selection of predefined tasks. The UI

2 Faculty of Mathematics and Informatics, University of Plovdiv Paisii Hilendarski, Bulgaria; malinova@uni-plovdiv.bg
developers/designers can make a technology selection for the generated Final User Interface when they create their initial project.

Figure 1: Our extension of the four abstraction levels defined by the CRF

In this article, we also describe how we implemented the transformation of the Task model into an Abstract User Interface. We developed a modern programming approach for that purpose.

**Functional Areas of Operations**

From a functional perspective, there are four types of information systems: Sales and Marketing, Manufacturing and Production, Finance and Accounting, Human Resources (Laudon and Laudon, 2015). Therefore, we implemented the selection of functional areas and business functions as a first step of the UI development process. We also developed the functionality of adding and deleting functional areas. We give the UI designers detailed descriptions for every business function as well as the ability to select more than one functional area. That way we enable them to easily build user interfaces for multifunctional information systems as CRM\(^3\), ERP\(^4\) and SCM\(^5\).

**ConcurTaskTrees Notation**

In our software prototype, we have implemented sample task models using the CTT notation (Paternò, 2003; W3C, 2012) for different business tasks so that we ease and speed up the process of creating user interfaces for business applications. All these predefined tasks are stored in a library for quick access and reuse. The predefined tasks are limited on the second step by analyzing the selected functional areas from the user. We have also implemented the functionality of creating new tasks and saving them in a personal library for reuse.

This notation is specifically built for the aims of a model-based user interface development approach. Therefore, we chose it for base task notation in the task modeling step. ConcurTaskTrees notation focuses on the actions, has a hierarchical structure, has graphical syntax, which helps when describing different types of tasks and operators between them, supports object attributes and supports Task allocation. There are four task types in CTT: User Task, System Task, Interaction Task, and Abstract Task. CTT defines around 10 types of operators between tasks of the same hierarchical level.

**Building ConcurTaskTrees Editor**

Dealing with abstract user interfaces and task tree models requires an editor created to aim at maximum adaptability. Designers developing multiplatform adaptable user interfaces should be capable of doing it via a wider range of devices and operating systems (Rahnev and Stoeva, 2010) hence selecting a technology stack suitable for the Web seemed most reasonable. We built our own CTT editor as part of the software prototype, described in this paper, instead of using the CTT environment (Mori et al., 2002) because of several reasons: we wanted the task editor to have build-in

---

3 CRM – Customer relationship management systems
4 ERP – Enterprise resource planning systems
5 SCM – Supply chain management systems
functionality in our prototype so that the UI developers do not need to install different products in order to create a user interface; the task modelling step needed to be connected to the first step (the selection of functional areas).

To use an open-source approach, we built the CTT editor described in this article using PHP, MySQL, JavaScript, HTML and CSS, and GoJS (Northwoods Software, 2017). The GoJS library is used for implementing the interactive diagrams for three of the five steps of the development cycle – Task Model, Abstract UI and Concrete UI. The engine for creating diagrams was chosen after a detailed research of several other libraries (e.g. GraphStream, Treant.js, Dracula Graph) that are used mainly for drawing graphs. GoJS works with specific JSON format, while the CTT environment generates different XML. If we were using this environment separately, instead of our own task editor, the UI developers should install this environment, build their own tasks, upload the generated XML into our system, then generate the rest of the UI model. If there were changes needed in the task model, they should have made them in the CTT environment and go again through all the steps that follow. With the CTT editor created in our web-based prototype, we save the users’ time as they can traverse through all steps immediately with the only need to click the “Save” button to apply their changes in the models.

In the development process of the CTT editor several challenges arose: unclear and incomplete documentation of the graphing libraries; lack of examples; lack of opportunity to describe different node types and different types of the relations between them, which is a must-have feature for the selected notation as there are different types of tasks and links between them (Figure 2); none of the researched JavaScript libraries provided ready-to-use examples of hierarchical representation of graphs that have different types of connections between elements of the same level (siblings).

![Figure 2: Simplified CTT notation model – different task types and relations between them.](image)

In Figure 2 a simplified CTT notation model is presented – this is what we need to build the task model data structure. The different node shapes represent different task types. The links between them have different symbols. This indicates the diversity of relations that two tasks can have. The structure should be a directed graph.

For our CTT editor we selected the GoJS library, which has several advantages: many different data structures can be described, multiple different relations between nodes can be described. It also renders HTML5 Canvas element or SVG without any server-side requirements. It is very convenient for building an integrated development environment as it has many advanced features for user interactivity such as drag-and-drop, copy-and-paste, in-place text editing, tooltips, context menus, templates, data binding and many other.

The development of the CTT editor went through several iterations of feature enrichment. First, we built a basic diagram with a tree structure. Then we added a toolbar with different types of tasks and relations. Functionality of adding and deleting tasks, children of the root element was created. We also created a graphical representation of different tasks: different icons according to task types plus labels under the tasks. Next we implemented the capability of renaming the task label as well as button “Save” to save the data structure in the database in JSON format with the task types and labels. Afterwards, we added the functionality of linking two sibling tasks with different types of relations (operators). In order to maintain horizontal structure between linked sibling tasks we defined a second layout for the linked siblings with a Horizontal link template. They ought to be in a horizontal line, not in vertical as placed by default by the graphs engine. Last, we implemented two-way data binding.
mechanism so that when the user makes edits on the JSON model and clicks the “Load” button, the changes are applied to the graph in the canvas and vice versa.

A result was achieved through which structures of tasks according to the CTT notation (Figure 3) can be successfully described, including: adding different types of tasks, using different icons and labels; the option of editing labels; connecting subtasks with different types of operators (links).

Figure 3: End result - CTT modeling editor. Example task model of Create Organisation task.

One of the main difficulties during this module creation was linking tasks, while their hierarchical structure remains untouched. In other words, creating a representation of a multigraph where multiple edges are two or more edges that connect the same two vertices. A loop is an edge (directed or undirected) that connects a vertex to itself; it may be permitted or not, according to the application. In this context, an edge with two different ends is called a link. Two sibling nodes may have a directed link but this does not make the former node a parent of the latter. To achieve this, a new horizontal layout template had to be defined. This template was applied only to those elements that have relation to the same hierarchical level. In GoJS isLayoutPositioned ignores the diagram layout direction, which by implementation is vertical, representing a tree view. After that a TemplateMap object should be defined. This object is used to store templates from different object types – groups, links or node. In our case, we use two templates – the default one which supports vertical layout and horizontal.

In GoJS, there is a function model.toJson(), which transforms the model drawn in the HTML5 canvas into a JSON data structure. There is also a reversed function model.fromJson which takes the JSON and applies it to the model. An important detail here is that in order to keep the changes in the tasks names in the JSON file and vice versa, we added a two-way communication binding.

Transforming Task Model into an Abstract User Interface

In this section, we propose a programming approach for the process of automatic transformation of the task model into an abstract user interface model.

To build the structure of the abstract user interface, the topology of the tasks tree should be analyzed (Molina et al., 2012). First, every task that is a leaf is identified. These are the tasks that do not have any children. They will be the basic elements in the abstract user interface. Then we go up to the next level of the tree structure, which appears to be the container elements. They hold the basic elements. Then we go up in the tree structure using a recursive function and we define the other containers until we reach the root element which appears to be the main container.

Depending on the task type (abstract, interactive, system or user) and node type (parent or leaf), the task can be transformed into different abstract interactive objects (Montero and López-Jaquero, 2006). If the node is a parent it is always transformed into an Abstract Container. The only exception to the rule is if the task is a User type, because there is no abstract representation as this is a cognitive action.
performed by the user. The Abstract task type is always transformed into an Abstract Container as this task needs to be decomposed into simpler ones. If the Interactive task type is a leaf in the task tree structure, then it might be one of the four Abstract Interactive Objects - input, output, control or navigation. This choice is made by the user as this cannot be automatically selected. When the System task type is a leaf, it may be transformed into an output or navigation as this is a task performed by the software system. The result from the transformation of the task tree presented in Figure 3 is shown in Figure 4.

Figure 4: Generated Abstract User Interface of the Login task.

Our process of automatic transformation of the task model into an abstract user interface model follows these steps:

- Fetch the CTT model in a tree structure.
- Convert the CTT tree structure recursively into a list structure.
- Iterate the list structure node by node to extract data needed for the AUI model.
- Populate the missing data with the user’s provided input. Through the IDE the user has to select the type of the facets which cannot be explicitly determined by the transformation rules.
- Store all data in a list structure.
- Convert the final list structure to a format needed for rendering the AUI (JSON in the described case).

**Conclusion**

The creation of adaptive user interfaces benefits a lot from the model-based user interface development approach. That way the designers can focus more on the user tasks rather than the implementation. On the other side users are able to be part of the whole process as no code development is required when a proper development environment is used. Furthermore, designers can specify different adaptations for the different levels of abstraction. This paper details a programming algorithm for transforming the task model into an abstract user interface. This is part of a larger system that helps designers create context-aware user interfaces using a model-driven development approach. An evaluation study has to be conducted to evaluate the usability of the system and the development time of the final user interface. Future work includes adding a prior step of selecting a technology for building the final user interface so that the user is not only limited to HTML and CSS.

AN INVESTIGATION OF BRUCELLOSIS KNOWLEDGE, ATTITUDE AND PRACTICE AMONG LIVESTOCK OWNERS IN THE WEST BANK

Elena Awwad,1 Osama Awwad,2 Mohammad Farraj,3 Tamer Essawi,4 Kamel Adwan,5 Assad Manasra,6 Stelian Baraitareanu,7 Maria Rodica Gurau,8 Doina Danes9

Abstract: Brucellosis is endemic in Palestine and therefore since 1998 a national program of brucellosis control has been launched. In the traditional breeding area of small ruminants, brucellosis is often reported in humans, mainly as a food borne disease. Any control strategy requires a well-functioning surveillance system, the co-operation with owners and a sustainable financial support. The aim of this study is sizing up of the current situation of knowledge, of the attitude and practice (KAP) regarding brucellosis, among sheep and goat farmers. A cross-sectional survey was conducted in 118 participants through an anonymous questionnaire to assess to which extent the flock owners are familiar with the knowledge and practices related to brucellosis of small ruminants. The designs of the questionnaire consider the implementation of KAP. Results shown that farmers, independent on their education, heard about brucellosis (100%) and all of them consider the washing of hands as necessary after close contact with animals or their products, and animal vaccination as being necessary to prevent brucellosis. Despite the educational level, almost all owners are aware about the risk of exposure of their family to animals infected with Brucella: they are considering the heating of cheese at boiling point and the use of gloves, as appropriate practices to reduce the exposure to Brucella. Great majorities of the participants (89.8%) have good knowledge about the transmission of Brucella from animals to humans, but only 37.3% correctly answered about the transmission of brucellosis by drinking raw milk, eating unpasteurized cheese, eating raw meat, liver, spleen and kidney or by contact with an aborted foetus and placenta fluid. Referring to the brucellosis’ prevention, 83% answered that boiling of milk and cheese and wearing of gloves when handling an aborted foetus could prevent it: these answers fit with the level of knowledge. From the questioned owners, 28.8% knew that boiling the milk affect his nutritive value; 84.7% think that owners of animals and their families are more exposed to brucellosis and 11.9% of their families have been diseased. Relative good general knowledge of owners about brucellosis was recorded, but high-risk behaviors still exist. Awareness campaigns on the control and prevention of the brucellosis are success stories, and government agencies should continue the public education.

UDC Classification: 614.9; DOI: http://dx.doi.org/10.12955/cbup.v5.1068

Introduction

Globally, brucellosis is still an important issue of the public health authorities (Doganay & Aygen, 2003; Gul & Khan, 2007). In the traditional breeding area of small ruminants, brucellosis is often reported in humans, mainly as a food borne disease - by ingestion of raw dairy products, or as an occupational disease - by exposure to infected livestock (Sanco, 2001; Doganay & Aygen, 2003; Zvizdic et al, 2006; Kaoud et al, 2010; Saleem et al, 2010). This infection is also associate with high economic losses, as a result of abortions, weak offspring, reduced milk production and the commercial banning of the products (WHO, 1998; FAO, 2010). Many countries are carrying on programs of brucellosis eradication, but they have not yet fully succeeded. Any control strategy requires a well-functioning surveillance system, the co-operation with owners and sustainable financial support (Refai, 2002; FAO, 2010). The brucellosis control program must consider public health education as an essential activity performed within this framework, among all the concerned population, and underlining the key factors in the disease spreading (WHO, 2009; FAO, 2010).

Public health education is a difficult and extremely complex task, which includes culture, beliefs, traditions, educational level, social status, occupation, and age. Therefore, health education programs should be firstly aimed at physicians, veterinarians and farmers. These groups should be directed not

only at specific measures, but should also emphasize the responsibility of their own and community safety by defining their own problems, to understand what can be done to deal with it using their own resources and external support and to decide appropriate resolutions. Secondly, the whole community should be involved through health education in schools, in the workplace and in all the population (WHO, 2009).

The aim of this study is sizing up of the current situation of knowledge, of the attitude and practice (KAP) regarding brucellosis, among sheep and goat farmers, after 15 years of implementation of this project. This study showed relative good general knowledge of owners about brucellosis, but they still have high-risk behavior. It is therefore recommended that government agencies pay more attention to public education, by creating awareness campaigns on the control and prevention of brucellosis, as one of the most important steps in the eradication of brucellosis.

Material and Methods

Area of study and population

West Bank is the part of Palestine with a population of 2754722. The terrain is mostly rugged dissected upland, some vegetation in the west, but somewhat barren in the east. There are few natural resources in the area except the highly arable land, which comprises 27% of the land area of the region. It is mostly used as permanent pastures (32% of arable land) and seasonal agricultural uses (40%) (CIA, 2014). The value of the agricultural sector is about 60% of the plant and 40% of the livestock production. (MOA, 2013). The study was performed in seven districts of the West Bank territory (Palestine): Jenin, Tubas, Nablus, Jerusalem, Bethlehem, Hebron and Dura. These districts have been selected considering the high density of humans, animal and of familial farming of sheep and goats. The query was done only on livestock owners, which not only consume, but also sell their dairy production. The livestock sector is dominated by small ruminants: 732,399 sheep and 240,136 goats. There are also 39,625 cattle, 1,506 camels and 3,603 horses. In poultry farms, there are 36.5 million layers and 1.6 million broilers. The number of traditional and modern beehives is 44,278 and the total quantity of fish is 1,318 tons. A quarter of livestock owners (25.3 %) is basing their livelihood on agriculture (MOA, 2011; MOA, 2013; EU, 2013).

Study design

We carried out an anonymous questionnaire survey to assess to which extent the flock owners were familiar with the knowledge and practices related to brucellosis of small ruminants. The designs of the questionnaire consider the implementation of KAP (WHO, 2009). The questionnaire was submitted to 118 flock owners.

Ethic consideration

All participants have been informed about the purpose and methods of the study. Owners agreed to participate voluntarily and anonymously.

Statistical analyses

The provided data were analyzed with the software SPSS (version 20, IBM, Chicago, IL, USA), by descriptive statistic, ordinal and binary logistic regression models and correlation between groups. To determine the relationship between associations two or more variables was used with a chi-square test with p value of 0.05 considered as the level of significance. Using the binary version of each category (of knowledge) as a response, a logistic regression models was fitted to investigate potential predictions and associations between the level of knowledge about brucellosis, the practice of drinking dairy products, boiling of cheese and other important predictor variables. The correct answer was considered as code: “0”, don’t know: “1”, and not correct was coded: “2”. Multivariate logistic regression analyses were performed separately to determine the predictors of knowledge, and the adoption of management practices at a farm level. Also, an ANOVA was used as a homogeneity test (significance more than 5%) which showed that present equal deviation between variables and significance less than 5% in its mean and present differences between the types of variables.

Results and Discussion

The Table 1 presents the socio-cultural pattern of respondents: the most prevalent profile is “male, from rural area, medium education level”.

The respondents have been answered to basic questions, related to their knowledge concerning: diseases transmitted from animals to humans, minimal personal hygiene rules, the risks of the processing or of the ingesting of animal products (Table 2).

Our study shows that farmers, independent on their education, heard about brucellosis (100%). All respondents consider the washing of hands as necessary after closed contact with animals or their products. They are considering animal vaccination as being also necessary to prevent brucellosis. Other aspects of the KAP study had a significant difference of level of education and knowledge (Table 2).

The next questions targeted the “beliefs” of respondents in terms of their insight about: occupational exposure, cooking practices, the personal hygiene, the vaccination and the specific knowledge, on brucellosis (Table 3).

Despite the educational level, almost all owners are aware about the risk of exposure of their family to animals infected with Brucella: they are considering the heating of cheese at boiling point and the use of gloves, as appropriate practices to reduce the exposure to Brucella.

Even if the questions previously assessed proved a satisfactory level of knowledge and an appropriate attitude toward brucellosis, the practices are far to be in accordance.

The great majorities of the participants (89.8%) have good knowledge about the transmission of Brucella from animals to humans, but only 37.3% correctly answered about the transmission of brucellosis by drinking raw milk, eating unpasteurized cheese, eating raw meat, liver, spleen, and kidney or by contact with aborted foetuses and placenta fluid. Referring to the brucellosis’ prevention, 83% answered that boiling of milk and cheese and wearing of gloves when handling aborted foetuses could prevent it; these answers fit with the level of knowledge, as revealed in table 2. From the questioned owners, 28.8% knew that boiling the milk affects its nutritive value; 84.7% think that owners of animals and their families are more exposed to brucellosis (Table 3), and 11.9% of their families have been diseased (Table 4).

Source: Authors

*Brucella* accidentally infects humans. The pathogen infects directly or is mediated, either through injured/broken skin, a mucous membrane or by ingestion of contaminated products, mainly fresh milk products. The greatest risk of infection is through direct contact with aborted animals, during lambing or the kidding period. Products such as unpasteurized milk and homemade cheese are the main source of infection for people who do not have direct contact with animals. Brucellosis is primarily an occupational risk in exposed professions, veterinarians, farmers, laboratory technicians, abattoir workers, and others who work with animals and their products. People living near infected premises may also be infected (Sanco, 2001; Corbel, 2006; Rumosa Gwaze et al., 2009; Smits, 2012). Therefore, the knowledge of livestock owners regarding brucellosis play an important role in the taking of preventive measures that could stop or reduce the spreading of the disease. The level of knowledge could be monitored through the KAP survey, as a quantitative method, with questions formatted in standardized questionnaires that provides access to information. KAP surveys reveal misconception, which represent obstacles to the activities and can raise potential barriers to behavior change (WHO, 2009; USAID, 2011; Macias & Glasauer, 2014).

Knowledge is the information of which a person, group of people, organization or other entity becomes aware of something and improves his attitude and practice through learning, education or by experience, perception or reflection. Attitude is the mental state about an issue or subject and is manifested through the practice or behavior of a person or organization. Practice generally depends on knowledge, economic stability and the socio-economic condition of farmers. The poor knowledge about brucellosis and the natives’ population is interfering in Brucellosis’ control and its spread (WHO, 2009; Addo et al., 2011; USAID, 2011; Khan et al., 2013). In Palestine, since 1998 the Ministry of Agriculture in cooperation with the UNDP/PAPP organization started the implementation of the Brucellosis Control Program, financially supported by Argentina, Japan and Spain, and technically by the WHO, FAO and OIE organizations.
This study revealed that only 46.6% participants have information about brucellosis, more than half (53.4% participants) consume raw milk and 89% of respondents consider the use of gloves while dealing with animals (Ramlawi, 2000). This project improved the control strategy, proposing the mass vaccination of small ruminants and all other activities, including the awareness campaigns about brucellosis among all population. Since 1999 the Brucellosis Control Program has been implemented at a national level (UNDP, 2010). In our study, the status of knowledge, attitude and practices was assessed through discussion with farmers and gave us a general picture for the 15 years of the brucellosis control: the implementation of Brucellosis Control Program generated many achievements, including the change of farmers’ mentality. Before starting Brucellosis Control Program less than 50% of owners heard about brucellosis as being a dangerous infectious disease, but in the current study all of them are aware (100%). Most of the participants (87.3%) have been interested and requested more information about education in public health. The interest manifested toward knowledge by the respondents is a promising factor for early improvement of practices of animal husbandry and milk processing; this general interest acts as a factor for reducing exposure, not only to *Brucella* spp, but also to other zoonotic pathogens.

The current study found that the level of education was an important predictor and was positively associated with the adoption of preventive practices: this correlation was observed in many KAPs surveys (Xiang et al., 2010; Holt et al., 2011; Khan et al., 2013; Lindahl et al., 2015). This study can help to develop appropriate policies of preventive measures by improving the knowledge and practice of farmers in sanitation, hygiene and waste management.

**Conclusion**

This study showed relative good general knowledge of owners about brucellosis, but they still perform high-risk behavior. It is therefore recommended that government agencies pay more attention to public education, by creating awareness campaigns on the control and prevention of brucellosis, as one of the most important steps in the eradication of brucellosis.

A NOTE ON SOME THEOREMS OF R. DATKO
Cristina Andreea Băbăiță¹, Raluca Mureșan², Petre Preda³

Abstract:
The asymptotic behavior of the evolution families is a widely interesting topic in mathematics over time. In 1930, O. Perron was the first one who established the connection between the asymptotic behavior of the solution of the homogeneous differential equation and the associated non-homogeneous equation, in finite dimensional spaces. Further, the result was extended for infinite dimensional spaces. The case of dynamical systems described by evolution processes was studied by C. Chicone and Y. Latushkin. One of the most remarkable results in the theory of stability of dynamical systems has been obtained by R. Datko in 1970 for the particular case of \( C_0 \)-semigroups. Practically, R. Datko defines a characterization for uniform exponential stability of the \( C_0 \)-semigroups. Later, it was proved that a similar characterization is also valid for two-parameter evolution families.

In this paper, we obtain different versions of a well-known theorem of R. Datko for uniform and nonuniform exponential bounded evolution families. More precisely, we obtain theorems that characterize the nonuniform and uniform exponential stability of evolution families with uniform and nonuniform exponential growth. We show that, if we choose \( K \) dependent of \( t_0 \) in the form of Datko’s theorem used by C. Stoica and M. Megan, we obtain a result of nonuniform exponential stability, which is no longer possible in the original form of Datko’s theorem.

In conclusion, we generalize the results initially obtained by Datko (1972) and Preda and Megan (1985), by presenting some sufficient conditions for the nonuniform exponential stability of evolution families with nonuniform exponential growth.

UDC Classification: 517.9; DOI: http://dx.doi.org/10.12955/cbup.v5.1069

Keywords: Evolution family, Nonuniform exponential stability, Datko method

Introduction
In the present paper we study the asymptotic behavior of evolution families. As a starting point for a vast amount of literature concerning this subject, we mention the pioneering work of O. Perron (Perron, 1930), who was the first who establish the connection between the asymptotic behavior of the solution of the differential equation
\[
(A) \quad \dot{x}(t) = A(t)x(t)
\]
and the associated non-homogeneous equation
\[
(A,f) \quad \dot{x}(t) = A(t)x(t) + f(t)
\]
in finite dimensional spaces, where \( A \) is a \( n \times n \) dimensional, continuous and bounded matrix and \( f \) is a continuous and bounded function on \( \mathbb{R}_+ \). This idea was later developed by W. A. Coppel (Coppel, 1978) and P. Hartman (Hartman, 1964) for differential systems in finite dimensional spaces.

In (Massera & Schäffer, 1958) and (Massera & Schäffer, 1966), J. L. Massera and J. J. Schäffer study the same problem as O. Perron for differential systems in infinite dimensional spaces and prove that if the pairs \((L^1, L^\infty)\) and \((L^p, L^\infty), p > 1\), are admissible to \((A)\), then it is a uniform exponential dichotomic differential system.

Further developments for differential systems in infinite dimensional spaces can be found in the monograph of J. L. Daleckij and M. G. Krein (Daleckij & Krein, 1974). The case of dynamical systems described by evolution processes was studied by C. Chicone, Y. Latushkin (Chicone & Latushkin, 1999).

One of the most remarkable results in the theory of stability of dynamical systems has been obtained by Datko (Datko, 1970) in 1970 for the particular case of $C_0$-semigroups. Thus in (Datko, 1970) it was established that all the trajectories $T(\cdot \cdot) \cdot x$ of a $C_0$-semigroup $\{T(t)\}_{t \geq 0}$ have an exponential decay as $t \to \infty$ (i.e. $\{T(t)\}_{t \geq 0}$ is uniformly exponentially stable) if and only if, for all vectors $x \in X$, the function $t \to \|T(t)x\|$ lies in $L^2(\mathbb{R}_+)$, and later, A. Pazy shows in (Pazy, 1972) and (Pazy, 1983) that the result remains valid if we replace $L^2(\mathbb{R}_+)$ with $L^p(\mathbb{R}_+)$, where $p \in [1, \infty)$.

In 1972, R. Datko extends (in Datko, 1972) the above result for two-parameter evolution families stating that an evolution family $\{\Phi(t, t_0)\}_{t \geq t_0 \geq 0}$ (with uniform exponential growth) is uniformly exponentially stable (i.e. there exist $N, \nu > 0$ such that $\|\Phi(t, t_0)\| \leq Ne^{-\nu(t-t_0)}$, for all $t \geq t_0 \geq 0$) if and only if there exists $p \in (0, \infty)$ such that $\sup_{t \geq 0} \int_0^t \|\Phi(\tau, t)\|^{p} d\tau < \infty$, for all $x \in X$. It is worth noting that the above Datko's theorem already appears in (Daleckij & Krein, 1974) for the special case of differential systems.

A similar characterization for uniform exponential stability of evolution families was obtained by S. Rolewicz in 1986, in (Rolewicz, 1986). More precisely, the author proved that if, for a continuous non-decreasing mapping $F : \mathbb{R}_+ \to \mathbb{R}_+$, with the properties $F(0) = 0$ and $F(t) > 0$ for all $t > 0$, and for an evolution family $\{\Phi(t, t_0)\}_{t \geq t_0 \geq 0}$ on a Banach space $X$, with exponential growth, the following relation holds $\sup_{t \geq 0} \int_0^t F(\|\Phi(\tau, t)\|) d\tau < \infty$, for all $x \in X$, then the evolution family is uniformly exponentially stable.

Datko's result was extended to dichotomies by Preda and Megan (Preda & Megan, 1985) in 1985. We also mention the contributions of M. Megan, A. L. Sasu and B. Sasu, who in (Megan & Sasu, 2002) and (Megan & Sasu, 2003) obtained generalizations of some results of Datko, Rolewicz and van Neerven. Other generalizations of Datko’s theorem for asymptotic stability of evolution families were obtained by C. Buşe in (Buşe, 1994) and (Buşe, 1997).

Generalizations of the above Datko’s theorem for skew-evolution semiflows appear in (Stoica & Megan, 2010). Also, in this paper, Datko’s theorem is used in an equivalent form, i.e. an evolution family with uniform exponential growth is uniformly exponentially stable if and only if there exist $p \in (0, \infty)$ and $k > 0$ such that $\int_0^\infty \|\Phi(\tau, t)\|^{p} d\tau < k \|x\|$, for all $t \geq 0$ and $x \in X$.

In 2010, L. Barreira and C. Valls introduced in (Barreira & Valls, 2010) some appropriate adapted norms (which can be seen as Lyapunov norms), to show an equivalence between the admissibility of their associated $L^p$ spaces ($p \in [1, \infty]$) and the nonuniform exponential stability of certain evolution families. The result is extended by the same authors in 2011 (Barreira & Valls, 2011) to the case of nonuniform exponential dichotomy where they also establish a collection of admissible Banach spaces for any given nonuniform exponential contraction.

The aim of our paper is to obtain theorems that characterize the uniform and nonuniform exponential stability of evolution families with nonuniform and uniform exponential growth using the Lyapunov norms introduced by L. Barreira and C. Valls in (Barreira & Valls, 2010) and Datko’s method. We show that, if we choose $K$ dependent of $t_0$ in the form of Datko’s theorem used by C. Stoica and M. Megan in (Stoica & Megan, 2010), we obtain a result of nonuniform exponential stability, which is no longer possible in the original form of Datko’s theorem.

Preliminaries

Let $X$ be a Banach space and $\mathbb{B}(X)$ the space of all linear and bounded operators acting on $X$. The norms on $X$ and on $\mathbb{B}(X)$ will be denoted by $\| \cdot \|$.

**Definition 1:** An evolution family $\{\Phi(t, t_0)\}_{t \geq t_0}$ on $\mathbb{R}_+$ is a family of operators $\Phi(t, t_0) \in \mathbb{B}(X)$, $t \geq t_0 \geq 0$, satisfying:

(i) $\Phi(t, t) = I$, for all $t \in \mathbb{R}_+$, where $I$ denotes the identity on $X$;

(ii) $\Phi(t, s)\Phi(s, t_0) = \Phi(t, t_0)$, for all $t \geq s \geq t_0 \geq 0$;

(iii) the map $\Phi(\cdot, t_0)x$ is continuous on $[t_0, \infty)$ for all $x \in X$ and $\Phi(t, \cdot) x$ is continuous on $[0, t]$ for all $x \in X$. 

1049
If there exist $M, \omega > 0$ such that
\[ ||\Phi(t, t_0)x|| \leq Me^{\omega(t-t_0)}||x||, \text{ for all } t \geq t_0 \geq 0 \text{ and } x \in X, \]
then it is said that the evolution family $\{\Phi(t, t_0)\}_{t \geq t_0}$ has uniform exponential growth.

If there exist $M : \mathbb{R}_+ \to \mathbb{R}_+$ and $\omega > 0$ such that
\[ ||\Phi(t, t_0)x|| \leq M(t_0)e^{\omega(t-t_0)}||x||, \text{ for all } t \geq t_0 \geq 0 \text{ and } x \in X, \]
then it is said that the evolution family $\{\Phi(t, t_0)\}_{t \geq t_0}$ has nonuniform exponential growth.

We denote $||x||_{t_0} = \sup_{t \geq t_0} e^{-\omega(t-t_0)}||\Phi(t, t_0)x||$. It is easy to see that $|| \cdot ||_{t_0}$ defines a norm on $X$, for all $t_0 \geq 0$, and
\[ ||x|| \leq ||x||_{t_0} \leq M(t_0)||x||, \text{ for all } t_0 \geq 0. \]

If $\{\Phi(t, t_0)\}_{t \geq t_0}$ has a uniform exponential growth, then $|| \cdot ||_{t_0}$ is uniformly equivalent (with respect to $t_0$) to the norm $|| \cdot ||$.

**Remark 1:** If $\{\Phi(t, t_0)\}_{t \geq t_0}$ has uniform exponential growth, then
\[ ||\Phi(t, t_0)x||_t \leq e^{\omega(t-t_0)}||x||_{t_0}, \text{ for all } t \geq t_0 \geq 0 \text{ and } x \in X. \]

Indeed we can see that for all $t \geq t_0 \geq 0$ we have that
\[ ||\Phi(t, t_0)x||_t = \sup_{t' \geq t} e^{-\omega(t-t')}||\Phi(t', t_0)x|| = \sup_{t' \geq t} e^{-\omega(t-t_0-t+t_0)}||\Phi(t', t_0)x|| = e^{\omega(t-t_0)} \sup_{t' \geq t} e^{-\omega(t_0-t')||\Phi(t', t_0)x||} \leq e^{\omega(t-t_0)}||x||_{t_0}, \text{ for all } x \in X. \]

We can also see that for all $t_0 \geq 0$ and $x \in X$ the function $[t_0, \infty) \ni s \mapsto ||\Phi(s, t_0)x||_s \in \mathbb{R}_+$ is lower semi-continuous, therefore it is measurable.

**Main results**

In what follows we will present some sufficient conditions for nonuniform exponential stability of evolution families with nonuniform exponential growth in terms of Datko’s theory, which was also highlighted by C. Stoica and M. Megan in (Stoica & Megan, 2010).

**Theorem 1:** Let $\Phi$ be an evolution family with nonuniform exponential growth. Then there exist $K : \mathbb{R}_+ \to \mathbb{R}_+, \ p > 0$ such that
\[ \left( \int_t^{\infty} ||\Phi(\tau, t_0)x||_\tau^p d\tau \right)^{1/p} \leq K(t_0)||\Phi(t, t_0)x||_t, \text{ for all } t \geq t_0 \text{ and } x \in X \]
if and only if there exist $N, \nu : \mathbb{R}_+ \to \mathbb{R}_+$ such that
\[ ||\Phi(t, t_0)x||_t \leq N(t_0)e^{-\nu(t-t_0)}||x||_{t_0}, \text{ for all } t \geq t_0 \geq 0. \]

**Proof.** Necessity. Let $x \in X, \ t \geq t_0 + 1$ and $\varphi : [t_0 + 1, \infty) \to \mathbb{R}_+, \ \varphi(t) = \int_{t_0}^{t} ||\Phi(\tau, t_0)x||_\tau^p d\tau$. It is obvious that
\[ \varphi(\tau) \leq -K^p(t_0)\varphi(\tau) \text{ for all } \tau \geq t_0 + 1. \]
Therefore, by integrating on the interval \([t_0 + 1, t]\) with respect to \(\tau\),
\[
\frac{1}{K^p(t_0)}(t - t_0 - 1) \leq \ln \frac{\varphi(t_0 + 1)}{\varphi(t)} \text{ for all } t \geq t_0 + 1.
\]

It follows that
\[
\varphi(t)e^{\frac{1}{K^p(t_0)}(t - t_0 - 1)} \leq \varphi(t_0 + 1) \leq -K^p(t_0)\varphi(t_0 + 1) = K^p(t_0)||x||^p_0.
\]

The last relation is equivalent to
\[
\int_{t_0}^{\infty} ||\Phi(\tau, t_0)||^p_0 d\tau \leq e^{-\frac{1}{K^p(t_0)}(t - t_0 - 1)}K^p(t_0)||x||^p_0, \text{ for all } t \geq t_0 + 1 \text{ and } x \in X. \tag{3}
\]

Let \(t \geq t_0 + 1, \tau \in [t - 1, t]\) and \(x \in X\).

We have that \(||\Phi(t, t_0)x||_t \leq e^{\alpha t}||\Phi(\tau, t_0)x||_t\). We integrate the last relation on \([t - 1, t]\) with respect to \(\tau\) and by (3) it follows that
\[
||\Phi(t, t_0)x||_t^p \leq e^{\alpha t} \int_{t_0}^{t} ||\Phi(\tau, t_0)x||^p_0 d\tau \leq e^{\alpha t} e^{-\frac{1}{K^p(t_0)}(t - t_0)}K^p(t_0)||x||^p_0.
\]

Therefore
\[
||\Phi(t, t_0)x||_t \leq e^{\alpha t}K(t_0)e^{\frac{1}{K^p(t_0)}(t - t_0)}e^{-\frac{1}{K^p(t_0)}(t - t_0)}||x||_0, \text{ for all } t \geq t_0 + 1 \text{ and } x \in X. \tag{4}
\]

Let \(t \in [t_0, t_0 + 1)\) and \(x \in X\). In this case
\[
||\Phi(t, t_0)x||_t \leq e^{\alpha t}e^{\frac{1}{K^p(t_0)}(t - t_0)}e^{-\frac{1}{K^p(t_0)}(t - t_0)}||x||_0 \leq e^{\alpha t} e^{\frac{1}{K^p(t_0)}(t - t_0)} e^{-\frac{1}{K^p(t_0)}(t - t_0)}||x||_0, \tag{5}
\]

We denote \(N(t_0) = e^{\alpha t_0}e^{\frac{1}{K^p(t_0)}} \max\{1, K(t_0)\}\) and \(v(t_0) = \frac{1}{pK^p(t_0)}\). By relations (4) and (5) we can conclude that
\[
||\Phi(t, t_0)x||_t \leq N(t_0)e^{-v(t_0)(t - t_0)}||x||_0, \text{ for all } t \geq t_0 \geq 0 \text{ and } x \in X.
\]

Sufficiency. Only some simple calculations are needed in order to draw the conclusion.

\[\square\]

Remark 2: The above result can be considered as the stronger version of the main result of the article (Stoica & Megan, 2010).

This is proved by the following corollary.

Corollary 1: Let \(\{\Phi(t, t_0)\}_{t \geq t_0}\) be an evolution family with uniform growth. If there exist \(K: \mathbb{R}_+ \rightarrow \mathbb{R}_+^*\) and \(p > 0\) such that
\[
\left( \int_0^\infty ||\Phi(\tau, t_0)x||^p d\tau \right)^{1/p} \leq K(t_0)||\Phi(t, t_0)x||, \text{ for all } t \geq t_0 \text{ and } x \in X,
\]
then there exist \(N, v: \mathbb{R}_+ \rightarrow \mathbb{R}_+^*\) such that
\[
||\Phi(t, t_0)x|| \leq N(t_0)e^{-v(t_0)(t - t_0)}||x||, \text{ for all } t \geq t_0 \text{ and } x \in X.
\]

\[\square\]

Proof. It follows from Theorem 1.
Remark 3: If $\sup_{t_0 \geq 0} K(t_0) = K < \infty$, for all $t_0 \geq 0$, in the corollary above, then, there exists $p > 0$ such that
\[
\left( \int_t^\infty \|\Phi(\tau, t_0)x\|^p d\tau \right)^{1/p} \leq K\|\Phi(t_0)x\|, \text{ for all } t \geq t_0 \text{ and } x \in X,
\]
if and only if there exist $N, v > 0$ such that
\[
\|\Phi(t_0)x\| \leq Ne^{-v(t-t_0)}\|x\|, \text{ for all } t \geq t_0 \text{ and } x \in X.
\]

Proof. Sufficiency. If $\tau \geq t \geq t_0$, then
\[
\|\Phi(\tau, t_0)x\| \leq Ne^{-v(t-t_0)}\|\Phi(t_0)x\|.
\]
It follows that
\[
\left( \int_t^\infty \|\Phi(\tau, t_0)x\|^p d\tau \right)^{1/p} \leq \frac{N}{(vp)^{1/p}}\|\Phi(t_0)x\|, \text{ for all } t \geq t_0 \geq 0 \text{ and } x \in X.
\]

Necessity. It is obvious by Theorem 1. \qed

Remark 4: The converse of Corollary 1 is false.
Indeed, let $X = \mathbb{R}$ and $\Phi : \{(t, t_0) \in \mathbb{R}_+^2 : t \geq t_0\} \to \mathbb{R}$, $\Phi(t, t_0) = \frac{t^{d+1}}{t_0^{d-1}}$.

We have that
\[
\int_t^\infty \frac{t_0^2 + 1}{\tau^2 + 1} d\tau = (t_0^2 + 1)\left(\frac{\pi}{2} - \arctan t\right) \leq \frac{\pi}{2} (t_0^2 + 1) = K(t_0).
\]
We now assume that there exist $N, v : \mathbb{R}_+ \to \mathbb{R}_+$ such that $\|\Phi(t, t_0)\| \leq Ne^{-v(t-t_0)}$, for all $t \geq t_0$. If $t_0 = 0$, then it follows that
\[
\frac{1}{t^2 + 1} \leq N(0)e^{-v(0)t}, \text{ for all } t \geq 0.
\]
Therefore
\[
\frac{e^{-v(0)t}}{t^2 + 1} \leq N(0), \text{ for all } t \geq 0.
\]
If $t \to \infty$, the last relation is equivalent to $\infty \leq N(0)$, which is absurd.

Therefore we can conclude that there do not exist two functions $N, v : \mathbb{R}_+ \to \mathbb{R}_+$ such that $\|\Phi(t, t_0)\| \leq N(t_0)e^{-v(t-t_0)}$, for all $t \geq t_0$. This shows that it is impossible to choose $K$ independent of $t_0$ in (6).

Corollary 2: Let $\{\Phi(t, t_0)\}_{t \geq t_0 \geq 0}$ be an evolution family with uniform growth. The following statements are equivalent:

(i) there exist $N, v > 0$ such that $\|\Phi(t_0)x\| \leq Ne^{-v(t-t_0)}\|x\|$, for all $t \geq t_0 \geq 0$ and $x \in X$;
(ii) there exist $k, p > 0$ such that $\left( \int_t^\infty \|\Phi(\tau, t_0)x\|^p d\tau \right)^{1/p} \leq k\|x\|$, for all $t \geq 0$ and $x \in X$;
(iii) there exist $k, p > 0$ such that $\left( \int_t^\infty \|\Phi(\tau, t_0)x\|^p d\tau \right)^{1/p} \leq k\|\Phi(t_0)x\|$, for all $t \geq t_0 \geq 0$ and $x \in X$.

Proof. It follows from Remark 3 and Theorem 1. \qed
Conclusion

In this paper are obtained different types of R. Datko theorems which characterize the uniform and nonuniform exponential stability of evolution families with uniform and nonuniform exponential growth. Practically, the result initially obtained by Datko (1972) and Preda and Megan (1985) was extended using so-called Lyapunov norms (i.e.

$$||x||_{t_0} = \sup_{t \geq t_0} e^{-\omega(t-t_0)} ||\Phi(t,t_0)x||, \forall t_0 \geq 0, \forall x \in X$$

introduced by L. Barreira and C. Valls in (Barreira & Valls, 2010).

We shown that, if we choose $K$ dependent of $t_0$ in the form of Datko’s theorem used by C. Stoica and M. Megan, we obtain a result of nonuniform exponential stability of the evolution family, which is no longer possible in the original form of Datko’s theorem. So, considering $\Phi$ an evolution family with nonuniform exponential growth, then there exist $K : \mathbb{R}_+ \rightarrow \mathbb{R}_+^+$, $p > 0$ such that

$$\left( \int_{t_0}^{\infty} ||\Phi(\tau,t_0)x||_{t_0}^p d\tau \right)^{1/p} \leq K(t_0)||\Phi(t,t_0)x||_t, \text{ for all } t \geq t_0 \text{ and } x \in X$$

if and only if there exist $N, \nu : \mathbb{R}_+ \rightarrow \mathbb{R}_+^+$ such that

$$||\Phi(t,t_0)x||_t \leq N(t_0)e^{-\nu(t)|t-t_0|}||x||_{t_0}, \text{ for all } t \geq t_0 \geq 0.$$

It was also proved, that the main result obtained in this paper (Theorem 1) is even stronger then the already existing results in the literature.

In conclusion, in this paper, we presented some new sufficient conditions for the nonuniform exponential stability of evolution families with nonuniform exponential growth in terms of Datko’s theory.

A NOVEL SOLUTION FOR QOS IMPLEMENTATION IN DATA NETWORKS

Marius C. Breabăn,1 Adrian Graur,2 Alin D. Potorac,3 Doru G. Bălan4

Abstract: Current data networks carry a multitude of data types. These include high-definition video streams and other data sensitive to network delays as well as real-time voice transmissions.

Active network node equipment fulfills requests, while providing network management without affecting the data availability. Starting out from this model, a new idea is based on moving the network bandwidth control at the user’s communication interface. This paper presents a new approach to setting up QoS parameters based on local upstream traffic limitation management. This approach is quite useful in providing a certain guaranteed bandwidth for the users. So, this software ensures a specific network bandwidth according to with the rights coming up from their association with a certain “Active Directory” group of users. The necessary active network equipment in terms of basic QoS management can be replaced by a local application for data traffic limitation, while for the involved participants the remaining bandwidth for other communications has a higher degree of availability. An efficient bandwidth control can be implemented when extracting specific AD fields and transferring pre-calculated user related parameters to a local running limiter.

UDC Classification: 004.77 DOI: http://dx.doi.org/10.12955/cbup.v5.1070

Keywords: QoS, bandwidth limitation.

Introduction

The continued development of organizations, as well as the diversification of activity has also implicitly led to the rapid development of network infrastructure. Due to the complexity of the types of information conveyed, this infrastructure must be efficient, flexible and manageable. Unfortunately, the existing solutions partially meet these requirements, being susceptible to changes such as hardware and software upgrades, exponential growth in organizational development, centralized management, and efficiency improvements to major reconfiguration changes.

Another major issue is providing access to network resources based on the need to access certain information or applications.

Thus, in managing a private network by limiting the traffic rate, network administrators can control the input and output traffic rate, ensuring that no user or application exceeds the maximum transmission rate or monopolizes the band.

Network administrators can set policies to allocate bandwidth to specific users, user groups, or applications.

A traffic limitation policy is a network policy that allows the network administrator to evaluate traffic flows by allowing the policy to apply to all traffic from or to a particular network interface.

Bandwidth management is a requirement of data traffic, necessary for the efficient operation of data network corporations or institutions with many users, while ensuring the quality of data services regardless of the area of activity.

The solution for data traffic limitation

Current traffic patterns allow setting QoS rules on a distributed model at the traffic source using proper equipment.

According to the new approach of traffic limitation management, we propose a java application solution, which would provide traffic limitation options for a specific user, depending on his affiliation with a certain group of users.

This application can provide traffic limitation management avoiding the use of a layer three data switch and setting specific bandwidth availability for other client workstations.

The novelty of this implementation consists in the fact that, by applying upstream data traffic limitation at the network interface level, it provides, data upload traffic limitation at each user’s level. (Breabăn, 2016)

2 Ștefan cel Mare - University of Suceava, Romania, adrian.graur@usv.ro
3 Ștefan cel Mare - University of Suceava, Romania, alinp@eed.usv.ro
4 Ștefan cel Mare - University of Suceava, Romania, dorub@usv.ro
We focused on the following research directions:

- transferring the traffic limiting java file, after the user authentication on the workstation; (Microsoft, 2003)
- file transformation, which use commands to launch the java application as a Windows service and run it automatically when the operating system starts up;
- reading user’s rights and account proprieties, using a Microsoft Windows tool, gpresult command (https://technet.microsoft.com/en-us/library/cc733160(v=ws.11).aspx, 2017), and then placing the user in the user’s group membership, as it is defined in the Active Directory server; (Microsoft, 2003)
- providing a specific bandwidth limit for the outgoing traffic through the network interface of the workstation;

For the tests, there were two HP Probook 640 series computers used, with Intel i5 processors, 4 GB RAM, Gigabit Ethernet network cards and a switch Cisco Catalyst without the QoS settings (Cisco, 2010). The topology is presented in Figure 1.

Figure 1: Client-server topology

![Client-server topology](source)

On the HP Probook 640 series computer having the IP address 192.168.10.15, we installed a Virtual Machine Windows 2003 Server, with a running Active Directory and DNS (Domain Name Server) (Microsoft, 2003) server while at the other end the host workstation is engaged.

On the “Active Directory” server, we created groups, respectively users, as presented in Figure 2.

Figure 2: Groups and users in Active Directory server

![Groups and users in Active Directory server](source)

For the automatic run, we proceeded in copying a “bandwidth.bat” file from the Active Directory server to the workstation, and converting it as a Windows service able to automatically run after the user logon. The “bandwidth.bat” file contains the following elements:
• compare if the directory named “Bandwidth” exists on “C:\"drive, if not it will be created;
• copy the “bandwidthUser.jar” file from the server to the workstation in “C: \ Bandwidth”
directory already created;
• run the “bandwidthUser.jar” file.

All those operations are presented in Figure 3. We mention that Java(TM) SE Runtime Environment
(build 1.8.0_112-b15) (Java SE, 2017) was used, both for the server and for the workstation.

The conversion as Windows Service was made using “NSSM” (http://www.nssm.cc) freeware
software, as presented in Figure 4.

For the automatic run after the user’s logon, we setup the “bandwidth” service to run automatically, as
presented in Figure 5.

The “bandwidthUser.jar” file has the following functions:
• reading the user’s rights, using Microsoft Windows “gpresult” command and placing the user in
the user’s group membership, as it is defined on the Active Directory server,
• creating a string buffer in which information from the “gpreport” file are stored,
• selecting from the string buffer only the lines with the information regarding the security group;
• building a security groups list by ordering decreasingly using an associated UDP buffer value
for the maximum outgoing data bandwidth to be tied with the workstation network interface. An UDP
datagram has a 1470 byte length. So, for a 100 Mbps bandwidth we have an UDP buffer size of 1470 bytes. From this point, we calculate the buffer size for respectively 70 Mbps, 50 Mbps, 30 Mbps and 10 Mbps:

- going along the list of the assigned security groups and check if the user is in one of the listed security groups. The loop stops at the first security group found in the list, and the amount of bytes that can be transferred in a time unit by each group member is extracted.

- the last step consists in displaying the user information;

![Figure 5: Bandwidth Window service run automatically](image)

Figure 5: Bandwidth Window service run automatically

We should mention that, the last step - user’s information display, represent a necessary option, so that to show the java file execution. Normally, the application runs automatically, without displaying a message.

Thus, after running the “bandwidthUser.jar” file, the workstation displays the user’s information, according to the security group membership.

So after logging the user belonging to a certain user group, a buffer size value is allocated representing bandwidth, as presented in table 1.

<table>
<thead>
<tr>
<th>User</th>
<th>Group</th>
<th>Buffer (byte)</th>
<th>Bandwidth (Mbps)</th>
</tr>

</tbody>
</table>

Source: Authors

Figure 6 shows the displayed message for a user belonging to a group having the associated bandwidth of 30 Mbps. This message is displayed after logging in into AD domain. For user10, user50, user70, user 100 included in specific security groups the messages are similar except for the transferred traffic parameter numerical value which is a specific one for each individual group.
Conclusions

As presented above, this is a new approach as a software solution, in granting access to a larger or smaller traffic bandwidth to a group of users according to the user’s position in the hierarchy and to the specificity of their activity among an organization.

The application for data traffic limitation is actually a system comprising of combined and distributed elements that offer an integrated solution to successfully replace the hardware data switch types of equipment for the implementations of local one-way data flow limitation but based on a centralized management.

As a further developing direction, the use in intensive data traffic conditions is about to be tested, based on the iperf (https://iperf.fr, 2107) tool, with an UDP (Postel, 2017) data transport between the two systems, continuously, at a 100 Mbps constant speed.

After the authentication, based on the predefined user’s rights, the provided bandwidth should automatically be allocated in a group personalized manner, offering the necessary bandwidth allocation as part of QoS policy implementation.

INVESTIGATION OF INDIGO DYEING USING SODIUM BOROHYDRIDE AS REDUCING AGENT
Banu Yeşim Buyukakinci,1 Nihal Sokmen2

Abstract: Indigo, one of the oldest dyes, has a very important role for the textile sector. It is primarily used to dye cotton clothes, and blue jeans and over one billion pairs of jeans around the world are dyed blue with indigo. Although Sodium Hydrosulfite (Na₂S₂O₄) is used as a reducing agent in most indigo dyeing processes, it is environmentally unfavorable because of the resultant contaminated toxic wastewater. In addition, the color fastnesses of dyed samples using Na₂S₂O₄ as reducing agent are not good enough.

In the present paper sodium borohydride (NaBH₄) were used as ecologically safe reduction systems for the indigo dyeing of cotton fabric. After dyeing processes, the color yield and fastnesses according to washing and rubbing were measured, and results were compared.

It was found when NaBH₄ was used as reducing agent instead of Na₂S₂O₄, the color yield and the fastness properties of the dyed samples improved.

JEL Classification Numbers: L65, L67, Q53; DOI: http://dx.doi.org/10.12955/cbup.v5.1071

UDC Classification: 677

Keywords: Indigo, dyeing, sodium borohydride, reducing agent

Introduction
Indigo, one of the oldest colorants, is widely used for dyeing cotton yarn for blue jeans. Because of the popularity of blue jeans, indigo is still one of the most important of all dyes in present use. The water-insoluble, blue pigment gives a pale yellow, water-soluble leuco form on reduction (Figure 1).

Although sodium dithionite (Na₂S₂O₄) has been used as reducing agent in most indigo dyeing processes because of its low cost, it is considered to be environmentally unfavorable because of the resultant contaminated toxic wastewater (Yao, 2015).

In this work, 100% knitted cotton fabric samples (produced by Kadifeteks) were dyed with indigo dye using sodium borohydride as reducing agent instead of sodium dithionite.

Using of the environmentally friendly boron and boron compounds will have very an important roll in the textile industry in the future. Sodium borohydride is a well-known reducing agent and has been extensively employed in chemical synthesis and in some hydrogen generation processes. This compound is non-toxic and has minimal effects on the environment (Dincer 2015, Meksi 2007).

Sodium borohydride is an effective and very selective specialty reducing agent used in organic -biochemical reactions and in the manufacture of pharmaceuticals. It is alternative to Na₂S₂O₄ as reducing agent for indigo dyeing processes with its ecological properties.

1 Engineering Faculty, Istanbul Aydın University, Istanbul, Turkey, byesimb2@gmail.com
2 Technology Faculty, Marmara University, Istanbul, Turkey. nsokmen@marmara.edu.tr
Indigo dyes usually have good washing fastness. The light fastness varies from moderate to good in heavy shades. In addition to cotton, other fibres, for example, silk and wool and polyester have also been dyed using different methods in the past. (Baig, 2011; Tichaa, 2013; Meksi, 2007-2010)

Experimental
Materials: In the present study, 100% knitted cotton fabric samples (130g/m²) were dyed with Indigo 4B coll. liq., supplied by DyStar. It was found that the color yield and the fastness properties were improved when using NaBH₄ giving fastness properties better than those obtained with Na₂S₂O₄ as reducing agent (Merck).

Methods: Dyes were applied at 1% depth of shade (owf), and the liquor/fabric ratio was 20:1. The dyeings were initiated at 40 °C, then the temperature was raised to 60 °C. After keeping at this temperature for 30 min, the samples were removed from the bath and kept at atmospheric conditions to be oxidised.

The reflectance values of the dyed materials were measured using a SF600 Plus Datacolor spectrophotometer, and the CIELab values were calculated using illuminant D65 / 10° standard observer. K/S, the color strength values of the samples were calculated by using Kubelka Munk equation (Eqn 1) (McDonalds, 1997)

\[ K/S = (1-R)^2 / 2R \]  

Where K is the absorption coefficient of the substrate, S is the scattering coefficient of the substrate and R is the reflectance of dyed fabric at \( \lambda_{\text{max}} \).

The rubbing and wash fastnesses of the dyed cotton fabrics were determined according to ISO105-X12 and ISO105:C06 (A1S ) standards, respectively.

Results and Discussions
The colorimetric parameters, color strength (K/S) and fastness values are given in Table 1 and Table 2 respectively.

| Table 1: Color Values and Color Strength of Cotton Dyed with Indigo (when used Na₂S₂O₄ and NaBH₄ as reducing agent) |
|---|---|---|---|---|---|---|
| Reducing agent | L* | a* | b* | C* | h° | \( K/S \) (max K/S in 600nm) | \( \Delta E \) |
| Na₂S₂O₄ | 30.22 | 1.04 | -32.04 | 32.06 | 271.85 | 19.06 | 6.508 Darker redder less blue |
| NaBH₄ | 24.43 | 3.34 | -30.15 | 30.34 | 276.32 | 26.97 |

Source: Author

The K/S values are 26.97 and 19.06 for the NaBH₄ and Na₂S₂O₄ used samples, respectively and the color difference is 6.508. The sample which was dyed by using Na₂S₂O₄ as reducing agent is darker redder and less blue than the using NaBH₄.

| Table 2: Colour Fastness Values of Dyed Samples (when used Na₂S₂O₄ and NaBH₄ as reducing agent) |
|---|---|---|---|---|---|---|---|---|
| Reducing agent | Colour change | Staining* | Rubbing* |
| | | CA | Co | PA | PES | PAN | Wo | Dry | Wet |
| Na₂S₂O₄ | 4.5 | 4.5 | 4.5 | 5 | 5 | 4-5 | 5 | 4-5 | 4 |
| NaBH₄ | 5 | 5 | 5 | 5 | 5 | 5 | 5 | 4-5 |

Source: Author

As shown in Table 2, it was determined that the results of the samples used NaBH₄ were slightly better, although there was no significant difference in color fastness values of the painted samples using both reducing agents.

Conclusion
It can be concluded that using NaBH₄ enhances the dye uptake of cotton fabric and dyed samples can be obtained with good color strengths and fastnesses. Using non-harmful chemicals like NaBH₄ in the indigo dyeing processes is very important for the ecosystem. From an environmental point of view, it
is possible to replace the toxic reducing agents (sodium dithionite) by the ecological product as the NaBH₄ in the reduction process of indigo dye.

A STUDY OF UNMANNED GLIDER DESIGN, SIMULATION, AND MANUFACTURING

Anil Demircali,¹ Huseyin Uvet²

Abstract: This paper describes a mini unmanned glider's design, simulation, and manufacturing with a wing-folding mechanism. The mini-glider is designed for the CANSAT 2016 competition, which has the theme of a Mars glider concept with atmosphere data acquisition. The aim is to facilitate transportation and to land it to the destination point. Having a light and compact design is important since it is a glider without an engine and it uses power only for the transmission of sensory data. The glider is produced with a wingspan which is 440 mm, and its longitudinal distance is 304 mm. The wings can be packaged in a fixed size container whose dimensions are 125 mm in diameter and 310 mm in height. The glider's weight is only 144 gr, and it can increase up to 500 gr with maximum payload. The mechanism, which includes springs and neodymium magnets for wing-folding, is capable of being ready in 98 ms for gliding after separation from its container. The mini-glider is capable of telemetry, communications, and other sensory operations autonomously during flight.

UDC Classification: 621.7; DOI: http://dx.doi.org/10.12955/cbup.v5.1072

Keywords: MAV, Autonomous System, Wing-Folding, Reconnaissance

Introduction

The international CANSAT competition concept is somehow identical to typical gun-launched air-vehicle systems (Lozano et al., 2013). The wing-folding structure allows it to be covered with a small volume and thus to be placed in a protective container (Steven, 2007). Recent research and industrial works related to gun-launched drones are principally focused on foldable fixed-wing configurations (Koehl, Arnaud, et al., 2012; Wood et al., 2014). Our goal in this work is to ensure that the wing-folding mechanism operates quickly and reliably immediately after separation from the rocket. It must fulfill its assigned tasks successfully in terms of control regulations (CanSat, 2016). In order to gather information about the atmosphere, there are fixed-wings and larger-sized heavier systems (U. S. Navy, 2004) or measurements with different approaches (Ru-Shan et al., 2015; Phillipona et al., 2016) instead of foldable wing systems. As a matter of fact, in many control applications in order to find an optimal solution for a stable glider flight, PID, Adaptive and Neural network are widely used. However, in our scenario, a phugoid mode is necessary, thus our system is a glider and will not have any motors assembled. Meanwhile, we designed the glider systems' center of gravity and the inertia matrices, we conducted a production that would ensure that the system would fly in a phugoid mode. At this point, the system has already had mechanical control embedded (Smith, Andrew J., 2015).

Our aim is to combine all electronic equipment such as telemetry, communications, and sensory operations into a small PCB (Printed Circuit Board) card while maintaining a light and compact design. Our work is not just a mini-glider production for a competition, but it can also be used in areas with developments to be made in the future. Those areas are: transportation of medical and surgical supplies, search for chemical and radioactive areas, search and rescue operations, in communication systems, and agriculture. In our work, 6 degree of freedom movement systems were first created and simulations were done with the MATLAB/Simulink® program. The mechanical design and analysis of the planer were done in the 3D Solidworks® program, and the electronic card design is also made through the Proteus program. In the second part of the work, measurement models used with satellite kinematic and dynamic equations are presented. In the third part, the system and the simulated studies are analysed, and finally in the fourth part, the result section was discussed and evaluated.

Mathematical Model

In this section, the small wing-folding glider's dynamic properties are expressed as fundamental calculations. The wing design, dynamic model of the glider, and the aerodynamics calculations are given in detail. The basic principles of hovering flight can be demonstrated with a MATLAB® simulation after autonomous separation of the glider from the container (Cox et al., 2003; Bachuta, M. J., et al., 2012). The glider is designed in accordance with the rule stating: "The container shall fit in a cylindrical envelope". The operational scheme as shown in Figure 1 is in compliance with the

¹ Yildiz Technical University, Department of Mechatronics Engineering, Istanbul, Turkey, demircalianil@gmail.com
² Yildiz Technical University, Department of Mechatronics Engineering, Istanbul, Turkey, huvet@yildiz.edu.tr
CANSAT 2016 competition rules (CanSat, 2016). Firstly, operational schematic should be known and should be expressed as in Figure 1. The glider is launched from point A and follows the trajectory B, it is separated from the capsule at point C, which is 600 meters above ground level. The glider has to be separated autonomously at point D at the height of 400 meters and the collected data during the flight has to be observed by the ground station at point F.

![Figure 1: The application scheme of the CANSAT 2016 competition.](image)

Source: Author

**Wing Design**

The glider's longitudinal length and wingspan of the folding position are imposed by the container size. The pre-designed model and container including the materials are shown in Figure 2. In order to determine the dynamic behavior of the glider, lift coefficient $C_{L, \text{required}}$ must be calculated according to the maximum pre-designed glider's established mass. Also, the thrust force of the glider should be observed under gliding condition together with the drag coefficient $C_D$ acting on it. The pre-designed container mass is calculated as 248 gr by using Kevlar. Then, it is important to determine $C_{L, \text{required}}$ with respect to the glider’s maximum estimated mass (252 gr). The maximum hovering speed $V_{\text{max}}$ (m/s) can be calculated by determining the $C_{D,0}$.

![Figure 2: Container sizes are determined according to the standards of the competition. Eppler 793 Airfoil, $C_L$, $C_M$, $C_D$, $C_L/C_D$ graph results for $\alpha=-9.5^\circ$ to $9.5^\circ$ and Reynolds number, Re=5x10^4 with respect to estimated glide speed.](image)

Source: Author

$C_L/C_D - \alpha$ graph allows the maximum lift coefficients $C_L$ to be described as a variable value of the AoA, which is selected $2^\circ$- $6^\circ$ to have maximum $C_L$. Also, similar stability effects are shown in $C_M -$
\( \alpha \) for the same range of \( \alpha \). By calculation of \( \alpha = 5.5^\circ \) from \( C_L - \alpha \) graph showing stable and reliable flight can be observed. At the point of minimum drag \( C_{D,0} = 0.07 \) and (K: Aspect Ratio, AR) \( K = 9.466 \) are determined for the determined AoA. Dynamic behaviour of the glider can be expressed,

\[
V = \frac{2W}{\sqrt{\rho S c_R^2 \cos^2 \left( \frac{\alpha}{2} \right)}}
\]

\[
V_{\text{max}} = \frac{2W}{\rho S} \sqrt{\frac{K}{C_{D,0}}}
\]

\[
C_L = \frac{2L}{\rho SV^2}
\]

\[
K = \frac{1}{\pi AR e_0}
\]

\[
Re = \frac{\rho V^2 L}{\mu}
\]

where air density \( \rho \) (kg/m\(^3\)), descending speed with container+payload \( V \) (m/s), total wing area \( S = 0.0205 \) (m\(^2\)), outer diameter of parachute \( R \) (m), inner diameter of parachute \( r \) (m), total mass \( W \) (N), drag force \( D \) (N) (Yechout, Thomas R., 2003). In that case, \( C_L, V, V_{\text{max}}, \alpha \) can be calculated and shown in Table 1.

Source: Author

The thrust force, which will determine enough lift to stable flight, can only be solved by introducing another equation or by determining of \( C_{L,\text{required}} \). By using \( V_{\text{total}} \):(container+payload together) and \( V_{\text{container}} \):(container only) the descending speed and duration of the glide could be expressed. \( V_{\text{max}} \) represents the maximum lifting force of \( \alpha \).

**The Dynamic Model of the Glider**

The primary goal of calculations is to determine the dynamic behavior of the glider. To obtain a simulation of the system, a mathematical model has to be derived by Newton motion laws with 6 degrees of freedom (DOF) (Garza, Frederico, Eugene A., 2003). Non-linear equations could be yielded,

\[
X - mg \sin(\theta) = m(U + QW - RV)
\]

\[
Y + mg \cos(\theta) \sin(\phi) = m(\dot{V} + RU - PW)
\]

\[
Z + mg \cos(\theta) \cos(\phi) = m(\dot{W} + PV - QU)
\]

where glider mass \( m \) (kg), position \( X, Y, Z \), axial speeds \( U, V, W \) (m/s), axial acceleration \( \dot{U}, \dot{V}, \dot{W} \) (m/s\(^2\)), and angular speeds \( P, Q, R \) (rad/s). Axial acceleration can be expressed as (9-11) and angular speeds can be calculated as (12-14) where rolling moment \( L \), pitching moment \( M \), yawing moment \( N \). Axial acceleration and angular speeds are expressed,

\[
\dot{U} = RV - QW - g \sin(\theta) + X/m
\]

\[
\dot{V} = PW - RU + g \cos(\theta) \sin(\phi) + Y/m
\]

\[
\dot{W} = QU - PV + g \cos(\theta) \cos(\phi) + Z/m
\]

\[
\dot{P} = (c_1 R + c_2 P)Q + c_3 L + c_4 N
\]

\[
\dot{Q} = c_5 PR - c_6 (P^2 - R^2) + c_7 M
\]

\[
\dot{R} = (c_8 P - c_2 R)Q + c_4 L + c_6 N
\]
where \( c_1 = l_{xx}, c_2 = -l_{xy}, c_3 = -l_{xz}, c_4 = -l_{yx}, c_5 = l_{yy}, c_6 = -l_{yz}, c_7 = -l_{zx}, c_8 = -l_{zy}, c_9 = l_{zz} \) (Etkin, Bernard, Lloyd Duff Reid, 1996). By using (9-14) equations, the glider stability analysis are done. Solving the equations of (9-14) yields Euler angle’s derivatives in (15-17). The Euler angles could be expressed by,

\[
\dot{\phi} = P + \tan(\theta)(Q \sin(\phi) + R \cos(\phi)) \\
\dot{\theta} = Q \cos(\phi) - R \sin(\phi) \\
\dot{\psi} = \frac{Q \sin(\phi) + R \cos(\phi)}{\cos(\theta)}
\]

By specifying the Euler angles, the resulting specific instant speed of the glider can be obtained which is defined on the body axis, then the equation (18-20) could be expressed including axial velocity,

\[
\begin{align*}
\dot{x} &= Uc(\theta)c(\phi) + V(s(\phi)s(\theta)c(\psi) - c(\phi)s(\psi)) + W(c(\phi)s(\theta)c(\psi) + s(\phi)s(\psi)) \\
\dot{y} &= Uc(\theta)s(\phi) + V(s(\phi)s(\theta)s(\psi) + c(\phi)c(\psi)) + W(c(\phi)s(\theta)s(\psi) - s(\phi)c(\psi)) \\
\dot{z} &= -Us(\theta) + V(s(\phi)c(\psi)) + W(c(\phi)c(\theta))
\end{align*}
\]

where (cos = c, sin = s). A method of evaluating the glider’s positions on the airframe is to calculate the glide duration.

**Aerodynamics Calculation**

The goal of the XFLR5® aerodynamic analysis is to determine the position of the glider on a X, Y, and Z axis after the instant speed of the glider is obtained in section B. To determine the position of the glider, stability and control coefficients have to be calculated, which will be show in the (Figure 5). The results of the coefficients are shown in Table 2 where X direction \( c_x \), Y direction \( c_y \), Z direction \( c_z \), rolling moment \( c_i \), pitching moment \( c_m \), yawing moment \( c_n \). The obtained coefficients are used to calculate X, Y, Z, L, M, N (Dilão, Rui, João Fonseca, 2013).

Source: Author

The result of the designed model for the completed equipments are shown in Figure 3.

**Figure 3:** The model is designed by 3D Solidworks® and shown as an isometric view including the equipment.
The communication & GPS unit provide the glider's position, images are captured by camera during flight, when it is launched, the first separation inside of container, and after separation of container and glider happen. Moreover, the ground station should acquire flight information data during gliding which are provided by circuit board including variety of sensors such as a pitot tube, pressure, and altitude. A battery is used to provide the necessary energy. The equipment is modelled individually according to the weights on the sensitive scale; the center of gravity is placed of the wing's leading edge (1/3) in the glider.

**Simulation and Analysis**

The designed model of the glider is given in Figure 3 of the mathematical model section. The analysis should be achieved with ready-made equipment in the design model to carried out further improvements easily. Location of the center of gravity, estimation of the size of horizontal and vertical stabilizers and maximum lift were obtained in the previous section. The aim of the simulation is to compare parametric verification of the results with the calculations. Figure 3 in Aerodynamics Calculation section shows the completed design of the glider. To obtain the aerodynamic behaviour of the system, analysis is done by XFLR5®. The result is shown by using the Vortex lattice method, (VLM). It is applied for range of the $\alpha = -5^\circ$ to $15^\circ$ and $\text{Re} = 5\times10^4$ to $12.6\times10^4$ (Mueller, Thomas J., 2001).

The most folding theories are concerning with either the speed of the stowed mechanism or its effect of the thrust force, but they neglect the strength of the wings and the folding mechanism. Deployment of the glider just needs a simple action from the user, since usage of basic components which are springs and magnets are shown in Figure 4.

![Figure 4: Wings are deployed in 98 ms. Left: Picture of instant position. Middle: The duration of deployment. Right: Picture of the completed deploy of the wings.](source)

To verify the mathematical model of the system in SIMULINK®, the weights of the equipment to be used must be taken into account. The hardware design of the glider is done in this way. For given simulation (figure 5), it is possible to observe the dynamic behavior of the glider. The Glider force and moment stability could be achieved during 13 (m/s) flight speed and $\alpha = -3^\circ$. According to the obtained speed and $\alpha$; X, Y, Z positions of glider and glide duration time could be calculated. Glide duration and helical path could be controlled by 2 different control input which are the elevator and the rudder. The helical path, whose diameter is a maximum 60 m, could be followed when rudder = $1^\circ$ in 117.37.

During descent, at the first 1.5 cycle of descent path whose diameter has bigger helical cycles than remaining path, the glider does not reach limit speed which is required for stable state of phugoid motion. However, when the glider is about 310 m above ground level, equal helixes are seen since maximal speed is reached. Moreover, the glider is separated from the container with an initial speed of 0 (m/s) so, the necessary time for landing must be calculated. It can also be noted that the helical path diameter from the longitudinal distance and lateral distance with respect to the time graphs show that...
stable flight takes 23.7 seconds to achieve. Also, linearity, which gives information about stable flight, could be seen from the height-time graph. As a result, the glider shall be stable around 310 meter above ground level and at 23.7 seconds after releasing. According to the analysis and the simulations, this section shows that the wing-folding structure is safe; the glider can fly and hover according to the operational rules.

**Figure 5:** Helical path is followed by the glider which shows a stable flight during descent.

Source: Author

**Results**

Along with the direction of the iteration stages of the targeted criteria and the simulation, the wing design has been achieved successfully. The sizing studies have been optimized through the XFLR5® program. The wing angles, the position of the center of gravity and the static margin values were determined, depending on the polar plot of the selected wing profile and planer. The glider system, modeled in the Solidworks 3D® design program, has successfully opened its wings when it left the container, just as it did in the test result. The wing-folding mechanism works very well and fast as seen in Figure 6.

**Figure 6:** Wings are deployed in 98 ms. Left: Picture of instant position. Middle: The duration of deploy. Right: Picture of the completed deployment of the wings.

Source: Author

The prototype was made using a 3D printer, successfully completing the competition goals.

Precise Positioning of DiMagnetically Levitated Microrobot

Anil Demircali,1 Huseyn Uvet,2 Yusuf Kahraman,3 Tunc Kose,4 Serhat Sisu,5 Kadir Erkan6

Abstract: In this article, we present a microrobot manipulation technique with high precision positional ability to move in a fluid environment with diamagnetic levitation. Untethered manipulation of microrobots by means of externally applied magnetic forces has been emerging as a promising field of research, particularly due to its potential for medical and biological applications. The decreased size of the robots makes them suitable for both in vitro applications such as sorting, moving, filtering micro particles (e.g. cells) within lab-on-a-chip platforms and in vivo applications such as minimally-invasive surgeries or targeted drug delivery inside a human body. Precise (nano) positioning of the levitated microrobot on the pyrolytic graphite is demonstrated in the liquid. Positioning is achieved by the movement of a “lifter” magnet on the sensitive microstage. The suspended microrobot successfully tracked the identified roots. Our study is about controlling the microrobot suspended on the pyrolytic graphite with nano-precision via fixed lifting magnets. The purpose of the presented method is to eliminate the friction force between the surface of the substrate and the microrobot. Thus, high accuracy motion can be achieved.

UDC Classification: 606 DOI: http://dx.doi.org/10.12955/cbup.v5.1073

Keywords: Microrobots, Magnetic Levitation.

Introduction

Microrobots are used in biological and medical applications for a number of purposes such as drug delivery, biopsy, marking, cell manipulation, microparticle transport, etc., with minimal damage to the desired site (Mooney et al., 2014; Arai et al., 2012; Arai et al., 2010; Cui et al., 2011; Abbott et al.; 2010). In the microfluidic environment, principles of physics change with decreasing dimensions. The change in the number of Re (Reynolds Number) indicates that the environment has laminar or turbulent flow characteristics. In the environment with laminar flow characterization, micro-objects move in the water to transport the viscous medium character (Nelson et al., 2013). Under the mentioned conditions, microfluidic channels are seen in different structures from microrobots for control of the intended processes. Microrobotic applications can benefit from factors such as optical tweezers, thermal gradients, electrostatic forces, di-electrophoresis forces, chemical concentration differences (Ohta et al., 2012; Nelson et al., 2015). The use of microrobots in such applications is more advantageous than other applications when considering the effect on ambient conditions, the force to be applied and the precision of motion (Arai et al., 2012).

Recent studies show that Metin Sitti and Arai use magnetic levitation and acoustic levitation, respectively. These studies have controlled microrobots in the fluid environment by cutting off the contact with the surface. In both systems, the forces applied to retrieve position information and data collected from the sensors must change interactively. For this reason, ultrasonic vibrations affecting the positioning of microrobots are still present in the environment, and as a result, vibrations affect the objects in the environment. At this point, it can be seen that the last trend of studies to increase positioning accuracy and efficiency of applied force is based on levitation. Current levitation procedures require continuous energy consumption and feedback (Arai et al., 2016; Sitti et al, 2015). In the course of the work, it shows that microrobots systems are difficult to position precisely.

By cutting the surface contact; Diamagnetic levitation technique is an important method for precise positioning. With a permanent magnet to be positioned on the diamagnetic material, the microrobot can be levitated without the need for an active control mechanism. The diamagnetically levitated microrobot application was originally developed by Ron Pelrine et al. (Pelrine et al., 2012).

4 Yildiz Technical University, Istanbul, Turkey
5 Yildiz Technical University, Istanbul, Turkey
6 Yildiz Technical University, Istanbul, Turkey, kerkan@yildiz.edu.tr
For the first time in the literature, we present a new method of using diamagnetic levitation in microrobotics in liquid media. Using this method, the theoretical background of a robotic work that can do 3-dimensional nano-positioning was established and confirmed by experimental results. In this way, innovative microrobotic systems can be developed that can integrate with lab-on-a-chip applications in a liquid environment.

**System Modelling**

Using the diamagnetic force, precise levitation and contactless manipulation of the microrobot arm can be performed (Pelrine et al., 2012; Chen, Zhou, Meng, 2008; Kustler, 2007). Movement limits within the fluid can be calculated by determining the system dynamics of the robot. According to the mathematical model of the system, the stability point of the robot can be determined in the liquid. The parameters used in the system model are given in Table-1. In Figure 2, the forces acting on the robotic arm z-axis are shown on the schematic given system. In addition, the forces resulting from moving the lifting magnet on the x-axis are also expressed by the x-axis components.

Source: Author

The forces shown in Figure 2 can be expressed as (1-3).

\[ F_r = m_r g \]  
\[ F_B = V_r \left( \rho_r - \rho_f \right) g \]
\[ F_D = \frac{1}{2} c_d \rho f A v^2 \]  

(3)

According to (1-3) equations, the dynamic model can be expressed by (4) for z axis.

\[ \ddot{z} = \frac{1}{2 \mu_0 \mu_r} \left( \frac{\mu_r - 1}{2} \right) \oint_{\nu} \nabla B^2 \, dv + \frac{v |v|}{m_r} \left( \rho_r - \rho_f \right) - g + \frac{(F_{m,x} + F_{g,z})}{m_r} \]  

(4)

\( v^2 \) for the equation given in (3), is shown as \( v |v| \) in the equation (4-6). Such an expression has been used for the positive and negative positional effects in the axes to be observed in the drag force expression. In the determination of \( F_m \) and \( F_g \) forces not shown in the equation set, basic physics is used first. The reason for this is the correct determination of the boundary conditions of the simulation in the analysis to be done in COMSOL\textsuperscript{®}. Thus, the magnetic force acting on the microrobot arm for the permanent magnet is theoretically expressed as follows.

\[ F_m = \frac{\mu_r - 1}{2 \mu_0 \mu_r} \oint_{\nu} \nabla B^2 \, dv \]  

(5)

\[ F_m = \frac{\mu_r - 1}{2 \mu_0 \mu_r} \oint_S B^2 \, ds \]  

(6)

Considering the Thomson’s formulation for the microrobot arm,

\[ F_m = \frac{V_p \chi}{2 \mu_0 \mu_r} (B \nabla) B \]  

(7)

the force between the lifting magnet and the robot arm is formulated. There are boundary conditions such as \( \nabla B^2 > 0 \) and \( \mu_r - 1 < 0 \) to ensure stability at the equilibrium point. From this equation, a magnetic field gradient is needed so that a linear force can be generated on the robot. The position of the microrobot can be controlled by positioning the gradient of the magnetic field within it relative to the microrobot. In calculating the diamagnetic force, which is another magnetic force, calculation is made assuming that the material used is uniform. If the diamagnetic force components in Z direction is simplified according to Ostrogradsky’s divergence law (Katz, 1979) as \( F_{dia,z} \),

\[ F_{dia,z} = \frac{X_{dia}}{\mu_0} \oint_S |B|^2 n_z \, ds \]  

(8)

where \( n_x, n_y, n_z \) are the surface normal vector component of the diamagnetic material in x, y, z direction respectively; \( ds \) is the surface area unit of the diamagnetic material. The force between the diamagnetic material and the floating magnet can be calculated through equations (8). In addition, the net force (9) can be expressed by a single parameter to simplify the sum of the magnetic forces acting on the microrobot.

\[ F_{net} = F_m + F_g \]  

(9)

After the mathematical model is formed, the relevant parameters have to be calculated except \( c_d \) and \( F_{net} \). Numerical analysis is necessary to calculate them. Because the drag coefficient, \( c_d \) varies depending on the stress, which is also depending on the velocity of the robot. Thus, (3) Number of equation is reshaped and \( c_d \) left alone,

\[ c_d = \frac{2 F_D}{\rho_f A v^2} \]  

(10)

\( F_D \) shall be calculated to determine drag force coefficient. To do this, the FSI (fluid structure interface) module in time-dependent is used. Time-dependent analyzes allow the simulation conditions to vary with time. For this reason, instead of "stationary", "time-dependent" analysis method is used in drag force calculation. Moreover, \( F_{net} \) can be calculated with the MNFC (magnetic field no
currents) module when stationary analysis mode is applied according to distance between the microrobot and the magnetic materials as well.

</table>

After the theoretical values have been determined in Table 2, the relevant experimental setup is shown for the calculation of \(c_d\) and \(F_{net}\).

Figure 3: The overall view of the test setup, the materials used and the measurements are shown. The system was placed in a global air environment of \(r = 50\) mm. Pyrolytic graphite: 1.5 mm map mesh, water: max 3 mm and min 0.05 mm extra fine mesh were applied. In the remaining domains, a tetrahedral mesh was applied with a max element size of 8 mm and a min element size of 0.2 mm. Sensitivity is increased by regular refinement in all simulations.

On the basis of the analysis given in Figure 3, the interaction of the robot arm with water was focused on and analysed. The microrobotic arm in the steady DI-water has been subjected to a certain axial movement, and the \(c_d\) has been obtained due to the stretching on its surface. In the analysis performed, the stresses for the \(-Z\) axis were calculated and the surfaces were selected. The robot arm in the container filled with water of dimensions 4x4x2 mm was moved in the \(-Z\) direction. At the speed range of 0-6.83 mm / s, the stress between 16.6-348 Pa was observed on the robot surface. The analysis results are calculated as \(c_d = 7.681\) and max \(F_{D,z} = 0.781\) μN.

Since the \(F_D\) speed depends on the speed, the micro manipulator in which the lifting magnet is placed will vary according to the speed of the stage. Since the speed limits of the stage used in the experiments are in the range of (-5 - 5) mm/s, drag force and speed relation will show a parabolic variable behaviour in this range. According to the simulation results, it is calculated that the force generated for the maximum stage speed of 5 mm/s is 0.781 μN.
The other forces are fixed, except for the magnetic forces acting on the robot. For this reason, the determination of the magnetic forces after the drag force analysis, i.e., calculation of $F_{\text{net}}$, is necessary. As a result of the analysis, $F_{\text{net}}$ shows the point where the forces acting on the robot are zero. In the simulations, the lifting magnet heights corresponding to each zero value and levitation height for the robot were obtained. The analysis of the experimental setup was solved using the COMSOL direct solver method to obtain more accurate results. The result of the analysis is calculated by using the Maxwell stress tensor and global matrix evaluation method, which effects the robot arm, and the results are the same. The force obtained in the Z direction were taken with a 3.31% error by surface fitting is shown in Figure 4.

![Figure 4](image)

According to the parabolic surface graph obtained from the analysis made, when the "Lift Magnet Distance" indicated by Y axis and the "Levitation Height" indicated by X axis increase, the net force generated on the microrobot is reduced. Max: 51.89 $\mu$N and min: 8.11$\mu$N force values were calculated.

Along with the drag force obtained, the net force, lift force on the z-axis and microrobot mass act on the microrobot at the same time. Related forces;

$$F_T = F_{\text{net},z} - F_{D,z} + F_{B,z} - F_{r,z}$$

and $F_T$ (total force) are shown as equation (15). In addition, the related force values are given in Table 3 and the required magnetic force is calculated as 16.7345 $\mu$N. The corresponding force value given in Figure 6 is shown as marked on the surface graph. The corresponding force value given in Figure 6 is shown as marked on the surface graph. As a result, the robot is separated from the stabilization point at a levitation height of 329.1 $\mu$m according to the analysis. In addition, there is a flat profile with a linear slope at the levitation height: 0.1-0.3 mm. The area outside the region concerned may be called the region of instability; Within this region, the microrobot arm can be stably operated.

**Experimental Results**

Implementation of experimental setup: It contains a microrobot arm positioned in a DI water container with pyrolytic graphite on its surface. The ring magnet (lifter-magnet) on which the magnetic force required for levitation is obtained is on the vessel. To achieve stable and micro-precision levitation, it is necessary to position the lifter magnet on the DI water tank parallel and rigid. In order to perform levitation and precise position control at the micro level, A PI Micro Stage (M-126.PD2 / 20x20x20 mm) with 3-axis linear micro-movement sensitivity was placed on the Z axis. A manual micro-stage was used to position the DI water container parallel to the floor and to move the 3 axes when...
necessary. A nano-sensitive laser distance sensor (optoNCDT-ILD2300-50) is preferred for instant measurement of levitation height within the system. The microrobot is made to levitate by the movement of the fiber magnet in the order of microns along the Z axis. It exhibits a levitation characteristic depending on the magnets and properties used within the system. The reason for using a ring-shaped lifter magnet is that it has a hollow structure required for laser measurement. Thanks to the gap in the middle of the ring structure (10 mm diameter), the laser is aligned with the microrobot arm in the vertical position. The PI Stage, which we designed through the system interface, was moved by 50 μm on the Z axis, followed by 10 μm steps as the first levitation occurred. When the microrobot is in the levitated state, the behavior of the fiber magnet in the motion range of about 6 mm is observed. The measurement made according to the distance between the different levitation heights and the fibroid magnet microrobot is given in Figure 6.

Figure 6: The experiment was observed by recording the position data with the laser distance sensor in each movement step. The microrobot has been shown to operate at a maximum stabilization level of 330μm in the current system. Subsequently, the resultant force acting on the microrobot was acting in the upward direction, indicating that the robot departed from the stable region and moved upwards under the influence of the magnetic force.

In addition, the change in the 6 mm between the lifter magnet and the graphite also affects the levitation height of the microrobot, as shown in Figure 7.

Figure 7: Prior to the critical region where the lifter magnet effect increased, the microrobot showed a levitation elevation with linear characteristics similar to the simulation results.

Considering the objects and motion field to be manipulated by the microrobot in lab-on-a-chip applications, the 333 μm levitation height obtained from the experimental results is sufficient. In
Figure 7, it is a characteristic of our existing system that we have designed and designed. The diamagnetically levitated method we have developed may vary according to the system requirements to be applied. The proposed manipulation method allows for the microrobot design and driving magnet properties to be modified to achieve specific levitation intervals for different applications.

**Conclusion**

With diamagnetic levitation, the microrobot has been removed from the surface to achieve high precision positioning. The method we have developed will provide new solutions for precise micro-nano size objects and microfluidic applications requiring high precision positioning.

In addition to horizontal and vertical axis positioning accuracy, applicability has been demonstrated by means of end elements. Precise positioning of the levitation height of the microrobot has also been proven by experimental findings. In this way, nano-precision levitation and position control are ensured so that the microrobot can control movement in the micro-fluidic channel, nano-level and 3 axes.

A CAMERA-BASED MEASUREMENT SYSTEM FOR OPTIMIZATION OF DIFFERENTIAL-ALGEBRAIC ECOTOXICOLOGICAL MODELS

Pawel Drąg,1 Krystyn Styczeń,2 Konrad Matyja3

Abstract: We present a general framework for measurements and optimization of differential-algebraic models. Moreover, we propose an application of the considered methodology in ecotoxicology. The differential-algebraic models can be used to describe different ecotoxicological relations. One of them is the influence of the environmental pollution on the Daphnia's movement characteristics. Changes in these characteristics can be used as a tool for assessment of neurotoxicity. The camera-based measurement and optimization system enable us to obtain the differential-algebraic ecotoxicological relations in a fully automated way.

UDC Classification: 519.6; DOI: http://dx.doi.org/10.12955/cbup.v5.1074

Keywords: differential-algebraic models, ecotoxicological models, measurement system, nonlinear optimization

Introduction

The aim of this study is to present and discuss a new method for measurement, which uses a camera-based observation system. The general difficulty in the presented methodology is connected with an appropriate interpretation of the obtained measured values and an optimization of parameters of a model. The considered task has an important practical application in the modeling of ecotoxicological phenomena. Moreover, the presented approach summarizes and extends the recently obtained results.

A fast development of new industrial technologies can generate a significant amount of pollution. Especially xenobiotic substances from technological processes, which can be introduced into the environment, can be dangerous for living organisms. Therefore, the toxicity of these substances has to be assessed to predict the possible impact on ecosystems.

A general idea of a toxicity assessment consists of determining the relationship between a dose (or concentration) and the toxic effects, which can be divided into two main groups:

- discrete effects
  - mortality, i.e. the number of immobilized organisms,
- continuous effects
  - changes in enzyme activity,
  - the rate of growth.

In practice, national and international institutions and organizations, like US Environmental Protection Agency (US EPA), Organization for Economic Co-operation and Development (OECD), International Organization for Standardization (ISO), often normalize toxicity tests. Documents provided by them contain a detailed description of conditions, as well as the methodology of required experiments.

Unfortunately, the toxicity assessment methods typically possess some disadvantages.

1. Changes of toxic effects during the period of exposure are often ignored (Hatano & Shoji, 2010).
2. Measurements are carried out with arbitrarily selected exposure time (Matyja et al. 2016).
3. Some effects, like mortality, provide a very little information about properties of the toxins.
4. Other effects require long-term measurements for their analysis.

Therefore, there is a request for a possible simple toxicity test, which would eliminate most of the mentioned disadvantages.

In this article, we considered an idea of a pattern motion analysis as a new toxicity test, that would possess the desired properties. Some chemical substances can affect the behavior of an observed organism. The nervous system, as well as the movement abilities, can be impaired. An impact of chemical pollutants can be observed and analyzed clearly and in depth on the example of Daphnia

magna and crab Barytelphusa Guerini (Guilhermino et al., 1996; Fingerman et al., 1996). In particular, insecticides parathion and paraoxon can inhibit acetylcholinesterase of Daphnia magna (Guilhermino et al., 1996). Some substances, e.g., glucose and caffeine, may increase the mobility in general. Conversely, other substances can decrease the mobility. Moreover, the analysis of mobility can be applied not only to a single organism but also to groups, herds, and shoals. Some compelling studies regarding this matter have been conducted (Mach & Schweitzer, 2007; Ordemann et al., 2003).

In the presented study, an application of motion pattern analysis of a single Daphnia magna has been considered. The observed motion changes can be used to illustrate the influence of some chemicals on Daphnia. Moreover, they can be used to assess their toxicity. The camera vision systems play a key role in many processes. In the discussed issue, using camera observations is required by a high frequency of changes, as well as by the size of the object observed, which is not larger than several millimeters. Long-term observations can be very tiring for the human eye, and this may lead to inaccurate results of the measurements.

The continuously operating vision systems are employed in many branches of environmental engineering. They can be used for direct observations of the essential parameters, as well as in the indirect observations, where the appropriate indicators are taken into account. Therefore, the main application of the proposed camera vision system is to find the relation between the indicators of pollution indicators and the observed behavior of the object.

The relations between the elements of the studied system can be modeled in many ways (Ahlkrona et al., 2016). One of the most commonly used ways is to describe the relations by ordinary differential equations (ODEs) (Balsa-Canto et al., 2005). In some cases, when not only differential but also algebraic relations can be defined, the differential-algebraic equations (DAEs) are employed. The algebraic relations, above all, express physical conservation laws of physical quantities such as mass, energy or momentum. Moreover, the algebraic equations can represent the geometrical constraints (Brenan et al., 1996; Diehl et al., 2002).

Therefore, the aim of this project was to design a camera-based vision system, which can observe the organism and model its motion, as well as to identify parameters of the unknown model (Betts, 2010; Biegler, 2010). The position changes of Daphnia magna have been described using new systems of differential-algebraic equation (DAEs). Subsequently, the nonlinear optimization algorithm was applied to identify the unknown model parameters.

Three milestones had to be achieved to realize the presented task. The required and available materials needed to be specified. Then, features of the motion patterns had to be combined into the new differential-algebraic model. Finally, the nonlinear optimization approach was proposed to evaluate the unknown model parameters.

Materials

Daphnia magna is small crustacean living in the freshwater environment. Its maximal length is 5 mm. It is widely used for ecotoxicology purposes (El-Doma, 2013). Daphnis motion is very characteristic. They move by a series of “jumps,” therefore is similar to flea movement (Daphnis are often called "water fleas"). The body of Daphnia is shown in Figure 1.

Figure 1: Daphnia magna.

The Measurement System

The main ideas of a fully automated vision system include data storage units, as well as image-processing algorithms for solving such problems as localization and path following of the objects observed. In recent years, the considered vision systems have been introduced in ecology, ecotoxicology, and environmental and agriculture engineering. For improvement of the efficiency and flexibility of such systems, the data could be obtained from different vision-based sensors, and the data-structure should be suitable for advanced image processing algorithms as well. Therefore, the required information can be obtained using the implemented reliable numerical procedures.

As it was indicated above, automated vision systems require both vision sensors, as well as image processing algorithm to obtain useful information about the systems, their quality, and other features. The environment can be characterized by lots of parameters, which are dependent on the available sensors and data acquisition possibilities.

The main part of the designed measurement system is the high-speed camera Optronis CL600x2 (Figure 2). The particular features of the camera, important from the application in measurement system point of view, have been presented in Table 2.

The image processing algorithm

The most prominent part of Daphnia are its eyes. For the identification of the eye position on an image, a threshold approach is usually sufficient. Therefore, a light background is necessary to avoid any inaccuracies.

The position of Daphnia can be equated with a position of their eyes. Therefore, only two coordinates are needed to define a position of an observed organism.

The position of Daphnia at time \( t = t_i \) can be defined as

\[
S_i = (x_i, y_i),
\]

(1)

where \( S_i \) denotes a state at time \( t_i \), which can be determined by values of \( x \) and \( y \)-axis: \( x_i \) and \( y_i \), respectively. The state at time \( t = t_{i+1} \) can be defined similarly as

\[
S_{i+1} = (x_{i+1}, y_{i+1})
\]

(2)
and in general
\[ M_{i \rightarrow i+1} = (\Delta x_{i \rightarrow i+1}, \Delta y_{i \rightarrow i+1}), \]  
(3)
where \( M_{i \rightarrow i+1} \) denotes a movement from the state at time \( t_i \) to the state at time \( t_{i+1} \). Therefore
\[ S_{i+1} + M_{i \rightarrow i+1} = (x_i, y_i) + (\Delta x_{i \rightarrow i+1}, \Delta y_{i \rightarrow i+1}) = (x_{i+1}, y_{i+1}) = S_{i+1}. \]  
(4)
The sequence of the observed movements can take a form of the series
\[ \{M_{i \rightarrow i+1}\}_{i=0}^{N-1} = \{M_{0 \rightarrow 1}, M_{1 \rightarrow 2}, \ldots, M_{N-1 \rightarrow N}\}, \]  
(5)
where \( N \), the number of steps, does not need to be known a priori.

### The new differential-algebraic model

The presented considerations lead us to the new form of the Daphnia’s motion model. Each observed step
\[ S_{i+1} - S_i = M_{i \rightarrow i+1} \]  
(6)
has been taken at a known time. Therefore, the position change can be defined as
\[ \frac{S_{i+1} - S_i}{t_{i+1} - t_i} = M_{i \rightarrow i+1}, \]  
(7)
If the interval \( t_{i+1} - t_i \) is constant, then
\[ \frac{S_{i+1} - S_i}{\Delta t} = M_{i \rightarrow i+1}. \]  
(8)
Moreover, the differential motion model can be obtained
\[ \dot{\mathbf{x}} = M_{\dot{x}} = \begin{bmatrix} M_{x} \\ M_{y} \end{bmatrix} \begin{bmatrix} \dot{x} \\ \dot{y} \end{bmatrix}, \]  
(9)
with the initial conditions
\[ \begin{bmatrix} x(t_0) \\ y(t_0) \end{bmatrix} = \begin{bmatrix} x_0 \\ y_0 \end{bmatrix}, \]  
(10)
which are known from the measurements. The values \( M_{x} \) and \( M_{y} \) are unknown and needed to be estimated. Moreover, the geometrical constraints have to be incorporated into the model. These are the extreme values of the state coordinates
\[ x_{\min} < x(t) < x_{\max} \]  
(11)
and
\[ y_{\min} < y(t) < y_{\max} \]  
(12)
In this way, the new model of the Daphnia’s motion with the differential-algebraic constraints has been obtained.

### The nonlinear optimization approach

The data obtained from measurements \( \{(x_{\text{meas}}(t_i), y_{\text{meas}}(t_i))\}_{i=1}^{N} \) enable us to design the following nonlinear optimization task
\[ \sum_{i=1}^{N} (x_{\text{meas}}(t_i) - x(t_i))^2 + (y_{\text{meas}}(t_i) - y(t_i))^2 \rightarrow \min \]  
(13)
with the differential-algebraic continuous-pointwise constraints
\[ \begin{align*}
\dot{x}(t_i) &= M_{x} \\
\dot{y}(t_i) &= M_{y} \\
x(t_0) &= x_0 \\
y(t_0) &= y_0
\end{align*} \]  
(14)
\[ x_{\text{min}} < x(t) < x_{\text{max}} \]
\[ y_{\text{min}} < y(t) < y_{\text{max}} \]

for \( t \in [t_0, t_N] \).

In the proposed methodology, the successive quadratic optimization algorithm has been suggested (Nocedal & Wright, 2006). Moreover, the optimization can be carried out simultaneously with the measurements. The results of the optimization from the previous iteration can be treated as a new starting point for the optimization with the extended set of measurements. This approach is appropriate for a huge set of measured data.

**Conclusions**

The main contribution of the presented work is the camera-based observation system of Daphnia's mobility. The general system consists of the measurement, as well as the algorithm for model parameters estimation.

The process of data acquisition and data analysis can be fully automated through the use of cameras and Matlab software. This kind of automation is a considerable advantage, which may result in shortening time of analysis of a large samples number.

Moreover, the new model of Daphnia's mobility consisting of the piecewise-continuous differential-algebraic constraints has been introduced. The presented methodology can found its application in ecology and environmental engineering, where the Daphnia are employed as the indicators of environmental pollution.

EVALUATION OF A GROUP OF PYRROLE DERIVATIVES AS TUBERCULOSTATIC AGENTS

Maya Georgieva,¹ Diana Tzankova,² Stanislava Vladimirova,³ Atanas Bijev⁴

Abstract: This research aims to contribute to the global search for more effective tuberculostatics that has been triggered by recent outbreaks of tuberculosis. A group of pyrrole-containing derivatives are designed and theoretically elucidated. The identification of the pharmacophore group using the PharmaGist webserver is attempted. Also, the corresponding drug-like properties of the tested compounds are evaluated, together with their possible toxicity risks. The pharmacokinetic behavior of the structures is predicted, based on the Lipinski’s Rule of Five. The effects of some structural parameters are tested. In addition, in vitro evaluations of the anti-tubercular activity against Mycobacterium tuberculosis H₃₇Rv are performed, with compound GA-9 registering the highest activity.

UDC Classification: 615.3; DOI: http://dx.doi.org/10.12955/cbup.v5.1075
Keywords: pyrrole-derivatives, pharmacophore, drug-likeness, tuberculostatic

Introduction

According to recent statistics published by the World Health Organization (WHO), tuberculosis (TB) is one of the top 10 causes of death worldwide. In 2015, 10.4 million people were infected with TB, with 1.8 million deaths, including 0.4 million among them with the human immunodeficiency virus (HIV). Over 95% of TB deaths occur in low- and middle-income countries, where, according to WHO (2017):

Six countries account for 60% of the total deaths, with India leading the count, followed by Indonesia, China, Nigeria, Pakistan and South Africa. In 2015, an estimated 1 million children were infected with TB and 170 000 children died of TB (excluding children with HIV). TB is a leading killer of HIV-positive people: in 2015, 35% of HIV deaths were due to TB. Globally in 2015, an estimated 480 000 people developed multidrug-resistant TB (MDR-TB) (APA: WHO Tuberculosis, 2017).

Considering these statistics, “ending the TB epidemic by 2030 is among the health targets of the newly adopted by WHO Sustainable Development Goals” (WHO Tuberculosis, 2017).

Also, according to Euro WHO (n.d.):

Bulgaria is among the 18 high priority countries for tuberculosis (TB) control in the WHO European Region. Challenges for the National Tuberculosis Programme (NTP) include the lack of efficient TB infection control and the low level of engagement of TB care providers, especially primary health care providers, in early detection and follow-up of TB patients (APA: Euro WHO, 2017).

Thus, in the search for a promising platform of structures for evaluating anti-tubercular agents, a significant number of investigations have focused on a variety of heterocyclic derivatives, including structures containing a pyrrole heterocycle, such as the known anti-tubercular agent BM 212 (Deidda, 1998) and its analogs (Poce, 2013).

In the same context, a series of substituted pyroles were synthesized at the Faculty of Pharmacy, Medical University –Sofia, Bulgaria and laboratory of organic synthesis at University of Chemical Technology and Metallurgy (UCTM) - Bulgaria and evaluated as anti-tubercular agents, with up to 100% inhibitory activity against Mycobacterium tuberculosis or a half maximal inhibitory concentration (IC₅₀) less than 6 μg ml⁻¹ (Bijev, 2010; Georgieva, 2010; Georgieva, 2011). In addition, reliable structure-activity relationships have been derived (Lessigiarska, 2012) that attempt to contribute to the global fight against the spread of tuberculosis.

Design and Synthesis of the Evaluated Structures
A variety of chemical templates has been explored by us (Bijev, 2006), including hydrazones (Bijev, 2008a) and derivatives of pyrrole (Bijev, 2008b). The performed analysis motivated us to combine the active principles of these moieties, and thus we synthesized consecutively several series of such pyrrole derivatives as potential anti-TB (anti-tubercular) agents (Bijev, 2006; Bijev, 2008a; Bijev, 2008b; Bijev, 2010; Georgieva, 2010; Vladimirova, 2015).

This research aims to contribute towards the global search for more effective tuberculostatics. The design of the molecules included in this study is addressed to diversify the available pyrrole derivatives already identified as perspective inhibitors of *M. tuberculosis*.

Data and Methodology
This study examined structural changes in three focus areas identified as A, B, and C of targeted compounds (Figure 1).

This approach was based on observations of Vladimirova & Bijev, (2015, p. 5): “The most radical change was made in moiety A, whereat the N-acyl-chain in the previously developed pyroles in our laboratory was replaced by R₂-R₃-substituted phenyl”, which was “motivated by the presence of the same moiety in series of bioactive products.”

In an attempt to evaluate the independent effect of this new moiety A, the ester group (R = OC₂H₅) in moiety B was maintained in three of the products. Aiming for an analogy with the piperazine- or thiomorpholine-heterocycle in BM 212 and their analogs, a change in moiety B with R = CH₃ or a morpholino-substituent was expected. In group fragment C, X = H alternates with X = Cl aimed to identify some similarity to substituted active tuberculostatics previously developed by the authors (Georgieva, 2010; Biava, 2004; Biava, 2008).

The products targeted in this study as described elsewhere by Vladimirova (2015, p. 3): “were synthesized via adopted Paal-Knorr cyclization by condensation of three 1,4-dicarbonyl compounds with a set of substituted anilines.”

Identification of the Pharmacophores
According to Schneidman-Duhovny, Dror, Inbar, Nussinov, and Wolfson (2008, p. 1), “Predicting molecular interactions is a major goal in rational drug design.” They also stated that: “The spatial arrangement of features, identified as pharmacophore group and responsible for the interaction of the designed molecule with a desired target receptor, is an important model for achieving” this purpose (Schneidman-Duhovny, Dror, Inbar, Nussinov, and Wolfson (2008, p. 1)).

This study aimed to identify the pharmacophore group using the PharmaGist Webserver (Schneidman-Duhovny, Dror, Inbar, Nussinov, and Wolfson, 2008). The evaluated compounds were separated into two groups, according to their structural similarity to the published pyrrole agent with underlined antituberculosis activity, BM 212 (Biava, 2004; Figure 2).
A ligand based method was employed, and the candidate pharmacophores were outlined, computed by multiple flexible alignments of the input ligands. The method explicitly considers the flexibility of the input ligands within the alignment process (Schneidman-Duhovny, Dror, Inbar, Nussinov, and Wolfson, 2008).

**Drug-likeness Prediction**

There are many approaches that assess a compound’s ‘drug-like’ properties, partially based on topological descriptors, fingerprints of MDL structure keys or other properties. The biological activity is also identified as a function of the complex influence of a variety of molecular descriptors. The underlayment of a certain structural parameter and the expected pharmacological effect is at times possible. The hydrophobicity of the compounds expressed as LogP outlined the key parameter for determination of compounds Drug-likeness.

The study aimed to predict the drug-like properties of the newly synthesized pyrrole derivatives using the following two approaches: Lipinski’s Rule of Five limitations (Lipinski, 1997; Lipinski, 2001) and OSIRIS Property Explorer evaluation score (Sander, Thomas Actelion Pharmaceuticals Ltd., 2017). The OSIRIS Property Explorer prediction tool used in this publication is an integral part of Actelio’s in-house substance registration system (Sander, Thomas Actelion Pharmaceuticals Ltd., 2017). The prediction process relied on a precomputed set of structural fragments that provided preliminary information on a number of drug-relevant properties, such as drug-likeness and toxicity alerts (Sander, Thomas Actelion Pharmaceuticals Ltd., 2017).

**Prediction of the Pharmacokinetic Behavior**

The pharmacokinetic of the evaluated structures was important for initial information in their identification as possible active agents. The behavior of the targeted structures was easily predicted, based on the results from the performed elucidation of Lipinski’s Rule of Five parameters pointing the following boundaries: hydrophobic parameter Log P < 5, molecular weight MW < 500, the number of hydrogen bond acceptors n(O, N) < 10, and the number of hydrogen bond donors n(OH, NH) < 5 (Lipinski, 1997; Lipinski, 2001). The desired parameters were calculated with the help of online cheminformatics services offered by Molinspiration Cheminformatics.

**Evaluation of Drug-likeness**

The synthesized new derivatives of pyrrole were assessed for drug-likeness using two parameters: Fragment Based Drug-likeness and Drug Score.
The Fragment Based Drug-likeness was calculated by the following equation for summing score values of those fragments that were present in the molecule under investigation, as follows:

\[ d = \frac{\sum v_i}{\sqrt{n}} \]  

(1)

A positive value meant that the analyzed molecule contained predominantly fragments that are frequently in commercial drugs (Sander, 2017).

The Drug Score was the combined value of the drug-likeness, cLogP, logS, molecular weight, and toxicity risks, used to evaluate the compound’s overall potential to qualify as a drug. It was calculated by multiplying contributions of the individual properties with Equation 1:

\[ ds = \prod \left( \frac{1}{2} + \frac{1}{2} S_i \right) \cdot \prod t_i \]  

(2)

where \( ds \) is the drug score and \( S \), the contributions calculated directly from of cLogP, logS, mol weight and drug-likeness \( (p_i) \) using Equation 3, which describes a spline curve:

\[ S_i = \frac{1}{1 + e^{a p_i + b}} \]  

(3)

where, respectively, \( a \) and \( b \) were the values of cLogP \( (1, -5) \), logS \( (1, 5) \), mol weight \( (0.012, -6.000) \), and drug-likeness \( (1, 0) \). The \( t_i \) was the contribution obtained for the four toxicity risk types. The \( t \) values were 1.0, 0.8 and 0.6 for ‘no risk’, ‘medium risk’, and ‘high risk’, respectively (Sander, 2017).

**Screening for Tuberculostatic Activity**

The anti-tubercular activities of the target compounds were determined by in vitro procedure at the SRI International, a contractor for National Institute of Allergy and Infectious Diseases (NIAID), USA (SRI International, 2010).

The evaluation was performed according to the SRI International Screening Program. This involved a single point concentration procedure where all compounds were initially screened against *M. tuberculosis* strain H\textsubscript{37}Rv (Collins, 1997). This assay was the primary screen. Where compounds were active at 10 µg mL\textsuperscript{-1} level, they were further tested in a minimal inhibitory concentration (MIC) assay at eight concentrations in a dose range between 10.000 and 0.078 µg mL\textsuperscript{-1} (Georgieva, 2010).

The procedure was performed as follows: 20 µl of the 3.2 mg mL\textsuperscript{-1} test compound was added to a 96-well microtiter plate. Two-fold dilutions were made by adding 20 µl of diluent. Each dilution was further diluted 1:10 in sterile water (10 µl of dilution to 90 µl of sterile water). An amount of 6.25 µl of each dilution was transferred to duplicate 96-well test plates. Then, 93.75 µl of the cell suspension \((\sim 10^8\) bacteria) in 7H9 medium was added to the test plates. Positive (included rifampicin and isoniazid), negative (included cell culture with solvent and water, and cell culture only), sterility (included media only; and media with solvent and water) and Resazurin (7-Hydroxy-3H-phenoxazin-3-one 10-oxide; included one plate containing the diluted compound with Resazurin only) controls were tested. The 96-well test plates were incubated at ambient 37°C incubator for six days. After the 6-day incubation, 5 µl of a 0.05% sterile Resazurin solution was added to each well of the 96-well plate. The plates were placed in an ambient 37°C incubator for two days. After the 2-day incubation, a visual evaluation and a fluorimetric reading were performed. The results were presented as ‘% Growth Inhibition’ (Georgieva, 2010).

The tuberculostatic activity of the tested series of pyrrole derivatives against *M. tuberculosis*, strain H\textsubscript{37}Rv, evaluated by SRI International as ‘% Growth Inhibition’ was transformed into a more common general format in an attempt to identify possible trends. Thus, with the help of simplifying considerations, the current results were recalculated from ‘% Growth Inhibition’ to ‘% inhibitory activity’ related to that of BM 212 (accepted to be a standard within 100%). The following approximations were applied:

Recalculated % inhibitory activity = % Growth Inhibition + 7.13

where the value of 7.13 was the absolute poorest registered (with negative sign) activity (Georgieva, 2010).

**Results and Discussion**

The best pairwise solution for the evaluated molecules and BM 212 was its pairing with MV-3 (Figure 3).
The identified pharmacophores for the most active agent identified from the microbiological testing and then used as reference agent BM 212 are shown in Figure 4.

The identified pharmacophores may be further used for generating new leads and optimizing existing ones or both in designing drugs.

The results of the performed calculations for prediction of the pharmacokinetic behavior are presented in Table 1.

</table>
The compounds MV-13, GA-1, GA-2, GA-5, and GA-8 violated the rule with the miLogP parameter. As the structures are considered antimicrobials, the observed violations do not affect their value as pharmacokinetics.

Another confirmation was the result from the performed prediction with the absolute value (%ABS), calculated by the expression: %ABS = 109 – 0.345TPSA introduced elsewhere (Zhao, 2002). The results showed the target compounds had commensurable and high %ABS, which indicates valuable pharmacokinetics and thus indicated they follow the regulations of Lipinski’s Rule of Five, decreasing any pharmacokinetic concerns.

The corresponding values of the computational analysis for Drug-likeness and Drug Score are presented in Table 2.

Source: Author
The evaluation established that compound MV-13 shows the highest drug like properties with Fragment Based Drug-likeness score of 4.60 and total Drug Score of 0.49, equal to the new anti-tuberculat agent BM 212.

The primary screening results of the evaluated compounds are presented in Figure 5.

![Figure 5: Primary screening results for the evaluated compounds](image)

Source: Author

From the test group, compound GA-9 showed the highest inhibitory activity. This result confirms the expectation of the drug-like effect of the underlined structure, based on the drug-like similarity with the new anti-tuberculat agent BM 212.

**Conclusion**

The results indicate that the identified pharmacophores have additional use in generating new leads or optimizing existing ones or both in drug design. The newly synthesized products strongly aligned with Lipinski’s Rule of Five limitations, which is a premise for sound pharmacokinetics. In addition, the target compounds had commensurable and high absolute values. On the one hand, a comparison of results showed five compounds failed to meet Lipinski’s Rule of Five parameters, with these compounds unsuitable for further structural optimizations. On the other hand, the compound MV-13 had the highest drug-like properties, with a Fragment Based Drug-likeness score of 4.60 and total Drug score of 0.49, equal to the new anti-tuberculat agent BM 212. As well, compound GA-9 was underlined as having the highest tuberculostatic activity amongst the evaluated molecules.

CURRENT APPROACHES TO INCREASED PROTECTION AGAINST TROJAN HORSES IN CLOUD SERVER SOLUTIONS

Peter Veselý,1 Michal Greguš,2 Eleonóra Beňová3

Abstract: IT companies are presenting to their customers cloud computing as a technology that will give them a competitive advantage if they implement it faster than their competitors. It is true that cloud computing can improve the businesses capability to access, share, and protect their company's data, particularly when they have a limited capacity to manage on-site modern technology resources. Using cloud services or simply only thinking of moving data to the cloud creates a wide set of concerns, starting with basic security concerns, and going as far as to the availability of cloud services, that is the company would not be able to get to the data when it needs it. Small and medium companies do not have enough resources to fight cyberattacks, but they can implement policies that will minimize the risk of the loss of their valuable data. The aim of this paper is to describe the current threats companies are facing when they use cloud services and to give them advice how to minimize the risk of these threats. We will specify a set of rules especially for small and medium companies and organizations that should help them to be able to choose more secure cloud services for their particular needs.

UDC Classification: 004.49; DOI: http://dx.doi.org/10.12955/cbup.v5.1076

Keywords: cloud, security, Trojan horses, 0-day, hack

Introduction

Every day we use the connection to a cloud server. A large proportion of people do not even know, that they are connected to cloud server solutions. And not considering this, they use any functions of standard computers or smartphones (Davidekova, 2016). Companies are increasingly switching to cloud server solutions and implement various services to their corporate infrastructure. The threat of a cyber-attack does not surface until they become a victim (Kumar, 2017). The use of cloud server solutions brings many benefits but also a large number of new security risks. The whole world is currently in a great cyber war and it is only a matter of time before we become a target (Wenli, 2015). However, the primary targets shift towards cloud infrastructure and services based on cloud server solutions, where there are many users, a lot of data traffic, and personal data (Somani et al., 2017). There is currently a number of documented Trojan Horses, which are likely formed by state governments for the purpose of entering foreign computer systems to damage them, or more likely, in order to be used for a massive data collection. Cyber-attacks have evolved from simple ones to sophisticated and devastating Advanced Persistent Threats (Redondo-Hernandez et al., 2015), such as the Stuxnet attack was (Farwell and Rohozinski, 2011). These threats have the capabilities to stop business operations and even cause physical damage (Bajramovic and Gupta, 2017). Effective IS/IT security must ensure an adequate level of confidentiality, integrity, availability, authenticity and nonrepudiation (Karovic et al., 2015).

Stuxnet

The super virus Stuxnet is considered the first virus developed by intelligence services to track other countries or to damage the technologies of other countries. It is estimated, that more than 100,000 computers were infected by Stuxnet. The main goal, however, was initially only one target, the Natanz enrichment facilities in Iran. This is generally considered to be the first strike in the global cyber war. According to the reports, diaries and subsequent analysis of a number of authors like Fiaidhi and Gelogo (2012), Byres (2016), or Kenney (2015) including ESET, a leader in antivirus solutions, it is clear that the development of Stuxnet could be contributed to US intelligence agencies, the NSA and an Israeli military unit known as UNIT 8200. The virus itself was a relatively sophisticated solution that contested alone the core of the Windows operating system using a 0-day exploit. At the same time, it was a cross-platform solution, which after analysis of the virus infecting other systems, especially the Siemens PLC systems, where a firmware upload in particular centrifuges, which then changed parameters to lead to their physical destruction. A comprehensive solution indicates, that the virus itself must constitute more people versed in multiple systems. The biggest threat is currently

1 Faculty of Management, Comenius University in Bratislava, peter.vesely@fm.uniba.sk
2 Faculty of Management, Comenius University in Bratislava, michal.gregusml@fm.uniba.sk
3 Faculty of Management, Comenius University in Bratislava, eleonora.benova@fm.uniba.sk
using a 0-day exploit Windows operating systems. The use of these errors means that the virus conceals itself perfectly and had existed several years before it was discovered.

Figure 1: Possible ways to infect system with Stuxnet

Source: Byres (2016)

The technology is relatively simple, based on the recognition that the target group uses Windows in several versions and these versions are called 0-day bugs, errors which have not yet been discovered, not even by the manufacturer of the operating system. In the world, there are several companies that specialize in finding just those errors and sell them to governments. For example, a company VUPEN according to Forbes magazine in November 2011, received the amount of 250 000 USD for the supply of information on software vulnerabilities from the US government (Bohdalova and Kurdyova, 2013). Stuxnet itself according to the version contains an analysis of approximately 15,000 lines of code that is written quite sophistically and includes a section for introducing a different code to the PLC equipment.

Duqu and Flame

The new super virus Duqu and Flame are successors to Trojan horses produced by state organizations. Trojan Duqu is able by means of false digital signature certificate update the system by running the document to take control of the Windows kernel. Duqu is able to thereby change the computer to a botnet zombie. To function it is sufficient to have only about 3000 lines of code, unlike Stuxnet which depends on libraries having a size of approximately 20 megabytes. Already there is a visible shift from a pure Trojan horse technology, that is Duqu and Flame is a mixture of worms and Trojan virus and relies on the use of libraries of the Windows operating system itself. The Trojan Horse Flame collects information not only on the computer’s local network but due to undocumented bugs in Bluetooth, also collects data from mobile devices (BYOD abuse). Then it sends the information on to more than eighty servers. When analyzing these sites with Symantec, there has been issued a statement, which the efforts and plans to create Duqu and Flame requires government approval. It also proves the track of the eighty servers registered to cover German and Austrian companies around the world. Based on Flame there were created several generations of Ransomware viruses that also exist today and commit great damage in cybersecurity. Creating a Windows protection against the types of attacks such as the Duqu and Flame took a few weeks for Microsoft programmers. In doing so, they had to change part of the core system, in particular authentication and encryption of the core system, so that the 0-day exploits did not continue to abuse it.

FinFisher

The FinFisher software was sold legally by company Gamma International Ltd. worldwide to governments. For example, according to available information, Slovakia has purchased 49 licenses, which is more than Hungary. According to published information, there are several versions of FinFisher according to the degree of difficulty in the implementation of the target system. Malware/Trojan horse then actively analyses all available documents and databases, and extensive data is sent to the attacker. FinFisher is also known to actively exploit a security loophole in the
iTunes system for spreading itself. It took three years, until Apple has resolved the issue of its services - operated by its private cloud iTunes. In addition, a frequently used masking technique is used to attack Mozilla Firefox. Gamma had created an espionage program that was entitled Firefox.exe and even provided a version number and trademark claims that appear to be a legitimate Firefox software. Currently it is very difficult for detection since the algorithm is constantly changing as well as techniques for masking the Trojan Horse FinFisher.

**Future Trojan Horses and Other Cracking Tools**

It would be naive to think that after the success of Stuxnet, Duqu and Flame, the creators decided not to continue further in their development. At present, intensive work in the legal sphere of cross platform security and privacy is needed, since various solutions that seek to decrease vulnerability, e.g. Microsoft.NET, are being implemented for all operating systems. For policy makers that means the possibility of a smooth entry into the system. However, the authors of the operating system try to improve the security of the operating system core. For example, Ubuntu has agreed with Microsoft to implement running Bash on Ubuntu on Windows.

It is assumed that at the moment different versions of Trojan Horses are being tested and that the new version of Stuxnet, Flame and Duqu are already in circulation and are detectable.

**Infection Storm with Locky**

A new kind of infection ran like a chain reaction across the globe. Abused to distributing the 4th most popular operating system in the world - Linux Mint, combined with the most widespread misuse of the web applications from WordPress. The attackers have changed the distribution from the 20.2.2016 to their own for several distribution servers. As a result, over 20 million distributions of Linux Mint began to spread the ransomware Locky. It is estimated that over 2 days Locky infected over 250 million computers. Its sophisticated code first deletes all kinds of backups on disk, including shadow copies of Windows and then scans all drives attached external drives as well as any local network connection. Then it crypts in a quite sophisticated way (Davidkova and Farkas, 2014) individual files, and demanded 0.5 per Bitcoin ransom per file.

**Using Cloud Server Solutions**

Currently, cloud solutions is based on several projects such as OwnCloud, or OpenStack Zential. There are other solutions, but number of these solutions lead to large multinational companies. In addition, the functioning of the cloud server solutions rely upon e-Government solutions in world.

**Cloud Server Protection**

One of the possibilities of protection is the consistent prevention of security incidents, the consistent application of antivirus agents, keeping and updating the list of installed programs. However, in the cases described above, such prevention is meaningless. An attacker familiar with the company's internal affairs enforces and infects the standard security measures. In addition, standard antivirus solutions recognize only the threats that already have been analyzed, despite the fact that they dare to try to do a heuristic analysis.
The second option is a consistent cataloging of each file in the system with consistent hardware and software tracking. In practice, there are few systems for monitoring complex information systems, but they are mostly based on Windows technology. This means in practice that most of the hybrid networks can be controlled and protected. But not the whole hybrid network. Comprehensive cataloging of hardware and software on the corporate network should be able to check up and control the security of complex IS/IT, including BYOD. In fact, each file would be analyzed, compared to the file catalog of existing systems, and if a system kernel file would differ, the file would be refused to be copied down or it would be evaluated in detail as a threat. Currently, for example, Linux editions have a completely described file system, including the CRC checksum for system checking. The only exploitable weakness would be that the state starts publishing its own editions of operating systems that will have cataloged files in the part of the system, so the comparison will go well, but it will actually pose a security risk. The third option is to use other operating systems that are different from Windows. For example, there exist many variations of the system Linux as is documented by Karovic (2013), a vivid example is Scientific Linux that is used by scientists at CERN laboratories. Or the existence of Linux Ubuntu Kylin, which is approved by the Chinese government, and the standard version of Ubuntu is for example recommended by the UK Government as a safe one. The problem of the cloud solution however, is that there are currently several cloud server solutions based on only a few operating systems. So, the attacker only needs the knowledge of the given operating system, and basically the attacker does not have to deal with the other operating systems to get into a specific cloud server solution.

Conclusions
Currently as is documented especially by Lifars (2017), the development of super viruses and Trojan Horses is progressing faster than we are willing to admit. Individual countries are investing hundreds of millions in development, and over 150 states are developing solutions to protect against intruders from the internet. The war in cyberspace has already begun, and the protection against is becoming increasingly difficult and costly. Paradoxically the most efficient solutions now - cloud server solutions - are currently in the position as the most vulnerable ones because they are the often the primary aim of attackers and use only a narrow set of solutions for their operation.

RATIONAL DESIGN, SYNTHESIS AND CHARACTERIZATION OF HYBRID MOLECULES WITH PYRAZOLINE, PYRIMIDINE AND THIAZOLIDINE NUCLEI AS POTENTIAL ANTIBACTERIAL AGENTS

Liliana Rocio Guerrero-Villalobos,1 Fabián Orozco-López2

Abstract: In this paper, a set of computational tools were used to design and evaluate molecular structures resulting from the combination of the biologically interesting pyrazoline, aminopyrimidine and thiazolidine nuclei (molecular modification) to obtain new bioactive compounds. Key physicochemical properties were calculated (absorption, distribution, metabolism, excretion and toxicity), to determine the bioavailability of the designed compounds and to perform a preselection of 12 derivatives which were then optimized and studied by molecular docking with the receptor PBP3 (4bpj) from Escherichia coli. By these studies, 8 compounds were selected by their binding energies (from -5.36kJ/mol to – 7.05kJ/mol) and significant interactions with the amino acids of the receptor in its active site. In general, the synthesis of the selected compounds was carried out from the α,β-unsaturated carbonyl compounds as precursors. The dihydropyrazole derivatives were obtained from the reaction of chalcones with one equivalent of hydrazine derivatives by one-step cyclocondensations. The pyrimidine series were synthesized starting by the reaction of chalcones and guanidine, giving rise to the corresponding aminopyrimidines, which were then reacted with aromatic and heteroaromatic aldehydes to obtain the acyclic azomethine compounds. The thiazolidine-4-ones were obtained from the aminopyrimidines synthesized above, using three-component cyclocondensation reactions with 2-mercaptoacetic acid and benzaldehyde, in anhydrous toluene or benzene as solvents and using conditions of reflux with Dean-Stark. Finally, assays were carried out aiming to the formation of β-lactam rings, using the Staudinger-type cycloaddition reaction of 2-chloroacetyl chloride with cyclic imines. All the obtained compounds were fully characterized by IR spectroscopy, as well as mono- and bidimensional NMR techniques. The most promising compounds will be evaluated by in vitro assays as potential antibacterial agents.

Introduction

The indiscriminate use of antibiotics due to the growing proliferation of bacterial diseases has generated resistant and highly infectious strains that are often fatal in immunocompromised patients (Cuellar, 2013). This has motivated the scientific community to face new challenges in the development of latest introduced compounds with the widest possible spectrum, low toxicity, greater bioactivity and high selectivity.

In addition, the synthetic methods that could be more versatile, economical and practical, implying both health benefits and the generation of new knowledge in the development of pharmacophores of interest (World Health Organization, 2016). This scenario has made it possible to boost the search and discovery of new antimicrobial agents, which is reflected in the long lists of new antibiotic compounds that were not available due to the high amount of research and development in the different areas of both chemistry and medicine, seeking to address the problem (Vardanyan & Hruby, 2016). Along with this, advances in the understanding of bacterial physiology have established a structure-activity relationship (SAR) (Reguero, Barreto, & Jimenez, 1989), which has been used to modify the chemical structures of antibiotics with the aim of improving their antimicrobial activity, and thus to fight bacteria that have acquired resistance to previous antimicrobials (Amábile-Cuevas, 2003).

In this field, it is important to mention that the process of developing new medicines can take years to reach its final stage and represent an excellent economic investment to ensure its mechanism of action and guarantee its safety and efficacy in vivo (Marovac, 2001). Consequently, the current trend in obtaining new medicines seeks to rationalize the development of new therapeutic agents based on the relationship between the chemical structure of the medicine and its biological activity, as well as the rational design of new drugs using current tools of computational chemistry which daily grow in their ability to detect unobvious similarities and differences between pharmacotherapeutic agents (Escalona, Carrasco, & Padrón, 2008).

From this standpoint, the synthesis of heterocyclic compounds is proposed as an alternative to address this problem by means of versatile approaches such as Diversity-Oriented Synthesis - DOS (Spring,

1 National University of Colombia, Bogotá, Colombia, lrguerrero@unal.edu.co
2 National University of Colombia, Bogotá, Colombia, forozcol@unal.edu.co
molecular modification or hybrid pharmacophore (Moreno-Díaz, et al., 2008) and bioisosterism (Navarrete-Vázquez, et al., 2006), in order to circumvent the defence mechanisms and thus enhance pharmacological and pharmacodynamic effect of drugs; a process that throughout several studies have shown new and/or better biological activity.

In this respect, this work seeks to apply the methodology of rational *in silico* drug design with the aim of obtaining molecular prototypes with pyrazole, aminopyrimidine, thiazolidonic and β-lactam nuclei with potential antimicrobial activity; all of them tackled by the derivatization of chalcones as building blocks. In this study, ADMET parameters and virtual screening were considered in order to establish bioavailability and the proper structure-activity relationships, selecting this way the best prototypes to be synthesized by means of computational tools (Cheng et al., 2012), thus contributing to an increase in the chances of success and a decrease in costs (time, infrastructure, experimentation, among others), compared to traditional methods used in the discovery of drugs.

**Methods**

a. Structures preparation and virtual screening

Several aspects were taken into account. At the outset, the identification and design of the prototypes to be studied was carried out through the molecular modification approach (hybrid pharmacophore), with the fusion of some nuclei of the different chemical structures of the antibiotics (pyrazolines, aminopyrimidines, thiazolidones and β-lactams). To establish the best oral bioavailability profile according to the model developed by Lipinski (Lipinski, 2001), 60 new hybrid structures were designed and were then evaluated through *in silico* studies for the prediction of some relevant ADMET properties. In this study, molecular prototypes (pharmacophoric nuclei) were designed and diversified by the substitutions patterns at the Ar and Ar₁ positions, which sought to enhance biological activity and/or improve their bioavailability (Table 1).

In order to determine the bioavailability and toxicity profile of the prototypes, *in silico* tools were used that allowed the analysis and subsequent pre-selection of candidate compounds to be studied further. The first source of filtration was the prediction and evaluation of oral absorption from the physicochemical properties (Lipinski’s rules) since the more distant they are from the parameters of the rule, the more more complicated to overcome the subsequent stages in a possible development of drugs. Table 2 shows the values of the best prototypes, in which only 5 violates one of Lipinski’s rules (lipophilicity), showing an excellent bioavailability profile. *Ampicillin* was chosen as blank and was therefore subjected to the same process of evaluation of the bioavailability profile used in the other compounds, to compare the values and to analyse the selection criteria of the compounds in each phase. In that sense, it is observed that most of the scores are considerably higher except 5j.
acceptable in terms of efficacy (activity) and safety (Toxicity) for the molecular docking study, since it was necessary to confirm that the potential new drug will be subjected to estimation of in silico toxicity from their molecular structure using the free online software admetSAR, which is a database that relates structure-activity (Cheng et al., 2012). In general, for toxicity predictions, the entire series of compounds with -NO2 substituents showed toxicity as possible carcinogenic agents and exhibited significant levels of toxicity in environmental, biological models. Compared with Ampicillin, scores for Rat Acute Toxicity LD50 of most of the prototypes resulted similarly, but almost at the limit of the toxicity value, according to the scale of (Hodge & Sterner, 1949) (From moderately toxic to slightly toxic). The prototype 5i presented the best profile, with the lowest toxicity of the series (Table 3).

To predict the toxicity of the prototypes that presented the best bioavailability profiles, the compounds were subjected to estimation of in vitro toxicity from their molecular structure using the free online software admetSAR, which is a database that relates structure-activity (Cheng et al., 2012). In general, for toxicity predictions, the entire series of compounds with -NO2 substituents showed toxicity as possible carcinogenic agents and exhibited significant levels of toxicity in environmental, biological models. Compared with Ampicillin, scores for Rat Acute Toxicity LD50 of most of the prototypes resulted similarly, but almost at the limit of the toxicity value, according to the scale of (Hodge & Sterner, 1949) (From moderately toxic to slightly toxic). The prototype 5i presented the best profile, with the lowest toxicity of the series (Table 3).

With complete ADMET data obtained, it was possible to select the group of molecules to continue to the molecular docking study, since it was necessary to confirm that the potential new drug will be acceptable in terms of efficacy (activity) and safety (Toxicity) for in vitro and in vivo assays in animals and subsequently, in humans.

The group comprised of 12 compounds that presented the best bioavailability profiles were subjected to geometric optimization with the help of the HyperChem v.8.0.10 computational tool, in order to find the lowest energy (most stable) molecular conformation for each candidate, which will allow the study of the atomic and molecular properties of the prototypes. With this study, it was possible to establish that 10 of the molecules are below the energy value observed for the reference compound. Only prototypes 6a and 6c have values close to Ampicillin, indicating that these molecules at the conformational level are the least stable and possibly the most reactive.

With the objective of determining the viability of the interaction of the selected molecules with the catalytic domain of the enzyme transpeptidase PBP3 (4bjp) of E. coli (Berman, et al., 2000), and to find the most likely ligand-receptor binding conformation, the group of compounds were subjected to computer-aided molecular coupling analysis. The study of molecular docking was performed using the computational tool Auto Dock 4.2.6, by a rigid-body approach and study was conducted at the active site identified for the enzyme PBP3 and considering eight key amino acid residues: Ser307, Lys310, Ser359, Asn361, Lys494, Thr495, Gly496 and Thr497, responsible for the binding of ß-lactams to the active site of PBPs (Sauvage, et al., 2014).

The different Docking results (Table 5), show which of the selected molecules display binding energy values similar to the reference drug Ampicillin (-6.16 kJ / mol), and which of them have a better interaction with the amino acids of the catalytic site of the enzyme. In the set of results comprising hydrogen bonds, bonding energies and docking conformations of each of the molecules with the active site, it is evident that the prototypes 1i and 4i had interactions with several amino acids in the pocket and which of the atoms of the molecule participate in those bindings. It is also shown that 5i and 5j have no apparent interaction in the study.

After the enzyme-ligand molecular coupling study, each prototype was visualized and analysed using the PyMOL computational tool (Figure 1), which determined that 10 compounds have interaction with at least one of the residues of the amino acids that are part of the active site of E. coli PBP3. Among the compounds that showed interaction with the catalytic site of the enzyme, one is a chalcone (4i), two belong to molecules with pyrazoline nuclei (2g, 2j), two to aminopyrimidine derivatives (3d, 3h), three to thiazolidone compounds (4a, 4i, 4j) and two to derivatives with β-lactam nuclei (6a, 6c). The last two prototypes are still under consideration to pass to the synthesis stage.

**Chemistry**

In general, the synthesis of the selected compounds was carried out in the preparation of α, β-unsaturated carbonyl compounds as precursors (chalcons), using the Claisen-Schmidt type cyclocondensation reaction between aromatic aldehydes and the corresponding substituted acetophenones, according to the procedure reported in the literature (Durst & Gokel, 1985). Dihydropyrazole derivatives were obtained from the reaction of chalcones with one equivalent of hydrazine or hydrazine derivatives, by cyclocondensation reactions monitored by TLC. The aminopyrimidine series synthesis was performed by the reaction of chalcones with guanidine to obtain thereby the substituted aminopyrimidine derivatives, which in turn were reacted with aromatic and heteroaromatic aldehydes to obtain the acyclic azomethines. Such as the pyrazolines synthesized,
aminopyrimidine series exhibited high fluorescence properties in solution, making them interesting because of their potential application in molecular materials science.

**Figure 2: General scheme of synthesis of the selected hybrid compounds.**

In general, thiazolidine-4-ones were obtained from the aminopyrimidines synthesized above, using three-component cyclocondensation reactions with 2-mercaptoacetic acid and benzaldehyde, in anhydrous toluene or benzene as solvents and using conditions of reflux with Dean-Stark trap. Finally, assays were carried out for the formation of β-lactam rings, which were conducted using the cycloaddition reaction of 2-chloroacetyl chloride with a cyclic imine, in our particular case pyrazolines. This reaction is known as a Staudinger cycloaddition; however, although many the reaction conditions were used, the desired product could not be obtained, and the pyrazole compound was obtained instead, leading to the conclusion that there is a possible competition between the oxidation reaction (aromatization) and the cycloadition (formation β-lactam ring). That is to say that the thermodynamic driving force of the aromatic and more stable pyrazole formation ends up overcoming the formation of the fused β-lactam ring.

All the obtained compounds were fully characterized and confirmed by IR spectroscopy, 1H-NMR, 13C-NMR and two-dimensional techniques.

Conclusions

Following a methodology based on the rational design of in silico drugs, it was possible to propose and study a series of prototypes that have in their structure thiazolidone, aminopyrimidine, pyrazoline and β-lactam rings. Out of 60 molecules proposed, it was possible to determine that ten exhibited interactions directly with some of the key amino acids that make up the active site of E. coli’s PBP3 enzyme (4BJP). The ten selected prototypes were considered for synthesis phase, from which eight were obtained and are considered promising hits to be evaluated in subsequent in vitro tests to corroborate the acceptable profile of bioavailability and potential antibacterial activities observed in the computational studies. The series of aminopyrimidine and pyrazoline derivatives presented a characteristic luminescence that could be used for other purposes, such as bioindicators and chemosensors, as well as in molecular materials science.

PREVALENCE AND BIOFILM FORMING ABILITY OF LISTERIA MONOCYTOGENES ISOLATED FROM MEAT

Anna Zadernowska,1 Wioleta Chajęcka-Wierzchowska,2 Arkadiusz Zakrzewski3

Abstract: *Listeria monocytogenes* is a Gram-positive intracellular bacterium, which causes foodborne listeriosis. This organism can be introduced through many routes to food-processing environments and may become established on food-processing equipment. Examination of 130 meat samples was conducted and the *Listeria monocytogenes* prevalence was determined by using an ISO culture method and PCR method. The isolated strains’ ability to form a biofilm was determined with the microplate (MP) method. Out of 130 meat samples examined, 22 (17%) contained *L. monocytogenes*. The majority (n=13; 59%) of the strains were characterized by a no biofilm producer. Four of the of *Listeria monocytogenes* strains (18,2%) showed strong and five of them (22,7%) moderate ability to form biofilm.

**UDC Classification:** 614; **DOI:** http://dx.doi.org/10.12955/cbup.v5.1078

**Keywords:** *Listeria monocytogenes*, meat, biofilm

Introduction

*Listeria monocytogenes* is a Gram-positive, psychotrophic foodborne pathogen. The aim of this study was to investigate the incidence of *Listeria monocytogenes* in raw meat. Moreover, the aim of the study was to determine the isolated strains’ ability to form biofilm.

Literature review

*Listeria monocytogenes* is able to grow at different temperature (including refrigeration temperature) ranging from 2 to 52 °C, and in food having low pH value (4,4) or high salt concentration (14%). The minimum water activity (a_w) for the growth of *L. monocytogenes* in food is 0.92. The bacteria grow better (short generation and lag time) at the alkaline pH and high a_w. *Listeria monocytogenes* grows well in the presence or absence of oxygen. High concentrations of carbon dioxide are necessary to inhibit growth. At least 13 different serotypes of *L. monocytogenes* are known. Most cases are caused by serotypes 1/2a, 1/2b and 4b. The majority of reported foodborne outbreaks have been caused by serotype 4b (Ryser and Marth, 2007; Kramarenko et al., 2013). The minimum infective dose of *L. monocytogenes* is unknown, but is believed to vary in accordance with the immunity of the infected individual and the strain type (Bailey et al., 1989). Listeriosis arises from food contamination with *Listeria monocytogenes* causing encephalitis, septicaemia and miscarriage. The first epidemiologically confirmed foodborne outbreak of listeriosis occurred in 1981 in Canada and was linked to the consumption of Coleslaw salad. Other outbreaks of human listeriosis have been associated with milk, soft cheese, pate, jellied pork, tongue, rillettes and other foods of animal or vegetable origin (Capita et al. 2001). Some *L. monocytogenes* strains attack to environmental surfaces and form biofilms, perhaps by using peritrichous flagella encoded by flaA gene. Microorganisms growing in biofilms are protected against cleaning and disinfection and are difficult to eradicate. *L. monocytogenes* can attach and grow on abiotic surfaces including all types of foods processing surface such as glass, stainless steel, polypropylene, and rubber after contact times as short as 20 minutes. The biofilm formation renders the organisms more resistant to harsh environmental conditions, such as food processing, antibiotics, and detergents (Fux et al. 2005; Mafu et al., 1990).

Materials and Methods

Isolation of *Listeria* strains

A total of 130 samples were obtained from several local markets in Olsztyn, north-west Poland. Samples consisted of poultry meat: duck, chicken, turkey (n=40), beef meat (n=45), and pork meat (n=45). All the samples were kept at 4°C during transport and during storage before analysis. The analysis was done within 4 hours of purchase.

1 Industrial and Food Microbiology Department, University of Warmia and Mazury in Olsztyn, anna.zadernowska@uwm.edu.pl
2 Industrial and Food Microbiology Department, University of Warmia and Mazury in Olsztyn, wioleta.chajecka@uwm.edu.pl
3 Industrial and Food Microbiology Department, University of Warmia and Mazury in Olsztyn, arkadiusz.zakrzewski@@uwm.edu.pl
Culture method of *Listeria monocytogenes* isolation was based on the International Standard ISO 11290-1:1996. For primary enrichment, 25 g of each of the collected food samples was transferred to 225 ml of Half-Fraser broth (Merck, Poland), homogenized using a stomacher, next incubated overnight at 37°C. After 24 h incubation of the primary enrichment broth, 1 ml of the culture obtained was transferred to 10 ml of secondary enrichment broth, the Fraser broth (Merck, Poland). Inoculated Fraser broth was incubated for 48 h at 37°C. After incubation, a portion of the culture was taken with a loop for inoculating of the surface of Oxford and Ottawiani and Agosti agars (Merck, Poland). After incubation for 48 h at 37°C the plates were examined for the presence of colonies presumed to be *Listeria* spp. Colonies suspected to be *Listeria* spp. were selected for further confirmatory tests indicated in ISO 11290-1:1996. Finally, the colonies identified as *L. monocytogenes* were confirmed by PCR. Prior to analysis, isolates were stored in a Microbank at -80°C (Biocorp, Poland).

**PCR identification of *Listeria monocytogenes***

Identification using a Multiplex PCR was performed with primers and conditions described previously (Szymczak et al., 2011), specific for the *Listeria sp.* and *Listeria monocytogenes* based on the amplification of fragments of 16S rRNA gene sequence (938 bp) and *iap* (287 bp) (Table 1). In all PCR reactions used, amplified products were analyzed by electrophoresis through a 1.5% high resolution agarose gel (Promega) in 1 x TBE buffer pH 8.3. The sizes of the amplification products were estimated by comparison with a 100-bp molecular size ladder (Thermo Scientific, Fermentas). Gels were stained with ethidium bromide (Sigma-Aldrich) and visualized using the system for the documentation of fluorescently stained gels G-BOX F3 (Syngene) and analyzed using the program Gene Tools (Syngene). Each profile was visually compared with those obtained from the reference strains: *Listeria monocytogenes* NCIMB 13726.

**Table 1: Primers used for the amplification of the *Listeria* spp. and *Listeria monocytogenes***

**Detection of biofilm formation by the microplate (MP) method**

The method for assessment of biofilm formation by the MP method was based on the techniques proposed previously by Stepanovic et al. (2004) with some modifications described previously (Chajecka-Wierzchowska, Zadernowska & Łaniewska-Trokenheim, 2016). Wells of a sterile 96-well flat-bottomed sterile polystyrene microtiter plates were filled with 200μl of fresh sterile broth BHI (Merck, Poland). An overnight cultures (20μl) of each strain with a cell density of 1x10⁹ cells/ml were added in triplicate, onto the 96-well plates. Negative control wells contained broth only. The plates were covered and incubated aerobically at 36°C for 24 hours. The bacterial suspension was aspirated and each well was washed three times with 250 μL of PBS buffer (Sigma). After that, the biofilm was fixed with 200 μL of ethanol (99%) for 15 minutes, and later removed. The plates were dried at room temperature, stained with 200 μL of crystal violet solution used for Gram staining (Merck, Germany) for 5 minutes, washed in running water until the unbound crystal violet was removed and dried at room temperature. The dye bound to the adherent cells was re-solubilized with 160 μL of 33% (v/v) glacial acetic acid (Sigma) per well. Absorbance was read using an Infinite M1000 PRO plate reader (Tecan) at 570 nm. The optical density (ODs) of each strain was obtained by the arithmetic mean of the absorbance of three wells and this value was compared with the cut-off OD (ODc) which was defined as three standard deviations above the mean OD of the negative control. The following classification was used for the determination of biofilm formation: no biofilm production (ODc≤ODc), weak biofilm production (ODc<ODc≤2xODc), moderate biofilm production (2xODc<ODc≤4xODc) and strong biofilm production (4xODc<ODc).
Results and discussion

A total of 130 meat samples, including poultry, beef and pork meat were analysed for *Listeria monocytogenes*. Results are summarized in Table 2. The prevalence of *L. monocytogenes* in raw meats marketed in Olsztyn (Poland) was 17%. The percent occurrence of *Listeria monocytogenes* in the tested meat in descending order was poultry (20%), beef (9.8%) and pork (4.5%). Capita et al. (2001) isolated *Listeria monocytogenes* from 15% of poultry carcasses. A study conducted by Vitas (2004) in Navarra (Spain) revealed the presence of *Listeria monocytogenes* in 34.9% in minced pork and beef and 36.1% in poultry meat. No documented outbreaks of listeriosis have yet been directly attributed to the consumption of poultry meat. Nevertheless, the high prevalence of *L. monocytogenes* in poultry meat presents a potential risk, which may lead to outbreaks of listeriosis (Capita et al. 2001).

The pathogens’ ability to form biofilms has a twofold meaning. From a medical point of view, the ability to form it is a feature which proves the strain’s virulence. Components of a biofilm matrix protect bacteria against an immune attack and against penetration of chemotherapeutics. However, in terms of their industrial significance, strains which can form biofilms of manufacturing surfaces can pose a big problem; they are more difficult to remove from those surfaces, they can be less sensitive to disinfectants and they often cause secondary (cross) infections in the food industry (Shi & Zhu X 2009, Zadernowska, Chajęcka-Wierzchowska & Laniewska-Trokenheim 2017). Strains of *L. monocytogenes* are recurrently found on surfaces in the food industry, notably in refrigerated premises, even though these are routinely cleaned and disinfected (Carpentier et al. 2004). The majority of the *Listeria monocytogenes* strains were characterized by a no biofilm producer (n=13), or moderate ability to form a biofilm (n=5), only four of the investigate strains showed a strong ability to produce biofilm (Table 2). In a study conducted by Barbosa et al. (2013) revealed that most food isolates were classified as weak or moderate biofilm formers, although the majority were weak. In a study conducted by Kalmkoff et al. (2001), significant differences were found in the ability of various *L. monocytogenes* strains to attach to a test surface. In monoculture, the majority of strains did not form biofilms which coincides with our results.

Conclusions

Our results and data presented by other authors demonstrate the ubiquitous occurrence of *L. monocytogenes* in raw chicken, beef and pork meat. Since *L. monocytogenes* may be present in meat the consumption of raw or undercooked meat can be an important factor in the transmission and epidemiology of *Listeria monocytogenes* infection. It is also necessary to raise consumer awareness regarding secondary infections, which can occur during the transport of meat from a shop or during its processing. Regular monitoring of *Listeria monocytogenes* prevalence in food are necessary for disease surveillance and tracing the epidemic outbreaks.

STAPHYLOCOCCUS AUREUS FROM READY-TO-EAT FOOD AS A SOURCE OF MULTIPLE ANTIBIOTIC RESISTANCE GENES

Wioleta Chajęcka-Wierzchowska,1 Anna Zadernowska,2 Łucja Łaniewska-Trokenheim3

Abstract: The emergence of antibiotic-resistant strains of S. aureus such as methicillin-resistant S. aureus (MRSA) is a worldwide problem. Ready-to-eat (RTE) food which does not need thermal processing before consumption could be a vehicle for the spread of antibiotic-resistant microorganisms. The present study evaluated the molecular genetic characteristics (RAPD) and pheno- and genotypical antimicrobial resistance profile of S. aureus isolated from 75 RTE food samples (sushi, hamburgers, salads). All of the isolates (n=32) were resistant to at least one class of antibiotic tested of which 75% strains were classified as multidrug resistant. Most of the isolates were resistant to cefoxitin (87.5%) followed by clindamycin (78,1%), tigecycline and quinupristin/dalfopristin (53,1%). All methicillin resistant staphylococci harbored mecA gene. Among tetracycline resistance isolates all of them harbored at least one gene: tet(M), tet(L) and/or tet(K) and 78,9% of them were positive for the Tn916/Tn1545-like integrase family gene. Our results indicated that retail RTE food could be considered an important route for transmission of antibiotic resistant staphylococci harboring multiple antibiotic resistance genes.

UDC Classification: 614. DOI: http://dx.doi.org/10.12955/cbup.v5.1079

Keywords: antibiotic resistance, Staphylococcus aureus, antibiotic resistance genes, MRSA

Introduction

Staphylococcus aureus is one of the leading etiologic agents of hospital infections (Le Loir et al., 2003). It is known to cause a number of pathological conditions in humans and animals like bacteremia, urinary system infections, systemic diseases, osteomyelitis (Lina et al., 1999; Hageman et al., 2006). Toxins produced by S. aureus are one of the most frequent causes of bacterial food poisonings (Hennekinne et al., 2012). Foodstuff contamination may result from poor hygiene during production processes or the retail and storage of food. The pathogenic nature of S. aureus is related to the high genotypic and phenotypic heterogeneity of its strains. This results mainly from the abilities of staphylococci to exchange genetic material through mobile genetic elements.

Growing antibiotic resistance in S. aureus strains is a worldwide problem. The most worrying are strains resistant to methicillin (Methicillin-resistant Staphylococcus aureus - MRSA). The presence of antibiotic resistant strains among food derived microorganisms suggests that it may play a much more important role in transferring the antibiotic resistance encoding genes than previously thought (Chajęcka-Wierzchowska et al., 2016). Antibiotics are used for prophylactic purposes in swine, cattle, rabbit and poultry production as well as in vegetable and fruit cultivation and beekeeping (Ding and He, 2010) and, thus, the meat of farm animals, fruit, vegetables and water may be a source of resistant strains. Food and feed safety is essential, and the presence of MRSA in the food chain may contribute to the increasing dissemination of MRSA worldwide (Oniciuc et al., 2017). The multi-drug resistant S. aureus strains may have an increased ability to spread. This does not only provide therapeutic challenges for clinicians but may be very detrimental to human health. The study was designed to determine the occurrence of S. aureus and MRSA strains in ready-to-eat food products as sushi, salads, and hamburgers in Poland. Moreover, the presence of genes which encode resistance to methicillin and tetracycline’s was investigated.

Materials and methods

2.1. Isolation and biochemical identification of the strains

Staphylococci were isolated from samples obtained from sushi, hamburgers and salads purchases in fast-food bars and restaurants. Totally, 75 ready-to-eat samples were collected. These consisted of 25 sushi samples, 25 hamburgers and 25 salads. Samples were immediately transported to the laboratory under refrigerated conditions. All microbiological analyses were performed within the same day. Food samples (10 g) were homogenized in 90 ml buffered peptone water (Merck, Germany), incubated overnight at 37°C and streaked on selective plates containing Mannitol Salt Phenol-red Agar (Merck,

2 Chair of Industrial and Food Microbiology, University of Warmia and Mazury in Olsztyn, anna.zadernowska@uwm.edu.pl
3 Chair of Industrial and Food Microbiology, University of Warmia and Mazury in Olsztyn, lucja.laniewska- trokenheim@uwm.edu.pl

1108
Germany). Mannitol (+) colonies were differentiated into coagulase-positive and coagulase-negative with a test detecting the production of a clumping factor (CF) and production of coagulase on the RPF medium (Biomerieux) with rabbit blood plasma and fibrinogen. Isolates were Gram-stained using standard techniques. Gram positive, coagulase positive bacteria were presumptively identified as staphylococci and were selected for further biochemical identification. Prior to analysis, isolates were stored in Microbank at -80°C (Biocorp, Poland).

2.2. Bacterial strains and DNA extraction

For DNA extraction bacterial strains were cultivated on Brain Heart Infusion Broth with agar (BHI, Merck, Germany) at 37°C. Colony were suspended in TE buffer and lysed by Lизostaphin enzyme (0.6mg/ml). Total Genomic DNA of isolated and reference strains was extracted using the Genomic Mini DNA Purification Kit (A&A Biotechnology) according to the manufacturer’s instructions.

2.3. Molecular identification of isolates to the genus level

RAPD-PCR reactions were performed with primer M13 according to protocol published by Andrighetto et al., (1996). For the identification of isolates to the genus level, part of the 16S rRNA Staphylococcus gene was amplified according to Morot-Bizot et al. (2004). Amplification was carried out in a Kyratec Super Cycler Trinity Triple Zone (Nippon Genetics Europe) PCR reaction mixture were analyzed by electrophoresis through a 2% high resolution agarose gel (Promega) in 1 x TBE buffer pH 8.3. The sizes of the amplification products were estimated by comparison with a 100-bp molecular size ladder (Thermo Scientific, Fermentas). Gels were stained with ethidium bromide. Images of the gels were visualized using the system for the documentation and analysis of fluorescently stained gels G-BOX F3 (Syngene) and analyzed using the program Gene Tools (Syngene). Each profile was visually compared with those obtained from the S. aureus ATCC® 25923 reference strain.

2.4. Antimicrobial susceptibility test

Antimicrobial susceptibility testing was performed on Mueller-Hinton agar (Biomérieux) using the disk diffusion method. Isolates were tested for their susceptibility to erythromycin (E, 15μg), clindamycin (DA, 2μg), gentamicin (CN, 120μg), cefoxitin (FOX, 30 μg), norfloxacin (NOR, 10μg), ciprofloxacin (CIP, 2.5μg), tetracycline (TE, 30μg), rifampicin (RD, 5μg), nitrofurantoin (F, 300μg), linezolid (LZD, 30μg), chloramphenicol (C, 30μg), trimethoprim (W, 5μg), and tigecycline (TGC, 1μg), trimethoprim/sulfamethoxazole (SXT, 25μg), quinupristin/dalfopristin (QDA,15μg) using antimicrobial disks (Oxoid). Plates were incubated at 37 °C for 20–24 h and results were interpreted according to the Clinical and Laboratory Standard Institute document M100-S20.

2.5. PCR detection of antimicrobial resistance genes

All the strains phenotypically resistant to at least one antibiotic were examined for the presence of the resistance genes. Polymerase chain reaction for detection of genes mecA (533 bp) were carried out (Table 1). Amplification cycles for this two genes were done according to Barski et al. (1996). The

tetracycline efflux gene tet(K) amplification was performed according to Gevers et al. (2003). PCR detection of resistance to tetracyclines - tet(M), tet(L) was determined using the specific primers and the conditions reported by Rizzotti et al. (2005). For all the tet(M)-positive isolates the presence of conjugative transposons of the Tn916-Tn1545 family was determined by using primers targeting the integrase gene int according to Macovei and Zurek (2006).

The amplicons were evaluated by 1.5% agarose gel electrophoresis followed by staining with ethidium bromide (0.5mg/mL). Images of the gels were visualized using the system for the documentation and analysis of fluorescently stained gels G-BOX F3 (Syngene) and analyzed using the program Gene Tools (Syngene).

Results and discussion

The present study evaluated the molecular genetic characteristics (RAPD) and pheno- and genotypical antimicrobial resistance profile of 32 S. aureus strains isolated from 75 RTE food samples (sushi, hamburgers, salads) (Figure 1).

All staphylococcal isolates were examined for their susceptibility to 15 antibiotics. The data obtained from the disc diffusion testing are summarized in Table 2. The overall percentages of antimicrobial resistant isolates were: 87.5% to cefoxitin, 78.1% to clindamycin, 53.1% to tigecycline and quinupristin/dalfopristin, 46.9% to tetracycline, 31.2% to rifampicin and gentamycin; 12.5% to trimetoprim/sulfametoxasol and nitrofurantoin; 9.4% to erythromycin and trimethoprim and 6.3% to ciprofloxacin and linezolid. All of the investigated strains (n=32) were resistant to at least one class of antibiotic of which 24 strains were classified as multidrug resistant – MDR (resistant to three or more classes of antibiotics). Most MDR strains (n=11) revealed simultaneous resistance to 4 classes of antibiotics, followed by 5 strains to 6 classes; 4 strains to 5 classes; 3 strains to 3 classes. One of the examined strains revealed simultaneous resistance to antibiotics of 7 various classes (Table 2). All MDR strains (n=24;100%) were resistant to cefoxitin (FOX) and the majority of them (n=20; 83.3%) were resistant to clindamycin (DA), 16 MDR strains (66.7%) were resistant to quinupristin/dalfopristin, 14 of them (58.3%) to tigecycline and 13 MRD strains (54.1%) were resistant to tetracycline (Table 2).
Most of the studies on antibiotic resistance contrast to results published by other authors (Hammad et al., 2012; Lee et al., 2004) and reported on S. aureus (Chajęcka et al., 2008). A study of 200 samples of RTE food (including cheeses, cured meats, sausages, smoked meats, and raw fish) in our previous research (Hammad et al., 2012) examined 858 samples of RTE food (including cheeses, cured meats, sausages, smoked meats, and raw fish) in our previous research, tested for the presence of MRSA and MR-CoNS. In the study of 200 samples of RTE food (including cheeses, cured meats, sausages, smoked meats, and raw fish), 6% of isolated strains were positive for mecA (35 MRSA and 17 MR-CoNS strains) (Chajęcka-Wierczowska et al., 2014). Unlike in other studies, all MRSA strains carry mecA gene, in contrast to results published by other authors (Hammad et al., 2012; Lee et al., 2004).

Most of the studies on antibiotic resistance in S. aureus have concentrated on strains isolated from clinical samples. Recently, some researchers have suggested that environment and food could play a significant role in the transmission of resistance to humans (Wang et al., 2012; Chajęcka-

Source: Authors

Genotyping analysis indicated that all of the isolates phenotypic resistant to tetracycline harbored at least one tetracycline resistance determinant on which tet(M) was most frequent. The tet(L) genes did also appear but were less common. Gene tet(K) was always associated with tet(M) and tet(L). All of the isolates positive for tet(M) genes were positive for the Tn916/Tn1545-like integrase family gene. All of the cefoxitin resistant strains harbored mecA gene. Most MRSA strains were resistant to at least three of the antibiotics tested, and 25 of 28 MRSA strains were classified as MDR.

In other recently reported studies, lower isolation frequencies for MRSA in foods were found. In an Italian survey of 160 S. aureus strains analyzed six strains (3.75%) harbored the mecA gene. In Japan, Hammad et al. (2012) examined 200 samples of retail ready-to-eat raw fish (sashimi) of which they recovered 10 MRSA/MR-CoNS isolated from 10 different samples (5%, 10/200). In our previous study we have examined 858 samples of RTE food (including cheeses, cured meats, sausages, smoked fishes) on which 6% of isolated strains were positive for mecA (35 MRSA and 17 MR-CoNS strains) (Chajęcka-Wierczowska et al., 2014). Like as in these studies all MRSA strains carry mecA gene, in contrast to results published by other authors (Hammad et al., 2012; Lee et al., 2004).
Wierczowska et al., 2014, 2015). Furthermore, Gram-positive bacteria acquire and transfer resistance to antibiotics much more often and more easily than Gram-negative bacteria. The results obtained indicate the need for food monitoring for the presence of antibiotic-resistant \textit{S. aureus} and the possibility of transferring and transmitting antibiotic resistance genes. \textit{S. aureus} strains present in ready-to-eat food can pose a hazard for consumer health serving as a reservoir of resistance genes.

**Conclusions**

Our data indicate that \textit{S. aureus} is widely present in retail sushi, but also hamburgers and salads. Many isolated strains are antibiotic resistant and carry transferable genes which represent a potential source of resistance transmission to bacteria in humans. The most disturbing fact is that most \textit{S. aureus} strains were resistant to methicillin and had \textit{mecA} gene. Our results indicated that retail RTE food could be considered as important route for transmission of antibiotic resistant staphylococci harboring multiple antibiotic resistance genes.

NLP MODULE FOR BULGARIAN TEXT PROCESSING
Stoyan Cherecharov,1 Hristo Krushkov,2 Mariana Krushkova3

Abstract: The wide use of web-based information systems and a lack of highly skilled developers are the primary motivation to search for methods and approaches to optimize the building of such systems. This paper describes a model for creating web-based information systems by using a core of reusable, independent, and installable base modules. Such a system is easily adapted to a client’s needs and is extendable by adding specific modules that interact with the remainder of the system by following certain rules. The approach allows flexible and rapid development of applications for small to extremely large web-based systems, simply by adding modules with adequate functionality. The growing demand of Bulgarian customers for such systems is the reason for building a base module for automatic processing of Bulgarian text. This paper presents a module that performs automatic morphological analysis and synthesis, verifies syntactic agreement, automatically places stress, and processes complex verb forms, among other functions. The described functionality can be integrated with other modules using a suitable interface.

UDC Classification: 004.4’2; DOI: http://dx.doi.org/10.12955/cbup.v5.1080

Keywords: natural language processing, computational linguistics, software modules, web-based systems

Introduction
In recent years, there has been an increased interest for wide use of web-based systems (Prokofyeva & Boltunova, 2017; Yang et al., 2016). The high customer requirements and the lack of highly skilled and experienced developers are primary motivations for seeking methods and approaches to optimize the building of such systems. Using similar functionality allows a system to be built with reusable, independent, and installable modules. The systems can be built rapidly without compromising their quality. For this purpose, developers use the principles of the Aspect-Oriented and Modular programming. The installation can be performed using the standard package depended upon by managers of technology.

For example, one can use the log mechanism to track exceptions. An analysis of different web-based systems reveals the exceptions are managed by code snippets. This aspect of the functionality is spread across the application with different parts involved in more than one role and elements strongly coupled. That is, the various components have more than one primary role, and hence, the functionality does not conform to principles of strong cohesion, loose coupling, and single responsibility. One way to remedy this nonconformity is to extract and encapsulate each functionality into a separate module with a single role. This approach would mean the modules having a single assignment would be independent of the system for recording exceptions (a log system).

Another example is the authorization system that controls access to system resources by different roles or users. Such functionality can be encapsulated in a separate module where the system resources are independent of the controlled access. The method of a dynamic and parallel slicing algorithm that is context-sensitive for distributed Aspect-Oriented Programming (AOP; Singh et al., 2017) can be used. However, there are certain code pitfalls in AOP and analyses that need to be avoided (Santos et al., 2016). Certain technology with agnostic programming techniques for modular programming (Toulson & Wilmshurst, 2017) can be used during the separation of the functionality into modules.

There have been increased problems with the use of the Bulgarian language, from the students in recent years. Errors are evident in the speeches of the politicians and journalists in the mass media. Some universities overcome this problem by organizing Bulgarian language courses during the first year of the education. The abilities of the Information Technology (IT) in this type of education are still not used extensively. According to Blagoeva et al. (2011), the support for Bulgarian language text analysis is fragmentary, while for English it is sound, and for Dutch, French, German, Italian, and Spanish moderate. The state of speech and text resources is the same for cited European languages, although languages with moderate support include Czech, Hungarian, Polish, and Swedish.

There are also some fragmentary publications related to the automatic processing of the Bulgarian language. Different problems emerge with different approaches. The formal models comprise two main types: rule-based and statistical. Rule-based models are traditional and are a result of research by

linguists. The creation of tagged text corpora allows for statistical methods to apply over large amounts of data. The development of IT enables statistical models to improve and extend the rule-based models with new rules derived empirically. Rule-based Part Of Speech (POS) tagging as a part of a machine translation system is presented in Jackov (2015).

Regression models are used for fine-grained sentiment analysis in Bulgarian movie reviews (Kapukaranov & Nakov, 2015). Statistical methods provide sound practical achievements, while rule-based ones give students appropriate linguistic knowledge, and are thus, better for educational purpose.

Applying the methods of Active Learning, in which the student is the center of the educational process, is an important step in the direction of increasing its quality. The gamification is one form of such education.

Different techniques from the game industry, such as earning points, badges and medals, levels, a list of the leaders, avatars, and virtual currency are used, to increase the motivation of the students. A scientific report, dedicated to this topic, reveals that these techniques are used mostly in the informatics and IT education (Dicheva et al., 2015). Educational computer games that support utilization of Bulgarian morphology are described in Krushkov et al. (2015).

The conclusion of the research indicates the positive effect the gamification has on the students, by increasing their motivation, activity, commitment, and success. The usage of only traditional methods in the education of the high school and university students is monotonous and demotivating, especially for the ‘Z-generation’ (Internet generation). This generation (born after 1994) accepts the virtual world as the normal environment and cannot imagine their education without information technology (IT). The number of the students, graduates, and prospective students is decreasing. In such an environment, the courses of teachers and schools that are attractive to students are those using innovative educational methods based on IT. Hence, the main aim of this study is to create a natural language processing (NLP) module for Bulgarian text processing that is an integral part of every web-based system.

**Data and Methodology**

Analyses showed that the base modules necessary for rapid web-system development are: authentication module, log module, authorization module using access control list, navigation module using the authorization, session module, and a content management module.

The system we have built was open to extensions. Different modules with specific functionality can be added following certain rules. This approach allows flexible, rapid application and development of small to extremely large web-based systems, by only adding modules with adequate functionality. It allows programming with event and control loops, which further augments the usage of the modular programming (Ricci, 2016).

The modules can be distributed and separated in the web space. The communication between these is based on RESTful Web application programming interface (API) over Hypertext Transfer Protocol (HTTP) or the secure hypertext version (HTTPS). The modules can be built using different programming languages and technologies.

To expand the scope of the systems, built with the modules, we started to add highly abstract modules with general purpose using different mathematical and linguistic formalisms. Such a module that helps to solve numerous problems is the Workflow Engine Module based on Petri Nets theory. It augments the rest of the modules and creates another abstraction layer. Different types of concurrent processes can be modeled with the Petri Nets Theory and implemented without writing programming code.

Another module is based on the formal model of the Bulgarian language grammar. It allows Natural Language Processing. It gives extra abilities for searching and proofreading of Bulgarian text in the web-based applications. It is extremely useful for building educational systems.

The Bulgarian language belongs to the group of inflected languages. The NLP module is based on the formal model described in (Krushkov, 1997). In this model, the Bulgarian words are divided into disjoint classes of equivalence. Every class has a unique machine number for identification and a list of rules for generation of the paradigm. A part of speech is a set of classes. Every set can be divided into subsets depending on criteria pertaining to this particular part of speech.

For example, the set of nouns includes the classes with machine numbers 1–75. There are four subsets depending on the gender as follows: with machine numbers 1-40: masculine, 41-53: feminine, 54-73:
neuter, 74–75: only plural. Two words are in the same class if their paradigms are generated in the same way. The paradigm is described as a list of word forms with specific grammatical features for each of them. Every word-form also has a number. Two-word forms with equal numbers have the same grammatical features. For example, in the paradigm of the adjectives, word-form num. 1 has grammatical features (masculine, singular); word-form num. 2 has grammatical features (plural); etc. For all parts of speech word-form num. 1 is the base (citation) form. The model is appropriate for all inflected languages. It is extended for proper nouns (Krushkov, 2001).

A morphological processor is a tool performing automatic morphological analysis and synthesis. An approach for automatic morphological generation and analysis is investigated, based on the presented classification. For every word, a pattern is built up. The pattern and the inflectional type number determine the paradigm of that word. The pattern shows which letters are constant in all word forms in the paradigm of the word and which are changing. The changing letters are marked with ‘*’ in the pattern. For example, the pattern of the word ‘в*ен’ (faithful) is ‘*ен’. All other words from the same inflectional type (84) ‘*ен’ (narrow), ‘*ен’ (mad), ‘*ен’ (right), with the following patterns: ‘*ен’, ‘*ен’, ‘*ен’, have two changing letters (last two vowels) in the pattern. The rules for the word-form generation are of two types:

1) Replacing the ‘*’ with a letter (including the empty one, ‘’); and
2) Appending the endings.

The paradigm of the word ‘*ен’ according to the rules for type 84 is shown in Table 1.

Source: Authors

For other adjective types (types numbered from 76 to 89) a column with respective rules is prepared. The rules for a member of some inflectional type are the same for all other members of this type.

The purpose of the automatic morphological analysis is to perform automatically morphological classification of an arbitrary word-form. This includes identifying the base form of the word, its grammatical features and to which inflectional type (part of speech) it belongs. A machine dictionary consists of (word-pattern, inflectional type number) entries. When an arbitrary word-form has to be classified, the analyzer looks up a matching word-pattern in the dictionary. If such a pattern has been found, using the second part of the entry pair (inflectional type number) the rules are extracted from the generation table. Based on these rules a paradigm from this pattern is generated. If the analyzed word coincides with a word-form from the generated paradigm, it obtains the grammatical features of that word-form. In such way, the word is morphologically completely determined. For every word, an inflectional type number (t) and a word-form number (g) can be extracted.

For checking the agreement between two words, the following sequence was obtained: t1, g1, t2, g2, where t1 and t2 were the inflectional type numbers of the words; g1, g2 were the word-form numbers of the words. For example, the analysis of ‘в*рната жена’ (the faithful woman) produces the sequence 84, 8, 41, 1, which means that:

- The former word is an adjective (t1=84), feminine, singular, definite article (g1=8);
- The latter word is a noun, feminine (t2=41), singular (g2=1).
The agreement of words is right if there exists a row in the table of agreement $tb_{fw}$, $te_{fw}$, $g_{fw}$, $b_{sw}$, $te_{sw}$, $g_{sw}$, where $tb_{fw} \leq t_1 \leq te_{fw}$ and $g_1 = g_{fw}$ and $tb_{sw} \leq t_2 \leq te_{sw}$ and $g_2 = g_{sw}$ gives true.

In our example, the 5-th row of Table 2 agrees with the sequence 84, 8, 41, and 1:

$$76 \leq 84 \leq 89 \text{ and } 8 = 8 \text{ and } 41 \leq 41 \leq 53 \text{ and } 1 = 1$$

If such a row does not exist hypotheses for the right agreement are building up:

1. if $tb_{sw} \leq t_1 \leq te_{sw}$ and $g_1 = g_{sw}$ and $tb_{sw} \leq t_2 \leq te_{sw}$ and $g_2 \neq g_{sw}$, then $g_2$ is wrong. It has to obtain the value of $g_{sw}$; and
2. if $tb_{sw} \leq t_1 \leq te_{sw}$ and $g_1 \neq g_{sw}$ and $tb_{sw} \leq t_2 \leq te_{sw}$ and $g_2 = g_{sw}$, then $g_1$ is wrong. It has to obtain the value of $g_{sw}$.

For example, the analysis of 'врён вената' (present Google translation of 'faithful woman') produces the sequence 84, 1, 41, and 1, which means that the former word is an adjective ($t_1=84$), masculine, singular ($g_1=1$), and the latter is a noun, feminine ($t_2 = 41$), singular ($g_2 = 1$). These two words are not in agreement.

There is no row in the table of agreement giving true for the sequence 84, 1, 41, and 1. However, there are two rows which can produce hypotheses:

- the 4-th row ($76 \leq 84 \leq 89 \text{ and } 1 \neq 3 \text{ and } 41 \leq 41 \leq 53 \text{ and } 1=1$) gives the sequence of right agreement $84 \ 3 \ 41 \ 1$ (варна жена – ‘faithful woman’)
- the 5-th row $76 \leq 84 \leq 89 \text{ and } 1 \neq 8 \text{ and } 41 \leq 41 \leq 53 \text{ and } 1=1$ gives the sequence of right agreement $84 \ 8 \ 41 \ 1$ (варната жена – ‘the faithful woman’)

The practical research leads to the conclusion that, it is better to build another table. This is a table of the syntactic disagreement. In the table, there are some variants of incorrect agreement of adjacent words. This is due to the inability for each two adjacent words to determine if the agreement is correct or incorrect without syntactic analysis. The second table is built for the adjacent words, which certainly cannot reach an agreement (e.g., preposition and verb).

A phonetic classification is performed to determine the stress position of all words of the paradigm. To every dictionary word, a vector is attached. The length of the vector coincides with the length of the paradigm. The element $v[i]$ of the vector shows the relative position (in vowels) of the stress of the $i$-th word of the paradigm according to the stress position of the base form. That is why the first element of every vector is 0: $v[1] = 0$. If the stress remains constant for all the words in the paradigm, the vector consists of zeros $c = (0, 0, 0, ..., 0)$. For example, the vector assigned to the word 'врён вената' (the enemy – full def. art.), 'врён вени' (the enemies).

A formal model of complex verb forms, as well as an algorithm for automatic analysis and synthesis of these forms, is also investigated.

**Conclusion**

The NLP module performs automatic morphological analysis and synthesis, verification of syntactic agreement, automatically placing the stress, automatic processing of complex verb forms. These
functionalities allow searching in Bulgarian texts for all word forms of a given word. It is possible to search for words, which belong to a specific part of the speech or have specific grammatical features, as well as to replace the word forms of a given word with the word forms of another word if they belong to the same part of the speech. If the replacement words are nouns, where it is appropriate in the adjacent words, the gender of the adjectives is changed. The main dictionary comprises 82 thousand base forms, which can produce over than 1 500 thousand word forms. Dictionary lookup allows one to retrieve words with specific grammatical and morpho-syntactic features. It is possible to extract words from the same morphological class, with the same type of stress mobility and more. The module can work together with the Content Management Module, Authorization Module and the Workflow Engine Module creating and managing complex workflow processes for proofreading, text analyzes, editing and more. Creating an article in the Content Management system could trigger proofreading and text analyzes in the NLP module. Depending on the results of the analyzes work items can be instantiated in the Workflow Engine Module for different roles and actors. The work items represent tasks to be completed by the roles and actors in the workflow process. The Petri Nets theory is used to create a model of the process. So, the NLP module adds a unique functionality to the system. The module will be used for building a web-based system for teaching the Bulgarian language. The main functionalities will help teachers to construct computer-aided e-lessons according to their wishes selecting appropriate lexical and grammatical material. Much of the options of the system could be done automatically: extracting sentences and vocabulary of selected text material, analyzing the number of the new words, generating tests and exercises similar to those described for English (Malinova & Rahneva, 2016).

EFFECT OF CHILLING STRESS ON THE PHOTOSYNTHETIC PERFORMANCE OF YOUNG PLANTS FROM TWO MAIZE (ZA MAYS) HYBRIDS

Rositsa Cholakova-Bimbalova,1 Andon Vassilev2

Abstract: In the climate conditions of Bulgaria, early stages of maize plants development often go under suboptimal temperatures. Chilling stress is known to cause different physiological disturbances in young maize plants during the transition period from heterotrophic to autotrophic nutrition. However, the effect of chilling may differ among maize hybrids. Photosynthetic performance could be a good indicator for the hybrid tolerance to chilling. The aim of our study was to evaluate the tolerance of young maize plants from two hybrids – the new Bulgarian hybrid - Kneza 307 and the hybrid P9528 using as criteria the changes in their photosynthetic performance.

Plants at the third leaf stage were exposed for seven days to chilling stress. At the end of the experimental period, growth, leaf lipid peroxidation, and several photosynthetic parameters were measured. We found that chilling stress reduced the fresh mass accumulation, increased lipid peroxidation, diminished net photosynthetic rate and chlorophyll content, and enhanced non-photochemical quenching of chlorophyll fluorescence. Although the responses of both hybrids were similar, some specificity were observed and discussed.

UDC Classification: 581.1; DOI: http://dx.doi.org/10.12955/cbup.v5.1081

Keywords: Zea mays, chilling, photosynthesis, pigments, chlorophyll fluorescence

Introduction

Maize (Zea mays) is a tropical crop which has a relatively high temperature optimum for growth and development: 30–35 ºC (Miedema, 1982). Temperatures below 12-15ºC may damage the young plants, causing chilling stress (Hola et al., 2007; Leipner, 2009). Maize plants are the most sensitive to chilling during the transitional phase from heterotrophic to autotrophic nutrition (Stamp, 1984), which usually lasts several weeks after sowing. In the climate conditions of Bulgaria, maize plants during their early stages of development are often subjected to suboptimal temperatures. Chilling provokes different physiological disorders in maize plants. It disturbs the balance between formation and quenching of the reactive oxygen species (Foyer et al., 2002), damages membrane integrity (Aroca et al., 2003) and modulates enzyme activities (Farooq et al., 2008; Takac, 2004). These negative effects are further multiplied on the scale of cardinal physiological processes, such as mineral nutrition, water relations, photosynthesis, dark respiration, etc. and lead to plant growth inhibition (Leipner, 2009; Zaidi et al., 2010).

Photosynthesis is one of the processes most susceptible to low-temperature inhibition in maize (Zea mays) (Nie et al., 1992). Chilling stress negatively affects both formation and functional activity of the photosynthetic apparatus of the plants (Leipner, 2009; Sowinski et al., 2005). It has been shown that it decreases stomata conductance (Aroca et al., 2001; Melkonian et al., 2004), disturbs chloroplast development (Moseki, 2004; Nie et al., 1995), diminishes photosynthetic pigment content (Haldimann, 1998, 1999) and lowers PSII photochemistry and CO2 assimilation (Al-Shoaiib, 2008; Bilska and Sowinski, 2010). It also retards photosynthetic carbon export from the leaves (Bilska and Sowinski, 2010).

The performance of maize plants during both chilling stress and recovery strongly depends on hybrid tolerance (Bano et al., 2015; Sowinski et al., 2005). Many reports demonstrated significant differences in chilling tolerance among maize hybrids (Aroca et al., 2001, 2003; Haldimann 1998, 1999; Hola et al., 2007). Photosynthetic performance during the chilling period and after recovery could be a good indicator for the hybrid tolerance to chilling. In fact, many authors studied maize hybrids’ tolerance to chilling temperature using photosynthetic parameters as criteria (Haldimann, 1998; Kosova et al., 2005; Sowinski et al., 2005).

The tolerance of Bulgarian maize hybrids to chilling stress is not well characterized. Therefore, we decided to perform a study aiming to evaluate the tolerance of young maize plants from two hybrids, using as criteria the changes in their photosynthetic performance.

1Agricultural University of Plovdiv, Plovdiv, Bulgaria, rositsa.cho@abv.bg
2Agricultural University of Plovdiv, Plovdiv, Bulgaria, vassilev@au-plovdiv.bg
Material and methods

The experiments were carried out in a climatic room of the Department of Plant Physiology and Biochemistry at the Agricultural University of Plovdiv, Bulgaria. Maize plants from two hybrids: Kneza 307 (Kn.307) and P9528, were grown as a hydroponic culture on ½ strength modified Hoagland nutrient solution at controlled environment: photoperiod – 12 hours, PPFD (photosynthetic photon flux density) 200 μmol m⁻² s⁻¹, temperature – 25±1°C/ 20±1°C (day/night) and relative air humidity – 60±5%. The solution was aerated 15 minutes per hour.

At the appearance of the 3rd leaf of maize plants, the following experimental design was arranged. Plants from both hybrids were cultivated for the next seven days at different temperature regimes, namely: no chilling regime 25±1°C/20±1°C (day/night) and chilling regime 10±1°C – constantly. Each treatment consisted of 3 replications (pots) with four plants per pot. The experiment was performed twice.

Both growth and photosynthetic performance of the maize plants were analyzed at the end of the experiments. Leaf gas exchange (A – net photosynthetic rate, E – transpiration rate, gₛ – stomatal conductance as well as cᵢ – internal CO₂ concentration) was measured by an open photosynthetic system LCpro⁺ (ADC, England) on the upper fully developed leaf, at PPFD of 450 μmol m⁻² s⁻¹, after one hour adaptation.

Chlorophyll fluorescence measurements were performed with a pulse modulation fluorometer (MINI-PAM, Heinz Walz, Germany) in the same leaves after dark and light adaptation. The measurements were done on both top-leaf zone and middle-low part zone of the leaf lamina in no chilled and chilled plants. The maize plants were kept in the dark for 30 min before the start of the measurement. By switching on the measuring beam (0.02 – 0.20 μmol m⁻² s⁻¹), the minimal level of fluorescence (F₀) was recorded. Immediately after that, a saturating light pulse of 5500 μmol m⁻² s⁻¹ with 0.8 s duration was sent out to record the maximal level of fluorescence in the dark-adapted state (Fm), from which the maximal quantum yield of PSII (Fv/Fm) was calculated (with Fv = Fm – F₀). After 30 min light adaptation at 450 μmol m⁻² s⁻¹ the steady-state level of photosynthesis was achieved, and a saturating pulse with the same characteristics was applied. Fluorescence yields before triggering the saturation pulse (F); maximal (Fm') fluorescence, reached during the saturation pulse; as well as an apparent electron transport rate ETR as (Genty et al., 1989).

1) \[ ETR = Y \times PAR \times 0.5 \times 0.84 \], where \( Y = (Fm' - F)/Fm' \).

Both photochemical quenching qP and non-photochemical quenching qN, can be calculated according to Schreiber (2004).

2) \[ qP = (Fm' - F)/(Fm' - F₀) \],

3) \[ qN = (Fm - Fm')/(Fm - F₀) \],

Photosynthetic pigments (chlorophyll a, chlorophyll b and total carotenoids) were extracted in 80% acetone, measured spectrophotometrically and calculated according to the formulae of Lichtenthaler (1987).

For the measurement of lipid peroxidation in leaves, the thiobarbituric acid (TBA) test, which determines malonyldialdehyde (MDA) as an end product of lipid peroxidation (Heath and Parker, 1968), was used. The amount of MDA–TBA complex (red pigment) was calculated from the extinction coefficient 155 mM⁻¹ cm⁻¹. Plant fresh weight was determined at the end of the experiments.

Statistical analysis was performed using one-way ANOVA (for P<0.05). Based on ANOVA results, a Duncan test for mean comparison was conducted, for a 95% confidence level, to test for significant differences among treatments. In the figure and the tables, different letters (a, b, c and d) express significant differences at the P < 0.05.

Results and discussion

The applied seven-day-long chilling significantly retarded the plant growth of both maize hybrids (Figure 1). The fresh weight of the chilled plants from Kn.307 and P9528 were lower as compared with the plants grown at the 25/20°C regime by 67% and 68%, respectively. In addition to the inhibited growth, the chilled plants were distinguished by some leaf yellowing, in particular between
the middle and the lower part of the lamina of the 3rd leaf. These symptoms were more expressed in the leaves of the hybrids Kn.307.

The data concerning MDA content, which is a marker for oxidative degradation of membrane lipids, is also presented in Figure 1. The results show that the MDA content significantly increased in the chilled plants - 39% in hybrid Kn.307 and 24% in hybrid P9528. The higher lipid degradation in the leaves of these plants provides evidence they suffered from chilling-provoked oxidative stress. The upper leaf MDA content in the chilled plants from the hybrid Kn.307, the more expressed damage symptoms as well as, the more strongly depressed growth as compared with that of P9528, show this hybrid is more susceptible to such conditions.

Figure 1: Influence of chilling on plant fresh weight (FW; g plant⁻¹) and malondialdehyde content (MDA; nmol g⁻¹FW) in the leaves of young maize hybrids Kn.307 and P9528.

![Diagram showing FW and MDA content](image)

Different letters above the columns (a, b and c) mean significant differences at P<0.05.

Source: Authors

The data presented in Table 1 shows the effect of chilling on leaf gas exchange of maize plants. The net photosynthetic rate (A) of both maize hybrids, grown at no chilling regime, was similar, while a larger difference was observed between the respective values of the chilled plants. The chilling-induced decrease of A was 67% in Kn.307 and much less - 44% in P9528. Our results well correspond well with Al-Shoaibi’s (2008) observation for strongly retarded carboxylation efficiency of chilling-exposed maize plants.

The chilling significantly diminished transpiration rate (E), which is more strongly affected in plants of Kn.307 (67%) than in those of P9528 (39%). The changes in stomata conductance (gₛ) of the chilled plants showed a similar trend. It was more retarded in Kn.307 than in P9528, by 80% and 50%, respectively.

Our results confirm the negative impact of low temperatures on leaf gas exchange (Al-Shoaibi, 2008; Aroca et al., 2001) as well as the existence of different sensitivity among maize hybrids to chilling, observed in many studies (Aroca et al., 2001; Biłska and Sowinski, 2010). The significant decrease of both E and gₛ in the chilled plants was a result of a developed leaf water deficit. Based on our previous results, we may propose that this effect was at least partly due to a chilling-induced decrease of the root mass formation (Cholakova and Vassilev, 2015).

Usually, the lower stomata conductance leads to decrease of CO₂ intake in leaves and subsequently to stomata limitation of CO₂ assimilation. In our experimental conditions, the internal leaf CO₂ concentration (cᵢ) of the chilled plants from both hybrids increased, which indicates that mesophyll limitations prevail over stomatal ones. The yellowing of the middle to lower part of the leaf lamina of the chilled plants motivated performing analyses on photosynthetic pigments content and photochemical efficiency.

The influence of chilling on photosynthetic pigments content is presented in Table 2. The data shows a significant decrease in chlorophyll (a+b) content in the chilled plants, being lower than in the no
chilled controls by 46% in the plants from Kn.307 and by 21% in those from P9528. The chilling stress affected to a smaller degree the total carotenoids content. It was diminished by 24% in the plants from Kn.307 and slightly (by 4%) and insignificantly in those from P9528.

The detected changes in both chlorophyll and carotenoids content resulted in a change in their ratio. The Car / Chl (a+b) ratio increased by 38% and 22% in Kn.307 and P952, respectively. The chlorotic symptoms and enhanced leaf lipid peroxidation in maize plants are consequences of chlorophyll photooxidative damage as was shown by Leipner et al. (2009). In addition to lower chlorophyll content, the increased Car / Chl (a+b) ratio could be related to the essential function of carotenoids in protecting the photosynthetic apparatus against photo-oxidative damage. Haldiman (1998) considered increased ratio carotenoids/chlorophyll in chilling-exposed maize plants as their adaptation strategy allowing them both to reduce light absorption as well as to increase the capacity for photoprotection.

The data obtained from the performed chlorophyll fluorescence analysis is presented in Table 3. The values of all parameters achieved in the top leaf zone of both no chilled and chilled plants were almost similar (data were not shown), while significant differences were detected in the respective values measured in middle-low part zones. The maximal quantum yield of PSII (Fv/Fm) of no chilled plants was the norm characteristic for healthy plants - 0.75-0.83 (Bolhar-Nordenkampf and Oquist, 1993), while the value of this parameter was significantly diminished in the chilled plants – by 15% in Kn.307 and 8% in P9528.

The reduction is due to both an increase of minimal fluorescence (F0) and decreases in the maximal one (Fm). While an increase of F0 usually points to photodamage, a reduction of Fm reflects heat dissipation as a mechanism for photoprotection (Schreiber, 2004). The lower Fv/Fm in the chlorotic leaf

---

Table 1: Influence of chilling on leaf gas exchange of young maize plants from hybrids Kn.307 and P9528. A – net photosynthetic rate (µmol CO2 m⁻² s⁻¹); E – transpiration rate (mmol H2O m⁻² s⁻¹), gs – stomatal conductance (mol m⁻² s⁻¹) and ci – internal CO2 concentration (vpm).

---
zones of chilled plants is a marker of photoinhibition (Bilska and Sowinski, 2010; Kosova et al., 2005). Another reason for this effect could be impaired chloroplast development as suggested by Nie et al. (1995). Considering the absence of significant changes in the Fv/Fm value in the top “healthy” leaf zones, we assume that the major limiting factor could be disturbed chloroplast development in the chlorotic ones. Nie et al. (1995) showed that several chloroplast polypeptides, including the very important for PSII functioning – D1, are poorly expressed in Zea mays leaves grown at chilling temperatures.

The apparent electron transport rate (ETR) is a calculated parameter representing linear electron transport rate of the overall in vivo photosynthetic process. In the chilled maize plants, it was retarded by 44% and 26% in Kn.307 and P9528, respectively. Using the so-called “quenching analysis” it is possible to distinguish the use of absorbed light for photochemical conversion and non-photochemical loss of excitation energy (Schreiber, 2004). Photochemical quenching (qP) indicates the proportion of open PSII reactive centers, while non-photochemical quenching (qN) – heat dissipation. The results presented in Table 3 show that the applied chilling treatment decreased very slightly (by 5-6%), but significantly, the qP values and sharply increased the qN values – by 97% in Kn.307 and 72% in P9528. The obtained fluorescence data demonstrate that the photochemical efficiency of the chilled maize plants was lowered. A small part of the reaction centers in PSII was closed. Due to the decrease in CO2 assimilation, the absorbed excitation energy overloaded the electron-transport processes. Therefore, the “excess” light was sufficiently de-excited by heat dissipation. Similarly to the other observed changes in the photosynthetic parameters, the chilling effect on chlorophyll fluorescence was higher in plants from in Kn.307 than in P9528.

**Conclusion**

The young maize plants from the hybrids Kn.307 and P9528 suffered from chilling stress when exposed for seven days at 10 °C. They responded to this treatment by different physiological alterations, including growth retardation, increased membrane lipids peroxidation, diminished leaf gas exchange, decreased photosynthetic pigments and lowered efficiency of PSII photochemistry. These alterations were more pronounced in the chilling-exposed plants of the hybrid Kn.307 than in those of P9528. Based on the obtained results we consider the hybrid P9528 as more tolerant to chilling at the early stage of plant development. Further studies will be performed to evaluate its tolerance in field conditions as well as to describe the physiological bases for this important trait.

THERMODYNAMIC PROPERTIES OF HYDROGEN PLASMA

Maratbek Gabdullin¹, Tlekkabul Ramazanov², Tomiris Ismagambetova³, Alexander Tikhonov⁴

Abstract: In this paper dense hydrogen plasma, which is of considerable interest in both theoretical and practical areas such as non-ideal plasma encountered in thermonuclear reactors, is considered. The structural and thermodynamic properties of dense non-ideal hydrogen plasma were investigated. Potentials taking into account the quantum-mechanical effects of diffraction and symmetry have been used as a model of interaction. The symmetry effect was considered for the different directions of spin of electrons. Pair correlation functions have been obtained in the solution for the integral equation of the Ornstein-Zernike in hyper-netted chain approximation on the basis of the interaction potentials. Thermodynamic properties for hydrogen plasma were calculated using the interaction potentials and pair correlation functions. The quantum symmetry effect weakens the interaction between the charged particles leading to a decrease in the absolute value of the non-ideal part of the thermodynamic characteristics of the dense plasma. The symmetry effect is more pronounced for higher values of density.

UDC Classification: 533.9; DOI: http://dx.doi.org/10.12955/cbup.v5.1082

Keywords: plasma, potential, structural, thermodynamic.

Introduction

One of the main problems of modern plasma physics is obtaining thermodynamic properties of a non-ideal plasma in a wide range of parameters. In this paper, the model of interparticle interactions, which takes into account quantum-mechanical effects of diffraction and symmetry, was used to study properties of dense non-ideal hydrogen plasma (Moldabekov, 2012).

The quantum-mechanical effect of symmetry takes into account the Pauli principle, which prohibits the simultaneous presence of two identical particles with a half-integer spin (in this case, electrons) in the same state, hence reducing the probability of finding particles at a distance from each other.

Interaction potentials

In the work conducted by Moldabekov (2012), interaction potentials used in this paper that take into account quantum-mechanical effects of diffraction and symmetry were obtained:

\[ u_{ab}(r) = \frac{e_a e_b}{r} \left[ 1 - th \left( \sqrt{2} \frac{\lambda_{ab}^2}{a_0^2 + br^2} \right) e^{-dr} \right] \left(1 - e^{-r/r_{ab}}\right) - \delta_{ab} \delta_{br} k_B T \ln \left(1 - \frac{1}{2} \exp \left(-\frac{r^2}{\lambda_{ee}^2}\right)\right). \] (1)

where \( e_a, e_b \) are electrical charges of particles a and b, \( m_{ab} = m_a m_b / (m_a + m_b) \), \( \lambda_{ab} = \hbar / \sqrt{2\pi m_{ab} k_B T} \) is the thermal de-Broglie wavelength, \( r_{ab} = \left( k_B T / (4\pi e^2 \sum_j n_j Z_j^2) \right)^{1/2} \) is the Debye radius, also dimensionless parameters such as coupling parameter \( \gamma = (Ze)^2 / ak_B T \) and density parameter \( r_s = a / \ell_B \) were used, \( a = (3/(4\pi n_s))^{1/3} \) is the average distance between electrons. The first term in the formula (1) takes into account the diffraction effect, the second term - the symmetry effect.

The following formula was used to account for different electron spin directions instead of the second term in (1):

---

¹ al-Farabi Kazakh National University, gabdullin@physics.kz
² al-Farabi Kazakh National University, Tlekkabul.Ramazanov@kaznu.kz
³ al-Farabi Kazakh National University, mirial@mail.ru
⁴ Nazarbayev University, atikhonov@nu.edu.kz
\[ U_{ce,0}^{S(T)}(r) = -k_BT \ln \left( 1 \pm \exp \left( -\frac{r^2}{\lambda_{ce}^2} \right) \right), \] 

where \( S=1 \) corresponds to parallel spins, \( S=0 \) to antiparallel spins.

For interactions between ions, the effective potential from work by Ramazanov (2010) was used. Polarizability of atoms was taken into account in the effective potentials from work done by Ramazanov (2005).

**Structural properties**

Pair correlation functions \( g(r) \) were calculated on the basis of the integral equation of Ornstein-Zernike from work by Goodstein (2002):

\[ h(\vec{r}) = C(\vec{r}) + n \int C(\vec{r}_1 - \vec{r}_2) h(\vec{r}_1 - \vec{r}_2) d\vec{r}_2, \] 

which in HNC approximation can be written in the following form:

\[ C_{HCA}(r) = h(r) - \ln g(r) - \frac{\Phi(r)}{k_BT}, \] 

where \( h(\vec{r}) = g(\vec{r}) - 1 \) – full correlation function, \( C(\vec{r}) \) – direct correlation function, \( \Phi \) is the interaction potential. The equations (3) and (4) were calculated by numerical schemes.

**Thermodynamic Properties**

Thermodynamic properties such as internal energy and the equation of state were calculated using interaction potentials (1-2) and were obtained on their basis pair correlation functions in approximation (4):

\[ E = \frac{3}{2} N k_BT - \pi \sum_{\alpha=i,e} n_\alpha \sum_{\beta=i,e} n_\beta \int_0^{\infty} g^{ab}(r) \Phi^{ab}(r) r^2 dr, \] 

\[ P = n k_BT - \frac{2}{3} \pi \sum_{\alpha=i,e} n_\alpha \sum_{\beta=i,e} n_\beta \int_0^{\infty} \frac{\partial \Phi^{ab}(r)}{\partial r} g^{ab}(r) r^3 dr, \]

where \( N \) is the number of particles in the system (Ramazanov, 2014).

The interaction potentials for different models are presented in figure 1. Black, red, and green lines present the results based on the potential (1) with differences in the symmetry effect, the yellow line shows the results based on the Deutsch theory, and the blue line – on the Debye theory.

Pair correlation functions for different directions of spins are presented in Figure 2. The black lines represent results based on the potentials (1), the red lines represent the results for antiparallel spins, and the green lines represent the results for parallel spins. The results, denoted by a solid line, represent data for \( r_i=1 \). The results, indicated by the dashed line, represent data for \( r_i=2 \). The effect of symmetry takes into account the Pauli principle. The effect of the symmetry effect, as a quantum-mechanical effect, is more pronounced at short distances and for denser plasma.

Figures 3-4 show internal energy and the equation of state calculated in the present work in comparison with the results of other authors. It can be seen that for small values of the coupling parameter (up to \( \Gamma=1 \)) the results of the present work are in good agreement with other results. With increasing value of the coupling parameter, the results of this work start to deviate due to the weakening of the interaction between the particles due to a change in the composition of the plasma.
Figure 1: Different potentials for $\Gamma=0.3$, $r_s=2$. Black line – potential (1), red line – potential (1) with antiparallel spins, green line – potential (1) with parallel spins, yellow line – Deutsch theory, blue line – Debye theory.

Figure 3: Internal energy for hydrogen plasma at $r_s=1$. Black line – Debye theory, circles – Izteleuov (2001), black triangles – Pierleoni (1996) and Magro (1996), green line – present work.

Source: Authors
**Figure 4:** Equation of state for hydrogen plasma at $r_s=1$. Solid line – Debye theory, dashed line – Ichimaru (1987), circles – Izteleuov (2001), black triangles – Pierleoni (1996) and Magro (1996), green line – present work.

**Conclusion**

Thermodynamic properties of hydrogen plasma were calculated on the basis of the interaction potential taking into account the quantum-mechanical symmetry effect. Pair correlation functions were obtained through the solution of the integral equation of the Ornstein-Zernike in hyper-netted chain approximation. The quantum symmetry effect weakens the interaction between the charged particles, which leads to a decrease in the absolute value of the non-ideal part of the thermodynamic characteristics of the dense plasma. The symmetry effect is more pronounced for higher values of density. The results of this work are in a good agreement with the results of other authors.

TOOL TO SUPPORT THE DESIGN AND IMPLEMENTATION OF INNOVATIVE SOLUTIONS
Dominika Jagoda-Sobalak\textsuperscript{1}, Iwona Łapuńska\textsuperscript{2}

Abstract: This article indicates the need to create innovation in the economy. The innovative process is closely related to creative management, including methods of creative problem solving. The presented tool to support the use of creative problem-solving methods (in particular inventive creation methods) is aimed at design and implement innovative solutions. The described tool supports the selection process of methods and enables fast application of the method. The tool was designed based on literature research and a repeated case study. A case study consisted of 3 stages: creativity research, creative sessions using the inventive methods, and development of guidelines for the construction of the tool to support the design and implementation of innovative solutions. The study included manufacturing and service companies in southern Poland. The tool (in the form of a database of inventive methods) has been positively verified. The conducted verification was held according to the adopted scheme in the repeated case study. However, the methods used to generate innovation have been selected by using the application process of the tool supporting selection of inventive methods.

UDC Classification: 65.012; DOI: http://dx.doi.org/10.12955/cbup.v5.1083

Keywords: inventive creation, creative problem solving, design and implementation of innovation

Introduction

Reality is a world of turbulent changes. These changes continuously bring chances and threats to enterprises. The industry intensively evolves, and incessantly develops innovative technologies, and hence in consequence management and supervision methods. Yet, the routine analytical approach used to solve newly appearing problems does not show the expected results.

The result of the traditional approach to management is a low degree of innovation in Polish enterprises (Kowalski and Nasirowski, 2007; Franken, 2010; Patalas-Maličewska 2012; Baruk, 2002). This fact is confirmed by numerous reports including the Innovation Union Scoreboard, among others. Poland is characterized by a lower level of the Summary Innovation Index – SII than the average for all other countries of the European Union (Polish Agency for Enterprise Development report, 2015). At the same time, Poland is in one of the last places in the ranking of EU countries with regard to participation of enterprises conducting innovation activities, 25th place out of 27 (report of the Ministry of Economy, 2015).

The methods and techniques for the creative solving of problems may turn out to be the support that is needed. It is used to solve problems in a creative way, to create innovation or to support creativity in the organization while at the same time positively affecting the widely comprehended sphere of economics of work, and supporting efficiency, performance, and functionality in achieving results. The results of their application are visible not only for the person who uses them, but for the entire organization; they affect management, philosophy of thinking, and social relations in the company.

The systematic development of the creativity of employees in enterprises, by applying methods of creative problem solving, will positively affect innovative potential. New solutions – innovations can contribute to the increase of competitiveness of the enterprise.

However, there is difficulty in applying creative methods. Their limited description the literature, small number of experts, or their focus on only the psychological aspect of discussed methods (rather than also on results), hinders their use in enterprises. Therefore, a simple tool for the selection of methods of creative problem solving was proposed (in particular inventive creation methods), with regard to problems of the enterprise. The tool (in the form of a database of inventive methods) is supposed to provide information, which method should be applied in the given conditions (situation), and provide a comprehensible, synthetic description that enables its immediate application.

Research methodology

Empirical research were conducted, based on the literature analysis concerning the innovation level of Polish enterprises (in particular from the SMEs sector) and with methods of creative problem solving, in the enterprises of Opole and Silesian Voivodeships in the form of a repeated case study. Procedure

\textsuperscript{1} Opole University of Technology, d.jagoda@po.opole.pl
\textsuperscript{2} Opole University of Technology, i.lapunka@po.opole.pl
compliant with an indication o in Yin’s textbook (1984), early stage of knowledge development in the given area of research, identification of current phenomenon in real conditions, vague boundaries between phenomenon and circumstances of its occurrence). The procedure of conducting the case study proposed by Czakon (2013) was adopted, the diagram presents Figure 1.

Studies were carried out in the enterprises of Opole and Silesian Voivodeship (Poland) in the years 2013-2016. The scientific basis included:

- quantitative methods (creativity test) – which provide information on the creativity level of employees,
- quality methods (in-depth interview) – used in the study of creativity of the organization
- methods of creative problem solving,
- techniques to support the development of creativity,
- methods of decision making based on many evaluation criteria.

These studies included the following stages (according to Figure 2):

1. Preliminary studies – creativity tests were conducted in enterprises, which enabled us to measure the creativity of employees in the given enterprise. Tests were drawn up based on specialist psychological tests. Tests enabled us to assign employees of the given enterprise to one of three groups: innovators, persons not fully using their creative abilities, and persons whose creativity is “dormant.” Moreover, barriers limiting the individual and collective creativity were identified in surveyed enterprises using an in-depth interview.

2. Basic empirical research – in analyzed enterprises, the employees participated in creative sessions in which inventive creative methods were used in order to design innovative solutions. An expert was responsible for the selection of methods and carrying out the creative session. Innovative organizational, procedural, product solutions were designed. Employees positively used the process of the creative sessions and the application of inventive creation methods to solve problems.

3. Development of a tool supporting the selection of inventive creative methods to the problem. Conclusions from conducted basic empirical research, preliminary studies, and literature analysis were used to build a tool supporting the selection of inventive creative methods to the problem (situation) of enterprises. One by one the base of inventive methods 1 was verified in enterprises. Verification was based on the assumption that in the creative session there would be the use of methods indicated by the selection tool, the expert will only carry out an open observation.
It should be noted that currently there are longitudinal studies being conducted, and tests assessing the creativity level in enterprises after certain time of applying inventive creation methods are repeated in order to study the changes of this level.

**Tool to support the design and implementation of innovative solutions**

Participation of the expert and, his knowledge and experience is important for proper and effective application of inventive creation methods. The expert’s task is to indicate the method which should be used, and to present its scenario. The group of experts is small, which largely impedes the use of inventive creation methods by a larger group of companies. Therefore, it was reasonable to create a tool supporting the selection of inventive creative methods to the problem. This will facilitate the use of creative problem solving methods by the largest group of recipients. The base of the inventive methods, which is extremely simple, was built in Access program, and this is supposed to also contribute to its popularization. The user of such a database, by answering a few questions about the detected problem and specifics of the given organization, will receive advice in the form of: which method to choose and description of the method for its immediate application.

The first design stage of the tool supporting selection of inventive creation methods was to determine the criteria for the selection of inventive creation methods to the problem. Due to the specificity of solved problems and the practical aspect of applied methods, attention was paid to inventive creation methods.

Criteria for selection of methods based on literature studies, preliminary and basic studies include:

- The number of participants in the creative session (individual or team). There are inventive creation methods, which require one to work in the group. There is also a group of methods, which can be applied to both individuals and to a group.
- Method area (comprehensive or fragmentary). This criterion is aimed to indicate, whether the method is supposed to be applied only to search for solutions or is supposed to be helpful in the entire problem-solving process (from defining the problem to seeking solutions).
- Duration (up to 1 h, up to 1 working days, above 1 day). This criterion is very important for entrepreneurs, because it enables to choose the method to time at its disposal.
- Method nature (based on forced or free associations, analytical methods; lists of test questions, not-systematized).
- Creativity and experience, this criterion is necessary to determine whether the organization’s appointed team for creative problem solving is creative. The previously carried out test is supposed to be used for this purpose. It is possible also to be based on previous experience associated with application of inventive creation methods.
- Problem type (technical/technological, organization and management).

The design base of inventive methods supporting the selection of inventive creation methods to the problem in a form of a database of the inventive creation methods is unusually easy to use and transparent, which makes it easier to apply. From the main menu, it is possible to carry out one of four orders: browse the database of inventive creation methods, add a new method, select a method to a determined situation, or close the database. The most important element of the main menu and specific objective of the designed tool that supports the selection of inventive creation methods to the problem is to find a method that will be selected to the following factors: solving entity, duration of creative session, method nature, creativity, and experience in applying inventive creation methods to a problem type. While selecting the method we can define all criteria or those selected. The result of the selection will be shown in table. As a result of the defined criteria, the proposed methods will be indicated along with their description (Jagoda-Sobalak, 2016).

Design stages of database included:

1. Creating tables – 6 tables were created for the selected criteria and for the inventive creative methods.
2. Providing clear values in the table fields (keys) – keys were entered in tables: Id_metody, Id_podmiot, Id_obszar, Id_charakter, Id_rodzj, Id_czas, Id_kret_dosw.
3. Determining the relation between tables – determined the correct connection of related data in a logical whole.
4. Creating the form – 5 associated and 6 supporting forms were created for communication with the user.
5. Creating queries – in order to enable searching (selecting) methods and displaying search results.
6. Creating reports – created reports display inventive creation methods (that meet the criteria) along with their characteristics and description.
Tool verification

The last research stage was based on inventive methods verification, which was held among others in the enterprise of the construction industry (finishing and decorative elements). Conducted verification was held according to the adopted scheme in the repeated case study. However, methods used to generate innovative solutions have been selected by using the application process of the tool supporting selection of inventive creation methods to the problem. Before proceeding with the problem solving, the employees of the enterprise filled out the questionnaire, determining their creativity level. The questionnaire showed that the surveyed group has a large creative potential, willingly seek unconventional solutions, and they are open and ready for changes and taking risks. The next research stage in the enterprise was to familiarize employees with the idea of creative organization and with inventive creative methods. Interviews have been conducted with employees, which enabled us to get to know the barriers limiting creativity in the organization. Employees pointed at the following barriers: lack of knowledge, lack of possibilities (place, time, way) of reporting new solutions, and lack of faith in their own abilities. In order to develop creative potential, the management board of the enterprise decided: to create a Research and Technology Development Department, the systematic organization of creative sessions, further supporting employees in personal development and knowledge acquisition by participation in programs of the European Union (Human Capital program), funding trainings, courses, and studies.

20 persons, representing all departments, took part in the creative session. Employees of the enterprise already earlier participated in such sessions. They usually used methods of: brainstorming, crumbling, or 5 why. The tool supporting the selection of inventive creation methods to the problem was used to select the method of creative problem solving (designing the innovative product). The following selection criteria were adopted:

1. Solving entity – team.
3. Duration – up to 1 day.
5. Creativity and/or experience – moderate.

The defectologist method was indicated to solve the problem, which was applied to generate product innovation. Employees of enterprises had the task to search for as many shortcomings of the products currently offered by the company, as a result the employees on the board one by one wrote out defects in the elevation stage. In the next stage, defects were divided into two groups: defects associated with material, nature, and properties of the product (on which the producer has no impact), and defects possible to remove.
The next step was seeking the solution in order to eliminate defects from the second group. A detailed method was used in order to eliminate defects, which was also indicated by the tool supporting selection of inventive creation methods to the problem. Employees using a detailed method pointed to the problem with assembly (necessary good specialists, assembly increases costs, often connections between tiles are visible, assembly requires the time and practice) as the main reason of resignation from the purchase of elevation stone. Therefore, the problem to be solved was defined as follows: “Design tiles of the elevation stone, which will simplify the assembly.” Again, a tool supporting selection of inventive creation methods to the problem was applied, changing the nature of the method based on associations in order to stimulate the creativity of employees. Then an analog transmission method was applied to solve the problem. Laying tiles were compared to puzzles, which then indicated the elements which facilitate assembling puzzles. Next an attempt of analogous transferring to the assembly of tiles was made.

The solution generated in the session, and developed in the laboratory of the enterprise is product - brick tile currently available for sale. It is a revolutionary product – tile combined with the groove. Due to the design it is extremely easy to assembly. The tile is in the color white, but it is possible to paint it any color needed. Its texture and special corners cause that the texture of wall does not differ in appearance from real bricks.

The developed tool supporting selection of inventive creation methods to the problem has been positively verified. The selected methods enabled the organization to generate the innovative solutions without the participation of the expert. The first indicated method – defectologist, enabled to reveal tiles deficiencies, which affect the customer’s decision, and which are possible to remove. The next method – details, enabled to indicate the major defect from the customer point of view (difficult assembly). The application of the indicated analogy by the database of inventive creation methods contributed to find the solution, which enables simple assembly, hence increasing the attraction of tiles on the market and it became an innovation of the national scale.

Conclusions
Research in a form of a repeated case study indicated that inventive creation methods support the growth of innovation. They enabled to generate innovative solutions: processes, products and organizational innovation. Positive opinions of the employees in relation to creative sessions with inventive creation methods confirmed the benefits from applying inventive creative methods. The conducted studies enabled to build the creative organization, identification, and development of the creativity level of employees, and eliminated barriers limiting their creativity. The applied inventive creation methods extorted on employees a creative way of thinking, and taking brave, unconventional decisions, contributed to integration of employees, created the climate that supports creation of new solutions, which in consequence significantly affected the creativity in individual enterprises.
The designed tool enables to popularize inventive creation methods, and their application without participation of the experts. The process of tool verification has proven the correctness of the criteria selection and assumptions.

CARBON STRUCTURES AS EFFECTIVE MODIFIERS OF THE MATERIALS’ BASIC PROPERTIES
Natalia Kamanina

Abstract: Because of the unique energetic, refractive and photoconductive characteristics of effective nano-objects, especially carbon nanotubes, the modification of optical properties of the organic and inorganic materials can be considered as the preferable one via the use of the nanostructuration process. Emphasis has been given to the incorporation of nanoobjects directly in the materials’ body and on their surface. Under the conditions of a surface treatment of the inorganic structures, an IR-laser at the wavelength of 10.6 micrometers was used to orientate carbon nanotubes deposited in the electric field of 100-600 V/cm\(^1\). Dramatic spectral and mechanical parameters changes have been found. Refractive features of the nanostructured organics have been studied via applying the second harmonic of the pulsed Nd-laser at different spatial frequencies and under the nanoparticles sensitization doping such as fullerenes, carbon nanotubes, shungites, quantum dots, and graphenes. A drastically obtained laser-induced refractive index has been established. A prediction has been proposed to extend the area of the application of the systems considered.

Keywords: Carbon nanotubes, organics, inorganics, interface, refraction, laser-matter interaction

Introduction

It is well known that after the discovery of fullerenes (1985) and carbon nanotubes (1991), many scientific and research groups have conducted scrupulous studies on them and found different areas of applications of these nanoobjects and related ones (Bhattacharya et al., 2004, Yamamoto et al., 2004, Xu & Xiong, 2004, Yu et al., 2011, Taranko et al., 2012, Ciszewski et al., 2013, Asokan, 2013, Xi et al., 2014, Neyts & Erik, 2015,Guo et al., 2016). The peculiarities of the growth, the mechanisms of the sensitization, and the changes of the basic physic-chemical parameters have been tested. Our own steps in this direction occupy a significant place too (Kamanina, 2002, Kamanina, 2005, Kamanina & Uskokovic 2008, Kamanina et al., 2012, Kamanina et al., 2016). The main reason to use fullerenes, shungites, and quantum dots is connected with their unique energy levels and high value of electron affinity energy. The basic features of carbon nanotubes, graphene, graphene oxides are their branched surface, high conductivity, strong hardness of their C—C bonds as well as complicated and unique mechanisms of charge carrier moving. These features of the mentioned perspective nanoobjects can provoke, the discovery of new physical and technology ways to optimize the photorefractive, photoconductive and dynamic parameters of organic conjugated polymers, monomers and liquid crystal (LC) systems via nanoobjects sensitization. For example, due to its ability to enhance the polarization of the composites the sensitization process (connected with the activation of the intermolecular charge transfer complex formation) permits to increase the speed of the LC elements (from 8-16 ms to 1-2 ms and less for the structured nematic LC) and to improve the photorefractive features, such as can be seen in the laser-induced refractive index Δn from the value of \(10^{-5}\) up to \(10^{-3}-10^{-2}\). It also increases the surface mechanical hardness, laser strength as well as the wetting angle of the inorganic materials.

In the current paper, some evidence will be shown of the increase of the transparency of some inorganic materials and their mechanical and wetting features will be discussed as well as the modification of the organics’ refractive properties by checking the increase of the laser-induced refractive index.

Experimental conditions, materials and results: inorganic system modification

It should be mentioned that to modify the properties of the inorganic materials via their surface treatment, the carbon nanotubes have been deposited on the material surface using an IR CO\(_2\)-laser with \(p\)-polarized irradiation at a wavelength of 10.6 \(\mu\)m and power of 30 W. Moreover, when single wall carbon nanotubes (SWCNTs) have been placed at the materials interface, an electric field up to 100-600 V/cm\(^1\) was applied in order to orient the nanotubes during the deposition process. The spectra of the nanotube-treated materials have been obtained using Perkin-Elmer Lambda 9 and

---

1 St.-Petersburg Electrotechnical University, nvkamanina@mail.ru
Furrier FSM-1202 instruments. Surface mechanical hardness was revealed using the CM-55 instrument as well as via using of the microhardness device PMT-3M ("LOMO," Saint-Petersburg). The laser strength was checked with a pulsed nanosecond Nd-laser. The special accent was given to observe the relief at the material surface via checking the wetting angle. In this case the camera with parameters as Compact F1.6 1/3 CS Mount 6.0-60 mm Manual Focal Iris Zoom Lens for CCTV Camera (Black) was applied.

**Si materials spectra and hardness**

As an effective material in the application of solar energy and as the perspective photosensitive layer in the spatial light modulators operated in the reflective mode, the Si structure was treated. Using a laser deposition technique and as a method to orient the carbon nanotubes (Kamanina & Vasilyev, 2009, Kamanina & Vasilyev 2010), the essential increase of the transparency of the Si materials was obtained as well as the increase of the micro hardness was shown. The quantum chemical calculation based on the LAMMPS program (Plimpton, 1995, Tersoff, 1989) was made to support the different penetration of the CNTs depended on the different CNTs diameter and varied their speed. The data are shown in Figure 1 and 2 and in Table 1.

Figure 1: Transmittance spectra of the pure Si (lower curve) and Si covered with the vertically aligned CNTs (upper curve), a. Transmittance spectra of the pure Si (lower curve), Si covered with the vertically aligned CNTs (middle curve), and Si covered with the graphene (upper curve), b.

Analyzing the spectral dependence (see Figure 1a), one can see that the transparency of the Si materials has drastically increased in the IR range from 2 to 16 micrometres. It should be noted that the refractive index, for example of CNTs, is close to 1.01-1.1 (Yang et al., 2007), thus the Fresnel losses are decreased dramatically. Furthermore, the spectral range of the inorganic materials which surfaces’ can be treated with carbon nanoparticles, such as CNTs, can be extended to the IR spectral range due to the fact that the imaginary part of the dielectric constant of the CNTs (responsible for absorption) is close to zero in the near IR and the middle IR-ranges. Moreover, based on the data in Figure 1b, the advances of the graphene layer as a promising coating can be suggested. It permits to propose that the graphene treated systems can be effective elements in optoelectronic devices when the transparency of the devices should be dramatically increased. Furthermore, this can be proposed for the laser technique too, for example, when the thickness of the key layers of the optically addressed spatial light modulators should be decreased and the mobility for the charge should be increased. It should be noticed that the increase of the charge carrier mobility is an important parameter for the solar energy elements and the battery as well.

Analyzing the mechanical properties (see Table 1), one should take into account the fact that the coupling length between the Si-Si atom is large (0.23-0.235 nm), in comparison with the length of C-C bond in the carbon nanotubes (~ 0.139-0.143 nm), thus the hardness of silicon is much less than carbon nanotubes. This can be improved and optimized with the laser deposition of carbon nanotubes because of their unique physical and chemical properties and very high Young's modulus with the values placed in the range of some terra Pa (Namilae et al., 2004). Thus, a 7.7% increase of the micro hardness can be found. Moreover, the roughness of the pure Si sample (RMS, nm) was 0.206; 0.219; 0.200 in comparison to the optimized Si treated with CNTs: 0.160; 0.165; 0.169. In addition, the data for the Ge micro hardness improvement, for the comparison, has been presented (see Table 1).

ITO coating spectra, laser strength and hardness

In this paragraph, the emphasis was given on the modification of the ITO-conducting layers because these structures have a very broad area of application in the solar energy, biomedicine, display, laser, and general telecommunication systems areas (Vasilev et al., 1987, Kamanina & Vasilenko, 1997). Some problem with increase of the transparency, mechanical and laser strength have been existed. For example, the transparency connected with the annealing temperature, the laser strength coincided with the mechanical hardness, etc. Thus, the nanostructuration process permits us to find new ways to resolve the problem mentioned above. The data shown in Figures 3 and 4 as well as in the Tables 3 and 4 support the spectral evidence, the mechanical, laser, resistance and wetting features as well.

Figure 3: Transmittance spectra of the ITO-layer covered with the vertically aligned CNTs under the application of different electric fields.

![Transmittance spectra figure](image)

Source: Author
One can see from the Figure 3 data that the structuration of the ITO surfaces with oriented CNTs provokes the shift of spectral parameters. Moreover, the data from Figure 4 shows that the effect has been coincided with the formation of the link between the carbon atom and the atomic layer of the ITO surface. It should be noted that the quantum chemical calculation was made based on the LAMMPS program (Plimpton, 1995, Tersoff, 1989). Moreover, it supports the dependence of the penetration depth on the diameter and the speed of the CNTs placed on the ITO surface via the oriented laser deposited technique. The ITO-relief obtained can be sufficiently used in the display technique due to the fact that the modified relief at the ITO surfaces can be considered as the conducting layer with the decreased resistivity, from one side. But, this relief can be used as the orienting one to align the LC-dipole with good advantage as well.

Analyising the data shown in Table 3 one can see that the strength of the ITO-conducting layer can be successfully increased via the CNTs treatment. It should be mentioned that traditionally the researchers have used the HfO$_2$-coatings deposited on the ITO surface to eliminate their roughness and increase the strength, but the CNTs modification can lead to better results.

Source: Author
According to the change of the wetting angle of the pure and structured ITO-layers it should be noted that the wetting angle can be increased from 70-75 degrees up to 85-89 degrees.

Thus, using this consideration based on the Si and ITO materials study, the CNTs laser treatment can be proposed as an innovative way to modify the important physic-chemical characteristics of this type of the inorganic material.

III. Experimental conditions, materials and results: organic system modification

The laser-induced change of the refractive index has been studied at the wavelength of 532 nm under Raman-Nath diffraction conditions (Kamanina & Vasilenko, 1997, Kamanina & Vasilenko, 1995Kamanina et al. 2015). The Raman-Nath diffraction condition is realized in the case when the recorded grating period is larger than the thickness d of the treated sample. Beam energies incident on and transmitted through the sample in first-order diffraction can be measured. The experiments have been made at a nanosecond pulsed regime at the spatial frequency of 90–130 mm⁻¹ and at the laser energy density ranged from 0.01 to 0.6 J·cm⁻². The technical experimental scheme has been analogous to that it can be explained in detail (Kamanina & Vasilenko, 1997, Kamanina & Vasilenko 1995) and was recently shown in (Kamanina et al., 2015) in the modified variant.

3.1. Polymides, pyridines, LC structures laser-induced change of the refractive index

It should be mentioned that in order to analyze the refractive processes of the organic materials spatially, one it should take into account that when the electric field of the laser wave is less than the intra-atomic electric field correlated with the electron charge and with the Bohr radius, we should estimate the linear effect. But, when the electric field of the laser wave is larger than the intra-atomic electric field, we should draw attention on the nonlinear optical features. Using this aspect, the values of optical susceptibility play important roles in the nonlinear optical effect. Really, the most important optical characteristic in this case is the induced dipole, whose can be expressed through dipole polarizabilities α(n). These are in turn related to the proportional dependence to the nonlinear susceptibility χ(n) and to the local volume v of the materials (media). Thus, laser-matter interaction provokes the change in polarization of the media and predicts the change in such properties as dynamic, photorefractive and photoconductive ones.

To predict the change of the cubic nonlinearity χ(3), as the minimum media local volume polarizability (Kamanina, 2005, Kamanina & Uskokovic, 2008, Kamanina et al., 2012, Kamanina et al., 2008), the laser-induced change of the refractive index Δn can be calculated from the diffraction efficiency η (Kamanina et al., 2015, Kamanina et al., 2008, Akhmanov & Nikitin, 1997) via realization of the Raman-Nath diffraction conditions (Λ≥2d) using the equation (1):

\[
\eta = \frac{I_1}{I_0} = \left( \frac{2\lambda}{\pi \Delta n d} \right)^2 .
\]

Here Δn is the induced change of the refractive index, I₁ is the intensity in the first diffraction order, I₀ is the input laser intensity, d is the thickness of the medium, λ is the wavelength of the light incident on the medium, Λ is the spatial frequency.

The basic data of the laser-induced change of the refractive index of the materials studied are shown in Table 4.

According the studied nonlinear features of the polyimide, etc. materials with different nanosensitizers, it can be predicted that new composite materials can be considered in order to establish the dramatical nanoparticles influence on the photorefractive features of the organic conjugated matrixes and to apply the organic materials to the holographic recording, laser frequency conversion, switching, as well as for the testing of the dynamic properties of the modified composites and their possible application in general telecommunication systems and in biomedicine instead of the volumetric inorganic materials.

Conclusion To summarize the results, one can state that:

- Structuration of the inorganic material surfaces (based, for example, on the Si and ITO structures) has predicted the change in the spectral, mechanical and wetting features. The increase of the transparency, hardness, and wetting angle has been revealed.
• Structuration of the inorganic material surfaces based on ITO has shown and supported the essential decrease of the resistivity. It can incite the decrease of the applied voltage when these ITO coatings are considered as the transparent conducting layers in the spatial light modulators.

• Structuration of the inorganic material surfaces based on ITO via the CNTs oriented laser deposition technique can form possible quasi-graphene layers which can explain the change of the ITO resistivity due to the large charge from the core of the CNTs and their donor-acceptor properties.

• Sensitization of the organic materials by the studied nanoparticles has revealed the change of the laser-induced refractive index that is larger than the ones obtained for the pure matrixes.

• Sensitization of the organic materials by the studied nanoparticles has provoked the change of the laser-induced refractive index that is compared or larger than the ones obtained for the classical inorganics matrixes.

• The area of the applications of the materials which body and interface can be modified with effective nanoparticles can be extended essentially.

CEREAL CRISPBREAD IMPROVEMENT WITH DIETARY FIBRE FROM APPLE BY-PRODUCTS

Daiga Konrade,¹ Dace Klava,² Ilze Gramatina³

Abstract: In the production of apple juice, the by-products such as the peel, bark and seeds remain biologically active substances and a good source of dietary fibre. The aim of our study is to incorporate apple by-product flour (ABF) into cereal crispbreads and to determine the total dietary fibre (TDF) content, the colour and the structural changes after addition of ABF to cereal based extrudates. Hot air drying was applied for the preparation of ABF from apple pomace. For the development of new products, a laboratory single-screw extruder GÖTTFERT 1 L series (Germany) was used. An extrusion screw (compression ratio 2:1) at a speed of 60-80 rpm and a rectangular die (aperture: 20 mm wide, 1.0 mm high, 100 mm long) were also used. The basic ingredients for extruded crispbreads were wheat flour, rice flour, wheat bran, rye flour, oat flour with addition of ABF in different proportions (5%, 10%, 15%). The content of total dietary fibre (TDF) was determined according to the AOAC – AACC method No.985.29 by FOSS Analytical Fibertec E 1023 system. Density, textural properties and colour were also determined. The obtained results showed an increase of TDF from 9.39 to 15.89 g 100g⁻¹ in wheat crispbreads with AB and from 15.8 to 19.89 g 100g⁻¹ in rye crispbreads with ABF, hardness of products with ABF was from 17.2-21.7 N and density from 0.24-0.35 g cm⁻³, moisture of final product was 3.89-4.24±0.01%. The main purpose of the current research was to determine the effect of ABF addition to cereal crispbread content, of the TDF and the textural properties.

UDC Classification: 664.6.7; DOI: http://dx.doi.org/10.12955/cbup.v5.1085

Keywords: apple by- products, crispbreads, extrusion, dietary fibre

Introduction

Apple processing in the food industry results in a significant number of by-products such as the peel, mark, bark, and seeds which are still rich in bioactive compounds promoting health benefits. The high amount of dietary fibre could permit the use of these in developing new natural ingredients for the food industry (Figuerola & Mar, 2005). Apple wastes are good sources of fibre with a well-balanced proportion between soluble and insoluble fraction (Eskıcioğlu et al., 2015). The apple pomace have 51.10 g 100 g⁻¹ DM of total dietary fibre, of which 14.60 g 100 g⁻¹ DM is soluble and 36.50 g 100 g⁻¹ DM is insoluble dietary fibre (Olfe et al., 2003). Comparable to whole grain oat that contains the highest amounts of soluble fibre (6–8 g/100 g) among all cereal grains (Rodehutsscord et al., 2016).

The apple peel may be used in the formulation of functional foods and beverages (Henri, Almonacid, Lutz, Simpson, & Valdenegro, 2013).

Extruded crispbreads are produced from cereals: rye, wheat, rice, maize, based on high starch content (Kaur et al., 2015, Guine et al., 2013). Grains are important energy sources providing much of the carbohydrates, some proteins, lipids, dietary fibre, and other micronutrients in many diets. Fruits, oats, whole grain cereals, bran and rye are good source of dietary fibre β- glycan, cellulose, hemicellulose and lignin (Dreher, 2001).

Dietary fibre (DF) includes a mixture of plant carbohydrate polymers, both oligosaccharides and polysaccharides, e.g., cellulose, hemicelluloses, pectin substances, gums, resistant starch, inulin, that may be associated with lignin and other non-carbohydrate components (e.g., polyphenols, waxes, saponins, cutin, phytates, resistant protein) (Elleuch et al., 2011). High DF diets prevent some diseases, such as diverticular and coronary heart diseases (Figuerola & Mar, 2005). DF improves serum lipid concentrations, improves blood glucose control in diabetes, lowers blood pressure and appears to improve immune function (Yde et al., 2011). Dietary fibre intake should range from 20 to 35 grams per day or 10–13 g per 1000 kcal (Kohajdová et al., 2011).

The purpose of the study is to incorporate apple by-products in cereal based extrudates to obtain product with higher total dietary fibre content and to determine how chemical composition of ABF and TDF influence the physical properties of the final product.

Materials and methods
The study was realized at the scientific laboratories of the Faculty of Food Technology at the Latvia University of Agriculture.
For development of crispbreads we used wheat flour, rice flour obtained from rice grains by grinding, 2365 type wheat bran, rye flour and oat flour, water.
Experimental samples were prepared with addition of apple by-product powder 5%, 10%, and 15 % to dry ingredients.

Extrusion was done with a laboratory single-screw extruder GÖTTFERT 1 screw Extrusiometer L series (Germany). An extrusion screw (compression ratio 2:1) at a speed of 60-80 rpm and a rectangular die (aperture: 20 mm wide, 1.0 mm high, 100 mm long) were used. Temperatures for the extrusion process were set 78±2°C/83±2°C /98±2°C.
The moisture content of the selected material was determined by standard method with Memmert equipment Modell-100-800 according to standard LVS EN ISO712:2010 A.
Water activity (aw) was determined according to ISO 21807: 2004.
The total content of dietary fibre (TDF) was determined according to the AOAC –AACC method No.985.29 -1986 by FOSS Analytical Fibertec E 1023 system.
Textural properties of extruded cereal- apple by-products were measured using a TA HD texture analyzer Stable Micro Systems. The test was performed by compressing the samples to 80% of their original diameter using a 35-mm compression plate at test speed of 2 mm s⁻¹. Peak force (N), number of peaks, and initial gradient (N mm⁻¹) of the force–deformation curve was recorded and used to calculate hardness, crispiness of the products. An average of 10 samples was used to determine these properties.
Piece density of extrudates was determined by using a sand displacement method. Piece density was defined as the ratio of the sample mass of the sample to its volume to include internal pores but exclude the void or space between the extrudates and was measured by filling a container of known volume with the product. The procedure was repeated five times for each set of samples.

Colour changes of product samples in the colour system CIE L*a*b* were determined by means of the Colour Tec – PCTM equipment according to ISO 11664-4: 2011

Results were expressed in SIE L*a*b* system as tri-stimulus values (L* lightness, a* greenness/redness, b* blueness and yellowness. Measures for each sample were done in 10 replications. Total color difference (ΔE) was determined using the equation described by Garau et al. (2007).

The analysis of the experimental data was done in accordance with mathematical statistical methods used MS Excel 2007 software.

**Results and Discussion**

**Determination of TDF and textural properties of samples**

Textural and functional properties are the main decisive factor for acceptability of a snack food in the market. The incorporation of fibre in the extruded crispbreads generally results in changes of the nutrient profile (moisture and water activity) and physical properties (structure and texture) of the final extruded products (Brennan et al., 2008a). Thermal and mechanical treatment can reduce total dietary fibre (TDF). By incorporating 5 to 15% ABF, the TDF content of extruded products increased from 9.39 to 15.89 g 100 g⁻¹ in crispbreads from wheat -rice flour and ABF addition, from 15.8 to 19.8 g 100 g⁻¹ in rye crispbreads with ABF.

Fibre is usually used as a bulking agent, to provide nutritional attributes and to modify the texture of extruded products. Fruit fibre has better quality due to higher total and soluble fibre content, water and oil holding capacity and colonic fermentability, as well as lower caloric value (Figuerola & Mar, 2005, Dreher, 2001). The purity of the fibres has a direct influence on the expansion characteristics. Fibre usage is often limited by its effect on product expansion. The addition of oat and rice fibre normally reduces expansion characteristics (Huber, 2001). Fibre, cellulose, bran and fruit-derived pectin may be blended with cereal grain or protein blends to make healthful snacks. Fibre and proteins may each be added at 20% levels to expanded snack formulations. Higher levels can be added when more soluble fibres and proteins are used. Low levels of low-molecular weight starches also counter the effects of fibre and protein additions. Extrusion-reacted fibre or bran yields softer-textured snacks when high levels of fibre are desired (Huber, 2001). Apples are rich in components that influenced the extrusion process and final product.

The textural characteristics of samples with ABF are given in Figure 1 and Table 3. The toughness of the extruded products is highly dependent on its moisture and density. Starch structure is distorted at high temperatures leading to a harder product. ABF extrudates were crisper compared to cereal based extrudates that is a harder product. The 5-15% ABF incorporated products showed light in weight with piece density ranging from 0.15 to 0.17 g cm⁻³. Correlation between TDF and ABF addition is r=0.71.
Typical commercial low-density puffed snacks prepared by conventional steam extrusion have a density in the range of 0.02–0.7 g cm$^{-3}$ and the ABF-based extrudates fall well within this range, indicating the potential of incorporating of ABF into crispbreads without impairing their textural qualities. Compared to cereal-alone extrudates, in ABF incorporated extrudates, bulk density increased from 0.15 to 0.17 g cm$^{-3}$.

Colour

Colour is an important quality factor related to consumer acceptability. The addition of reducing sugars can have a detrimental effect on available lysine and browning can occur (Bhattacharya, 1981). The addition of ABF did not cause significant colour change, indicating the absence of the browning reaction in final extrudates even though the feed formulation of pomace contained a considerable amount of soluble sugars.

Colour changes were analyzed for samples with ABF addition.

Total colour difference $\Delta E^*=(L_0^*-L^*)^2+(a_0^*-a^*)^2+(b_0^*-b^*)^2)^{1/2}$

The results showed significant differences between all samples with ABF addition and control samples ($3.64<\Delta E^*<4.94$). The differences between samples of ABF from 5% to 15% were not significant ($\Delta E^*=0.82, 0.85, 0.66$ and 0.73).
Table 4: Colour difference of product samples in the color system CIE L*a*b*

Source: Author

Extrusion of ABF additionally decreased the lightness of samples, colour saturation (L*) and hue did not show a clear trend. Some authors also reported a darkened colour of the extrudates due to Maillard browning during extrusion which also can cause the colour change (Devi et al., 2013, Nayak et al., 2011, Jain et al., 2013).

Conclusion

Results show that ABF from apple processing could be considered as an alternative dietary fibre in extruded cereal products. Utilization of apple pomace offers opportunity to produce extruded foods with functional properties. Apple by-products can increase the level of TDF of the new product. Extrusion is possible with 1 screw extruder at the temperature 78/83/98 °C.

Abstract: Sedentary lifestyle has become a great concern to human health. City parks play a great role in the solution of this problem, but exposure to urban pollutants leads to the necessity to monitor environmental quality. Purpose of Study The aim of the study was to evaluate the possible cytotoxicity and genotoxicity of soil samples collected from Shumen city park using Allium cepa L.-test. Methods The following microscopic parameters were used: mitotic index, index of each phase of mitotic division, mitotic abnormalities and interphase cells with micronuclei or two nuclei. Findings and Results The decline of the mitotic activity and changes in the proportion of mitotic phases indicate soil cytotoxicity. Various mitotic abnormalities and binucleated cells revealed genotoxicity. Conclusions and Recommendations Established cytotoxicity and genotoxicity of soil revealed a potential health risk to park users. Further analyses should be provided, since positive results from Allium-test serve as an alarm. UDC Classification: 502/504; DOI: http://dx.doi.org/10.12955/cbup.v5.1086 Keywords: Shumen city park, Allium-test, soil cytotoxicity and genotoxicity

Introduction

More than a half of mankind now lives in towns. A sedentary lifestyle has become a great concern to human health (Owen et al., 2010). Physical inactivity is a major factor for various diseases. City parks play a great role in the solution of this problem. Numerous studies have documented the positive influence of urban green spaces on physical and mental health (Kabisch and Haase, 2013). On the other hand, being located in the towns, parks are exposed to various pollutants due primarily to traffic, industrial and domestic emissions (Galušková et al., 2011). Park demand determines the necessity to monitor environmental quality. Air pollution is deeply studied, but soil pollution has remained in the background (Science Communication Unit, 2013). It should be noted that citizens have direct contact with soils using recreational areas and adverse effects are generally associated with inhalation of dust (Moosavi and Zarasvandi, 2009). Exposure to contaminated soils may pose a health risk, especially for children because of the additional soil-hand-mouth pathway (Ljung et al., 2006).

Recently, a lot of studies have been focused on urban soil pollution (Karim et al., 2014; Luo et al., 2012; Yang and Zhang, 2015). The standard analytical approach is not appropriate for evaluation of health risk of complex mixtures like soil – bioassays are useful in such studies (Soodan et al., 2012). Special attention has been paid to soil mutagens (Monarca et al., 2002). A lot of studies have established genotoxic pollutants in soils (Watanabe and Hirayama, 2001; White and Claxton, 2004). Higher plant bioassays are used as genetic models for testing toxicity of various environmental contaminants (Chahal et al., 2014; Corneanu et al., 2009). The Allium cepa-test has been widely used to study of cytotoxicity and genotoxicity of different pollutants (Fiskesjö, 1993; Tedesco and Laughinghouse IV, 2012; Leme and Marin-Morales, 2009).

The present study is focused on an urban recreational area – Shumen city park (Bulgaria). A "site by site" approach is recommended in such studies, because of specific features of the particular site (Science Communication Unit, 2013). In the case of present study, the park is located near the center of the town of Shumen – a medium-sized city, an important transport hub with well-developed light industry. The park provides a variety of functions including spaces for relaxing, meeting friends, play areas for children, etc. The aim of this study was to evaluate the possible cytotoxicity and genotoxicity of soil samples collected from Shumen city park using Allium cepa-test.

Materials and Methods

Studied area and soil sampling

The study area in the present investigation is City Park in Shumen (CP), located in northeastern part of Bulgaria. Soil samples from CP (SCP) were collected during August 2015 under dry weather conditions. The latitude and longitude at sampling site were recorded using a handheld global positioning system (GPS) – N43° 16' 15.88" E26° 56' 21.47".

Sampling was provided by digging soil to depth of 0–10 cm (soil horizon A). Ten topsoil sub-samples were taken and bulked to give a composite sample. Sub-samples were taken in an ‘S-shape’ pattern at a distance of 5 m. The samples were air-dried at room temperature in laboratory to constant weight, pulverized and then sieved to < 1 mm particle size.

Allium cepa-test

The onion bulbs were purchased from a biofarm certified to the BCS Öko Garantie; GLOBALG.A.P and IFS Food. The outer scales of the bulbs and the old dry roots were removed without destroying the root primordia. The bulbs were kept for root germination in deionized water for 24 h. Bulbs with new roots with length of 1.5 cm were placed on soil:water suspension (25:1) and were allowed to root for 24 h at 25 ± 1 °C. The root tips were washed thoroughly with distilled water, fixed in Clarke’s fixative (95% ethanol: acetic acid glacial, 3:1) for 90 minutes and hydrolyzed in 1N HCl for 8 min and in 45% acetic acid for 60 min at room temperature. Then they were stained for 90 min in 1% aceto-orcein and the terminal root tips (1-2 mm) were excised and squashed in 45% CH₃COOH. Each soil sample and control group consisted of 9 meristems from 3 bulbs. At least 1000 cells of each root meristem were analyzed. The mitotic index was determined as a ratio between the number of cells in mitosis and the total number of analyzed cells, expressed as a percentage. The index of each phase of mitotic division was calculated as a ratio between the cell number in the respective period and the number of dividing cells. The frequency of aberrant cells was calculated as a percentage of the total number of analyzed cells. The following abnormalities were scored: mitotic cells with chromosome bridges, fragments, vagrant chromosomes, multipolar anaphase/telophase, diagonal spindle, C-mitosis and interphase cells with micronuclei or two nuclei.

Statistical analysis

Results were expressed as the mean ± standard deviation (SD), and significance was analyzed using Student’s t-test where significance was accepted at P ≤0.05.

Results and discussion

Effects of a soil sample from CP on mitotic index and phase indices in root meristematic cells of Allium cepa L. are summarized in Table 1. The mitotic index decreased in comparison with the negative control. The lower mitotic division could be associated with various factors (as listed by Lamsal et al., 2010): inhibition of protein synthesis, influence on enzyme function, reduction of oxidative phosphorylation. Several checkpoints in mitotic cycle ensure proper distribution of genetic material. If there is DNA damage or inhibition of DNA synthesis, the cells are blocked in G₂ phase (Selmi et al., 2014). Inhibition of mitotic activity is accepted as an indication of a cytotoxic effect (Olorunfemi et al., 2011). The treatment with soil suspension changed the mitotic phase distribution. The notable effect was a decrease of the telophase index. Changes in the proportion of mitotic phases also indicate the occurrence of a cytotoxic effect (İlbąg et al., 2011).

Source: Authors

Exposure to soil sample increased ~2.5-fold the percent of chromosome aberrations in comparison to negative control (Table 2). Different kinds of mitotic abnormalities were observed (Figure 1).
Diagonal metaphases and anaphases were the most frequent abnormalities. The occurrence of mitotic cells with diagonal position of spindle upon treatment with different compounds were reported in other studies (Bhattacharjee and Sakya, 2008; Lamsal et al., 2010; Tripathy et al., 2013). Presence of vagrant chromosomes was notable in the treated cells. Vagrant chromosomes served as a sign of spindle disturbances (Yildiz and Arikan, 2008). C-mitoses and bridges in ana-telophase also were scored. Disturbed metaphases may be caused by inhibition of spindle formation (Selmi et al., 2014). Bridges may be consequence of DNA breaks (Maluszynska and Juchimiuk, 2005). Fragments and multipolar anaphases were not detected. As can be seen, soil samples caused spindle disturbances (vagrant chromosomes and disturbed metaphases and anaphases) rather than clastogenicity (bridges and fragments).

Treatment did not affect percent of micronuclei (extranuclear bodies of chromatin material) as compared to negative control (Table 2). On the other hand, soil sample from CP increased the number of binucleated cells ~1.5 fold. Binucleated cells result from failure of mitotic cells to complete cytokinesis and are accepted as a sign of cytotoxicity (Leme and Marin-Morales, 2009).

Source: Authors

Studies on soil pollution could contribute to a municipal policy on environmental management (Žigová et al., 2008). Since soil pollutants can have harmful effect on human health, there is a necessity to find out proper bioindicators for ecotoxicological analyses (Fontanetti et al., 2011). Present study confirmed other data that *Allium cepa*-test can be recommended for detection of cytotoxicity and genotoxicity of complex mixtures (Fiskesjö, 1993; Leme and Marin-Morales, 2009; Tedesco and Laughinghouse IV, 2012). In our study, we compared effects of soil samples from CP on root meristematic cells with those of deionized water (as a negative control). The decline of the mitotic activity, changes in the proportion of mitotic phases, various mitotic abnormalities and binucleated interphase cells revealed cytotoxic and genotoxic effects. These observations indicate the existence of a health risk for people.

**Conclusion**

Established cytotoxicity and genotoxicity of soil sample from City Park revealed a potential risk to park users. Our study confirmed that bioassays could provide basic information about hazards of complex mixtures like soil. Further analyses on soils in City Park should be provided, since positive results from *Allium*-test serve as an alarm.

DEVELOPMENT OF A NEW GENERATION OF MAGNETIC CONTACT BASED ON HALL-EFFECT SENSOR

Milan Kutaj,1 Martin Boroš2

Abstract: This paper describes the development of a new generation of magnetic contact. The development of this new generation of magnetic contact is a part of the research activity of the security engineering laboratory. The new generation of magnetic contact is based on the Hall-Effect Sensor and microcontroller unit. Older magnetic contacts use a simple reed relay with only two states – normally closed or normally opened. The combination of the Hall-Effect Sensor and microcontroller unit provides advanced possibilities such as a programmable level of magnetic field sensitivity, adding different communication modules, programmable inputs/outputs etc. The results of this paper explain proposal of the new generation of magnetic contact, which can be used not only as a part of intruder alarm systems but also as a part of smart homes and other autonomous systems. The content of the paper can be used for even deeper research and by security systems developers as well.

UDC Classification: 621.3 ; DOI: http://dx.doi.org/10.12955/cbup.v5.1087

Keywords: Development, magnetic, contact, hall-effect, programmable, smart, autonomous.

Introduction

Magnetic contacts are one of the basic components of electrical security and distress alarm systems (they are mostly used in securing the object and therefore are only used partially – in the alarm intruder system). They are very simple detectors of perimeter protection consisting of 2 parts (an encapsulated magnet and an encapsulated reed contact) which use magnetic hysteresis which values differ from one manufacturer to another. They are mostly used in securing windows and doors.

Magnetic contacts

Reed contact is a mechanical switch consisting of two ferromagnetic leads placed in a hermetically sealed glass capsule filled with inert gas. The magnet is installed on the movable part of the windows and doors and the reed contact onto the fixed part of windows and doors (frame). The magnetic contact can be in its standby state open or closed. Standby state is such when the magnetic field of the magnet does not act on the reed contact (figure 1) (Loveček et al., 2015).

Figure 1: Principle of the magnetic contact (open in standby state, closed by moving the magnet closer)

Source: Authors

Magnetic contacts based on the technology of reed relay can be overcome by simple methods without making too much effort. To sabotage them, we can use a parasitic magnet with higher magnetic field intensity or bypass cables, which contacts are connected to the alarm intruder system control panel (Veľas, 2010). To increase the probability of intruder detection, we can use magnetic contacts with integrated reed relays using several mechanical switches in one glass housing with different standby states or polarized reed relays which change their standby mode only when a correctly oriented magnet comes in contact with them (Veľas, 2010).

Due to the simplicity of magnetic contacts and the ease with which they can be overcome, it is necessary to test their technical parameters and reliability. The testing of magnetic contacts is the focus of norm STN EN 50131-2-6 (Alarm systems. Electronic security and distress systems. Part 2-6: Opening contacts

1 Faculty of Security Engineering, University of Žilina, milan.kutaj@fbi.uniza.sk
2 Faculty of Security Engineering, University of Žilina, martin.boros@fbi.uniza.sk
(magnetic)) (STN EN 50131-2-6, 2014). The aim of these tests is to verify the functionality of magnetic contacts and thus their reliability in given conditions (Loveček, 2008).

As part of its R&D activities, the Faculty of security engineering performed tests on many magnetic contacts and for the needs of this article, we have selected one specific magnetic contact from manufacturer USP SP-1000. All tests were performed in laboratory conditions, as specified by the norm:

- temperature 15°C – 35°C,
- relative humidity 25 % – 75 %,
- air pressure 86 kPa – 106 kPa (Ripka, 2001; Loveček et al., 2015) (STN EN 50131-2-6, 2014).

Tests were focused on measuring the distances of opening, which were clearly recorded in a chart and after calculating the arithmetic mean, they were compared with the technical documentation provided by the magnetic contacts manufacturer. During the first measurements, we used the UNI-T 70A multimeter in the mode for measuring the circuit integrity (short-circuit probe). After a few repetitions, we noticed a slow response of the multimeter and decided to create a simple electric circuit which served for optical signalization of “on” state (red LED lights up) and “off” state (red LED turns off) of the magnetic contact. To put it simply, it is a system which tests the electric continuity (figure 2) similarly to a connected multimeter, but the response is immediate.

![Figure 2: Block scheme of the testing circuit](image)

The procedure which we used in testing was as follows:

1. We created an electric circuit as described above.
2. Outgoing cables of the magnetic contacts were connected to the circuit.
3. The reed contact was placed on a solid pad using a 1-millimeter piece of paper.
4. The permanent magnet was moved on the millimeter paper back and forth, perpendicularly to the reed relay.
5. After each turning off of the LED, we recorded the distance between the permanent magnet and the reed relay into charts 1 and 2.
6. Using the formula \( \bar{x} = \frac{\sum_{i=1}^{n} x_i}{n} \) we calculated the arithmetic mean of distance of closure when moving the magnet in or distance of opening when moving the magnet away.

The results were compared to the technical documentation provided by the manufacturers.

Source: Authors
The measured results show that the magnetic contact made by USP SP-1000 is not suitable. The distance of opening after moving the permanent contact away was 13mm greater than the information given out by the manufacturer, which can create a big enough opportunity for the intruder to break the protection or use and install an espionage device without being detected. Apart from the simple overcoming of a magnetic contact, the risk to the security of the object is increased due to installing a magnetic contact with inaccurate specifications.

**Development of magnetic contact based on advanced technologies**

For an intruder who has sufficient knowledge on the installation of an alarm intruder system, overcoming a magnetic contact with a reed relay becomes a matter of seconds. Reed relay is a simple technology, its roots going back to the 1930s and they are used in today’s alarm intruder systems mostly due to their simple structure and very low price (Ripka, 2001).

Taking into account the aforementioned drawbacks of reed relay-based magnetic contacts, development has been initialized that would replace the reed relay in magnetic contacts with an integrated semiconductor circuit using the Hall-Effect technology. Using a more advanced technology in designing a next-generation magnetic contact will provide exact setting of distance for opening/closing of the contacts. Values of distance can be changed in real-time thanks to the implementation of a microprocessor. Its memory can be programmed to hold the intensity value of the magnetic field stemming from the permanent magnet in the dynamic part of the security system (Bahreyni, 2006). Once there is no magnetic field acting on the Hall-Effect Sensor, the alarm is sounded. Almost all magnetic contacts available on the market work based on this logic. Implementing a processor allows for the use of other functions which reed-relay-based magnetic contacts don’t and can’t have. The task of the microprocessor is not only to evaluate the alarm state based on losing the permanent magnet’s magnetic field (Popovic, 2004). The high performance of a microprocessor allows for monitoring even the slightest changes of intensity of the magnetic field and based on this data, it can correctly analyze what sort of intrusion is occurring – alarm or sabotage.

**Concept of the new-generation magnetic contact – The nju:MAG**

The proposed next-generation magnetic contact (nju:MAG) is the result of a project, which was originally meant to utilize the MEMS technology (MicroElectroMechanical Systems). MEMS integrate a set of mechanical elements, sensors, action members and control and analysis electronics onto a ceramic substrate using various production technologies. Today this technology is an inseparable part of all smartphones, laptops, office tech, cars, planes … (Bilotti et al., 1997)

The MEMS based magnetic contact would offer a range of advanced functions. For instance, the tremor detection seemed a very attractive function. The high sensitivity of MEMS sensors and digital communication in combination with a high-performance microprocessor would allow for distinguishing knocking from an attempted intrusion by damaging the opening fillings (breaking a window, the destruction of doors, …etc.). Evaluation of these states is possible, but it would require programming complex algorithms for the microprocessor, which would increase the market price. Within our project, we decided to stay away from similar functions and only focus on the main function of the magnetic contact – detection of the permanent magnet’s magnetic field. Due to this rationale, there is no reason to utilize MEMS technology and substantially simpler semiconductor technology can be used for the magnetic field detection. MEMS will therefore not be used as the basis for the nju:MAG magnetic contact. However, a microprocessor as the centre for evaluating states remained as well as all other circuits ensuring the magnetic contact works as it is supposed to. The MEMS sensor was replaced with BiCMOS technology, specifically a Hall-Effect Sensor. The CMOS technology is known to be sensitive to temperature changes. The manufacturer took this into account and the Hall-Effect Sensor compensates for the temperature changes which ensures accurate output values within the entire range of the working temperatures (Randjelovic et al., 2002).

There was a very significant change as far as communication is concerned between the selected type of sensor and the microprocessor. While the MEMS sensor communicated with the microprocessor using the PC or SPI digital interfaces, the Hall-Effect Sensor outputs a continuous analog signal (Kanda & Migitaka, 1976). The output from the Hall-Effect Sensor can be connected directly into the microprocessors input pin, which processes the analog signal and converts it into a digital one (Analogue-to-digital converter – ADC). In the nju:MAG magnetic contact, the Hall-Effect Sensor output
is connected to the analog input of the microprocessor using a differential amplifier, which amplifies the output signal from the probe, doubling it, and changes the range of the output voltage of the Hall-Effect Sensor from the original 2.5-4.5V to 0-3.8V (Loflin, n.d.).

The microprocessor implemented in the nju:MAG magnetic contact can process an analog signal with a resolution of 10 bits, which represents 1024 (0-1023) values of the duty cycle. To calculate the value of the voltage of one step of the duty cycle, we use the value of the microprocessor’s system voltage and resolution of the analogue input of the microprocessor. These values we then put into equation 1:

**Equation 1: Value of one step of duty cycle**

\[
\text{One Step of Duty Cycle [mV]} = \frac{\text{System Voltage [V] \times 1000}}{\text{Resolution of the ADC}} = \frac{5V \times 1000}{1023} = 4.89 \text{mV}
\]

Source: Authors

Due to the modified range of the output voltage of the Hall-Effect Sensor amplified by the differential amplifier, which reaches values between 0-3.8V, the 10-bit resolution of the ADC won’t be fully utilized. The maximum value of duty cycle, which can be achieved can be calculated using equation 2:

**Equation 2: Maximum value of duty cycle**

\[
\text{Max Duty Cycle} = \frac{\text{Hall – Effect Max Output [V] \times 1000}}{\text{One Step of Duty Cycle [mV]}} = \frac{3.8V \times 1000}{4.89mV} = 777
\]

Source: Authors

Even despite the fact that we’re only using approximately two thirds of the entire range, initial tests have shown that in real-life conditions, this was no effect on the work of the magnetic contact. For future use, however, using and external reference voltage set exactly to 3.8V is being considered (Loflin, n.d.).

The microprocessor and other circuits are supplied stable, constant voltage – this is ensured using a linear voltage regulator, its input terminals can be connected to up to an 18V power supply. Use of such linear voltage regulator proves ideal, because components of alarm intruder system usually are supplied by voltage of 12V.

The nju:MAG magnetic detector is capable of detecting any sabotage attempt:

- forcible removal from a wall,
- forcible opening of the front cover,
- detection of a parasitic magnet
- detection of partial opening of the door.

Sabotage through the forcible removal from a wall or opening of the front cover is detected using two switches. The switch dedicated to the detection of forcible removal from the wall is placed on the back side of the motherboard, the switch responsible for detecting the forcible opening of the front cover is placed on the front side of the motherboard.
The detection of a parasitic magnet and partial opening of the door is possible thanks to the principle on which the Hall probe works; it measures the intensity of the magnetic field of the permanent magnet and based on the programmed values, the microprocessor can recognize it with a probability close to 1.

The nju:MAG magnetic detector integrates an RGB LED light to display information of the current status. Colours of individual states can be programmed; intensity of the light can also be adjusted and set at different values for each state, just like the color.

Communication with the alarm intruder system, specifically with the control center, is done only through a bus, and a loop circuit is not possible. A loop circuit would not be problematic from technical standpoint however, all advanced functions offered by the nju:MAG detector would go unused (Veľas, 2015). This is the main and only reason, why only a bus connection to the control unit was considered.

**Conclusion**

Initial tests of magnetic contacts performed as part of the research and development activities show the actual need for testing magnetic contacts. Not all magnetic contacts correspond to the specifications stated in the technical documentation of the manufacturers or coincide with the conditions specified by technical norms. Based on these findings and results of testing the specifications and resilience of magnetic contacts, a project was designed focused on eliminating their negative properties. The aim of the article is to design a nju:MAG magnetic contact, which brings new functions to this field and increases the amount of security provided. It offers advanced sabotage detection for any attempted breach and allows for programming of specific parameters of permanent magnets in real-time. The nju:MAG magnetic detector is without a doubt a great asset not only from a R&D standpoint, but also an interesting product for manufacturers and companies focused on security projects and installation of alarm intruder system.

DETERMINATION OF ANTIOXIDANT CAPACITY OF SELECTED BOROXINES
Maja Marasović,1 Antonio Roščić,2 Borivoj Galić,3 Mladen Miloš4

Abstract: Our previous in vitro and in vivo studies on standard tumor cell lines: mammary adenocarcinoma 4T1, melanoma B16F10, and squamous cell carcinoma SCCVII have demonstrated that dipotassium-trioxohydroxytetrafluorotriborate, \(K_2[B_3O_3F_4OH]\), affects the growth of cancer cells. Based on indicative results of its anticancer activity, that are comparable to the standard cytostatic 5-fluorouracil, we decided to analyze the antioxidant capacity of \(K_2[B_3O_3F_4OH]\). In our research, we include two other simpler representatives of the boroxine family compounds: trimethoxyboroxine and trimethylboroxine, which are two other commercially available. The study objective is to explore the possibility of similar behavior within the same class of boron compounds, that is, to examine the activity of \(K_2[B_3O_3F_4OH]\) compared to simpler representatives of the same family of compounds. On the one hand, \(K_2[B_3O_3F_4OH]\), theoretically has the ability to exchange electrons in the extinction of reactive radicals, since two boron atoms are sp3-hybridized and use electrons from the inner shell. On the other hand, trimethoxyboroxine, and trimethylboroxine, in theory, should not exchange electrons. However, recent studies indicate the potential for the boron atom to act like carbon and participate in the exchange of protons. The study used the standard laboratory method of 2,2-diphenyl-1-picrylhydrazyl (DPPH) antioxidant assay. The selected boroxines were treated with a DPPH radical at a temperature of 35° C in various concentrations, and with a reaction time of one hour. Results of the DPPH test show an extremely weak antioxidant capacity exists for all investigated boroxines. When \(K_2[B_3O_3F_4OH]\) was tested at high concentrations, instead of decreased color in the DPPH radicals, there was an increase in absorbance readings, which could mean that this compound acts as a pro-oxidant at higher concentrations. Future research is recommended to examine the length of reaction times needed, and whether a change in the reaction conditions would boost the antioxidant capacity of \(K_2[B_3O_3F_4OH]\). Finally, future research could test the hypothesis that \(K_2[B_3O_3F_4OH]\), in the absence of the expected antioxidant activity, acts as a pro-oxidant.

Keywords: antioxidant capacity, boroxine, DPPH, pro-oxidant

Introduction
In the last 20 years, the chemistry of boron compounds has been progressively investigated because of boron’s unusual characteristics. This element is at the boundary of metals and non-metals and thus, exhibits characteristics of both elemental types. Often characterized as highly toxic and as such, unacceptable in human medicine, boron compounds have been neglected and unexplored for some time. Within the family of boron compounds, boronic acids and boroxines are particularly interesting. Boroxines are compounds of the six-membered heterocyclic structure, anhydrides of boronic acids, which have a ring structure with three oxygen atoms and three boron atoms. Boroxines are prepared by dehydration of boronic acid. In some cases, the creation of a known six-membered heterocyclic ring can be achieved simply by heating the corresponding boronic acid in an anhydrous solvent, such as carbon tetrachloride or chloroform. Today, they are known as antimicrobials and enzyme inhibitors. Individual boroxines show potent antifungal activity, some anhydrides possess activity against a broad spectrum of gram-negative bacteria, which is based on inhibition of fatty acid synthesis.

Our primary interest is the halogenated boroxine (dipotassium-trioxohydroxytetrafluorotriborate), \(K_2[B_3O_3F_4OH]\), originally synthesized in 1951 in the Union of Soviet Socialist Republics (USSR) by Ryss and Slutskaya (1951). Galic (2012, 2013) observed that halogenated boroxine, \(K_2[B_3O_3F_4OH]\), acted on hyperkeratosis on the skin with dark-colored growths, exposed to small concentrations of \(K_2[B_3O_3F_4OH]\), losing their color and irrevocably shedding from the surface of the skin. Halogenated boroxine shows high solubility and stability in water, and these features can facilitate its eventual use in medical, dermatological and cosmetic formulations. Toxicological studies have shown that \(K_2[B_3O_3F_4OH]\) has low harmful effects on the health of humans and mammals. Haveric et al. (2011) investigated the antiproliferative, cytotoxic, and genotoxic potential of \(K_2[B_3O_3F_4OH]\) using an alamarBlue® test on the basal cell carcinoma and lymphocyte. Islamovic et al. (2014) and Vullo et al.

(2015) investigated the kinetic parameters and mechanism of inhibition of enzymes, catalase and human carbonic anhydrases, in the presence of $K_3[B_3O_f_3OH]$. Ivankovic et al. (2015) showed the potent antitumor activity of $K_3[B_3O_f_3OH]$ that is comparable to the well-known anticancer drug, 5-fluorouracil. The antitumor activity was tested in vitro on a number of tumor cell lines (adenocarcinoma 4T1, melanoma B16F10, and squamous cell carcinoma SCCVII) and in vivo on solid tumors of the same type in syngeneic mice. The study revealed high sensitivity of tumor cells with the $K_3[B_3O_f_3OH]$, independent of the mode of application.

This study aims to determine the antioxidant capacity and antiradical activity of $K_3[B_3O_f_3OH]$ using the standard 2,2-diphenyl-1-picrylhydrazyl (DPPH) method of antioxidant assay. The research includes two other simpler representatives of the boroxine family (Figure 1), trimethoxyboroxine ($C_9H_9B_3O_6$) and trimethylboroxine ($C_9H_9B_3O_3$), which are commercially available. The objective is to explore the possibility of similar actions within the same class of boron compounds, that is, to examine the activity of $K_3[B_3O_f_3OH]$ compared to the simpler representatives of the same compound family.

**Data and Methodology**

All chemicals used were of analytical grade. 2,2-diphenyl-1-picrylhydrazyl (DPPH), trimethoxyboroxine, and trimethylboroxine were supplied by Sigma-Aldrich, Merck, Germany. The halogenated boroxine, $K_3[B_3O_f_3OH]$, was prepared through a simple reaction between potassium hydrofluoride, KHF$_2$, and boric acid in the molar ratio of 2:3, at room temperature, as reported in the literature by Ryss and Slutskaya (1951).

The DPPH method was the standard method for the determination of antioxidant activity using a stable free radical, 2,2-diphenyl-1-picrylhydrazyl (DPPH, $C_{18}H_{12}N_3O_6$, Mw=394.32 g/mol). 2,2-diphenyl-1-picrylhydrazyl is characterized as a stable radical due to the existence of delocalized electrons that are not concentrated in one place. The electrons’ influence is felt throughout the molecule, and therefore there is no dimerization. The radical system has a dark purple color. After mixing radicals with antioxidants, hydrazine is reduced to hydrazine, donating hydrogen atoms by antioxidants to unpaired electrons of nitrogen. The reduction from hydrazyl to hydrazine occurs through the gradual loss of color, which can be observed by measuring absorbances at a wavelength of 520 nm.

DPPH$^+$ + AH → DPPHH + A$^-$

As discussed in more detail by Kedare and Singh (2011), while the DPPH radical readily accepts an electron or proton and becomes a stable diamagnetic molecule, its oxidation is complex and irreversible.
The DPPH method is fast, simple, inexpensive, and widely used as a reliable method of determining the ability of molecular systems that act as ‘traps’ for free radicals or hydrogen donors. The method is unique because samples react with the DPPH radical, which is dissolved in methanol, ethanol, or water. The measured values are comparable with the results of other methods: ferric ion reducing antioxidant power (FRAP), 2,2’-azino-bis(3-ethylbenzthiazoline-6-sulphonic acid) (ABTS) etc. The advantage of this method is that the DPPH radical reacts with the entire studied molecular system. If the reaction time lasts long enough, the DPPH radical can react with weaker antioxidants, in polar and non-polar organic solvents. This allows the detection of hydrophilic and lipophilic antioxidant through the visible colorimetric change after 15–20 minutes of reaction, in a darkened room. The antioxidant efficiency is usually measured at room temperature, which reduces the risk of thermal degradation of the tested molecule. The limitation of the method is reflected in the DPPH radical reactivity towards other radicals, in that it loses the linear response curve of the standard state by varying the antioxidant:DPPH ratio. This radical is sensitive to some Lewis bases and the presence of oxygen. The method is generally accepted because the measurement results are easily reproducible and small volumes of chemicals in the slightly acidic pH range of 5.0 to 6.5 are used. The initial concentration of DPPH should give absorbance values less than one. The simplest approach to the interpretation of results is a graph showing the dependence of absorbance on the concentration of substrate.

The measurement of the DPPH radical scavenging activity was performed according to methodology described in Brand-Williams, Cuvelier and Berset (1995). The solution of 4 mg DPPH in 100 ml of H2O was freshly prepared. The solution was diluted with H2O until the absorbance readings were no longer detected in the area of 1.0 (± 0.2). All samples were made in the initial solution of 1 M (K3[B2O3F2OH], Mw = 251.50 g mol⁻¹; trimethoxyboroxine, Mw = 173.53 g mol⁻¹, ρ = 1.195 g mL⁻¹; trimethylboroxine, Mw = 125.53 g mol⁻¹, ρ = 0.898 g/ml). Ethanol was used as the solvent for trimethoxyboroxine and trimethylboroxine, while K3[B2O3F2OH] was dissolved in water. Lower sample concentrations (1 mM, 10 mM, and 100 mM) were prepared by serial dilutions of higher sample concentration. The cuvette microtiter plates were filled with 200 μL of DPPH and 10 μL of sample in various concentrations. The microtiter plate was allowed to stand in the dark, at a temperature of 35°C, for one hour, after which the absorbances were measured. The experiment was done in triplicate for each substance and each concentration. Radical scavenging activity was calculated using the following equation (1):

\[
\text{Radical Scavenging Activity [\%]} = 100 \times \frac{(A_{\text{control}} - A_{\text{sample}})}{A_{\text{control}}} \tag{1}
\]

where

- \(A_{\text{control}}\) is absorbance of control, and
- \(A_{\text{sample}}\) is absorbance of sample

Measurements were obtained using a spectrophotometer Tecan Sunrise-Basic Tekan 2007 at the Department of Biochemistry at the Faculty of Chemical Technology, University of Split.

**Results and Discussion**

The results are shown as the dependence of absorbance readings on boroxine concentrations (Figure 2). The graph shows the mean absorbance value of samples and controls. The standard deviation expressed as a percentage of the mean value (for all measurements) was ±4.5%. Spectrophotometric test specimens themselves without DPPH radicals, showed no discoloration in a wide range around and at a wavelength of 520 nm, at which the measurements were made.

The absorbance readings of trimethylboroxine and trimethoxyboroxine show a slight color increase of DPPH radical-sample complex almost in all tested concentrations. If the formula that calculates the percentage of radical inhibition is applied to calculate the percent of increase in color of DPPH radical-sample complex, the trimethylboroxine is 0.06% to 1.45%, and the trimethoxyboroxine 1.78% to 6.51%. Results show that trimethylboroxine and trimethoxyboroxine do not act as antioxidants by the principle of giving electrons to free radicals to ‘turn off’ their radical activity.
Similar results were measured with halogenated boroxine \( \text{K}_2\text{[B}_3\text{O}_3\text{F}_3\text{OH]} \). At lower concentrations, it showed weak antioxidant activity (from 0.38% to 0.92%). The slight color increase in the DPPH radical-sample complex occurred in the sample of 100 mM (2.33%), while at a concentration of 1 M a strong color increase (33.55%) was observed. The results indicate that the halogenated boroxine acts as a highly weak antioxidant according to the principle of surrender electrons to free radicals at lower concentrations, whereas at higher concentrations shows no antioxidant activity.

![Figure 2: Measured dependence of absorbance (ABS) and the concentration of tested samples](source: Author)

The results suggest that boron atoms in the ring of trimethylboroxine and trimethoxyboroxine connect with three valence electrons from the outer shell (sp\(^3\) hybridized form). These compounds do not include OH groups, which could indirectly release electrons to the free radicals. Carbon in a CH\(_3\) group is less electronegative than oxygen, and there is a small possibility that the CH\(_3\) group releases a proton, and then an electron. It was expected that trimethylboroxine and trimethoxyboroxine would exhibit insignificant antioxidant activity, although according to the results of recent studies, boron, like carbon, has the ability to create individual ions and possibly exchange rings with radicals and halt their most reactive form.

The halogenated boroxine has two boron atoms in the ring that form four links. This configuration allows the boron atoms to connect through electrons of the inner shell, which are strongly affected by the attracting force of the core, especially in small atoms such as boron. Thus, these atoms convert to sp\(^3\) hybridized forms. Both forms of boron atoms are strongly influenced by electronegative fluorine atoms, and excitation of electrons from the inner shell provides a theoretical possibility of giving but also receiving electrons. The halogenated boroxine molecule has one OH group, which could free an electron. It was expected that the halogenated boroxine would show some antioxidant activity at lower concentrations than observed. The readings of increased color may indicate that the atoms of boron, especially in halogenated boroxine, are ‘hungry’ for electrons, and that instead of terminating free radicals, they continue their propagation.

The experiment with a sample of the 1-M concentration of halogenated boroxine was repeated many times with results that consistently showed a pronounced standard deviation relative to the mean of ±1.9%. We conclude that at the high concentration, the halogenated boroxine reacted with the DPPH radical in an unusual way. As the solvent for the DPPH radical and halogenated boroxine is water, it was not expected to contribute to the observed reaction. If the reaction occurred at a high concentration, then there is no reason for a weaker form repeated at lower concentrations.

In the assay, at higher concentrations the ratio between the quantity of DPPH radical and that of the sample was affected, as compared to similar tests at lower concentrations, and it is possible that this
ratio affects the results. Future studies could first determine the sensitivity of the results on reaction parameters, such as temperature, reaction time, type of solvent, and the ratio of DPPH radicals to sample, and then determine how to lessen these effects on the results.

Where the reaction parameters show no substantial effect, and since a reduction in color intensity means antioxidant activity, an increase of color intensity could indeed be interpreted as a pro-oxidant effect. Future research, in such a case, would be needed to confirm the thesis that halogenated boroxine are pro-oxidative.

According to recent literature, a pro-oxidant activity is not insignificant in the fight against cancer, because tumor cells have a particularly high sensitivity to the accumulation of free radicals in the cytoplasm. Thus, pro-oxidants are cytotoxic for the tumor cells, though not for healthy cells. Nevertheless, research into pro-oxidative properties is in the early stages, and there remains a lack of substantial evidence supporting this case.

**Conclusion**

The tested boroxines showed an exceedingly weak antioxidant (halogenated boroxine at lower concentrations) or no antioxidant activity. In most samples, the color absorbance increased in the DPPH radical-sample complex, especially at the 1-M concentration of halogenated boroxine. Future research is needed to investigate whether the parameters of the test reaction (reaction time, temperature, the ratio of DPPH radicals, and sample) influence the results and how this might occur, and whether the tested boroxines behave as pro-oxidants.

SYNTHESIS OF FUNCTIONALIZED MCM-41 MESOPOROUS SILICA

Nevin Karamahmut Mermer,¹ Muge Sari Yilmaz²

Abstract: The invention of mesoporous materials is of significant interest to many scientists worldwide. The Mobil Crystalline Materials No 41 (MCM-41) is a well-known mesoporous molecular sieve that was discovered in 1992 by a scientist at the Mobil Oil Corporation. The MCM-41 is widely used in catalysis, ion exchange, drug delivery, optics, gas sensing, and sorption. In this study, the surface of a mesoporous silica MCM-41, synthesized from pure silica, is functionalized with a methyl group by grafting. The synthesized and functionalized samples are characterized by X-ray powder diffractometer (XRD), and the functionalized sample are also characterized by Fourier transform infrared spectroscopy (FTIR). The textural properties of the samples are determined using N₂ adsorption and desorption analysis. Thermal behaviors of the samples are analyzed using thermogravimetry (TG) and derivative thermogravimetry (DTG). The results of the analyses show that the functionalization of the synthesized material through grafting was accomplished with the surface area of the functionalized sample determined as 600.87 m² g⁻¹.

UDC Classification: 66.03; DOI: http://dx.doi.org/10.12955/cbup.v5.1089

Keywords: MCM-41, grafting, methyl group, functionalization, XRD

Introduction

The Mobil Crystalline Materials No 41 (MCM-41) is a member of the M41S family and was first discovered by researchers at the Mobil Research and Development Corporation in 1992 (Gaydhankar et al., 2006; Feil et al., 2009). Porous materials can be classified based on certain criteria, such as pore shape, pore size, and production method. The most widely accepted classification is that of the International Union of Pure and Applied Chemistry (IUPAC) using pore sizes: microporous (pore diameter < 2 nm), mesoporous (pore diameter 2 – 50 nm), and macroporous (pore diameter > 50 nm; Kenneth, 1998).

The MCM-41 is an ordered mesoporous hexagonal structure that has an increasing number of applications, such as adsorption, optics, gas sensing, catalysis, drug delivery systems, molecular sieving, and membranes for filtration and ion exchange (Belmabkhout et al., 2009; Kim et al., 1995; Kozhevnikov 1995; Selvam et al., 2001; Xiao-Dong et al., 2010; Yuliarto et al., 2004; Zhao et al., 1996). It is an ideal candidate for specific adsorbent design because the pore size can be adjusted by modifying or functionalizing the organic functional groups that are used in quite extensive experimental investigations (Araki et al., 2009; Vartuli et al., 1996). Functionalization with organic and inorganic groups is carried out to improve the physical and chemical properties of mesoporous silica materials. These new organic-inorganic hybrid mesoporous silica structures have attracted attention due to their large surface areas, pore structures, and functionalized structures. These properties avail its extensive use in several areas of application (Taib et al., 2011). Studies on using mesoporous silica modified with amine groups as adsorbents in CO₂ adsorption are quite extensive (Belmabkhout et al., 2010; Builes & Vega, 2012; Gholami et al., 2016; Klinthong et al., 2013; Liu et al., 2015; Wang et al., 2015). The various chemical ligands that are either organic or inorganic can be anchored on the surface of MCM-41. These modifications have a considerable effect on the surface and structural properties of the mesoporous materials (Zhao et al., 2000). For instance, silylation of the MCM-41 improves the hydrothermal and mechanical stability of material due to its advanced hydrophobicity (Zhao & Lu, 1998). There are studies that attract great interest regarding the application of the functionalized mesoporous materials by organic compounds. These include heavy metal removal from water, CO₂ capturing, drug delivery system, and catalytic applications (Builes et al., 2012; Faghihian & Naghavi, 2014; Manzano et al., 2008; Rath et al., 2014; Wu et al., 2010). In the present study, the MCM-41 mesoporous silica was synthesized from sodium metasilicate pentahydrate, and then, modified using tri-methoxymethyl-silane (TMMS). The synthesized pure sample was characterized by X-ray powder diffraction (XRD), N₂ adsorption and

¹ Faculty of Chemical and Metallurgical, Yildiz Technical University, nevinkaramahmut@hotmail.com
² Faculty of Chemical and Metallurgical, Yildiz Technical University, mugesari@yildiz.edu.tr
desorption, and DTA or TG. The functionalyzed sample was also characterized by XRD, Fourier transform infrared spectroscopy (FTIR), N₂ adsorption and desorption, and DTA or TG.

**Data and Methodology**

The pure silica source used in the synthesis of MCM-41 was sodium metasilicate pentahydrate (SMP, SiO₂Na₂·5H₂O, 99% purity). The organic template hexadecyltrimethylammonium bromide (HTABr, 99% purity), sodium hydroxide (NaOH), sulfuric acid (H₂SO₄, 95-98%), trimethoxymethylsilane (TMMS), CH₃Si(ΟCH₃)₃, ≥ 98.0 %, and toluene (C₆H₅CH₃, ≥ 99.9 %) were obtained from Merck.

In the functionalization process, the sample was mixed in the Zhicheng ZHWY-200B brand incubator shaker. Crystallographic properties of the synthesized samples were investigated using a PANalytical XPert-Pro XRD instrument with Cu-Kα tube (λ = 0.153 nm). The functional band of the modified sample was determined by the FTIR-KBr technique with Perkin Elmer Spectrum One FT-IR spectrophotometer at a wavelength of 400–450 cm⁻¹.

Textural properties of the samples were determined on a Micromeritics ASAP 2020 surface area and porosimetry system. The specific surface area of the synthesized samples was calculated using the Brunauer-Emmett-Teller (BET) method. The BET surface area (S BET, m² g⁻¹) was calculated using an adsorption data, with a relative equilibrium pressure (P/P₀) in the range of 0.03 to 0.30. Thermal properties of synthesized and modified MCM-41 samples were subjected to thermal analysis in a Perkin Elmer Pyris Diamond DTA-TG thermogravimetry instrument. Analyses of the samples were carried out at nitrogen flow rate of 200 ml min⁻¹. The samples were heated from 35 °C to 900 °C with a heating rate of 10 °C min⁻¹ by using a platinum crucible.

The Synthesis of MCM-41

For the synthesis of MCM-41, a certain amount of SMP was dissolved in water to prepare 1.5-M sodium silicate solution. The appropriate amount of sodium silicate solution was added drop by drop into the prepared HTABr solution, and then, the obtained solution was stirred for one hour with a magnetic stirrer. The pH of the solution was adjusted to 11 with sulfuric acid. After the pH adjusting, the solution was aged overnight. The solution with the precipitate was filtered and washed with distilled water. The resulting white-solid sample was dried overnight at 100 °C and then, calcined at 550 °C to remove the template from the structure.

Functionalization of Obtained MCM-41

Functionalization of the synthesized sample with methyl groups was carried out by a grafting method. Firstly, a certain amount of MCM-41 sample was dissolved in dry toluene, then TMMS was added to the mixture under stirring. The resulting mixture was added to an incubator shaker and stirred at room temperature for 24 hours. At the end of the shaking period, the solution was left under reflux for six hours. The mixture was filtered, washed several times with dry toluene, and then dried at room temperature. The functionalized sample was named MCM-41-TMMS.

**Results and Discussion**

Figure 1 presents the XRD diagrams of prepared MCM-41-TMMS and MCM-41 adsorbents. The diagrams show characteristic peaks of MCM-41, namely, a strong (100) reflection peak with two small peaks (110 and 200) resulted after functionalization. This result indicates that the regular structure of MCM-41 was preserved after functionalization. In comparison, the peak intensities of MCM-41-TMMS (MCM-41 after the methyl group grafting) were noticeably lower.

The FTIR spectrum of the MCM-41-TMMS is shown in Figure 2. Only the peaks that differed from the MCM-41 sample were marked in the spectrum. Accordingly, the observed peaks at 2974.13 and 2922.41 cm⁻¹ belonged to the C–H asymmetric stretching vibrations of the methyl groups. The symmetric stretching vibration of C–H appeared at 2853.44 cm⁻¹. The observed peak at 1277.06 cm⁻¹ was affiliated to the symmetric deformation bending of C–H. The FT-IR spectrum of MCM-41-TMMS indicates whether a methyl group has been successfully grafted on the MCM-41 structure (Al-Oweini & El-Rassy, 2009).

Source: Authors

Figure 2: The Fourier transform infrared plot of Mobil Crystalline Materials-41 grafted with trimethoxymethylsilane

Source: Authors
The TG or DTG curves of the samples are shown in Figure 3. For MCM-41, only one weight loss was found to occur between 35 °C and 105 °C, with the weight loss of 0.65% due to the removal of physisorbed water on the external surface of the adsorbent. From 105 °C to 900 °C MCM-41 presented no obvious weight loss (Taib et al., 2011). The MCM-41-TMMS demonstrated minor weight loss up to 220 °C. From this temperature to 820 °C, a weight loss of 5.6% was observed due to the decomposition of the TMMS (Deepak et al., 2014).

$S_{BET}$: Specific area surface under Brunauer-Emmett-Teller theory.

The textural properties of the samples are listed in Table 1. There was a decrease in both the specific area surface ($S_{BET}$) and the pore volumes of the MCM-41 after functionalization (MCM-41-TMMS) that was related to replacing the silanol groups on the silica inner surface with methyl groups.

### Conclusion

In this study, MCM-41 was successfully synthesized from pure silica source. The obtained sample was functionalized with methyl groups to improve surface properties. The characterization of the samples was carried out using different analysis techniques. According to the results of these, the methyl groups were successfully grafted on the sample surface. The $S_{BET}$ and pore volumes of the MCM-41-TMMS were lower after the functionalization. The thermal stability temperature of MCM-41-TMMS in a nitrogen atmosphere was determined at about 220 °C.

### References

Abstract: The article presents an unsupervised learning algorithm that groups technological features in a setup for machining process. Setup generation is one of the most important tasks in automated process planning and in fixture configuration. A setup is created based on approach direction of the features. The algorithm proposed in this work generates a neural network that determines the setup each feature belongs to, and the number of setups generated is minimal. This algorithm, unlike others, is not influenced by the order of the input sequence. Parallel implementation of the algorithm is straightforward and can significantly increase the computational performance.

Keywords: neural networks, setup generation, interacting features, technological process

Introduction

The last 20 years have seen many works on automated process planning. Particular attention has been paid to fixture design and the setup and ordering of features (Joneja et al., 1999). Setup planning deals with the grouping of features into setups in proper sequences, sequencing the setups, and choosing machines, tools, and fixturing. Setups are used to group similar features that are processed at each step of the process. Setup generation done during the fixture design phase is aimed at determining the axial orientation and position of the grouped features as well as the cutting tools required to manufacture them (Rong, 2007). The setup generation phase takes into account both the requirements of the process planning and fixture design (Stampfer, 2009). Setup generation in Sakurai (1992) uses the location tolerance of the workpieces. Other CAPP systems (Delbressine et al., 1993) employ tolerances of the workpieces as criteria for setup generation and sequencing.

Neural network generation

In recent years many researchers have employed the neural network approach to solve setup generation problems (Pao et al., 1993, Westhoven et al., 1992). The standard approach is to either use different relationships between the approach directions in the given features, or based on approach direction and another factor such as tool commonality. Such algorithms do not always give optimal results for real technological processes. The number of generated setups strongly depends on the input features sequence.

The algorithm proposed in this work generates a neural network that determines the setup each feature belongs to, and the number of setups generated is minimal. The proposed unsupervised neural net can be viewed as modification of the one in Chen (1993) and solves the problem of the input feature sequence. An approach direction is a straight path that gives a tool an unobstructed access to the feature in the workpiece. Some features may have more than one approach direction. A neural network consists of clusters and every cluster represents a set of features that have at least one approach direction in common (Chen, 1993). We say that two clusters have a common approach direction if all features of the two clusters combined have a common approach direction. The net under consideration has a leveled structure. Each level of the net consists of a number of clusters and the clusters of this level may or may not share a common approach direction. One can merge clusters with common approach directions to form new cluster on the next level of the net. The idea behind the algorithm is to create the next level by merging clusters and thus producing fewer clusters with fewer common approach directions. Eventually the net reaches a level where any two given clusters do not share a common direction. This last level will determine the number of setups and their layout.

Self-Organized net generation algorithm

Let \( k \) be the number of different approach directions. For each feature \( F_j \) we associate the vector \( B_j = B_j^1 B_j^2 \ldots B_j^k \) in the following way: \( B_j^i = 1 \) if \( j \) is a valid approach direction, otherwise \( B_j^i = 0 \).

2 Faculty of Industrial Technology, Technical University of Sofia, Bulgaria, ginic@tu-sofia.bg
3 Institute of Information and Communication Technologies, Bulgarian Academy of Sciences, Sofia, Bulgaria, p.t.popov@city.ac.uk
other words, $B_i$ represents the bit mask of the allowed approach directions. It can also be treated as a binary number or as a $k$-dimensional vector of zeros and ones.

The neural network consists of $k$ levels numbered $0, 1, ..., k-1$. Clusters are denoted as $A_i^j$ - the $j$th cluster on the $i$th level of the net. Each cluster in the net possesses internal memory in the form of a single integer value which we denote $a_i^j$. Let this cluster represent the features $F_i, ..., F_i$. Then we have $a_i^j = B_i & B_i ... & B_i$, where & is the binary AND operator. In this way the 1s in the binary representation of $a_i^j$ indicate the approach directions that are common to all the features in this cluster, and the 0s represent approach direction that are not allowed for at least one feature in the cluster. Clearly two clusters, say $A_i^h$ and $A_i^j$, share a common approach direction if and only if $a_i^h & a_i^j \neq 0$.

Only clusters from neighboring levels are interconnected. For any level $p < k$ we introduce an integer weight function $e(A_p^j, A_{p+1}^j)$ associated with the connection from $A_p^j$ to $A_{p+1}^j$. The clusters can send the value of their memory $a_i^j$ across each connection (Chen C.L. P., 1993). The weight functions are determined as each cluster sends its internal memory across the newly formed connection. Each weight function assumes a nonzero value equal to the value sent from $A_p^j$ to $A_{p+1}^j$ if the cluster $A_p^j$ is grouped to $A_{p+1}^j$ (i.e. we also say that $A_p^j$ is being merged with some other clusters from that level to produce $A_{p+1}^j$) and is equal to zero otherwise. After the construction of the net is complete the internal memory of the clusters on the last level will tell the number of setups and the features that belong to each one of them.

At any time the value $a_i^j$ - in binary form - gives the allowed approach directions for this cluster. A new cluster is created at level $j+1$ if $A_i^j$ is determined to have approach directions incompatible with any existing cluster at level $j+1$. The internal memory of this newly created cluster is initially set to $a_i^j$. Clusters are grouped based on the similarity of the approach directions they represent. This “similarity” is expressed by the function $g(B_i, B_j)$ that takes two $k$-digit binary numbers $B_i$ and $B_j$ as arguments. It is defined as follows:

$$g(B_i, B_j) = \begin{cases} \lambda(B_i \text{ XOR } B_j) & \text{ if } B_i \text{ and } B_j \neq 0 \\ \infty & \text{ otherwise} \end{cases}$$

where $\lambda(N) = \sum_{i=0}^{k} N_i$, for the binary number $N = N_1N_2...N_k$ and the binary operation $\text{XOR}$ (exclusive or) is Figure 1.

When we write $g(F_i, F_j)$ we imply $g(B_i, B_j)$ where $B_i$ and $B_j$ are the bitmasks of the two features $F_i$ and $F_j$. When we write $g(a_i^j, a_i^j)$ we simply treat $a_i$ and $a_i^j$ as binary numbers.

When the two features (or clusters) $F_i$ and $F_j$ have at least one common direction then $g(\cdot, \cdot)$ returns the number of directions that are acceptable for $F_i$ and are not acceptable for $F_j$ and vice versa – acceptable for $F_j$ and unacceptable for $F_i$. It appears that the distance between $F_i$ and $F_j$ is simply the square of the usual Euclidean distance between the vectors $B_i$ and $B_j$ that is $\sum_{i=1}^{k} (B_i^j - B_i^j)^2$. If, however, $F_i$ and $F_j$ do not share a common direction then $g = \infty$ and as will be shown below, this does not allow for the two clusters to be grouped (in practical implementations one simply sets $g(\cdot, \cdot)$ to a sufficiently big integer). The distance between two features (or clusters) depends not only on the
shared approach directions, but also on the ones that are incompatible. The higher the value of \( g \) the more incompatible approach directions the two clusters have.

The structure of the net is shown in Figure 2. The description of the algorithm is inductive with respect to the number of levels. The order in which new clusters are created on any given level is not important. We suppose that level \( p \) is created and show how to create the next level \( p+1 \). For the sake of simplicity we assume that the clusters from level \( p \) are read in the order of their creation. By reading an input cluster we mean that its internal memory is sent to the next level.

1. The generation of the net begins with the creation of level 0: All input features \( F_i \), \( i = 1,2,\ldots,n \) are read from the input and the respective clusters \( A_0^i, a_0^i = F_i \) are created.

2. Suppose all levels of order up to \( p \) inclusively are already constructed. Let level \( p \) have \( m \) clusters. Level \( p+1 \) is constructed as follows:
   a. Step 1. [Create first cluster on level \( p+1 \)] Read the first input \( a_1^p \). Create cluster \( A_{p+1}^1 \) (on level \( p+1 \)) with initial internal memory \( a_{p+1}^1 = a_p^1 \) (and a single link) \( e(A_p^1, A_{p+1}^1) = a_p^1 \).
   b. Step 2. [Next input] Read next input - \( a_i^p \).
   c. Step 3. [Determine distance] Let level \( p+1 \) contain the clusters \( A_{p+1}^1, A_{p+1}^2,\ldots,A_{p+1}^{q-1} \). Evaluate \( g(a_p^j, a_{p+1}^j) \) for all \( j = 1,\ldots,q-1 \). If \( g(a_p^j, a_{p+1}^j) \leq p \) is true for at least one \( j \), then go to step 4 (NOTE: if \( g(a_p^j, a_{p+1}^j) \leq p \) for several values of \( j \) simple choose one of them arbitrarily). Otherwise, if \( g(a_p^j, a_{p+1}^j) > p \) for all \( j = 1,\ldots,q-1 \), go to step 5.
   d. Step 4. [Grouping] Group \( A_p^j \) to \( A_{p+1}^j \):
      i. Set the memory of \( A_{p+1}^j \) to \( a_{p+1}^j = a_p^j \& a_p^j \).
      ii. Update the weights of all links from \( a_p^j \) to clusters on level \( p+1 \): set \( e(A_p^l, A_{p+1}^j) = a_p^j \) and set \( e(A_p^l, A_{p+1}^l) = 0 \) for \( l \neq j \). Go to step 6.
   e. Step 5. [Create new cluster]. Create new cluster \( A_{p+1}^q \):

i. Set its memory to \( a'^{q}_{p+1} = a'_p \). Create a single link from \( A^i_p \) to \( A^{q}_{p+1} \) with

weight \( e(A'_p, A^{q}_{p+1}) = a'_p \). All other weights are equal to zero, i.e.

\( e(A'_p, A^{l}_{p+1}) = 0 \) for \( l = 1,2...q-1 \) and \( e(A'_p, A'^{q}_{p+1}) = 0 \) for \( l = 1,2...l-1 \).

Go to step 6.

f. Step 6. If there is no further input from level \( p \), then level \( p+1 \) is constructed. STOP.

Otherwise go to step 2.

3. The generation of the net is completed when level \( k-1 \) is constructed.

Suppose that when the last level \( k-1 \) (remember that \( k \) is the number of different approach direction and we have \( k \) levels – 0,1,…,\( k-1 \)) we have the clusters \( A^0_{k-1}, A^1_{k-1}, A^2_{k-1},... \). The definition of the function \( g(\cdot,\cdot) \) guarantees that \( a'_{k-1} \& a^l_{k-1} = 0 \) is true for every two different clusters \( A^l_{k-1} \) and \( A^j_{k-1} \). These clusters determine the number of setups – \( l \), as well as the approach directions for each setup – the bitmask of the internal memory \( a^i_{k-1} \) for \( i = 1,\ldots,l \). Note the following: it might happen that for some \( s < k \) it is true that \( a'_{i} \& a^s_{i} = 0 \) for any two clusters on that level, and thus any subsequent level \( s+1,\ldots,k \) will have the same clusters as level \( s \). If this happens it is not necessary to build any subsequent levels. However each time we generate a new level we should make the comparisons \( a'_{i} \& a^j_{i} \) in addition to all other operations involved to check for this condition, while building all levels up to number \( k \) eliminates these additional computations.

To determine the setup to which a feature \( F_i \) belongs to one proceeds in the following way: starting from cluster \( A^0_0 \) one follows the one link that has a non-zero length and reaches level. Then one follows the only non-zero weighted link that leads to level 2. The procedure is repeated until the last level \( k-1 \) is reached. The cluster that we reach on that last level is the required setup.

Testing of the neural network

In order to test the neural network two benchmark parts were designed. The first part to be tested is shown in Figure 3. It has four different features, and the approach directions are shown in Table 1.

The structure of the net with the appropriate weight functions is shown in Figure 4. It is constructed in the following way:

1. Level 0 of the net consists of four clusters - \( a^1_0, a^2_0, a^3_0 \) and \( a^4_0 \) - that represent the features \( F_i \), \( i = 1,2,3,4 \) with their respective approach directions.
2. Level 1 is built according to steps 2 through 5 of the algorithm. Here is an outline of the execution path (we have \( p=0 \)):

a. Cluster \( A_0^1 \) is read from the input (it corresponds to feature \( F_1 \), see the way level 0 is defined) and cluster \( A_1^1 \) is generated: \( a_1^1 = a_0^1 = [010010] \)

b. Cluster \( A_0^2 \) (= \( F_2 \)) is read and we get \( a_0^2 = [001011] \); \( g(a_0^2, a_1^1) \), which is evaluated: 

\[ g(a_0^2, a_1^1) = 3 > 0 = p \]

c. A new cluster \( A_1^2 \) is created, \( a_1^2 = a_0^2 = [001011] \) and the respective weight is

d. \( e(A_0^2, A_1^2) = a_0^2 = [001011] \)

e. The input from the previous level – level 0 – is not empty. So, we repeat again steps 2 through 5.

f. Level 1 is completed when \( A_0^4 \) is created.

3. Finally a network of five levels is generated. The last level consists of two clusters, namely \( a_5 \) = \([010010]\) representing features \( F_1 \), \( F_2 \) and \( F_3 \), and cluster \( a_5^2 = [001001] \) that represents only \( F_4 \). Although levels 3, 4 and 5 have the same number of clusters, we generate all levels up to 5 (the number of different approach directions is 6). A simple inspection of Table 2 reveals that the minimal number of setups for this part is 2, and this was the result of the algorithm.

The second part that was tested is shown in Figure 5 and has 12 features. The algorithm was tested for various ordering options of the input features. In all cases the number of clusters at the final level is two - \( A_1^2 \) (representing features \( F_1, F_2, F_3, F_4 \) and \( F_{12} \)) and \( A_2^2 \) (representing features \( F_5, F_6, F_7, F_8, F_9, F_{10} \) and \( F_{11} \)). Again, two is the minimal number of setups possible for the part.

---

**Parallel generation of the net.**

It is clear that each cluster generated on level 0 and level 1 is initialized once and then its internal memory is not changed. Indeed, level 0 does not involve any grouping. Clusters on level 1 are grouped only if the distance between the clusters from level 0 is 0, that is the bit masks of the clusters being grouped are the same.

This means that these clusters on level 1 and 2 can be formed as soon as the clusters from the previous level become available. Another possibility for parallelism becomes available when a given \( a_i^j \) (from any level \( i \)) assumes a bit mask that has a single 1. If this is the case, any clusters that are grouped to \( A_i^j \) should have at least one common approach direction and since \( A_i^j \) has only one allowed direction (the bit mask contains a single 1) its internal memory will not change. Under such circumstances the
value of $a_i$ can be used to begin construction of the next level – $i+1$ before level $i$ is entirely generated. Other situations where parallelism is possible can also be identified but they require additional comparison operations between clusters and are not presented here.

Conclusions

Setup design is an important part of the automated process planning and fixture configuration. The proposed algorithm for setup generation is based on unsupervised neural network. It provides minimal number of setups when the approach directions are used as a criterion. The number of setups that the network generates, unlike (Chen C.L. P., 1993) is independent of the input ordering of the features. A parallel implementation of the algorithm is straightforward and can significantly increase the computational performance. This is important for details with a large number of features.

AN INTEGRATED RBR FIXTURE DESIGN SYSTEM

Oleg Mihaylov,¹ Galina Nikolcheva,²

Abstract: Traditionally fixture design processes are costly and time-consuming when carried out manually. To try to reduce the negative features, we are creating a computer-aided fixture design system, integrated in the SolidWorks’ environment. This system uses rule-based reasoning in the form of If-Then-Else rules, incorporated in its VB.NET code. This paper presents our progress in the form of an interactive add-in program for locating parts. This program generates modular fixtures for locating prismatic or cylindrical parts, using rules and mathematical equations. Its usage can shorten the time needed for determining the type and position of every module of the fixture, their assembling, and inspection.

UDC Classification: 004.42; DOI: http://dx.doi.org/10.12955/cbup.v5.1091

Keywords: Fixtures, computer-aided fixture design, solidworks, add-in

Introduction

A fixture is a work-holding or support device used in the manufacturing industry – job, batch, and mass production. Fixtures are used to position the workpiece in a specific location and orientation, and support it during machining, ensuring that all parts produced using the same fixture will maintain conformity and interchangeability. These tasks require restricting the six degrees of freedom of the workpiece (Fig. 1a) and there are a variety of locating methods that can facilitate this such as: the 3-2-1 locating principle (6 points location), plane and pin-hole locating, long-pin locating, V-block locating (Fig. 1b).

Figure 1: The six degrees of freedom (a) and methods of constraining them (b).

The costs associated with fixture design and manufacture can account for 10%–20% of the total cost of a manufacturing system (Bi et al., 2001). These costs relate not only to fixture manufacture, assembly, and operation but also to their design. Approximately 40% of rejected parts are due to dimensioning errors that are attributed to poor fixture design (Nixon, 1971). Hence there are significant benefits to be gained by reducing both the design time and the costs associated with fixturing.

Modular fixturing systems are the most widely used flexible fixturing systems in manufacturing. They are based on the standardization of their components and they are designed as groups of pre-manufactured standard elements and units with relatively tight tolerances. Those elements can be assembled in variety of different fixtures for locating and clamping a variety of parts with different geometries, sizes and fixturing requirements. Once all the needed processes are completed the fixtures can be disassembled and reassembled in other completely different configurations (Zhu & Zang, 1990). This is the modular systems’ biggest difference and biggest advantage over the dedicated fixtures as the latter are usually scraped after completing their task. Generally, there are two types of modular fixture systems – T-slot-based and dowel-pin-based, each with their advantages and disadvantages.

² Faculty of Industrial Technology, Technical University of Sofia, Bulgaria, ginic@tu-sofia.bg
Fixture design system – interface and operation

SolidWorks is a CAD system allowing the use of an application programming interface (API), which allows the automation of many designing and analytical processes for both single parts and assemblies. This is achieved by creating a program with one of the supported programming languages (C++, C#, Visual Basic etc.).

An add-in integrated in the SolidWorks’ environment was developed by using the SolidWorks’ API and the VB.NET programing language. Its task is to automate the fixture design process for locating both prismatic and cylindrical workpieces. The locating is by one of three types – the 3-2-1 locating principle, the plane and pin-hole locating, or the V-block locating. These three options is what gives this add-in greater versatility than other programs which are concentrated only on one method or one type of parts. The automation of the design process is partial because the program needs the user to select locating surfaces, in other words the program is interactive.

The working principle of the add-in is as follows:

With an opened file of type “PART” the user starts it from the Toolbar which opens a new Property Manager Page on the left side of the window (Fig. 2). This page consists of:

- button “Clear” – deletes all names and additional features (axes, planes, points etc.);
- 3 buttons for surface selection – the user selects a surface then presses a button to confirm the selection and to check if the surface isn’t already selected;
- 4 text fields – for displaying information to the user (e.g. The surface is selected, The surface is not acceptable, etc...);
- button “START” – it starts the automated creation of an assembly file.

The user selects a surface and then presses one of the three buttons for selection to let the system collects data from it. The system’s first task is to determine what type of surface is selected – planar, cylindrical or other – and to decide which locating method to use. After that the system collects data on the shape and size of the surface and calculates the positions of the locating elements. The user has to wait for the system to finish its task for each surface before he can select the next one, depending on the surface’s shape and complexity this may take from a few seconds up to 1-2 minutes. After the selections, the user lets the system create the fixture assembly with the button “START.”

![Figure 2: Interface of the ADD-IN.](source: Authors)
Determining the positions of the locating elements

With the location of the parts it is crucial for the locating elements to be correctly positioned. Those positions directly depend on the surface’s shape (rectangle, circle, polygon), its dimensions, and if it’s solid or not, i.e.: are there holes, steps, etc… The program needs to “understand” what portion of the part it can use for locating with the help of the user and the set of rules. This allows the program to find other surfaces in the same plane without the user selecting all of them. The rules are using the SolidWorks’ options, available through the application programming interface (API). After the user selects a surface and presses a button, the program determines its orientation by extracting its normal vector data and gets the coordinates of the end points. Then the program checks every surface of the part for others with the same orientation and in the same plane. If there are such surfaces their end points’ coordinates are added to those of the selected surface.

After the comparison is concluded, a new sketch is created on the selected surface. The coordinates gathered from all end points are transformed to the local coordinate system of the sketch and the maximal and minimal values for each axis are determined - $x_{1\ max}, x_{1\ min}, y_{1\ max}, y_{1\ min}$. Those values are used for the calculation of a center point $O_1$:

$$x_{10} = \frac{x_{\ max} + x_{\ min}}{2}, \quad y_{10} = \frac{y_{\ max} + y_{\ min}}{2}. \quad (1)$$

The locating points are going to be calculated in relation to this center point in such manner that they will imitate the holes pattern on the base plate. Next the distance between the minimal and maximal value for each axis is calculated:

$$\Delta_x = x_{1\ max} - x_{1\ min}, \quad \Delta_y = y_{1\ max} - y_{1\ min} \quad (2)$$

$$k_x = \left\lfloor \frac{\Delta_x}{0.050} \right\rfloor, \quad k_y = \left\lfloor \frac{\Delta_y}{0.050} \right\rfloor. \quad (3)$$

The coefficient $k$ shows the multiplicity of the distance $\Delta$ to the step of the holes on the base plate ($50\ mm$) rounded down to an integer. Those coefficients are used for the calculation of the coordinates for the location elements so the round down guarantees that they will be between the endpoints of the surface. The coordinates are calculated as follows:

$$u_{11} = u_{12} = u_{10} - k_u \cdot 0.025; \quad u_{13} = u_{10} + k_u \cdot 0.025; \quad (4)$$

$$v_{11} = v_{10} - k_v \cdot 0.025; \quad v_{12} = v_{10} + k_v \cdot 0.025; \quad$$

$$v_{13} = v_{11} + \left\lfloor \frac{0.5 \cdot (v_{12} - v_{11})}{0.050} \right\rfloor \cdot 0.050. \quad$$

The values for $u_{10}, k_u, v_{10}$ and $k_v$ are taken from equations (2) and (3) depending on which value of $\Delta$ is greater – for $\Delta_x \geq \Delta_y \rightarrow u = x, v = y$, and for $\Delta_x < \Delta_y \rightarrow u = y, v = x$. The same logic is applied for the values of $x_{11}, x_{12}, x_{13}, y_{11}, y_{12}$ and $y_{13}$. With the calculated coordinates the program creates points in the sketch and closes it. Next there are checks on whether the points lie on the surface (or surfaces). The task of those checks is to avoid placing a locating element in a hole, a groove or outside the surface. If at least one point is not on the surface (or surfaces) (Fig.3,a) the program implements one or series of corrections aiming to get all points on the surface.

The corrections can be the mirror reversal of the points to one axis (Fig.3b) or a single or multiple displacement of all the points along one or both axes at a distance equal to the portion of the free space $f$ (Fig.3c), i.e. from (2) and (3):

$$f = \frac{\Delta - (k \cdot 0.050)}{2}. \quad (5)$$
Other corrections are recalculation of the coordinates with coefficient \( k-1 \), with the possibility of repetition until \( k = 1 \) or swapping the coefficient \( u \) and \( v \). The different corrections can be combined in various ways so after one type of correction, multiple corrections of different type can be executed.

When all points are lying on the surface, the program checks if the center of gravity (its projection on the plane of the surface) lies in the triangle of the three points. If it does, then the determination of coordinates is completed successfully, otherwise additional corrections are implemented. The corrections consist of displacement of one or two points along one or both axes at distances which are multiples of 50 mm (Fig. 4).

After the successful selection of the first surface (i.e., all checks are passed successfully) the user can make a selection for the second and third surfaces. For determining the locating points on the second and third surfaces the center point \( O_1(x_{10}, y_{10}) \) is projected onto their planes (thus ensuring the same symmetry in all planes) but the coordinates are determined differently than for the first surface. For the second surface the coordinates for one of the axes (the one parallel to the projection of the first surface) are calculated according to \( O_1 \):

\[
(6) \quad u_{21} = u_{20} - \left( \frac{|u_{2\text{max}} - u_{2\text{min}}|}{0.050} \right) * 0.050/2; \quad u_{22} = u_{20} + \left( \frac{|u_{2\text{max}} - u_{2\text{min}}|}{0.050} \right) * 0.050/2.
\]

In (6) \( u_{21}, u_{22} \) are the coordinates on the first axis; \( u_{20} \) is the coordinate of the projected point \( O_1 \) on this axis. The coordinates on the second axis \( v_{21}, v_{22} \) are selected according to the selected adjustable stops (Fig. 5).
The height of the adjustable screw is selected so that the center of gravity (its projection on the plane) is between the locating points and the first surface’s projection. The program creates a point with the calculated coordinates and starts the checks and corrections, similar to those for the first surface. The corrections can be mirror reversal or displacement of one or both points by 50mm on each of the axes. If necessary the locating points can be moved below the center of gravity.

For the third surface the coordinate \( u_{31} \) is calculated similar to \( u_{21} \) and \( u_{22} \):

\[
(7) \quad u_{31} = u_{30} \mp \left( \left[ u_{3max} - u_{3min} \right] * 0.050 \right) / 2.
\]

The symbol \( \mp \) in (7) is replaced with + or - so that the point of center of gravity is between the locating point and the second surface’s projection (Fig.6). For the second axis the coordinate of the point is selected the same way as \( v_{21} \) and \( v_{22} \). The checks and corrections are same as for the second surface.

**Assembly**

Once the selection process is completed successfully the user can select the button “Start” and let the program create a new file of type “ASSEMBLY” (.sldasm). In this file, the program places the base plate as a fixed part and starts inserting and mating processes for all locating and supporting elements and the part. The program inserts the default configuration of every element and changes it according to the values of the \( v_{21}, v_{22} \) and \( v_{31} \) coordinates (for 3-2-1 locating) or the diameter (for the stopping elements with the V-bloc). If it’s needed the adjustable stopper’s body can be placed on raising elements for additional height. The need, type and dimensions of the raising elements are automatically selected by the system.
All elements are mated together at the calculated positions and the system concludes its work by leaving the new assembly for the user to interact with it – to inspect, to manually correct it if needed, to save the file with a selected name and in a selected folder etc. The system can design a locating fixture for one of three methods – 3-2-1 location, plane and pin-hole locating, or V-block locating (Fig. 7).

Conclusions
This paper reports the development of a fixture design system that is able to generate modular fixtures for locating prismatic or cylindrical parts. The system is integrated in SolidWorks and uses the SolidWorks’ options and virtual environment to create an assembly of modular elements from a database. The system is interactive – it needs input information from the user in the form of a selection of surfaces. This information is passed through a series of If-Then-Else rules (Rule-Based Reasoning), compiled by the authors, for the accurate determination of the positions of the locating elements. The system automatically determines the needed modules (type, configurations, number) and their position on the base plate, and mates them into a new assembly file.

A methodology for determining the locating elements’ positions is developed, with rules and mathematical equations. The equations and the rules ensure the precise determination of the locating coordinates for the modules, and their further assembly in the new file. The methodology was developed for the 3-2-1 locating principle, but part of it is used in the Pin-hole locating method.

By using this program, the user can shorten the time needed to determine the type and position of every module of the fixture and in assembling them. The user can also use it for the visual inspection of the design without the need of assembling the fixture, or for comparing two types of locating (e.g. 3-2-1 principle and Plane and pin-hole locating) for comparing locating by different sets of surfaces.

Work is currently being carried on completing the system with clamping and verification.

ANALYZING WAREHOUSE ERGONOMICS USING SMART TEXTILES

Anca Mocan,1 Ştefan Călin Daniel,2 Anca Drăghici3

Abstract: Ergonomics is well recognized as the study of the design of workplaces, equipment, machines, tools, products, the environment, and systems which takes into consideration a human being's physical, physiological, biomechanical, and psychological capabilities. Within warehouse logistics the need for ergonomic improvements is considerable, given the high level of manual labor and range of movement. Wearable technologies have the potential to improve the means through which an ergonomic study is accomplished. This paper discusses smart textiles and the ways in which they can help with ergonomic modelling by providing a faster and cheaper alternative to video capturing and subsequent computer rendering as well as how they can help in reducing the Hawthorne effect during data collection.

JEL Classification Numbers: L2, M12; DOI: http://dx.doi.org/10.12955/cbup.v5.1092

Keywords: warehouse, logistics, ergonomics, modelling

Introduction

Upon reading the description of ergonomics given by the International Ergonomics Association (2017) it is clearly understood that ergonomics deals with the design of products and processes in order to improve a ‘human well-being’ as well as the ‘overall system performance.’ As Dul (2003) mentions ergonomics seeks to improve the human-machine interaction by assessing both the social as well as the economic impact of product and process design, striving to find a solution that maximizes the positive impact for both. Warehouse logistics is a field that offers vast opportunities for ergonomic process design and analysis as much of the labour done in this area is manual and with a high impact on the body, given the range of movements and positions a worker would be subjected to during the course of a regular work day.

According to Chapanis (1995) the field of ergonomics can be split into two major areas: the conduction of basic ergonomic research that improves the body of ergonomic knowledge, and the assistance in product development and design. In order to conduct ergonomic research, a lot of emphasis is put on finding models of interaction between humans and their respectively analyzed work environments. These models involve an ergonomics expert that analyses the current work environment and acts as a change agent, by modelling the perceived actions of the subject and analyzing their impact. The problem with this approach is that the perceived actions and the actions actually done are never 1:1. Monitoring sensors are often uncomfortable and movement restraining, causing the analyzed person to change their movements in order to be able to accommodate the new machinery. This leads to wrong assumptions and measurements and reduces the added benefit that an ergonomics assessment can bring. Participatory ergonomics seeks to reduce this misinterpretation. Motamedzade et al. (2003) discuss how it is a branch of ergonomics that emphasizes employees’ self potential for conducting ergonomic improvements at work, specifying that end-users should be actively involved in planning and implementing ergonomics solutions. The challenge in this case is to create an environment that is auspicious both to scientific enquiry as well as worker input. One of the ways in which both can be accommodated is with the help of wearable technologies.

In her thesis, King (2011) states that wearable technology is a term that refers to clothing or accessories that are created or enhanced using embedded electronics, while Svanberg (2013) posits that it can be used to aid their users by monitoring information about the user themselves or the surroundings they interact with on a regular basis. While currently the general market for wearable technologies is small, due to the high cost of manufacturing on the one hand and the sense of intrusion of privacy on the other, innovations in the mobile and electronic healthcare area are already providing doctors and patients with expanded capabilities of physiological monitoring. Appelboom et al. (2014) describe how smart sensors are being used for perioperative monitoring and rehabilitation medicine allowing physicians to monitor patients in home and in community settings, which lead to a better understanding of the impact clinical interventions have on the level of mobility and the quality of life.
of the patient. Sanchez et al (2016) claims that the creation of effective and unobtrusive wearable devices is one of the basic applications of pervasive computing, and that this creation can be used to improve the quality of ergonomic research by providing both the means of seamless user analysis as well as the solution to specific ergonomic issues that arise in warehouse logistics.

How smart textiles can help
It is important to first make the distinction within wearable technologies between wearable computers and smart textiles. Wearable computers imply electronics that are housed within a fashion accessory and which allow the consumer to carry out their tasks without being obstructed. Hertleer et al. (2012) define smart textiles as products where using either the physical properties of the material, or electronics woven into the fabric can measure and/or react to stimuli from the user or environment. They have a smaller range than wearable computers, but allow the comfortable wearing of sensors for longer periods of time, making long term monitoring studies easier to do. This paper will further present the benefits of smart textiles in ergonomics research and work design applications.

Smart textiles are defined as textile products such as fibres and filaments, yarns together with woven, knitted or non-woven structures, which can interact with the environment/user. Stoppa et al (2014) divided smart textiles into 3 subgroups:

- Passive smart textiles: only able to sense the environment/user, based on sensors;
- Active smart textiles: reactive sensing to stimuli from the environment, integrating an actuator function and a sensing device;
- Very smart textiles: able to sense, react and adapt their behavior to the given circumstances.

Passive smart textiles can help researchers via fabric sensors which can offer access to information such as body temperature (Sibinski et al., 2010), heart rate (Coosemans et al., 2006), movement and muscle tension (Meyer et al., 2006; Bonato, 2005), amongst others. At the same time carbon electrodes integrated into fabrics allow for the reading of environmental features such as moisture, salinity and contaminants, Zadeh (2006).

Ergonomics analysis often relies on models of human movement. Lämkulla et al. (2006) have shown that the human modelling tool used when showing and visually evaluating results makes a difference, in that there’s a bias that leads to a more thorough analysis of “human looking” models and their postures than that of manikins or enhanced stick figures. The issue with this is the fact that the more humanoid a model looks like the more time and effort have to be spent to add the extra layers of information and design. It’s also safe to say that regardless of the amount of time spent improving the model, by its very definition a model is a representation of a human and not an actual human, thus there is a compromise being made between the number of characteristics a human model retains and which information is eliminated in the process of digitalization and abstraction of the real life information.
Due to the cost efficiency of smart textiles in contrast with the combination of motion capture suits and cameras, analysis on actual humans during the work that they do in their actual working environments becomes a possibility, especially given that traditional warehouse logistics work involves a wide range of movements and positions that would be difficult to catch on a static camera. At the same time, due to the influence of the Hawthorne effect, as McCambridge et al (2014) have reviewed, the knowingly observed subject behaves differently under scrutiny. As represented in Figure. 1 textiles can gather information remotely and repeatedly over the course of a study, therefore creating an environment where the information can be extracted easily while limiting any possible observational biases would decrease the quality of the raw data thus leading to a better understanding of the underlining issues.

As a second step, after a baseline has been established, the possibility of using active smart textiles comes into play. These react to stimuli from the environment, by integrating both actuators and sensors. These textiles are capable of reacting automatically to the stimuli they receive, by becoming, among other things thermo-regulated or water resistant. At this point the same type of analyses can be done as for the baseline, but with modified parameters allowing to see how the change in environment impacts the workers and what kind of changes can improve or worsen the working situation. The third and final step would be to implement a study with the worker wearing very smart textiles, where the textiles can react in a personalized way with the wearer, adapting themselves based on previous experience and learning to react better to the wearer’s movements so that they lessen ergonomic strain whenever possible. Depending on the type of material used and the strength of the fabric, the possibility of a movement training harness arises, which would teach the wearer how to do correctly their daily movements and offer support when the movement done is straining. By changing the fabric of the textile to a material that offers more support one can effectively create an exoskeleton that could take on part of the physical strain, removing it from the wearer’s.

An experimental analysis should therefore have a minimum of 4 settings:

- Normal textiles
- Baseline/passive smart textiles
- Activated smart textiles
- Activated very smart textiles

These settings would allow the researcher to gain a deeper knowledge of the means through which ergonomic improvements can be brought to the analyzed workspace. In Table 1 an example evaluation form is given, which could be used to collect data about the measured bodily outputs of an experimental setting. For each experimental setting one such table should be filled in and, in the end, ranked according to best desired output.

<table>
<thead>

Table 1: Example ergonomics evaluation sheet

New fibres and textile materials are being discovered and improved upon every day, making intelligent clothing not only a possible future for ergonomics research, but a plausible one, where intelligent clothing can be worn like ordinary clothes and ensure that the wearer is protected from strain and discomfort when working.

**Conclusion**

Wearable technologies have the opportunity to make ergonomics analysis more reliable and easier to undertake. Whether it’s the use of smart textiles to perform a long term analysis of the day to day work
of a warehouse employee or to actually offer them a tool through which their job becomes easier, there is clear merit in the analysis of the applicability of emerging technologies in aiding participatory ergonomics. More analysis is needed into the applicability of smart textiles in a warehouse environment particularly the type and amount of sensors necessary to collect relevant and qualitative data while not constraining the wearer by creating an environment where their moves would not be natural. Similar attention should be paid to the interaction between the electro-magnetic fields created by wearing electrically charged clothing and the human body. Previous studies have shown that there can be serious health consequences as a result of electromagnetic interference within the human body, so the development of smart textiles should not be prioritized at the expense of human health.

As a final point, while the science is quickly advancing it is necessary to proceed with cautious optimism and make sure that the safety and security of the human wearer takes precedence to the possible advantages that smart textiles can offer, approving their utilization only after thorough analysis.

Abstract: In this paper composition of a non-ideal lithium-hydrogen-uranium plasma was studied using the Saha equation. The results obtained in this paper can be used both in theoretical calculations and in the implementation of various experimental projects related to non-ideal plasma, in particular, for studying the thermodynamic properties of nuclear fuel detected in gaseous plasma form in nuclear jet engines. The degree of ionization of lithium, hydrogen, and uranium atoms was determined as the ratio of the number of free electrons to the total number of nuclei in the plasma. The composition of the ionized plasma was calculated in the framework of the system of the chemical model of plasma. A system of nonlinear Saha equations is obtained, which was solved by numerical methods. The calculations were carried out in the Debye approximation, taking into account the screening effects. As a result, the dependence of the degree of ionization of lithium, hydrogen, and uranium atoms on concentration and temperature at different percentages of these atoms in the substance is presented: 10-85-5%, 9-90-1%, respectively.

Keywords: plasma, composition, ionization.

Introduction

The rocket engine is a jet engine that does not use a medium such as air or water to work. Many types of rocket engines such as chemical, electrical, nuclear and others are being developed and tested. In nuclear missile engines, it seems possible to use the colossal energy that is derived from the decomposition of the nuclear “fuel” to heat the gas. The principle of operation of nuclear rocket engines is based on a nuclear reaction or radioactive decay that occurs when the released energy heats a working medium, which can be either reaction products or some other substance, such as hydrogen. By using nuclear rocket engines, it is possible to obtain specific impulse values that are much higher than those provided by chemical rocket engines.

The working body is passed through a nuclear reactor in which the fission reaction of atomic nuclei (for example, uranium) occurs, and at the same time it heats the working body up. Nuclear missile engines do not need an oxidizing agent and therefore only one liquid can be used. As a working fluid, it is advisable to use substances that allow the engine to develop a large traction force. This condition is most fully satisfied by liquid hydrogen, followed by ammonia, hydrazine and water. The processes that release nuclear energy are divided into radioactive transformations, fission reactions of heavy nuclei, and the synthesis of light nuclei. Radioisotope transformations are realized in so-called isotope energy sources. Specific mass energy (the energy that can be extracted by a substance with a mass of 1 kg) of artificial radioactive isotopes is much higher than chemical fuels. Thus, for 210Po it is equal to $5 \times 10^8$ kJ/kg, while for the most energy-efficient chemical fuel (beryllium with oxygen) this value does not exceed $3 \times 10^4$kJ/kg. There are many radioactive isotopes, but uranium is more energy-efficient in nuclear reactors. Thus, the specific mass energy of 235U (the fissile uranium isotope) is equal to 6.75×10^6kJ/kg, that is about an order of magnitude higher than that of the isotope 210Po according to the work done by Liozov (1999).

The study of the thermodynamic properties of nuclear fuel found in a gaseous plasma form in nuclear jet engines is of great interest. Thus, we wrote a program for calculating various proportions of the complex plasma composition. For example, in this paper the results for ionization equilibrium and the composition of the lithium-hydrogen-uranium plasma are presented.

The composition of partially ionized plasma

The ionization equilibrium and composition of the lithium-hydrogen-uranium plasma were considered in the chemical model of plasma. From work by Gabdullin (2013) we have the following reactions of ionization and recombination of hydrogen, lithium and uranium:

1. NNO, al-Farabi Kazakh National University, gabdullin@physics.kz
2. ITEP, al-Farabi Kazakh National University, ramazan@physics.kz
3. ITEP, al-Farabi Kazakh National University, otarbay@physics.kz
4. ITEP, al-Farabi Kazakh National University, mira2604@mail.ru
5. ITEP, al-Farabi Kazakh National University, mira@mail.ru
\[ H \rightarrow H^+ + e, \quad Li \rightarrow Li^{1+} + e \]
\[ Li^{1+} \rightarrow Li^{2+} + e, \quad Li^{2+} \rightarrow Li^{3+} + e \]
\[ U \rightarrow U^{1+} + e, \quad U^{1+} \rightarrow U^{2+} + e \]
\[ U^{2+} \rightarrow U^{3+} + e, \quad U^{3+} \rightarrow U^{4+} + e \]

The relationship between the concentrations of plasma components can be described as follows:

\[
\alpha_{Li}^+ = \frac{n_{Li}^+}{n_{tot}}, \quad \alpha_{Li}^2 = \frac{n_{Li}^{2+}}{n_{tot}}, \quad \alpha_{Li}^{3+} = \frac{n_{Li}^{3+}}{n_{tot}}, \quad \alpha_{Li}^{4+} = \frac{n_{Li}^{4+}}{n_{tot}},
\]
\[
\alpha_{H}^+ = \frac{n_{H}^+}{n_{tot}}, \quad \alpha_{H}^2 = \frac{n_{H}^{2+}}{n_{tot}}, \quad \alpha_{H}^{3+} = \frac{n_{H}^{3+}}{n_{tot}}, \quad \alpha_{H}^{4+} = \frac{n_{H}^{4+}}{n_{tot}}.
\]

The system of Saha equations for calculating the Li-H-U plasma composition with the maximum ionization multiplicity:

\[
\frac{n_{H}}{n_{H}^{free}} = \frac{g_0}{g_1} \frac{\lambda^3}{2} \exp \left( \frac{I_1 - \Delta I}{k_B T} \right), \quad \frac{n_{Li}^{i+}}{n_{Li}^{i+}^{free}} = \frac{g_0}{g_1} \frac{\lambda^3}{2} \exp \left( \frac{I_{i+} - \Delta I}{k_B T} \right), \quad \frac{n_{U}^{i+}}{n_{U}^{i+}^{free}} = \frac{g_0}{g_1} \frac{\lambda^3}{2} \exp \left( \frac{I_{i+} - \Delta I}{k_B T} \right),
\]

In these equations \( n_{Li} \), \( n_{H} \), \( n_{U} \) are the concentrations of non-ionized Li, H and U ions, respectively, \( n_{Li}^{i+} \), \( n_{H}^{i+} \), \( n_{U}^{i+} \) are the concentration of \( i \)-times ionized Li and U ions, \( n_{H}^{i+} \) is the concentration of singly ionized H ions, \( n_{tot} \) is the concentration of all particles, \( n_{e}^{free} \) is the concentration of free electrons of Li, H and U, \( I_{i} \) is the ionization potential of Li, H, and U atoms, \( \Delta I \) is the Debye correction, \( \frac{g_0}{g_1} \) is the partition function.

The law of conservation of the number of nuclei
\[
n_{tot} = n_{H} + n_{Li} + n_{U} + n_{Li}^{i+} + n_{H}^{i+} + n_{Li}^{2+} + n_{Li}^{3+} + n_{Li}^{4+} + n_{U}^{i+} + n_{U}^{2+} + n_{U}^{3+} + n_{U}^{4+}.
\]

The law of conservation of the total charge in the system:
\[
n_{e}^{free} = n_{H}^{i+} + n_{Li}^{i+} + n_{U}^{i+} + 2n_{Li}^{2+} + 2n_{H}^{2+} + 2n_{Li}^{3+} + 3n_{Li}^{4+} + 3n_{U}^{3+} + 4n_{U}^{4+}.
\]

The system of equations (3) was solved by numerical methods. As a result, the degree of ionization was obtained as a function of concentration and temperature.

The results of the calculations are shown in figures 1-4. Figure 1 presents the results for the ratio of Li-H-U equal to 10-85-5%. The results of the calculations for the Li-H-U ratio of 9-90-1% are shown in Figure 2.
Figures 1 and 2 show the composition of the Li-H-U plasma as a function of temperature. With increasing temperature the concentration of hydrogen, lithium, and uranium ions increases and, starting from 160,000 K, the plasma becomes completely ionized. It can be seen from the figures that the ionization of hydrogen ions begins at a higher temperature value than for the remaining ions, which is explained by the fact that hydrogen has the highest ionization potential. The concentration of singly ionized lithium increases first, since the ionization potential is the smallest for lithium. The concentration increases with increasing temperature up to ~ 20,000K, then reaches a plateau, which is
due to the need for additional energy to fill the next electron shell. With a further increase in temperature (from ~ 70000K) the concentration of singly ionized lithium begins to decrease, the concentration of doubly ionized lithium increases, which reaches a maximum at ~110,000 K and decreases. At the same time, the concentration of triply ionized lithium increases from about 110000K to the plateau at 160000K. The concentration of singly ionized uranium increases with increasing temperature up to ~ 12000K, then decreases, the concentration of doubly ionized uranium begins to increase, which reaches a maximum at ~ 20000K and decreases. Simultaneously, the concentration of triply ionized uranium increases and reaches its maximum at ~ 30000K and decreases, the concentration of the four times ionized uranium reaches its plateau at ~ 70000K. At 160 000 K the plasma becomes completely ionized.

Figures 3 and 5 show the composition as a function of the concentration at a constant temperature T = 10000K. Ionization in dense plasma is a complex process, accompanied by a decrease in the concentration of free electrons and an increase in the concentration of atoms. As the density increases, the average distance between particles decreases, the interaction of the charge with the atomic nucleus increases, and the ionization of atoms is more difficult in dense plasma. The concentration of hydrogen ions gradually decreases with increasing plasma density, the concentration of doubly ionized uranium decreases down to n = 5×10^{20} cm^{-3}, while the concentration of singly ionized uranium gradually increases.

Figure 3: Dependence of the degree of ionization on the concentration at K for the ratio of Li-H-U is equal to 10-85-5%.

![Figure 3](image)

Source: Authors

Figure 4: Dependence of the degree of ionization on the concentration at K for the ratio of Li-H-U is 9-90-1%.

![Figure 4](image)

Source: Authors
Conclusion

The composition of non-ideal deuterium and tritium plasma was calculated using the Saha equation while taking into account the lowering of the ionization potential. The composition of dense non-ideal plasma was calculated using numerical methods. The system of Saha nonlinear equations was solved. As a result, the curves showing the degree of ionization depending on concentration and temperature have been obtained.

MODERN MEANS OF PRODUCTION AND THE STAFF AWARENESS OF THE TECHNICAL IN THE PLANT OF THE MINING INDUSTRY

Dorota Palka,¹ Jaroslaw Brodny,² Kinga Stecula³

Abstract: The rapid rate of introducing new technology leads to the issue of staff awareness in operating the latest equipment. Many users do not understand how new devices work and how to use the new machines and gadgets. This article presents the results of research aimed at determining the influence of new technology on the technological awareness of mining workers. Surveys and advanced expert interviews have shown that the lack of technical knowledge means the introduced changes are often perceived negatively by staff and that the main reason for this outcome is the absence of effective education. Lack of knowledge means that frequently the effectiveness of the new and technologically advanced machines is marginal. Presented problems due to the high competition in the energy market have a crucial practical significance. The results of this research may be valuable as a source of information and knowledge for companies.

UDC Classification: 622.8; DOI: http://dx.doi.org/10.12955/cbup.v5.1094

Keywords: mining, employees’ awareness, technological culture, technology assessment

Introduction

The increasing competition in the world energy market has adversely affected the hard coal market. Recently, Polish mining has faced serious economic challenges relating to the efficiency of work and the profitability of mines. The expectations of mine workers regarding salaries and overall improvement in the standard of living have increased. However, in the current economic situation, mining companies are not able to meet these expectations. At the current level of employment, the increase in wages sought is deemed impossible for these companies to meet. The main reason is that the industry employs too many people. Nevertheless, another reason for this situation is the low efficiency of the mining industry. The technical and organizational modernization of the mining industry provides an opportunity to improve this situation.

Organizational modernization could advance the situation through introducing modern management systems for mining companies, organizational restructures, and new ways of organizing the complete labor system. Improvement could also arise from optimizing employment and cooperation between all personnel working in the mine (Fayyad, Wierse, & Grinstein, 2002).

Technical modernization mainly involves the introduction of constantly improved, more efficient and modern machines and devices. The purpose of such modernization is to base mining on knowledge. Effective mining of hard coal requires the use of ever-increasing technology of exploitation, implementation of innovative mechanical systems, as well as advanced safety systems limiting the risk of adverse events (Ławniczak, Mazurek, Iwanowicz, & Mrugalska, 2013)

High competition in the raw energy resources market and dynamic changes in the global economy force mining companies to introduce modern technologies. It is necessary to optimize the cost and time of production, while at the same time shaping the environment in terms of work safety (Walczyńska & Lucjan, 2012).

In summary, the aim of all these activities is to improve the economic efficiency of mining enterprises, which should, in turn, also contribute to improving their employees’ livelihood.

One such effort to improve mining productivity is the introduction of increasingly modern, safe, efficient, and reliable mining machinery. In practice, it has emerged, that despite significant costs incurred for the purchase and introduction of these machines for production, there has been no significant increase in productivity of the mines. The economic effects of the investment have been unsatisfactory.

An analysis into the causes of this situation revealed that only marginal increases in efficiency result from using these highly efficient and costly machines (Brodny, Stecula, & Tutak, 2016; Stecula &
Brodny, 2016). Studies indicated that, in the area of efficient use of machinery, measures are needed to effectively reduce production costs. It must be assumed that one of the main reasons for improving the economic condition of mining enterprises is their technical modernization. Only in using modern machinery and equipment to their full potential can opportunities arise for the efficient operation of these companies. For this process to be successful, it is necessary to have a suitably trained crew who are convinced of the necessary changes (Guo-fa, 2010).

Employees, as beneficiaries, need to be extremely interested and strongly supportive of the changes. It is, therefore, necessary to educate employees about the need for change and implement appropriate training. The modern machinery required for operation requires proper maintenance and introducing innovative technical solutions requires proper preparation of employees. The employees’ high cultural and technical awareness are necessary to handle these machines and improve their efficiency (Robson, Stephenson, Schulte, Amick, Irvin, Eggerth, & Peters, 2012).

This article presents the results of surveys and in-depth expert interviews, aimed at identifying barriers and problems experienced by mine workers when modern technical means are introduced. The results of these studies have shown that, with the introduction of modern technical solutions, intensive educational activities are required for the employees. In the absence of such measures, it is very difficult to achieve the expected effects of these changes.

**Survey Research**

This study aimed to determine the state of technical awareness in mining enterprises by surveying employees of these companies. Another purpose of this study was to determine the reasons for low efficiency in use of modern machines owned by these companies.

Anonymous surveys were conducted among employees of mining companies. The survey consisted of three parts, containing a total of 12 questions. The first part involved verifying the details of the respondents, including age, seniority, and education. The second part contained closed questions concerning modern technologies and technical measures introduced at the mine. The third part contained open questions to explore the subjective opinions of the respondents.

The first question in the second part concerned employees’ views on the need for modern, innovative, technical solutions in the mine. Figure 1 shows the answers to this question.

---

Source: Authors

The results show that as many as 68% of the respondents regarded introducing modern technical equipment in the mining industry negatively. Only 27% supported their introduction, and 5% had no opinion on this topic.

Such a large group of opponents of technical progress is highly disturbing and may indicate the workers’ lack of technical awareness. Another question asked the reasons for the answers given in the first question. Particularly interesting are the responses from the respondents who had a negative attitude to the changes.
The most frequently cited reason was the lack of ability to handle modern machines and equipment, as well as the lack of thorough technical knowledge about the operation and functionality of these devices. More than 70% indicated a lack of skills and knowledge needed to work with modern technology. There were also fears of being exposed to an unknown technique and of the reaction of colleagues to the situation when revealing the lack of their ability to use modern machines and devices. Figure 2 shows the detailed results of these responses.

Another question required the respondent to indicate the machine that, according to staff, required the most technical knowledge. In response, 44% of respondents pointed to a shearer and 39% to a lift machine (Figure 3). These results appear to reflect the actual technical level of these machines.

Figure 3: Level of machine operation

Source: Authors

The next question was about willingness to participate in training to raise the technical knowledge of employees. In this case, the results referred to individual age groups of the respondents. The youngest individuals were the most interested in the training of new technologies. With increasing age, the number of workers interested in such training decreased. Figure 4 shows the results.
Figure 4: Influence of age on interest in training

![Figure 4: Influence of age on interest in training](image)

Source: Authors

The questionnaire also included questions about employees’ expectations and solutions to problems arising in their work. The diversity of responses revealed some problem areas that were discussed during expert interviews. Most employees recognized that the reason for ineffective work was an inadequate training program to prepare them for the required tasks. Both in-house training and vocational training programs did not contain sufficient knowledge about modern, innovative machines.

**Expert Interviews**

In-depth expert interviews with selected employee groups were conducted to better diagnose issues relating to the introduction of the modern means of production and technical awareness of employees. Results indicated that the major problem for these workers appeared to be the lack of an appropriate training system in the mines. This response indicated there was no possibility for deepening the knowledge and technical awareness of employees. The lack of promoting technical culture among the company’s crew has vital influence. The concept of technical culture may, in this case, be broadly understood. It concerns both the quality and availability of technical documentation and tools, as well as thorough knowledge of employees. Basic information on machine construction and functionality and analytical thinking enable workers to anticipate and prevent unauthorized events. This situation has a significant impact on the safety of workers in their challenging conditions. Especially, correct handling of machinery and equipment allows for failure prediction and prevention (Tomaszewski & Czekaj, 2009). Also, with a low level of technical culture more failure of machines and equipment is possible and this situation potentially increases the cost of repairs and complete overhauls.

The interviews also showed that employees who lacked sufficient technical knowledge were unaware of the consequences and costs of their actions. It is, therefore, essential that every company has a proper training policy, both in terms of safety and technical knowledge.

**Conclusion**

The abrupt pace of new technology deployment means that employees have problems handling and utilizing the full functionality of the advanced solutions. Many users seem unable to keep up with understanding how the latest machinery works and what follows is that they do not know how to operate the latest innovative machines and equipment. This predicament leads to a situation in which the machines are underutilized, and the company fails to achieve its business goals.

The surveys and expert interviews conducted among mine workers ascertained that one main cause of this state is the shortfall in educating employees. Deficiencies are mainly related to technical knowledge. The results clearly show that both the company’s in-house training system and the school education system cannot adequately prepare a technician.
This outcome is the result of the rapid introduction of new and innovative solutions that are a momentous challenge for some employees. Problems with handling and understanding the essence of these devices make these employees reluctant to introduce new machines and equipment.

Low technical awareness causes fears of using advanced technical equipment, stress, and dissatisfaction with work among the crew. Employees are often unaware of the costs generated by their misbehavior and ignorance. The lack of a proper level of technical culture makes the efficiency of using new and technologically advanced machines insignificant.

The results clearly show that mining companies should use all types of training, including technical. Raising the technical awareness of employees may prove to be a highly successful investment in the future. The training program in this area does not necessarily need to cause an additional financial burden for enterprises. Some of the training could be run by companies producing and supplying these mines.

Because of the high competition in the energy market, the presented issue is of great practical importance. The research results presented in the article may constitute an important source of information and knowledge for companies introducing modern technical measures.

THE ROLE AND IMPORTANCE OF TRAINING FOR IMPROVING THE SAFETY AND AWARENESS OF THE TECHNICAL STAFF IN THE MINING PLANT

Dorota Palka

Abstract: Harsh working conditions and the introduction of technologically advanced machines are placing growing demands on the qualifications of mine workers, forcing mine workers to undergo continuous training. This article presents the results of research concerning the evaluation of training and expectations of workers in a mining plant to identify further actions in this area. The results indicate that workers negatively evaluate previous training. Based on advanced expert interviews and panel discussions, the directions and recommendations regarding the necessary changes to training are set out. Employees suggest broadening the subject of occupational health and safety training. Their concerns relate to the operation and maintenance of new machines, telecommunication equipment, mining support, ventilation, and interpersonal communication. The results indicate a growing awareness among employees of the role and importance of training and the acceptance of upgrading skills as an investment in the future.

Introduction

Currently, the Polish coal mining industry employs almost 171 thousand people. This number includes people employed directly in the mines as well as various mining companies. In this industry, the current, and future jobs in many cases depend on the economy of the country and condition of the mining industry. This sector is particularly important for the economy of Upper Silesia, which is a region with a huge mining tradition. Despite changes in the employment structure, the development of other sectors of the economy, and the restructuring of the mining industry, this sector continues to be one of the largest employers in the region. It has a huge impact on the region in terms of shaping the economic picture by employing thousands of residents and being a major source of income for families. At the same time, working in the mining industry, especially underground, is challenging and dangerous. The complex environmental conditions under which underground mining operates and both numerous natural (Brodny & Tutak, 2016a; 2016b) and technical hazards result in many accidents, including fatalities in the mining industry. Mining and its products, especially gas, are also a significant threat to the external environment (Brodny & Tutak, 2016a; 2016b). Together these factors coincide with a high accident rate within the industry.

Various types of activities are undertaken to improve this situation and increase the safety of the workers. One example is the widespread use of various types of sensors to monitor the condition of the atmosphere in the mine. In most cases, these sensors form large systems that automatically monitor the level of the hazard in a specific area. Their task is to detect hazards as early as possible and alert workers. In many cases, the parameters registered by these systems are used for forecasting hazardous conditions. More reliable and safer mining machines are also introduced to improve safety (Brodny, 2012). The manufacture of modern mining machinery involves the latest technologies and innovative technical solutions. The aim is to improve both the safety of people operating the machines and the efficiency of the machine (Stecula & Brodny, 2016; Brodny, Stecula & Tutak, 2016).

Another step taken by mining companies to improve safety on mining premises is the implementation of occupational safety management systems (Ochman, 2011). Despite efforts to improve safety at work in mining companies, the mining industry continues to have the highest industrial accident rates. Table 1 presents the number of accidents in the mining industry during 2012–2017, showing the serious, fatal, and overall number of accidents.

An analysis of the data in Table 1 reveals that despite the use of advanced technologies and technical solutions, the number of accidents in mining is high. A deeper analysis of the causes of this situation shows that the employees have a strong impact on the number of accidents. People in harsh environmental conditions with many dangers are the weakest link in the whole system, with an

1 Faculty of Organization and Management, Silesian University of Technology, dorota.palka@polsl.pl
analysis of the causes of the accidents confirming this theory. In practice, despite the use of modern monitoring systems for the state of the underground environment and the use of modern machines, human errors are the most common cause of all types of accident events (Matuszewski, 2009).

Thus, action to improve this condition is needed. Such activities should include, in particular, the proper preparation and training of mine workers. Appropriate awareness and commitment of the employee, who has decisive influence on the effectiveness of production and level of occupational safety.

Difficult working conditions, numerous hazards, as well as the variety of technology used in mining require employees of mining companies to improve their knowledge continually. Acquisition of both practical and theoretical knowledge is possible through participation in various types of training.

The aim of this article is to indicate the importance of training for improving the safety and technical awareness of employees.

### Data and Methodology

The study entailed a survey with questionnaires and discussion panels involving coal miners. The objective of the research was to contribute towards improving work safety in the mining industry. The study was carried out with pit crew and surface mining companies and included electricians, drivers, surface mechanics, and employees involved in material processing. The audit questionnaire was open and anonymous, and information sought included age, work experience, and education of the respondents. The study was conducted over five consecutive days with each day involving a different group of employees completing the questionnaire. The survey consisted of two parts that included 15 questions overall. The first part contained five closed questions to verify details of the respondent. The second part contained both open and closed questions (10 each) on assessing the training. The questions were designed to allow employees to express themselves freely on topics of ongoing and future training.

One of the basic questions asked of the employees was to evaluate the organization of their training to date. In another, this time an open question, respondents were asked to provide suggestions for changes in their training necessary to improve their engagement. Results revealed certain areas required detailed discussion. For this purpose, panel discussions were organized and attended by representatives of particular groups of employees. The subject of the discussion covered issues about the role and importance of training. These discussions involved expanded questionnaires. The main purpose of these discussions was to understand the genuine reasons for responses and views of employees and gather proposals for change.

### Results and Discussion

The employees’ evaluation of their training regarding its organization are presented in Figure 1. The results show that most respondents regarded the organization of their current training negatively. Among the answers were the terms ‘bad’ and ‘rather bad’, which comprised over 70% of total responses to this question.
The research results regarding suggestions for changes in employee training to improve their engagement are shown in Figure 2. Almost half of the respondents showed interest in more practical activities. More than 30% suggested updating the technical knowledge provided during training on the operation of machinery and equipment introduced by the company. The other 20% recommended trainers use modern methods of transferring knowledge during training. They believed that this would result in greater diversification of training and provide more interest in the topics. The respondents also suggested lengthening the practical part of their training. The theoretical component was assessed negatively in many instances because the workers failed to see the connection between theory and practice.

The discussion panels identified a set of problems viewed by employees regarding their training. The monotony of the lectures and the way the lecturers conveyed the knowledge were two significant problems identified. Employees showed interest in new techniques of knowledge transfer, multimedia presentations, and stimulating teaching aids. Another problem identified was the incompatibility between theory and practice. Employees emphasized significant shortcomings in technical training in relation to modern machinery introduced into the company.

They believed that the development of the company depends on a well-organized training policy of the company. Respondents proposed extending the training program to include technical issues relating to operating new machinery, telecommunications equipment, mining enclosures, ventilation processes, and interpersonal communication. Thus, employees showed their willingness to participate in additional activities, and this is evidence of the growing awareness among employees of the role and importance of training.

Conclusions

As previously stated, mining is a sector characterized by a high number of accidents due to numerous hazards, difficult working conditions, and above all, the human factor. It is undisputed that the safety of the crew depends largely on the conscious and voluntary commitment of the employees. To
improve this condition, it is necessary to conduct cyclic training of a crew who may be subject to rotating shifts. New employees, in particular, require proper preparation for such a difficult job. To increase the level of their knowledge, it is therefore necessary to conduct training in terms of both occupational safety and the operation of modern equipment. Proper training improves the efficiency and safety of employees and has a significant impact on the development of the company. Therefore, special emphasis should be given to the proper organization of training and the whole of training policy pursued by the company. The results of questionnaires and discussion panels have shown that employees perceive significant mistakes in the organization of their training. The most important involved monotony and lack of training updates. An important shortcoming is the incompatibility of the presented theory with practical work in the mining industry. Employees have shown interest in modern training methods and in extending the training program. In addition, they have declared their willingness to participate in additional training on technical aspects of equipment. Proposed changes may be the key to resolving a technical barrier that arises together with the dynamic development of technology. This research and its analysis demonstrate the importance of training for the safety and awareness of the employees. It is recommended the outcomes are considered in company training policies. Breaking the technical barrier, raising awareness of the workers, and safety of the crew should have a significant impact on the development of the company. The results of this research contribute towards improving and organizing training not only in mining companies but in other types of industries.

EVALUATION OF LACTIC ACID BACTERIA GROWTH DURING AUTOCHTHONOUS ALBANIAN KALLMET WINE PRODUCTION WITH SPONTANEOUS AND INOCULATED FERMENTATIONS

Rozeta Hasalliu1

Abstract: The grape used in wine making has many wild microorganisms like lactic acid bacteria, yeast, acetic acid bacteria. During the alcoholic fermentation, the evaluation of these microorganisms depends on their activity. There is an interaction between yeast and lactic acid bacteria during this period of wine making. In this study, we have made wine from the autochthonous Albanian grape Kallmet variety using the spontaneous fermentation and inoculated fermentation with the yeast Saccharomyces bayanus. Yeasts carry out the alcohol fermentation, and lactic acid bacteria make malolactic fermentation in wine. With this fermentation, lactic acid bacteria convert malic acid to lactic acid, reducing the acidity of the wine and create a microbiological stability. During the alcoholic fermentation, the evaluation of lactic acid bacteria is not required. The aim of our study is to evaluate the first quantity of lactic acid bacteria to Kallmet grape, their performance during the two fermentations, spontaneous and inoculated fermentations.

UDC Classification: 63; DOI: http://dx.doi.org/10.12955/cbup.v5.1096

Keywords: lactic acid bacteria, Albanian wine, Kallmet grape, spontaneous and inoculated fermentations.

Introduction
In Albania, some of wine producers produce wine with spontaneous fermentation, and others produce wine with inoculated yeasts that are Saccharomyces cerevisiae, Saccharomyces bayanus or a mix between two yeasts, Saccharomyces cerevisiae and Saccharomyces bayanus (Hasalliu, 2016).

Must has a low pH value (3.5-3.5) as well as a high sugar concentration. Therefore, it represents a very specific habitat in which the chemical and physiological conditions are changing during vinification. There are only three groups of microorganisms that are adapted to these harsh conditions: yeasts, acetic acid bacteria (AAB) and lactic acid bacteria (LAB). These microbes also influence the wine making process itself (König et al., 2009, Petri et al., 2013).

Lactic acid bacteria can already be found on grapes. However, undamaged grapes contain less than 10³ colony-forming units (CFU)/g leading to a low initial titer in must (Lafon-Laforest et al., 1983). Only a few LAB species of the genera Lactobacillus (Lb.), Leuconostoc (Le), Pediococcus (P.), Oenococcus (O.) and Weissella (W.) can grow in must, whereas carnobacteria, enterococci, lactococci, streptococci, and bifidobacteria have not been isolated from must or wine. The acetic acid bacteria Acetobacter and Gluconobacter as well as more than 90 yeast species have also been found. Yeasts convert glucose of the sugar-rich must into alcohol. Most of the yeasts will usually die out once the alcohol level reaches about 5 %, whereas more alcohol tolerant Saccharomyces species take over. Also, the CFU of LAB decreases after an initial increase from 10³ to 10⁴ - 10⁵ CFU/ml during the first days of must fermentation. During alcoholic fermentation, LAB do not multiply or even disappear, except O. oeni, which resists at low cell levels.

We studied this growth in our experiments with the Albanian grape variety Kallmet.

After alcoholic fermentation, the growth of this species is stimulated because of the released cell constituents of yeasts, which are in a stationary or death phase. At this stage, oenococci have an influence on yeast lysis by producing glycosidases and proteases (König et al., 2009)

Only some other ethanol tolerant LAB species survive in young wine or wine. Furthermore, it was found that fatty acids (hexanoic, octanoic and decanoic acid) liberated by growing yeast also have a negative effect on bacterial growth (Lonvaud-Funel et al., 1991; Hui, 1995).

Relevance of LAB in wine and malolactic fermentation by LAB
LAB plays an important role in wine quality. The malolactic fermentation carried out by these bacteria leads to de-acidification and stabilization of wines. LAB converts malate into lactate and CO₂ after alcoholic fermentation. This so called malolactic fermentation primarily leads to biological de-acidification, but also to flavor modifications and microbial stabilization. Therefore, it has a positive effect on wine quality (Liu, 2002).

1 Faculty of Biotechnology and Food, Agricultural University of Tirana, Albania, hasalliur@yahoo.com
In addition to malate, lactic acid bacteria also metabolize tartrate and citrate, which also belong to the main acids of must. Citrate is metabolized to lactate, acetic acid, CO₂, and acetoin. According to Radler and Yamnissi (1972), tartrate can be converted to lactate, acetate, and CO₂ by homofermentative LAB (e.g., Lb. plantarum) and to acetate and CO₂ or fumaric acid (succinic acid) by heterofermentative LAB (e.g., Lb. brevis) (Llauheres et al., 1990; Duenas et al., 2003).

Even though malolactic fermentation can occur spontaneously, O. oeni is often used as a bacterial starter culture. Because of its high tolerance to ethanol and acidity, this species is the preferred starter culture applied for the reduction of the malic acid content (Brandolini et al., 2002). Especially in northern countries, where must can have a high acidity, the biological reduction with such starter cultures is an important step in vinification. However, the malolactic enzyme has also been found in many other lactic acid bacteria occurring in wine (e.g., Lb. casei, Lb. brevis, Lb. buchneri, Lb. delbrueckii, Lb. hilgardii, Lb. plantarum and Lc. mesenteroides (Schiitz and Radler, 1984). The malolactic fermentation and the consumption of nutrients (hexoses and pentoses), as well as the production of antimicrobial components (De Vuyst and Vandamme, 1994), can lead to more stable wines. Lactic acid bacteria potentially produce acetic acid, higher concentrations of CO₂, H₂O₂, diacetyl, pyrogulatamic acid and bacteriocins, which inhibit the growth of other bacterial and yeast species (Rammelberg and Radler, 1990; Blom and Mortvedt, 1991). For example, it is known that the bacteriocin brevinic from Lb. brevis inhibits the growth of O. oeni and P. damnosus (Rammelberg and Radler, 1990).

**Spoilage by LAB (e.g., mousiness, ropiness)**

In Albania, we do not have studies about the growth and the effects of lactic acid bacteria in wine. Nevertheless, the role of LAB in winemaking is ambivalent as this fermentation is only occasionally desirable during vinification in some wines. Exopolysaccharide production leads to grasse of the must, which causes problems during filtration. Different strains of P. damnosus, P. parvulus or Leuconostoc mesenteroides are well known for the formation of exopolysaccharide slimes, which lead to so called ropy wines (Vincenzini et al., 2009; König et al., 2009). Viscosity, which is influenced by many factors such as the ethanol concentration and temperature, becomes apparent at 10⁷ CFU/ml. Especially P. damnosus increases the viscosity by producing a glucose homopolymer.

Lactobacilli can also cause a loss of color (up to 30 %) after malolactic fermentation. This is due to pH changes that cause a shift in the equilibrium of anthocyanins, which contribute to the stability of color in wine.

Several LAB are also involved in the generation of numerous off-flavors, because they can produce acetic acid, diacetyl, acetoin, 2,3-butanediol, ethyl lactate, diethyl succinate, acrolein, mannitol and compounds that form the geranium note or mousy-off flavor (König et al., 2009; Petri et al., 2013). Mousy-off flavor or mousiness is a smell reminiscent of mice. Lactobacilli such as Lb. brevis, Lb. hilgardii and Lb. fermentum produce acetyl-tetrahidropyridine (perception threshold: 1.6 ng/l) from ethanol and lysine. Acetyl-pyrroline and ethyl-tetrahydroxybutyridine can also contribute to this off-flavor (Vincenzini et al., 2009; Nakayama and Sonomoto, 2002). Diacetyl and acetoin can be formed by the metabolism of citrate if the excess of pyruvate is reduced to lactic acid.

Fructose is reduced to mannitol or converted to erythritol and acetate. When Lb. plantarum is grown on mannitol, oxaloacetate can also function as electron acceptor leading to the formation of succinic acid (Chen and McFeeters, 1986).

Glycerol is converted to propanediol and acrolein leading to bitterness (Schiitz and Radler, 1984).

O. oeni can also produce off-flavors due to the metabolism of cysteine and methionine. Hence, cysteine is transformed into hydrogen sulfide or sulfanyl ethanol and methionine into dimethyl disulfide, propanol, and propionic acid. The latter has an earthy, red-berry fruit flavor (Ribereau-Gayon et al., 2006).

**Health hazards due to LAB (e.g., biogenic amines, ethylcarbamate)**

Biogenic amine production (e.g., tyramine, histamine or putrescine), is also mainly caused by microbiological activities of some LAB strains during vinification. O. oeni, P. cerevisiae, and Lb.
hilgardii are examples of producers of biogenic amines (Landete et al., 2005; Mangani et al., 2005; Sebastian et al., 2011; Petri et al., 2013).

The most important biogenic amine is histamine, which is produced by decarboxylation of histidine. The COST Action 917 (2000-2001) of the EU "Biologically active amines in food" suggested prescriptive limits for histamine (e.g., France: 8 mg/l, Germany: 2 mg/l) in wines. Biogenic amines can cause health problems like migraine and headache (Coton et al., 1998) and sensory defects in wine (Lehtonen, 1996). From arginine, ammonium is liberated by heterofermentative species such as Lb. hilgardii and O. oeni, but also by facultatively heterofermentative species like Lb. plantarum.

Ethyl carbamate, which is probably carcinogenic, is produced from urea and ethanol by O. oeni and Lb. hilgardii (Uthurry et al., 2006). Alcoholic fermentation must prevail against malolactic fermentation in the first days of fermentation. The growth of lactic acid bacteria in the first days of fermentation may cause shortcomings of the wine.

The aim of our study is to evaluate the first quantity of lactic acid bacteria to Kallmet grape, their performance during the two fermentations, (spontaneous and inoculated fermentations).

**Materials and methods**

100 kg of Kallmet grape (Figure 1) were used to produce Kallmet wine with spontaneous fermentation and fermentation inoculated with Saccharomyces bayanus yeast.

For this work, the grape of variety Kallmet was harvested in the village of Kallmet (Lezhe) at 18°Brix. The quantity was divided into 2 lots of 50 kg each (K1 and K2). The analytical parameters analyzed to the grape must were: pH, total acidity, % of sugar content and chromatic characteristics. After the crushing, each lot was treated with 3 g/hL of SO₂ and the K1 lot was also added 2.5g/kg of medium toasted oak chips.

Both lots were placed to macerate in cold temperature 5°C for 72 hours. After the cold maceration, the K1 lot was inoculated with Saccharomyces bayanus BC at 20 g/hL rate, while the K2 lot was left to ferment spontaneously. Both fermentations lasted six days and after the racking of the wine from the skins both lots were treated with 3 g/hL of SO₂ and held in storage for the second fermentation to take place.

For microbiological analysis MRS medium was prepared, sterilized in an autoclave in 121°C for 15 minutes, and spread out in Petri dishes.

*Figure 1: Kallmet grape (Autochthonous Albanian grape variety)*

25 ml of wine from two fermentations was homogenized in 225 ml of peptone water. Five tubes were filled with 9 ml of peptone water, and 1 ml from the homogenized wine was placed in the first tube, 1 ml from the first tube was placed in the second tube and in the same manner until the fifth tube. Finally, five dilutions were prepared: 10⁻¹, 10⁻², 10⁻³, 10⁻⁴, 10⁻⁵. 1 ml from each tube was placed in Petri dishes with MRS medium. Petri dishes with MRS medium were incubated in a thermostat at 30°C. After 48-72 hours, Petri dishes were taken from the thermostat, and lactic acid bacteria colonies were counted.

**Results and Discussions**

The results of Kallmet wine produced in this study for total acidity were 5.5 ± 0.08 for K1 samples (inoculated fermentation with S. bayanus) and 6.1 ± 0.05 for K2 (spontaneous fermentation). The results for pH of the Kallmet wine were 4.12 ± 0.02 for K1 wine (inoculated fermentation with S.
bayanus) and 3.98 ± 0.02 for K2 wine with spontaneous fermentation). The results for the % of alcohol of Kallmet wine was 11.9 ± 0.03 for K1 wine (inoculated fermentation with S. bayanus) and 12 ± 0.02 for K2 wine (spontaneous fermentation).

Due to its tolerance against ethanol and acidic conditions, LAB (Lactic Acid Bacteria) can grow in must. During the first days of must fermentation, the CFU of LAB increased from 10^5 to 10^6-10^7 per ml (Table 1).

Source: Author

The initial quantity of lactic acid bacteria is the same for the two samples K1 and K2 because it was the first day of fermentation and yeasts were just added and they have not started their activity yet. This quantity is the first quantity that is in Kallmet grape.

With the start of fermentation the number of lactic acid bacteria in K2 samples, (wine without inoculated yeasts) was higher (1.8 x 10^7, day 9) than K1 samples (8 x 10^6, day 9) of wine with inoculated yeasts Saccharomyces bayanus.

On the 10th day of fermentation, the number of lactic acid bacteria in K2 samples, (wine without inoculated yeasts) was also higher (2.2 x 10^7) than in K1 samples (2.8 x 10^6) of wine with inoculated yeasts Saccharomyces bayanus (Figure 2). This is because inoculated yeasts inhibit the growth of lactic acid bacteria. Yeasts cells are bigger than lactic acid bacteria cells, and they are competitive against lactic acid bacteria for the nutrient. Yeasts produce secondary components like toxic components that inhibit the growth of lactic acid bacteria and others spoilage bacteria for the wine like acetic acid bacteria or spoilage yeasts.

**Conclusions**

Lactic acid bacteria influence the flavor of wine because they can produce acetic acid, diacetyl, acetoin, 2,3-butanediol, ethyl lactate, diethyl succinate and acrolein.

Lactic acid bacteria are present in grape, must and wine, but their presence during alcoholic fermentation must not influence the activity of yeast for the normal alcoholic fermentation. The
activity and the growth of the number of lactic acid bacteria is be more desirable after alcoholic fermentation to avoid a stuck of alcoholic fermentation.

From the microbiological analyses of two samples K1 (Kallmet wine with inoculated yeasts Saccharomyces bayanus) and K2 (Kallmet wine without inoculated yeasts Saccharomyces bayanus), the initial number of lactic acid bacteria was 2 x 10^5 CFU/ml but during the spontaneous fermentation the number of lactic acid bacteria is higher than in wine inoculated with S. bayanus in days 9 and 10 of fermentations.

Inoculated yeasts Saccharomyces bayanus, therefore, cause the inhibition of lactic acid bacteria during the process of fermentation, during the production of Kallmet wine with autochthonous Kallmet grape.

1203
GENETIC DYNAMICS OF CONIFEROUS INTRODUCTENS IN THE CONDITIONS OF A FOOTHILL DESERT-STEPPE ZONE IN THE SOUTH OF KAZAKHSTAN

Dani N. Sarsekova

Abstract: Forest breeding should be produced not only by the representatives of the local flora, which is not very diverse in some areas of the Republic of Kazakhstan, but by species and forms of trees growing in temperate zones of the worldwide. In particular, this refers to arboreta located in the conditions significantly different from the place of natural growth of the introduced species. One of this arboretum is the JSC "Forest nursery" of the Ministry of Science and Higher Education of the Republic of Kazakhstan which is located in the South-East of the republic.

The aim of this study was to study the ecological and genetic variability of coniferous introducants in the foothill desert-steppe zone and to determine the share of genetic and environmental factors. The variability and the relative stability of the expression of the quantitative trait in ontogenesis, which characterizes the species adaptation to the new conditions in 9 Yellow pine trunks, Crimean pine trunks and Scots pine trees, 7 Blue spruce trees and the same number of trees in European spruce, in which annual increments of the height of one morphological Location.

Beginning with the growth of 2014 and then sequentially down the trunk, so long as lateral branches of the first order in whorls were preserved or traces were observed in a good way.

Thus, the value of the mean squares differs significantly in the increments of a single morphological location and in the increments of tree groups, in the introductions species and in the periods of their life. Therefore we are allowed to conclude that there are still some parts and interference in the estimation of the ecological, genotypic and phenotypic dispersions that have different values and are manifested to a greater extent, or in the analysis of increments of tree groups, or increments of one morphological location, that is, they change the cause of their display.

Introduction

The specific harsh environmental conditions of the desert-steppe zone of the Republic of Kazakhstan which are not suitable for forestry mean that afforestation should be performed not only with local flora, which in some areas of the Republic is not very diverse, but also using species and forms of trees growing in other countries of the temperate zones of the world. The study of forestry potential of the introduced most valuable species is of great importance. Such work is under the responsibility of the botanical gardens and arboretum. This applies in particular to the Arboretum located in the conditions that differ significantly from the natural habitats of the introduced species. This kind of arboretum is the JSC "Forest nursery" of the Ministry of Science and Education of the Republic of Kazakhstan which is located in the south-east of the country. It has a concentration (according to inventory 2014) of more than 1300 species, forms and varieties of trees and shrubs, representing 58 families and 153 species, introduced from different countries of Eurasia, the Mediterranean, North America, China, Korea and Japan.

The main features of the local climate should be considered relatively high air temperature from spring to late fall, especially in the summer months, the atmospheric dryness, coinciding with a period of high temperatures, dry winds domination, and therefore intensive evaporation resulting in a clear shortage of moisture.

The plantings of the arboretum are unique in the creation of a large enough biogroup collectively resembling the likeness of a forest environment; allowing to count per unit area (per hectare), important inventory indices of their growth and productivity. For the state with low forest cover it is extremely important to obtain marketable timber for the needs of construction, paper, wood chemistry and other purposes regardless of "vagaries" of the international market.

The arboretum's introducants are reached the age of about 60 years, it is enough to demonstrate its ability to adapt to harsh environments, and yet it is not enough to complete the process of acclimatization.

It is necessary to examine the results of acclimatization of the introduced tree species in order to better understand the process and learn how to manage them during this period of transition.

The aim of the study was to evaluate the ecological and genetic variability of the introduced coniferous in the conditions of a foothill deserted-steppe zone and to determine requirements in the variability of genetic and environmental factors, as well as the relative stability of expression of quantitative traits in ontogenesis, which characterizes the features of adaptation of a species to new conditions.

**Material and methods**

The growth dynamics of Pitch pine (*Pinusrigida* Mill) Crimea pine (*P. nigra*) Scots pine (*P. sylvestris* L.), Blue spruce (*Piceaunipens* Engel.) and Fir spruce (*Piceaexelsa* Link.) was studied in the JSC “Forest nursery” Arboretum, Astana, Kazakhstan. The annual increments in height since 2014 and in earlier years have been measured down on the stem in between consecutive whorls with lateral branches or clearly distinguishable traces of them. Seven from nine trees of each tree species were measured. The phenotypic variability of quantitative traits genetically diverse populations is a complex result of the interaction of genotype and environment (Turbin, 1961; Leper&Nikoro, 1966; Dyakov & Dragavtsev, 1975; Dyakov et al., 1976), competing plants relationship (Dyakov & Dragavtsev, 1975; Dyakov et al., 1976), the degree of stability of individual physiological processes and their relative autonomy from changes in external conditions (Shmalgauzen, 1942; Shmalgauzen, 1945).

The most important feature of genetic variation of wood species is the ability of its adaptation in ontogenesis for changing environmental conditions. This property is due to genetic formulas overriding attributes that ensure survival, especially when changing the combination of factors that are limited. Overriding the genetic formula of quantitative traits of plants in ontogenesis was shown by Dragavtsev and Utemisheva (1975), Dragavtsev, Tsilke and others (Dragavtsev et al., 1984). If the wood species have a variety of systems that determine drought resistance, cold resistance, heat resistance, immunity, the adaptation to the new conditions will be successful due to their ability of genotypic dynamics in ontogenesis, unless the level override genetic formulas will not be exceeded of the change the limiting factors of the new environment.

Evaluation of phenotypic variability of annual increment in height (hereinafter - increments) for the small number of plants in biogroups (Table 1) should be performed using an analysis of variance, which allows to establish the significance of differences in growth rates between individual trees and makes it possible to determine the heritability coefficient in a broad sense (Lush, 1949). It is also possible to compare varieties of increments of one morphological address (comparison increments, measurements) for the first and second period of increment, cm.

Phenotypic variance of increments in both constructions of dispersion systems is the same. If the assessment of the environmental variance increments of one morphological address will be different from random there is a need to assess a large number of parts of the phenotypic variability of the test number of years, in general, and for periods of growth. Random variance increments are usually taken as an ecological, but including proportion of variance determined by the interaction genotype-environment competitive genotypic and environmental interference.

Separation of the phenotypic variance of quantitative trait / $\sigma^2_{ph}$ / on genotypic / $\sigma^2_g$ / and the environmental / $\sigma^2_e$ / part is not enough if there is evidence of the dispersion increments of one morphological address and the use of normalized autocorrelation function and the spectral density of a stationary random function to assess the level of plant competition with an unknown degree of relationship (Saharov & Markovin, 1988; Saharov, 1988).

Therefore, the distinction of phenotypic variance has a different scheme (Dragavtsev, 1983): $\sigma^2_{ph} = \sigma^2_g + \sigma^2_{gcom} + \sigma^2_e \sigma^2_{ecom}$ (1).

On the right side of the equation is the allocated share of genotype variance due to competitive ($\sigma^2_{gcom}$) and dispersion, depending on the competition, determined by the environmental conditions ($\sigma^2_{ecom}$).

To the right-hand side of the equation it is necessary to include the variance determined by the interaction of the genotype environment, genotypic dispersion of adaptability, dispersion, estimating the accumulation of individual developmental differences, such as differences in the length of the growing season, which in new environmental conditions varies in each species, in accordance with its inherent features and is controlled by the limiting factors of the environment. But the evaluation of all components of phenotypic variance of quantititative traits in woody species always causes difficulties for a number of objective reasons: at first, the traditional methods of studying genotypic population structure based on known models of genetics of quantitative traits, have limited the conditions determining the validity of the method for obtaining estimates to quantify genetic parameters reflecting the structure of the population (Saharov, 1988). Failure to meet compliance requirements of limiting conditions of the used statistical method to the character of the target population will make cause a distortion in the evaluation results (Medvedev et al., 1998); secondly, distortion of the phenotypic variance components is possible because of the ambiguity and the integrity of the phenomena, when a number of effects practically do not divide and together affect the final expression trait in plants. This circumstance fully applies to introducents when it is impossible to estimate ecological consequences of the place of origin of the introduced offspring, influence of generality of the new environment on the offspring of different origin and contrast among parents on the environment of the new dwelling descendants, ontogenetic accumulation of differences due to the fluctuation of limiting factors and changing conditions of competition in the ontogeny of introducents of human origin; thirdly, there is no information about the ecological and genetic structure of populations of the original homeland of exotic species (USA, Canada, Europe, the North of the Republic of Kazakhstan); fourth, the unknown nature of the genotypic dynamics of quantitative traits at home conifer introductions.

**Results and Discussion**

The analysis of the components of phenotypic variance of increments for each tree group under Lash’s scheme with the calculation of the coefficients of heritability in a broad sense showed that the phenotypic variance of increments is almost equal to random, which in a univariate variance analysis approximately assesses the environmental share in total dispersion of variance. Therefore, heritability coefficients in a broad sense estimating variability share which are defined with hereditary factors, are equal to zero except for the first period of growth in pitch pine and the last 15 years of life of fir spruce (Table 2). Due to the significant change in the average growth in height on the periods of growth of scotch pine, a few smaller differences in average growth for the period of pitch pine and blue spruce and stable average growth for the period of Crimea pine and fir spruce was necessary to assess the significance of differences increments by the periods of growth and interaction-period gains.
The results of the analysis indicate a different character of increments variability increase in the periods of introducients growth and the interaction of the factors: Pitch pine and Scotch pine have significant differences in increments by the periods of growth at the level of 01 significance, there are no significant differences in tree increments, the interaction of factors period – increments of Pitch pine is insignificantly and it is essential in Scotch pine with a probability of 95%. There are no differences in increments in the Crimea pine neither in the factors A, B nor on their interaction. There are significant differences in both factors with a probability of 99% and 95% in Blue spruce, there is no interaction between factors, and on the contrary, there are no differences of increments by factors, but their interaction is significantly at level 01. Thus, it becomes evident the need to analyse the variability of increments by groups of trees for the entire period studied and its parts, and the presence or absence of the interaction of factors determines the need for a more detailed analysis of the ratio of the variance increments of one morphological address, by tree-groups and periods of growth (Table 3).

Increment of phenotypic, environmental and genotypic variances of increments, as well as the ratio of the increment of genotypic varies to phenotypic changes by type of introducents and by periods of growth. Dispersions signs and their increments indicate in what period this or that dispersion is more. In Pitch pine, all dispersions are more in the first period of growth and the ratio of the increment of genotypic variance to phenotypic increments are equal to a group of trees and a morphological address. In Scots pine, there are inverse values of the relationship of increment values of the phenotypic variance or increments of one morphological phenotypic address and the group of trees. There are the same values \( \sigma^2 e \) of increments of one morphological address by the periods of growth and reverse of the ratio in the Crimea pine.

In Blue spruce \( \sigma^2 \text{ph}, \sigma^2 g \) increments of one morphological address is more in the second period and \( \sigma^2 g \) in the group of spruce trees barbed all dispersion increments are more in the second period. Therefore, the increment ratio \( \Delta \sigma^2 g \Delta \sigma^2 \text{ph} \) of the group of trees is opposite to a similar ratio for the increments of the morphological address. Fir spruce shows a special relationship not only for increment dispersions, all dispersions are more in the second period, but for the excess of environmental variance increments of one morphological address of phenotypic variance and a similar excess of increments of tree groups in the first period for a second \( \sigma^2 \text{ph} \) is more than \( \sigma^2 e \). Genotypic variance of increments of one morphological address and increments the group of trees of Fir spruce is more in the second period of growth.

Change of the value and the "sign" of increment relations of genotypic proportion of increments variance of one morphological address and a group of trees to the increment of phenotypic leads to the conclusion that there are possible differences in the nature of the override genetic formulas of exotic species in ontogeny. Having obtained zero estimates of the level of genotypically determined variability in increment by tree groups and differing variance increments, it can be concluded that all species in new environmental conditions, due to a small number of measured trees or a small number of biogroups after a multistage artificial selection, do not have a genotypic variety of the trait under study. The entire phenotypic variance of increments is determined by changes in environmental conditions or genotypically caused differences are "smeared" by other shares of phenotypic variability, that is, competitive genotypic, competitive environmental, genotype-environment interaction, accumulated ontogenetic disturbances. In this regard, a change in the influence of the growth period factor on growth, the factor of the group of trees, was established. There is an interaction of these factors and a change in the average growth over the periods of spruce, pine and yellow, and especially in Scots pine. During the first period, pines have a higher average growth than in the second. Average growth of blue spruce in the first years is less and in future it will be more. Crimea pine and fir spruce differ with stability of average increment in life periods (Table 1). So, there is reason to assume the existence of the reasons determining the differences in the observed average increments and dispersions by periods of growth.

After the analysis of variance, increments of one morphological address, in which the random variance is indeed environmental and ecological competitive part of the phenotypic variance, it was possible to highlight the proportion of genotypic variance, but again not for all types and periods (Table 4).

Source: Author
Ecological and phenotypic variance of increments of Pitch pine as by periods and for all the years of study remains at the same level.

In the first period, the phenotypic variance of Scotch pine increments is almost equal to the environmental, a small proportion of genotypic variance appeared in the second period of growth, and in general during the 28 years of recording, about a third of the phenotypic variance accounted for genotypic share. Crimea pine showed little genotype variability due to increments only in the first period of life. Blue spruce has several large hereditary variables of growth for 26 years and in the first period of life. Fir spruce in all cases has an exceeding environmental variance of increment over the phenotype that determined the negative marks of zero heritability coefficient values in the broadest sense and indicates the presence of noise, overstating the environmental variance.

The analysis of variance increments of one morphological address gives only a glimpse of the ability of introducted species to adapt.

**Conclusion**

Thus, the value of the mean squares varies considerably by the increments of morphological address and increments of tree groups, introducten species and the periods of their lives, which leads to the conclusion about the presence in the environmental, genotypic and phenotypic variances of some interference which has a different value and are developed in a greater degree or in the analysis of groups of trees, or increments of one morphological address, i.e., change in the cause of its symptoms. Therefore, the scheme of separation of dispersions of increments on the genotypic and environment is insufficient and it is necessary to use other methods of determining the components of phenotypic variation of annual increments in the height of the introduced species.

ANALYSIS OF REASONS FOR UNPLANNED STOPPAGES OF MACHINES IN THE EXAMPLE OF THE LONGWALL SHEARER

Kinga Stecula,¹ Jarosław Brodny,² Dorota Palka³

Abstract: Production enterprises mainly focus on activities concerning tangible resources. In recent years, however, this focus has shifted increasingly towards intangible resources such as knowledge as a key resource. Knowledge plays a crucial role in building an enterprise’s competitive advantage, including that of mining entities involved in coal extraction. This article presents results of research into the causes of unplanned stoppages in the operation of longwall shearsers. An examination of the parameters of the longwall shearer operation reveals an oversight in recording the causes of many unplanned machinery stoppages. Using informatics tools, the authors determine the reasons for most stoppages. The knowledge gained in this research has practical significance in providing a basis for implementing actions to limit the number of stoppages and improve the effectiveness of the machinery.

UDC Classification: 622.2; DOI: http://dx.doi.org/10.12955/cbup.v5.1098

Keywords: unplanned stoppages, tacit knowledge, effectiveness, mining machines.

Introduction

Production companies mainly base their activities on tangible resources. Fixed assets, finances, and stores are essential elements for the industry to function and operate. In recent years, however, the role of intangible resources has increased. These resources are no longer perceived as additional elements of business and have become a key factor in achieving a competitive advantage for many organizations. The intangible resources consist of competencies, knowledge, relations, attitudes, opportunities, brands, and functional systems (Stankiewicz, 2005). In addition, these resources include internal knowledge about technology, employees’ skills and procedures of behavior (Wernerfelt, 1984).

The effective use of intangible resources also concerns the mining industry. The optimization of production costs (Loska, 2013; Loska 2017) means that intangible resources can determine the competitive advantage in this industry. In recent years, the increasing trend among varying industrial companies regarding the importance of these resources has reached the mining industry. Mining companies have started to increasingly appreciate the competencies of their employees, whose knowledge, skills, involvement, and identification with the company are among its greatest elements and thus, its influential capital (Każmierczak, 2014).

The research results presented in this paper are a positive example of the application of knowledge in the mining industry. The authors, using informatics tools, have identified the causes of breaks during the operation of mining machinery. The paper focuses on determining the causes of the breaks in the operation of a longwall shearer. However, it should be noted that the methodology developed from this research will help determine the reasons for breaks in the operation of most mining machinery. This identification refers to unplanned breaks that have been registered by the industrial automation system. Past procedures allowed for the identification of only about 25% of the causes for such breaks. The developed and applied new system identified on average about 70% of the causes. Therefore, the results have a significant practical meaning. The knowledge gained regarding the reasons for the unplanned stoppages allows for specific actions to limit the number of breaks. This remedial action then increases the effectiveness of these machines and thus, the entire enterprise. The longwall shearer was chosen for this study because it is directly involved in excavating coal from rock mass. The breaks in its operation almost always result in further stoppages affecting the transporting machines and are associated with considerable economic losses.

The System for Registration of the Reasons for the Breaks in the Machine Operation

Studies into the effectiveness of using mining machines indicate that the availability and performance of the machines are unsatisfactory (Nakajima, 1988; Brodny et al., 2016; Stecua & Brodny, 2016).

¹ Faculty of Organization and Management, Silesian University of Technology, kinga.stecula@polsl.pl
² Faculty of Organization and Management, Silesian University of Technology, jaroslaw.brodny@polsl.pl
³ Faculty of Organization and Management, Silesian University of Technology, dorota.palka@polsl.pl
This scenario is especially the case with availability. The registration of the operating times of these machines shows that there are many unplanned breaks. At the same time, the system that registers the causes of these breaks contains only a small fraction. The remainder of these breaks are not registered, and their causes are unknown. It is assumed that these breaks are caused by the difficult conditions of the underground exploitation. However, without knowing the direct causes of the downtimes, it is impossible to optimize the machines’ operation time. The low value of the availability indicator results in poor exploitation of the full potential of the mining machine.

The aim of this study is to improve the effectiveness of using mining machines by developing a system of semi-automatic registration of the causes of the breaks in the mining machinery’s operation.

**Data and Methodology**

The study involved expert interviews with mine dispatchers who had knowledge of the reasons for most unplanned downtimes but were not necessarily motivated to use the required system to register causes because of the potential consequences of using such a system. The new system for registering causes was developed to ensure an effortless, convenient and, most importantly, anonymous approach to registering the reasons. It was designed so that the information reported by dispatchers regarding a specific event was encoded and accessible only to the operator with only the Director of the mine having access to this information by written request. With the acceptance of these conditions, an IT tool was developed in the form of a system for identifying the causes of stoppages in operating the mining machinery. The system was designed to disclose the tacit knowledge of the dispatchers and for monitoring the increased use of the machinery as well as the general situation at the mine. Converting tacit knowledge into explicit knowledge was a key objective of the developed system.

The system of the registration of the causes of the breaks in the machine operation was integrated with the dispatcher’s system of the mine to allow for the use of existing infrastructure and to avoid generating additional costs. The system was developed so that the registration module intuitively registers the cause of equipment failure from reasons automatically proposed by the system, based on the most frequent causes of stoppages for that particular machine. In the case of a new event, the dispatcher manually adds a brief description of the event, which is then entered into the system after further analysis. This means that the system is open and its database is constantly updated. Figure 1 shows the online form for registering failure of equipment.

**Figure 1: The view of the online form for registering machine failure**

![Online form for registering machine failure](image)

**The Analysis of the Reasons for the Breaks in the Longwall Shearer’s Operation**

Registering the causes for stoppages in the longwall shearer operation took place over one week (15 operational shifts). The duration of specific breaks was determined from data of the industrial automation system. All breaks lasting more than 30 seconds were assessed. It was assumed that
downtimes less than 30 seconds would be difficult to identify, and thus, results for this group would have low credibility.

The developed system was also used to determine the types of causes for breaks in the longwall shearer operation. In this case, breaks were classified into five groups: mechanical, electrical, hydraulic, mining, and organizational causes. Interviews with experts and dispatchers provided the means of classifying the causes by the organizational group.

**Results and Discussion**

Figure 2 shows the time structure of the breaks recorded by the automation system during the operation of the longwall shearer for 15 work shifts and the number of breaks with identified causes compared to the total. Table 1 summarizes total durations of registered breaks and those with identified reasons. Additionally, the percentage of durations of breaks with an identified cause relative to the total durations is shown for each interval.

Figure 2: The total registered breaks in the longwall shearer operation compared with the number having identified causes for each duration

![Bar chart showing total registered breaks and identified causes for each duration](source: Author)

Figure 3 shows the results for before and after implementing the identification system where stoppage reasons were found for 190 of the 371 registered breaks (data from Figure 2) with a quantitative efficiency of the identification approximately 51.20%. The ‘after’ result was understated by a low level of determination for the short breaks. For the intervals lasting from 0.5–1.0 min, the efficiency was 30.6%. This low result was due to the shortness of the duration, which meant the dispatcher was not always able to register the event in the system. However, the reporting of breaks was higher in events with longer duration.

The study identified stoppage reasons for 83.94% of the total breaks registered for the longwall shearer during the study period (Table 1). This high percentage is attributed to the heightened efficiency, especially in determining the causes of the lengthy breaks. In the case of breaks lasting more than 10 minutes, this efficiency was above 93.65%, which is noteworthy.

Figure 3 compares the results of before and after implementing the new system to demonstrate the efficiency of the developed tool. The registration time was 15 operational shifts with different periods of the longwall shearer operation compared. Nevertheless, a significant change in the number of the identified causes of the breaks was observed. Thus, the application of the developed system to identify causes of breaks in the longwall shearer operation appears to improve the efficiency of the identification considerably.

Figure 3: The percentage of identified reasons for the breaks before and after the implementation of the identification system for 15 operational shifts

Source: Author

Figure 4: The durations of breaks in the longwall shearer operation for each type of reason

Source: Author
Figure 4 shows five groups of reasons for breaks in the longwall shearer operation according to the total durations of breaks (in minutes) and their cumulative percentage. The results reveal that the main causes of the breaks are mechanical and mining (Figure 4). Organizational, electrical, and hydraulic reasons play a smaller role. Information about the types of causes for the breaks has practical implications as it can be used to optimize the operation of individual maintenance services.

Conclusion

The issue presented in the article has practical significance. Knowledge about the reasons for recorded breaks in machinery operation can lead to actions to increase the effectiveness of operations. The results of the study indicate the low efficiency of the previous way for registering causes for operational failures and downtimes. The implementation of a new system, based on an objective registration of the duration of the breaks, and information about the causes provide a way to identify most reasons. The tacit knowledge of the dispatchers gained through expert interviews combined with the developed IT tool led to a solution to a significant problem related to the machine exploitation in the mining company. The information gained from this study is exceedingly valuable to the management of a mine as well as the producers of the machines, as it identifies the components of the machines that generate the greatest problems for the users. The results revealed that many small breaks occur in the operation of the longwall shearer. Further research is recommended to help identify the specific causes of these breaks. Although the breaks have little effect on the longwall shearer availability, they potentially create serious technical issues. Frequently, such short breaks require unproductive engine restarts of the longwall shearer. The data presented in this article are part of a larger set that includes the monitoring of all machinery in the mechanized longwall system. It is recommended that the results of this research be used as a basis for reducing downtimes, and subsequently, improving the effectiveness of mine machinery including the longwall shearer.

INFORMATICS PLATFORM AS A TOOL SUPPORTING RESEARCH REGARDING THE EFFECTIVENESS OF THE MINING MACHINES’ WORK

Kinga Stecūla,¹ Jarosław Brodny,² Magdalena Tutak³

Abstract: One of the factors which highly affects the economic effectiveness of production enterprises is the level of the use of technical means. This factor is also significant for mining companies extracting coal. The optimal use of mining machines can impact the future of these companies. The paper presents the authors’ solution which is an informatics platform supporting an analysis of the mining machines’ effectiveness. It uses a data warehouse to archive, synchronize and analytically process the data obtained from the studied machines. The article shows an example of applying an informatics platform to investigate the effectiveness of the longwall shearer’s work. The analysis was based on the data obtained from the industrial automation system. Afterwards, the shearer’s availability and performance, and quality of the product, which is coal, were determined. The developed tool should find wide practical application in production companies across different kinds of industries.

UDC Classification: 622.2; DOI: http://dx.doi.org/10.12955/cbup.v5.1099

Keywords: informatics platform, OEE, mining machines.

Introduction

The International market of energy resources is highly competitive. It also has a significant influence on the increased competitiveness in the Polish market. For this reason, enterprises extracting natural resources are forced to take activities which will make it possible to continue to exist in the market. One of the key areas that impact about the results of mining companies is the use of the technical means. Opinions of experts, as well as the results from audits, indicate that underutilization of the mining equipment is one of the biggest problems of mining enterprises (Przybyła, 2009). Currently used mining machines and devices are characterized by the high level of reliability and the technical parameters and at the same time are very cost-intensive objects. Therefore, it is justified for mining companies seek to use the equipment in the best manner that they can. In particular, it refers to the increase in their effectiveness. Moreover, this is the subject of this paper. The goal of the research, the results of which are discussed in this article, was to develop an informatics tool which would help to increase the effectiveness of the use of the mining machines. This tool is the informatics platform supporting the process of implementation and application of the OEE model to evaluate the level of the use of mining machines. This solution uses a data warehouse for archiving, synchronizing and analytically processing data which are obtained from the studied machines. It was assumed that the main task of this platform would be to integrate the data collection system and the supporting system using the OEE model. In the first stage of application, this tool will enable the initial evaluation of the effectiveness of the studied machines. In the next stage, it will make it possible to monitor the efficiency of the use of the machines and, thanks to this, assess the implemented changes and modifications. It appears that a significant problem in mining is also the identification of the causes of the low effectiveness of the machines and devices. In the paper, an example of the application of the informatics platform to study the efficiency of the longwall shearer’s work has been presented. The basis of the analysis was the data obtained from the industrial automation system. Thanks to this, the availability and the performance of the longwall shearer and the quality of the product, which in the case of mines is coal, has been determined. The developed tool is universal and should find a broad range of practical applications in the production companies of other industries too.

Characteristics of the Studied Object

The basic exploitation system in Polish coal mine is the longwall system. In this kind of system, the coal or other useful mineral is cut out in the zone of the longwall’s face. The length of the longwall’s face usually ranges from 60 to 300 meters. The height of the longwall can be from 0.6 to 9 meters (Korski & Bednarz, 2012). Such long exploitation walls make it possible to mechanize and automate the process of coal exploitation, especially in coal cutting and transporting. In this area, the machines

¹ Faculty of Organization and Management, Silesian University of Technology, kinga.stecula@polsl.pl
² Faculty of Organization and Management, Silesian University of Technology, jaroslaw.brodny@polsl.pl
³ Faculty of Mining and Geology, Silesian University of Technology, magdalena.tutak@polsl.pl
of the mechanized longwall system have significant meaning. They are dedicated to directly cut out coal and transport the coal from the zone of the longwall face. This system includes the longwall shearer, the armored face conveyor, the beam stage loader and the crusher. Also, there is also the longwall roof support designed to protect the work place. From a reliability point of view, these machines form a serial system. It means that they play a significant role in the continuity of the exploitation process and failure of one of these machines makes the entire system stop working. The most complicated and expensive machine of this system is the longwall shearer. It is directly responsible for coal cutting. Figure 1 shows an example of the longwall shearer.

Figure 1: The view of the longwall shearer

Source: Authors

Because of the significant meaning of the longwall shearer for the exploitation process, the authors decided to conduct an analysis of this machine’s effectiveness, using the developed informatics platform.

**Determination of the Efficiency of the Longwall Shearer**

To carry out the research on the efficiency of the mining machinery, it was necessary to choose the appropriate method and tools which would make it possible to evaluate the conducted process objectively. The authors decided to use the Total Productive Maintenance (TPM) strategy in their study. Moreover, to directly assess the utilization of the studied machines they applied the Overall Equipment Effectiveness model (OEE). This model is a quantitative tool for the TPM strategy. Its measure is the OEE indicator which is determined by the three partial indicators that include availability and performance of the machine and quality of the product. By analyzing these three areas, all relevant factors, which impact the effectiveness of the machine or the set of machines, are taken into account (Nakajima, 1988, Matejczyk, 2013).

However, the application of the OEE indicator in the original version to determine the effectiveness of the mining machinery was practically impossible due to the specificity of mining. For this reason, the partial indicators of the OEE indicator have been redefined and adjusted to the specific characteristics of the mining industry (Brodny et al., 2016). The availability values were determined for each of the studied machines (in this case, the longwall shearer), while performance and product quality indicators were calculated for the entire set of machines. The most critical data, which became the basis of availability determination, was obtained from the industrial automation system. This system works continuously and independently from the operator registers machine’s parameters and thanks to this, it guarantees high reliability of the data (Stecula & Brodny, 2016). This data is completely independent of the subjective factors and mistakes resulting from human factor. The data that was used to determine the effectiveness of the shearer was the work parameters, such as the current consumed by the particular shearer’s engines, the shearer’s position in the longwall about the right section of the longwall roof support, and the feed speed. Figure 2 shows the temporal chosen parameters waveforms of the longwall shearer for one work shift.
Figure 2: Recorded parameters of the longwall shearer’s work for one work shift.

Based on the obtained data, it was possible to determine the value of the availability indicator which is defined as the ratio of the real work time to the normative work time of the shearer (in this case, 360 minutes). By the recorded waveform, the level of the shearer’s availability was determined for the studied 20 work shifts. The performance indicator was determined thanks to the planned and the real extraction. The quality indicator was calculated based on the information from the processing plant. This information related the assortment and the gangue content in the valuable mineral. Due to the method of measurement, the qualitative data was averaged for the entire studied period. After determining the values of the partial indicators, it was possible to calculate the value of the shearer’s OEE indicator for 20 work shifts. Figure 3 shows the availability and performance values and the OEE values of the longwall shearer for 20 work shifts.

The results indicate that the use of the longwall shearer should be considered as low during the studied period. Therefore, it is necessary to develop a proper methodology to identify the causes of this state and plan the precise activities to improve the effectiveness.

Figure 3: The values of the availability, performance and OEE indicator of the longwall shearer

Source: Authors
Application of the Informatics Platform

The huge amount of data obtained from the industrial automation system needed the application of the appropriate informatics tool that would allow the archiving and analyzing the data. For this purpose, an informatics platform has been built to support the analysis of the effectiveness of the mining machines. This solution uses a data warehouse for archiving, synchronizing and analytically processing the data which comes from various machines. The data warehouse is thematically oriented, chronological, coherent and unchanging in its data collection. Its task is to support decision-making processes. It will help solve the decision problem by analyzing its data (Inmon, 1992). In the research, the data in the thematic bases concerns the work parameters of each of the tested machines. The database is a set of data and objects which are related to a given topic or task (Kopertowska-Tomczak, 2009). Also, the data warehouse integrates the data and process it analytically. As a consequence, it is possible to determine the specific values.

The use of the longwall shearer's parameters to determine its availability and overall effectiveness is only the first step in the application of the developed platform. In the next stage, it is necessary to conduct an analysis of losses in the production process. In particular, it concerns the identification of the structure and the causes of all types of breaks in the longwall shearer’s work. These losses were divided into several categories. The first category includes the losses of the availability of the very machine or the entire set of machines. Such losses are most often caused by random events that generate failures and downtimes. The second layer is about performance losses. They are related to a machine’s work. The third layer includes the losses in the quality of the product, which, in this case, is coal. For each of the three layers, the value of the proper indicator is calculated. Then, the final Overall Equipment Effectiveness indicator can be determined.

In the next stage of the study, conclusions are drawn by the level of determined effectiveness indicators. To achieve it, the quantitative qualification of the negative events has to be done first. The quantitative analysis is understood as the determination of the duration of a given event and the frequency of its occurrence. Also, the losses should be analyzed in a qualitative context which means that the specific cause of the given failure or downtime has to be found. The described informatics platform using a data warehouse for archiving and analyzing the work parameters has supported the research on the effectiveness of the longwall shearer. What is more, it will be used to study the entire set of the mining machinery further. It will enable quick and profound analysis, the results of which will be used in a further study.

Conclusion

In the current economic reality, every company is forced to optimize their production costs. This also applies to mining companies. One of the areas, in which there are significant reserves, is the use of the mining machines and devices. The informatics tool in the form of the platform, which is presented in this article, is aimed at facilitating the process of assessing and improving the effectiveness of the mining machinery. In the presented example, the study of only one machine, the longwall shearer, has been described. However, in practice, thanks to the developed platform, it will be possible to analyze the work of many machines that are involved in the technological process of coal mining. It should be highlighted that the essential meaning for the credibility and the quality of the analysis has input data. Relying on the industrial automation systems while obtaining the data guarantees the high quality and the independence from human factors. The results clearly showed that the level of the use of the longwall shearer is unsatisfactory. The availability, as well as the total effectiveness, are low despite the fact that there were no major failures during the period that could reduce the value of these indicators. The results confirm the validity of the use of IT tools and the industrial automation systems for analyzing the utilization of the mining machines. The results presented in the article are only a small part of the results of the whole longwall system research. However, even this little portion of research shows the large scale of the problem regarding the effectiveness of the technical potential which mining companies face.

**RESEARCH OF ACETALDEHYDE QUANTITIES IN COMMERCIAL AND LABORATORY PRODUCED FERMENTED PRODUCTS**

Suzana Stojanovska,1 Aleksandar Krstanovski,2 Julijana Tomovska3

**Abstract:** The main purpose of this research study is the determination of volatile flavoring substance acetaldehyde in some fermented, industrially manufactured dairy products, offered on the Bitola’s market and the comparison with acetaldehyde quantities measured in fermented dairy products produced in laboratory conditions. Six samples of fermented dairy products (yoghurt and sour milk) were purchased from the local supermarkets and four samples were “homemade” manufactured in laboratory conditions. Results of the acetaldehyde quantities in different fermented dairy products were obtained through the observation of acetaldehyde values successively in a two week period and, in order to confirm the mutual correlation of variables, i.e. of the absorbance and concentration, calibration curve was created. The highest acetaldehyde quantities in all fermented dairy samples were measured on the first day of this research study; while after the fifteenth day of examination acetaldehyde concentration in each sample was equal to zero. Undoubtedly, certain conditions like pH, temperature, strain ratio, etc. need to be met.

**UDC classification:** 637; **DOI:** http://dx.doi.org/10.12955/cbup.v5.1100

**Keywords:** acetaldehyde, aroma, fermentation, sour milk, yoghurt.

**Introduction**

Fermented dairy products are produced by adding cultures with thermophilic and mesophilic lactic acid bacteria (LAB) into milk. Generally, these cultures consist of Lactobacillus delbrueckii subsp. bulgaricus and Streptococcus thermophilus strains, which ferment the lactose into the lactic acid (Gelinas and Lachance, 1995; Shah, 1997; Gandhi 2006; Sfikianakis and Tzia, 2014) and produce volatile aromatic compounds (acetaldehyde, diacetyl, acetic acid and esters). They are produced in minimal quantities during biochemical ripening processes and are actually aroma and flavor carriers in fermented dairy products that deliver rich, rounded and characteristic taste of the fermented dairy products (Zonji, 1971; Marshall, 1987; Berković, 1998).

Acetaldehyde is an active carbonyl compound, which can react with amino acids in order to produce aromatic combinations. Hamdan et al. (1971) reported that acetaldehyde importance for yoghurt aroma was for the first time suggested by Pette and Lolkema in 1950, and later in 1968 by Keenan and Bills, who in their review stated that “high concentrations of acetaldehyde are necessary to produce a desirable flavor in yoghurt.” In literature, a broad range of optimal acetaldehyde level exists, suggesting the characteristic aroma of the plain yoghurt. There are statements where acetaldehyde levels from 10 to 20 mg kg$^{-1}$ are necessary for optimal taste and aroma, while there are reports implying acetaldehyde values from 21 to 41 mg kg$^{-1}$, are required for typical yoghurt flavor (Senel et al. 2009).

Yoghurt flavor formation occurs in three main stages; glycolysis, lipolysis and proteolysis, and the first phase of glycolysis is in fact the transformation phase in which the key aromatic yoghurt compounds like acetaldehyde, diacetyl, acetone and ethanol, are produced (Van Hylckama Vlieg et al. 2007; Baran, 2012). On the other hand, Ledenbach and Marshall (2009) examined factors influencing the relationship of aromatic compounds in fermented dairy products and concluded that the culture disbalance, inappropriate temperature or ripening time, culture infection with bacteriophages, the presence of inhibitors and microbe contamination could lead to products with undesired characteristics. This was also confirmed by Rašic and Kurmann (1978) and Baranowska et al. (2006) who suggested that yoghurt need to be fermented from a pH of 3.8 – 4.4, and optimal yoghurt taste could be obtained at pH 4.0 – 4.4.

Considering above statements the main purpose of this research study is the determination of the volatile flavoring substance acetaldehyde in some fermented, industrially manufactured dairy products, offered on the Bitola’s market and compared with the acetaldehyde quantities measured in fermented dairy products produced in laboratory conditions.

Materials and methods

Research material

Six samples of fermented dairy products (yoghurt and sour milk) were purchased from the local supermarkets and four samples were “homemade” manufactured in laboratory conditions. As a starter culture for laboratory produced samples *Lactobacillus delbrueckii* subsp. *bulgaricus* and *Streptococcus thermophilus* strains were used, as well as certain quantities of already purchased fermented products. Laboratory samples were produced from 1 liter of fresh milk, first pasteurized at 89 – 100° C for 5 minutes, then with stirring cooled to 37 – 40° C, and “inoculated” with 80 – 100 ml of previously purchased yoghurt or sour milk. To initiate the fermentation, milk samples were left at room temperature for 4 to 6 hours. When the fermentation process was finished, samples were stored in a refrigerator at 4° C.

Chemicals and reagents

All chemicals used for this examination had p.a. grade. The standard solution of acetaldehyde – C₂H₄O was prepared through dilution of the ampule quantity in dH₂O, in 1:100000 ratio. Different concentrations of working solutions, later used for the calibration curve creation, were prepared with additional dilution of the standard solution. Reagents were prepared appropriately to the instructions given in the methods.

Method and sample preparation

The determination of the acetaldehyde quantity in fermented dairy products in this paper was based on the mechanism described by Sawicki et al. (1961). This procedure, previously applied to formaldehyde quantification, includes the following steps: reaction of the aldehyde with 3-methyl-2-benzothiazolone hydrazone (A), to form the azine (B), oxidation of A to a reactive cation (C) and formation of the blue cation (D), (Figure 1).

This method underwent certain modifications by Pack et al. (1964), who have used the reaction with 3-methyl-2-benzothiazolone hydrazone to determine diacetyl, while their modification one year later was adapted for routine analysis of acetaldehyde in dairy cultures by Lindsay and Day (1965).

**Figure 1:** Aldehyde reaction with 3-methyl-2-benzothiazolone hydrazine monohydrate

Samples were prepared according to the method reported by Carić et al. (2000). 5 to 15 g of research material were measured in a reagent glass (25 x 250 mm). HCl was added into the glass in order to prevent foam formation. The next step included the addition of the following mixture to the glass content: 2.5 ml H₂O + 2.5 ml water solution of 3-methyl-2-benzothiazolone hydrazone hydrochloride acid + 0.5 ml dimethyl sulfoxide. The glass was closed with a rubber seal and placed in a water bath at 65° C for 60 minutes, with N₂ insufflation at the same time (100-125 ml per minute). After 60 minutes, insufflation was interrupted and the glass pipe was rinsed with small quantities of dH₂O, inside the glass. The content was left at room temperature for 25 minutes and then 12.5 ml solution of iron (III) chloride was added to it, thoroughly mixed and left for another 25 minutes at room temperature. In order to stop oxidation, 20 ml of acetone was added into the reagent glass, and the content was quantitatively transferred into the volumetric flask of 50 ml and filled with acetone to the mark.
flask content was centrifuged at room temperature, 3 minutes and 9000 RPM, and the supernatant was filtered (Figure 2). At the end, the filtrate was analyzed with a spectrophotometer and the color change was read at 666 nm. The result was compared with the absorbance value obtained for a blank sample (for blank sample appropriate quantity of dH₂O was used).

Figure 2: Colour changes after oxidation interruption with acetone

**Results and discussion**

Results of acetaldehyde quantities in different fermented dairy products were obtained by observation of acetaldehyde values, successively in a two week period (Table 1), and in order to confirm the mutual correlation of variables, i.e. of the absorbance and concentration, calibration curve was created (Figure 3), indicating high positive interaction, visible from the value of coefficient square, $R^2 = 0.9578$ (the closest value to 1, the stronger the correlation among the variables). Dependence of acetaldehyde concentrations on examination period can be observed from Figure 4.

A general suggestion is that the aroma and flavor formation occur in the first 24 hours of the production process and this is supported by values collected in this research. The highest acetaldehyde quantities in all fermented dairy samples were measured on the first day of this research, after the fifteenth day of examination acetaldehyde concentration in each sample was equal to zero.

Many authors have also confirmed this suggestion, demonstrating that acetaldehyde formation during yoghurt production develops in the first 6 hours and this is probably due to the fast metabolic activity of the starter. According to Imhof et al. (1994); Samet-Bali et al. (2012) and Chandan (2014), formation of acetaldehyde in yoghurt takes place predominantly in the first 1-2 hours of incubation, and its level decreases in later phases. They also note that combined cultures produce higher quantities of acetaldehyde, due to proto-cooperative growth of yoghurt cultures.

It is important to make a parallel comparison among the values of samples purchased from supermarkets and acetaldehyde quantities of those produced in the laboratory. It is obvious that after the seventh day of analysis no concentrations were detected in laboratory manufactured samples. This could be connected to the storage period and fermentation conditions.

Güler et al. (2009) has reported that volatile compounds found in yoghurt to a large degree depend on the storage period. Acetaldehyde levels in yoghurt samples were the highest on the first day, but decreased during the period of cold storage. Considering the prolonged term, the most meaningful
changes in all volatile compounds appeared at the end of the storage period, probably as a result of enzymatic reactions. Many authors connected (Tamime and Robinson, 2007; Güzel-Seydim et al. 2005) the lowering of acetaldehyde values during the storage period with the decrease of pH and increased oxidation of acetaldehyde to acetate. Özer et al. (2007) suggested that reduction of acetaldehyde concentrations during storage is induced by alcohol dehydrogenase, produced by yoghurt cultures, which converts acetaldehyde into ethanol during the storage.

The only concern that arose regarding the storage period of samples purchased in supermarkets was the interval between the date of production and the date of delivery to the local shops.

Furthermore, when samples were sensory tested, aroma, flavor and taste of industrially produced samples were stronger and more expressive in comparison with laboratory manufactured samples. However, it is relevant that industrially manufactured samples are produced under precise and controlled conditions, with employment of sophisticated technology, which is not the case with the samples produced in the laboratory. Undoubtedly, certain conditions like pH, temperature, strain ratio, etc. need to be met.

Proper fermentation with yoghurt culture leads to a typical aromatic compound formation and obviously acetaldehyde and other volatile aromatic compounds cannot be discussed separately,
considering the symbiosis among LAB. Xu et al. (2015) in their research indicated that acetaldehyde quantities and other flavoring compounds are connected with the fermentation time. The longer the fermentation time, the higher concentrations of acetaldehyde and other aroma compounds in the yoghurt. According to them, sustainability of *Streptococcus thermophilus* has double positive effect in flavoring compounds production; on the one hand it stimulates *Lactobacillus bulgaricus* to produce more acetaldehyde, and on the other, it produces more diacetyl itself.

**Conclusion**

Summarized the results illustrate that with further research of symbiosis among *Lactobacillus bulgaricus*, *Streptococcus thermophilus* and other bacteria strains, as well as with the investigation of the balancing ratio among acetaldehyde and other aromatic volatile compounds, new possibilities for creating fermented dairy products with desired aroma and flavor characteristics are accessible. Furthermore, this includes experimentation with factors affecting the fermentation process itself. Controlled conditions in an industrial production environment, utilization of sophisticated technology and regulated storage conditions, both in plants and supermarkets, will provide fermented dairy products with high quality, positively accepted by the consumers.

APPLICATION OF RESPONSE SURFACE METHODOLOGY (RSM) - REDUCTION OF INDUSTRIAL WASTEWATER CHEMICAL OXYGEN DEMAND

Emmanuel Kweinor Tetteh,1 Sudesh Rathilal2

Abstract: Industrial waste oil in water from oil refineries and petrochemical processing poses a major environmental concern. Environmental pollution from these wastewaters is increasing and will continue to rise due to a growing demand for petrochemical products and energy. The composition of these industrial wastes varies from location to location as well as with manufacturing processes. In terms of water quality issues, chemical oxygen demand is considered one of the most problematic in oil refinery wastewater treatment. This study applies the response surface methodology to obtain a response model for industrial wastewater treatment. Operating parameters are optimized to enhance the treatment performance. The study, focusing on the effects of input variables for chemical oxygen demand removal, was experimentally carried out using dissolved air flotation jar tests. The experimental matrix incorporated the Box-Behnken design in the response surface methodology. In addition, the procedure evaluated the effect of the input variables and their interactions to obtain the optimum condition for the extent of efficiency. The results show that the chemical oxygen demand removal was sensitive to the effect of the input variables and their interactions. The statistical analysis established that the quadratic model was highly significant with a low probability (< 0.0001), indicating that the correlated regression scattering was unlikely random. The predicted model results corresponded well to the experimental results, with a coefficient of determination close to 1.0. The response surface of the model is presented in three-dimensional plots. These study results show that the addition of a coagulant to remove chemical oxygen demand is effective under acidic conditions when response surface methodology is applied.

UDC Classification: 502/504, 628.3; DOI: http://dx.doi.org/10.12955/cbup.v5.1101

Keywords: Chemical oxygen demand, COD, design of experiment, DOE, response surface methodology, RSM

Introduction

Recovery of oil from industrial wastes is increasingly needed due to the oil’s high economic and calorific value. For this purpose, a combination of different operational units is required to enhance treatment efficiency (Welz et al., 2007; Maksimov et al., 2015). Similarly, the available crude quality and demand for petroleum products, as well as strict environmental regulations, affect the processing, operation, and configuration of the refinery and wastewater treatment plants (Vasseghian, 2016).

Waste oil, which is the main pollutant in the oil refinery and in petrochemical wastewater, forms a layer on the receiving water body surface, interfering with oxygenation of the water body, as well as producing a photochemical pollution that increases the chemical oxygen demand (COD). A high COD, when related to industrial oil wastes, can lead to mortality of aquatic life forms and when in drinking water can cause increased activity of mutagenic and carcinogenic in humans (Guan et al. 2017). To protect the environment and maintain good water quality, industrial wastewaters are treated by purification, removing sediment, and separation of water from the oil. About 50–60% of the oil recovered can be used as base oil or lubricants (Tetteh et al., 2017). The conventional treatment of industrial wastewater involves processes such as membrane technology, chemical and electrochemical oxidation, filtration, adsorption, and biological and various floatation methods (Welz et al., 2007; Diya’uddeen et al., 2011). However, there are certain limitations of each technique in industrial oil wastewater treatment. Due to complexity and cost of these processes, optimization is emphasized to maximize throughput with the lowest cost (Yuan et al., 2008; Santo et al., 2012). Thus, an efficient treatment method is required. The dissolved air flotation (DAF) mechanism has attracted the attention of many researchers. For instance, Karhu et al. (2014) applied a DAF to treat a high concentration of oil wastewater using polydiallyldimethylammonium chloride (polyDADMAC) as a coagulant. The result indicated that at an optimum coagulant dosage of 200 mg/L, about 70% of the COD was removed.

Process optimization is a means to obtain optimum operating conditions applied to the process to maximize and produce the best response. In general, the traditional technique of optimization involves investigating one-factor-at-a-time (OFAT). This has some demerits: (a) lack of interactive effects among the independent/input variables on the response; (b) demands much time and resources to

1 Faculty of Engineering and the Built Environment, Durban University of Technology, ektetteh34@gmail.com
2 Faculty of Engineering and the Built Environment, Durban University of Technology, rathilals@dut.ac.za
complete an investigation of effects of parameters on the response; and (c) requires high number of experimental runs which increases experimental expenses in terms of chemical usage and analyses (Bezerra et al., 2008). Therefore, to simultaneously optimize a process with several operating variables and enhance performance, a multivariable technique is required.

The RSM consists of statistical and mathematical techniques that allow the experimental data to behave according to the experiment, which is designed to obtain the best response possible for the factors studied. The RSM is among the most relevant multivariable methods recently employed in optimizing different types of industrial wastewater treatment processes, such as textile, palm oil, paint, oil, and sugar refinery (Bezerra et al., 2008; Pambi & Musonge 2016). The removal of COD from oil refinery wastewater was studied by Vassegghian (2016) using DAF, coupled with RSM. Their results showed that 68% of the COD was removed, as estimated by the COD model and were consistent with the experimental results at an optimum polyaluminium chloride (PAC) dosage of 25 mg L⁻¹.

To develop the experimental response model as a linear or quadratic polynomial function for the optimization, the best type of RSM design is recommended. Examples of the best design options include a 3-level full factorial design, central composite design (CCD), the Doehlert design (DD), and the Box-Behken design (BBD; Bezerra et al., 2008; Vassegghian, 2016). After selecting the type of experimental design and the independent variables, the next stage is to define the experimental region of interest to be studied. This stage requires a set of different values of the independent variables, termed levels, at which the experiment must be carried out. The BBD, which is a modified form of the two-level factorial design, with three level arrangements (3ᵏ), allows the estimation of the first and second order coefficient of the empirical response model. For an effective response, all the levels must be adjusted to only three ratings (+1, 0 -1) separated by equal intervals (Bezerra et al., 2008; Pambi & Musonge 2016; Vassegghian, 2016).

This study aims to investigate the effects of input variables, such as pH, coagulant dosage, and air saturator pressure on the removal of COD from oil refinery wastewater using the DAF treatment process. The use of BBD together with RSM was used to model the experimental data.

**Materials and Methods**

**Materials and Analytical Procedure**

The sample used in this study was obtained from a wastewater treatment plant of a local South African oil refinery located in Durban in the KwaZulu Natal province. Polyaluminium chloride (PAC) with a purity of 30% was used as a coagulant supplied by Sigma-Aldrich. Sulphuric acid with a purity of 98% and sodium hydroxide was used for the adjustment of the pH. The protocols by the American Public Health Association (APHA) standard method of examining wastewater were followed (APHA 2012). The COD was analyzed with a Hanna® HI 83099 COD and multiparameter photometer.

**Jar Test**

A DAF jar tester with six 1-L rectangular jars and an 8-L recycle air saturator at a constant rapid mixing of 250 rpm for two minutes followed by slow mixing at 30 rpm for 15 minutes was used. Then, the pressure in the saturator vessel was regulated by a pressure release valve to induce the dissolved air into the floatation tank base at a predetermined value while aerated for 15 minutes until reaching steady state (Tetteh et al., 2017).

**Design of Experiment**

The software, Design-Expert® (version 10.0.5; Stat-Ease, USA), was used to design the experiment, develop a response model, and optimize the process conditions. The COD removal was the response, and the RSM was used to evaluate the interactions among the input variables of pH, coagulant dosage, and air saturator pressure, where each factor was set at three different levels (Table 1).

Results and Discussion

The COD measured was used as an indirect measure of the soap oil and grease, and other organic compounds present in the water used. The key indicator of the process efficiency was the measurement of the COD removal. The RSM was used to develop a mathematical relationship between the input variables and the response. The BBD was used to design and identify either the simple or combined effects of the input variables ($X_1$, $X_2$, and $X_3$) to maximize the removal of the COD. Table 2 shows the results of the BBD runs.

Std DV: 9.01; Mean: 77.59; CV: 11.61%; Ad precision: 6.48
An analysis of variance (ANOVA) was used to select the most predictive model (Table 3). The two-factor interactions (2FI) was the preferred selected. This choice was due to the desirability to describe the relationship between the input variables for the response. It was found that the $P > F$-value was less than 0.05 with the highest value of the correlation coefficient (Actual $R^2$, Adjusted $R^2$, and Predicted $R^2$) and the lowest standard deviation showing a statistically significant result. However, the high values of the $R^2$ and the adjusted $R^2$ depicted the model having non-significant terms. In this case, the 2FI model with a low coefficient of variation (CV) of 11.61% similarly revealed the model prediction from the experimental data was reliable and precise. The signal to noise, which is a measure of adequate precision (6.48), was greater than four, which also indicated that the model was suitable to determine the optimum conditions for the removal of the COD (Wang et al., 2007; Vasseghian, 2016).

A coded equation (3) was used to identify the relative impact of the factors by comparing the factor’s coefficients. The equation regarding actual factors (Equation 4) can be used to determine the relative impact of each factor because the coefficients are scaled to accommodate the units of each factor and the intercept is not at the center of the design space.

$$Y_{coded} = 77.59 - 5.54X_1 + 4.92X_2 - 3.86X_3 + 9.69X_1X_2 + 6.27X_1X_3 + 12.99X_2X_3 \quad (3)$$

$$Y_{actual} = 628.067 - 69.367X_1 - 9.551X_2 - 0.872X_3 + 9.691X_1X_2 + 0.063X_1X_3 - 0.013X_2X_3 \quad (4)$$

Where the high F-values and the low P-values of the linear terms ($X_1$, $X_2$, and $X_3$) and the interactive terms ($X_1X_2$, $X_1X_3$, and $X_2X_3$) show the high influence they have on the removal of the COD.

Effects of Factors on COD Removal

The sensitivity of the input variables was tested for the removal of COD as a response. To establish this relationship between the input and response variables, one variable was kept constant while varying the other two variables within the specified range for the experiment. The visual representation of the interactional effects of the input variables on the COD removal was depicted using three-dimensional (3D) surface response and contour plots.

Figure 1 shows the response surface effects of pH and saturator pressure on the COD removal at a fixed coagulant dosage. It was observed that at lower pH and pressure levels, the amount of COD removed was high. Thus, at lower pH, the emulsion is destabilized for interparticle bridging, while the effect of the pressure depends on the solubility of the dissolved air induced into the flotation zone. The progressive increase of the pH and pressure to a higher level resulted in the COD removal declining. This outcome was attributed to the volume as well as the micro bubbles generated that affected the efficiency of the DAF. At higher pressures, extra gases are discharged, with vigorous bubbles formed, thus affecting the collision between the air bubbles and the contaminants present in the water that could later float to the surface of the flotation tank (Edzwald, 2010).

Figure 1: COD response surface for pH vs. pressure (kPa) at constant coagulant dosage of 40 mg L$^{-1}$

Source: Authors
Figure 2 depicts the influence of the coagulant dosage and the saturator pressure on the removal of COD at a fixed pH. The removal of the COD approached a maximum value at a high coagulant dosage and low pressure. However, at high-pressure levels, the coagulant dosage was low when the COD removal approached a maximum value. Thus, at a higher coagulant dosage, larger and heavier flocs are produced that can easily be fragmented by the vigorous bubbling, hence affecting the rising velocity.

**Figure 2: COD response surface for coagulant dosage (mg L\(^{-1}\)) vs. pressure (kPa) at constant pH 5**

Source: Authors

Figure 3 shows the effect of pH and coagulant dosage at a fixed pressure on the COD removal. It was observed that the coagulant dosage was the only factor that had a significant effect on the COD removal. The addition of the PAC for the removal of COD was effective under the acidic conditions. This result is attributed to neutralization of the negative ions of the organic compounds by the positive charge of the coagulant via the adsorption mechanism (Bezerra et al., 2008; Vasseghian, 2016). Also, an overdose of the coagulant will eventually lead to colloids re-stabilizing and producing larger flocs.

**Figure 3: COD response surface for coagulant dosage (mg L\(^{-1}\)) vs. pH at a constant pressure of 350 kPa**

Source: Authors

Process Optimization
The data obtained from the experiments were simulated into the form of a response (COD) predictive model to evaluate the effects of the input variables at different levels to enhance the process efficiency. The optimization goal was set to maximum. With this criterion, the desirable outcome was attained at 95% confidence level where over 80% COD was removed. The combination of the input factors was found to be effective, within the test ranges of pH (4.4–5.6), coagulant dosage (34–48 mg L\(^{-1}\)) and pressure (320–400 kPa), towards approaching a higher COD removal of 80 to 98%. The optimum region defined the value of the response, which is shown as the shaded portion in an overlay plot (Figure 4). This depicts the region of interest, which is the graphical representation of the two most influential factors in the response (pH and coagulant dosage) approaching the high desirable value. This provided information that serves as a landmark for optimizing the process.

![Figure 4: Coagulant dosage (mg L\(^{-1}\)) vs. (pH) overlay plot for COD removal](source: Authors)

**Conclusion**

The application of the RSM in this study depended greatly on the independent variable data obtained from the experiment and its effects on the response. Polyaluminium chloride (PAC) was used as the coagulant for the treatment of industrial wastewater. The use of the Box-Behnken design (BBD) to develop the experiment provided distribution points throughout the region of interest. In evaluating the quality of the response model in terms of the information possible for the interaction effects between the input and output variables, there were two main outcomes. First, the use of the RSM technique is considered the best technique for process modification, optimization, and experimental analysis. It generated a large amount of information from a small number of experiments and hence will reduce the cost of experimentations. Second, the coagulant dosage had a significant effect on COD removal under acidic conditions. The lower the pressure, the better the effect, as a result of the higher generation of micro bubbles for COD reduction.

PERFORMANCE COMPARISON OF THE DIFFERENT STREAMS IN A TCP BOTTLENECK LINK IN THE PRESENCE OF BACKGROUND TRAFFIC IN A DATA CENTER

Vilma Tomço,1 Aleksandër Xhuvani2

Abstract: The purpose of this work is the evaluation of the performance of TCP streams when the link that causes a bottleneck is also shared by the background traffic. Standard TCP is the most used protocol which sustains the majority of Internet traffic. Nevertheless, TCP manifests some problems when using almost all of the available bandwidth. Based on these problems, there are recognized different versions of TCP. The aim of this paper is to test the conflict between TCP flows bandwidth allocation. We have implemented a network which includes FTP traffic and background traffic. The TCP flows are simulated so that they begin transmitting at different times. Background traffic is added besides the TCP flows so that we approach a real network model. Besides studying how the TCP flows compete with each other, we will evaluate if the background traffic has an impact on the behavior of TCP flows and if it influences how the available bandwidth is shared equally among flows. We compare standard TCP Tahoe and TCP Reno, which do not differ much between each other, but use different algorithms so through simulation we will evaluate the changes in the bandwidth they use, even though we expect the TCP flows to be more aggressive in getting bandwidth from other TCP flows.

Keywords: components; TCP stream, FTP Traffic, TCP Tahoe, TCP Reno;

Introduction

TCP and UDP are the two protocols of the transport layer used in Internet network. TCP is a reliable connection-oriented protocol, which guarantees the sending of the packets from source to destination in the order they were sent (Chohan, 2006). UDP is an unreliable, connectionless protocol, so the best effort protocol which uses no mechanism to handle packet loss or managing out of order received packets. TCP is a congestion control protocol which controls the rate at which packets are transmitted between sender and receiver (it slows down packet sending speed when it detects that the network is overloaded). The purpose of the UDP protocol is to send data as fast as possible. Many implementations of TCP are realized, and for each of these implementations, different studies over their impact on network utilization are done. Based on this two protocols we will study the behavior of TCP flows which show an aggressive approach in getting the bandwidth, and UDP which transmits at a constant rate regardless of other traffic on the network. We have used the NS2 simulator (Issariyakul, 2009) to evaluate the differences between the TCP flows, and also to study the impact of the background traffic. In this paper, we will look through providing a Network Random Input, the analysing of Initial Conditions, the Mathematical Model (used algorithms), the realization of some Simulations (Yuvaraju et al., 2010), the Graphic Representation of Flow Comparison, the Calculation of the Confidence Interval and at the Conclusions from the finished simulations (Cho, 2006). At the end of the paper, there are included the references that we have referred to during our work.

Network random input

The network model we have used is composed of 10 nodes, based on the Dumbo-Bell typology that consists of only one bottleneck link which is shared between some streams. In the network, we have included two TCP flows, one UDP flow with CBR traffic and another UDP flow with VBR traffic where both UDP streams are in the background.

To test the network behavior, so that it approaches the real network where the traffic changes over time, we have included the different elements. First, we have involved background traffic; second, we have included VBR traffic which changes over time. We also have used the exponential method of generating the traffic, through which we do not generate traffic all the time, but there are periods of time when we generate traffic (burst time) and periods of time when we do not generate traffic (idle time). Third, to get different results each time we simulate the network we use a random number generator method which provides us random input for each simulation we do.

1 University of Tirana Computer Science & Applied Mathematics, Tiranë, Albania, vimatster@gmail.com
2 Polytechnic University, Tiranë, Albania, axhuvani@yahoo.com
Initial condition

Based on our network typology we distinguish four streams which share the bottleneck link between the nodes 4 and 5. The bottleneck link is 10 Mbps full-duplex and with a queue size of 10 packets while the other links have a queue size of 100 packets.

- We create traffic between nodes 0 and 6 (TCP Reno). For the TCP link, we use the maximum size of 100 packets for the congestion window and we take a 512 byte packet size, as we have an Ethernet link and that’s the packet size which can be transmitted in the network based on RFC 895 and it is also the standard packet size used by UDP. We use the minimum timeout of 0.2 seconds, and we set the first UDP flow’s starting time at 5.0 seconds and the ending time at 90.0 seconds.

- We create FTP traffic between nodes 3 and 9 (TCP Tahoe). We use the same parameters for this flow as the one above. In this way, we evaluate the flows under the same conditions. This flow begins to transmit later than the first one, starting at 10.0 seconds and ending at 90.0 seconds.

- We create CBR traffic between nodes 1 and 7. The CBR traffic generates packets at the speed of 100 packets/sec. The CBR traffic source starts at 15.0 seconds and ends at 60.0 seconds. CBR traffic does not transmit actual data but instead informs the UDP agent that has data to transmit, and the agent creates packets and sends the data. We use a simplex link as UDP does not have a congestion control mechanism.

- We create 1 Mbps VBR traffic between nodes 2 and 8. We use the exponential on/off method to generate traffic, and we set the “On” period to 150ms and the “Off” period to 100ms. The link which is used is a simplex one. The packet size is same as the one used in TCP and CBR. VBR traffic starts at 20.0 seconds and ends at the 70.0 seconds mark.

Network typology with 10 nodes:

- The nodes 4 and 5 create the bottleneck link
- The nodes 0 and 3 generate FTP traffic (source nodes)
- The nodes 1 and 2 generate CBR and VBR traffic (source nodes)
- The nodes 6, 7, 8, 9 are destination nodes

We set the bandwidth to 10 Mbps full-duplex for the bottleneck link to simulate a 10 BaseT Ethernet link. The queue size is 10 packets smaller than the queue size of other links to create in this way the bottleneck and the buffer should have an appropriate size as the congestion avoidance mechanism brings throughput oscillation. Over buffered routers increase latency when we have congestion, whereas under buffered routers bring more problems because packet forwarding generates throughput oscillation.
For all the other network links we set the capacity to 100 Mbps full-duplex to simulate a 100BaseTX Ethernet link, and we set the queue size to 100 packets. For most of the links, we use the DropTail algorithm for the queue (FIFO) whereas for the n2-n4 and n5-n8 links we use the SFQ algorithm to provide various network conditions.

In the simulation we will perform, a Dumb-Bell typology with 2 TCP sessions is used which shares only a bottleneck link between two routers. Dumb-Bell typology with a congested link allows us to study the network traffic and it simulates a bottleneck link where the TCP sessions are transmitted on the internet. Along with the TCP streams, we have the UDP streams which are placed in the background and cause congestion and TCP packet loss.

Mathematical model

The UDP protocol does not implement any congestion avoidance mechanism contrary to the TCP protocol which has congestion control mechanism (Cho, 2006). Standard TCP Tahoe is one of the earliest implementations which use the go-back-n model to control network congestion.

TCP Tahoe is based on the algorithms:

1) SlowStart
2) CongestionAvoidance
3) FastRetransmit

TCP Reno is similar to TCP Tahoe, but they differ because TCP Reno has an additional algorithm which is FastRecovery (Ha et al., 2011). During the slow start phase, the congestion window increases with one for each acknowledge (ACK) message received, so the congestion window grows exponentially. The slow start phase continues until the congestion window is equal to or greater than the threshold. Once this condition is true, the next phase begins which is congestion avoidance. During the congestion avoidance phase, instead of increasing the window size with one each time we receive a ACK message, and the congestion avoidance algorithm increases the window size with one for each RTT (Round-Trip delay Time), so in this way, the congestion window size has a linear growth.

In the fast retransmit phase, when we receive a certain number of duplicated ACK for the same packet, the sender retransmits the packet without waiting for the timer to expire.

Fast recovery works during those cases when a certain number of duplicated ACK (threshold usually is set to 3) is received. Just as during fast retransmit, the sender retransmits the lost packets but instead of a slow start the congestion window is decreased by half, and then it counts the duplicated ACK to determine when it should send packets again. The window used by the sender:

\[
\text{min} (\text{awin}, \text{cwin} + \text{ndup})
\]
- awin: receiver window
- cwin: sender congestion window
- ndup: the number of duplicated ACK (stays at 0 until the number of duplicated ACK reaches threshold)

Referring RFC 2581 related to TCP Congestion Control we could explain the mathematical model based on the mentioned algorithms. Specifications:

- SEGMENT: each TC/IP data or ACK packet
- SENDER MAXIMUM SEGMENT SIZE (SMSS): the maximum size of the segment that the sender can transmit
- RECIEVER MAXIMUM SEGMENT SIZE (RMSS): the maximum size of the segment that the receiver can accept
- FULL-SIZED SEGMENT: the segment which has the maximum number of data bytes that is allowed
- RECIEVER WINDOW (rwnd): the window that the receiver uses most
- CONGESTION WINDOW (cwnd):
  - The state variables that limit the amount of data that a TCP sender can transmit. At a certain time, a TCP sender may not send data with a greater sequential number than the sequential number confirmed and the minimum of cwnd and rwnd
- INITIAL WINDOW (IW): the size of cwnd after three-way-handshake has finished
• LOSS WINDOW (LW): the size of cwnd after the TCP sender detects loss of packets using a retransmission timer
• RESTART WINDOW (RW): the size of cwnd after the TCP sender again begins the transmission after an idle time (if the slow start algorithm is used)
• FLIGHT SIZE: number of data which are sent but not acknowledged yet.

The cwnd variable is a limit at the sender side, in the number of data the sender can transmit before getting the ACK. The rwnd variable is a limit at the receiver side, in the delayed number of data. Minimum size of cwnd and rwnd manage the transmission of the data; the Slow-start algorithm is used before the transmission or after the recovery of lost packets from retransmission timer, to inspect the network in determining the available bandwidth. IW, cwnd initial size, it should be smaller than or equal to 2 * SMSS byte and it should not be greater than 2 segments.

The initial value of the ssthresh (slow-start threshold) can be a random value and it can be reduced as a response to congestion. The slow-start algorithm is used when cwnd sssthresh, and the congestion avoidance algorithm is used when cwnd>ssthresh. The sender can use each of them when cwnd is equal to ssthresh. During slow-start, TCP increments cwnd with at least a SMSS byte for each received ACK that confirms the data send. During congestion avoidance, cwnd is incremented with 1 for each RTT. Slow-start ends when cwnd exceeds ssthresh or when congestion is detected. Congestion avoidance ends when congestion is detected.

cwnd += SMSS*SMSS/cwnd (1)

When a TCP sender detects segment loss using the retransmission timer, the value of ssthresh should be set to:

\[
\text{ssthresh } = \max(\text{FlightSize}/2, 2\times\text{SMSS}) (2)
\]

The TCP sender should use the fast retransmit algorithm to detect and repair the loss, based on the ACK duplicated packets. After receiving 3 duplicated ACK, the TCP performs a retransmission for the missing segment, without waiting for the retransmission timer to expire. Fast retransmit and fast recovery algorithms can be implemented together:

1. When the third duplicated ACK is received, ssthresh is set to the value given by equation (2)
2. The lost segment is retransmitted and cwnd is set to ssthresh + 3*SMSS. This affects cwnd in three segments which are away from the network and are in the receiver buffer.
3. For each duplicated ACK received, cwnd increments from SMSS. This artificially increments cwnd.
4. A segment is transmitted if it is allowed from the new value of cwnd used by the receiver.
5. When another ACK is received to confirm the new data, cwnd is set to ssthresh. This is called window deflation.

**Experimental phase**

To reach conclusions about how the TCP streams compete with each other in the utilization of the bandwidth that is being also shared from the traffic background we realize a total of 10 simulations. Given that the results obtained from each simulation differ, then for all the performed simulations, we realize superposition of graphs to see if they fall almost in the same footprint and to confirm with certainty the received outcome. By all performed simulations we will evaluate how much and what proportion of the available bandwidth occupies each stream and then we will give an overall average of bandwidth utilization from each stream. Below we provide graphical presentations obtained by NS2 to show the different results of realized simulations.

**Figure 2: Overview of NAM during the simulation and illustration of 2 different results taken from the simulations**

Representation of streams comparison

The purpose of this work is measuring and analysing the performance of TCP Reno and TCP Tahoe (Mo et al., 1998). The study is done in the presence of background traffic. We will conduct a comparison of TCP streams by evaluating the bandwidth that they allocate (also considering other streams). Regarding the graphics taken from simulations we see that streams which compete aggressively among themselves to exploit as much bandwidth are TCP streams. TCP Reno stream provides more bandwidth than standard TCP Tahoe stream. Meanwhile in cases when in the network appear all types of streams, such as TCP streams and those in the background like VBR or CBR, the bandwidth used by each TCP stream decreases. To give a clearer idea of graphical presentations we initially represent streams separately and then give a graphical representation of all streams that are on the network and compete for bandwidth, evaluating the bandwidth size that each stream occupies.

Figure 3: Graphic presentation for the bandwidth used by CBR (in the presence of 4 streams on the network)

Source: Author

So, as we see from the graph for CBR, the bandwidth that CBR use is very low compared with the size of the link. The maximum value that CBR can achieve in the utilization of the link’s bandwidth is 250 kbps, and the minimum value is 90 kbps. The nominal bandwidth is 170 kbps, and this relates to the fact that CBR transmits packages with constant speed and does not show any aggressiveness in obtaining bandwidth. On the other hand, this is related to the fact that UDP does not use any mechanism for congestion.

Figure 4: Graphic presentation for the bandwidth used by VBR (in the presence of 4 streams on network)

Source: Author

Compared with the case of CBR, VBR represents more fluctuations in bandwidth, and this is related to the fact that VBR transmits the packages with different speed. The size of the bandwidth that VBR allocates reaches the maximum value at 1 Mbps. Unlike CBR where we used the mechanism Drop Tail, in the case of VBR we use the GFS mechanism.

From the graph obtained for the bandwidth used by TCP Reno, we see that at the very beginning of the simulation when on the network none of the traffic sources had started any transmission, TCP Reno uses all the potential capacity of the 10Mbps bottleneck link. With the emergence of other traffic on the network, the bandwidth used by TCP Reno decreases, as TCP Reno should share the link-although at certain moments when it can find space in the link, it tends to use it aggressively. It is noted that the average of the values connected with the bandwidth used by TCP Reno is roughly 4-5 Mbps.
Figure 5: Graphic presentation of bandwidth used by TCP Reno (in presence of background traffic)

Source: Author

Figure 6: Graphic presentation of bandwidth used by TCP Tahoe (in presence of background traffic)

Source: Author

Just as we affirm theoretically that TCP Reno was an improvement on TCP Tahoe and it should be expected to have a low utilization of bandwidth, from the graph given above we confirm such a thing. TCP Tahoe does not show the same aggressiveness as TCP Reno therefore never fails to utilize the full capacity of the maximum bottleneck link. The maximum value of bandwidth that TCP Tahoe can achieve to utilize is 8 Mbps. Meanwhile the approximate average value of the average bandwidth that is being used is 2-3 Mbps, which is a result lower than the bandwidth used by TCP Reno.

In the following charts, we will provide graphical presentations of the TCP streams in the presence of background traffics. What is normally expected as a result is that in the presence of background traffic the used bandwidths by each TCP stream are expected to decrease, because the bottleneck link is shared by 4 streams. Normally TCP will remain aggressive in the link not only against the background traffic, but also against each other.

Figure 7: Graphic presentation for sharing the bandwidth of the bottleneck link among 4 streams

Source: Author
In the graphical representation of Figure 8, we note that in the presence of background traffic, the sharing of the bandwidth between streams starts to become fairer. This is due to the fact that with the increase of RTT, the delay of ranks also grows. With the increase of RTT, we see that there is also a decrease in the aggressiveness in getting the bandwidth for the TCP Reno stream, so TCP Tahoe has more opportunities to provide bandwidth even though the TCP Reno stream dominates on the network.

(Reminder: In telecommunications, the round-trip delay time (RTD) or round-trip time (RTT) is the length of time it takes for a signal to be sent plus the length of time it takes for an acknowledgment of that signal to be received. This time delay, therefore, consists of the propagation times between the two points of a signal).

**Calculation of the confidence interval**

The results of the simulation would not have any value if we don’t have any idea about their accuracy, knowing that from every simulation a different result is received. To evaluate the data from every simulator, we must build the interval of confidence. To calculate the interval of confidence we proceed as shown below:

- We simulate and obtain an evaluation $X_1$ for the measurement that we are interested
- We repeat the simulation $M$ times and get $X_2…XM$, all different from each other.
- We evaluate the average of $M$ champions

$\bar{X} = \frac{\sum_{j=1}^{M} X_j}{M}$

$\sigma_X^2 = \frac{1}{M-1} \sum_{n=1}^{M} (X_n - \bar{X})^2$

Knowing that we cannot find a right evaluation with only one value, we consider an interval $[c1, c2]$. Based on the theorem of certified limits, we assume that 95% of the values are in the same interval. For a Gaussian distribution, the interval of confidence evaluates with a derivation $\pm 1.96$. The interval of confidence was 95%

For $M=10$ we get $\bar{X} = 2.17$ and $\sigma_X^2 = 0.020005$

The interval of confidence: $[0.069; 0.075]$

We calculate the interval of confidence for the bandwidth in the CBR stream.

For $M = 10$ we get $\bar{X} = 0.073$ and $\sigma^2_x = 0.020005$

The interval of confidence is $[0.069; 0.075]$. We calculate the interval of confidence for the bandwidth for the VBR stream:

For $M=10$ we get $\bar{X} = 0.29$ and $\sigma^2_x = 0.0004$

The interval of confidence: $[0.278; 0.302]$. We calculate the interval of confidence for the bandwidth
in the TCP Reno stream: For M=10 we get \( \bar{X} = 4.14 \) and \( \sigma_x^2 = 0.021 \). The interval of confidence: [2.081; 2.259] (as we stated above from the graphical appearances, the majority of the values are between 2-3 Mbps)

**Conclusion**

In this project, we experimented how TCP streams (TCP Reno and TCP Tahoe) compete with each other in the allocation of the bandwidth in a bottleneck link and also how they compete with background traffic (CBR and VBR). Traffic in the background ensures an approach that resembles more in a real world network, and it is noticed that with this presence on the network, TCP streams become more fair in relation to each other by reducing aggression. What was observed in the graphic presentations was that TCP Reno dominated in its transmission on the network compared to the standard TCP Tahoe. This refers to the fact that TCP Reno is an improvement of the standard TCP Tahoe because besides the algorithms that it uses - slow start, congestion avoidance, fast retransmit, it also uses the fast recovery algorithm. Fast Recovery acts in those cases when a certain number of duplicate ACKs are taken (threshold generally is set at 3). The sender retransmits the lost packets, but rather than the slow start algorithm, the congestion window is halved and then counts the duplicate ACKs for defining when to send the packages.

The interval of confidence: [4.053; 4.227] (as we stated above from the graphical appearance, the majority of the values are between 4-5 Mbps)

- We calculate the interval of confidence for the bandwidth for the TCP Tahoe stream:
- Starting from the graphical presentations, we affirm that TCP Reno uses on average 62% of the link bandwidth while TCP Tahoe 32%. The rest of the link is shared between the CBR and VBR that use on average 1% and 5% of the available bandwidth of the bottleneck link.

TCP Reno performs better when the losses of packages are small. In cases where losses are great in a window, then Reno does not perform well, and its performance is almost the same as TCP Tahoe. Another problem is that if the window is very small when losses occur, then we will never get duplicate ACKs for fast retransmit and we must wait for timeouts. This method does not detect effectively the losses of packets.

RAPID MICROPROPAGATION OF VU NU ORCHID (Oncidium sp.) BY USING TISSUE CULTURE TECHNIQUE

Tran Van Minh, 1 Nguyen Van Khoa, 2 Bui Thanh Hoa 3

Abstract: The high demand of Oncidium orchids leads us to find out efficient methods of propagating them. However, the propagation rate of traditional methods are low in nature and a hybrid seed is not genetically stable. Thus, plant cell biotechnology is examined as the most effective way to resolve the barrier of elite clone production. Shoot clusters were cultured on MS medium supplemented with 2,4-D (1 mg/l) for callus induction (76.19%) before induced callus was favoured for PLBs regeneration (98 PLBs/callus cluster) on MS medium supplemented with NAA (0.75 mg/l); the combination of BA (0.5 mg/l) and NAA (0.5 mg/l) was favoured for PLBs regeneration (28.18 PLBs/shoot cluster) from shoots cultivation. The PLBs (79.21 PLBs/PLB cluster) were then proliferated on MS medium supplemented with NAA (1 mg/l) and BA (1 mg/l) for shoot regeneration (12.42 shoots/PLBs cluster). Multiple-shoots were divided to 3-4 shoots/cluster for micropropagation on the MS medium supplemented with the combination of BA (0.25 mg/l) and NAA (0.25 mg/l) to reach 11.66 shoots/cluster. Shoots were finally separated to single-shoot for rooting on the MS medium supplemented with NAA (0.75 mg/l). A scheme for Oncidium micropropagation using PLBs culture techniques was set up.

UDC Classification: 57.01; DOI: http://dx.doi.org/10.12955/cbup.v5.1103
Keywords: Oncidium, elite, callus, protocorm like bodies (PLBs), micropropagation

Introduction

Orchidaceae orchids include many of the flowers spices used in the cut flower industry. Vu Nu (Oncidium) orchid is a fragrance that is popular in the world market in the form of flower pots and cut branches (Arditti, 2008). Low natural shoots and hybrid shoots do not guarantee parental lineage. The technique of tissue culture has been successfully applied in the conservation and development of rare orchids, cut flowers, condiment and medicinal plants (Arditti, 2008).

Vu Nu orchid culture has yielded the groundwork for the construction of micropropagation technology, such as the shoot tip, root tip, inflorescence culture of O. Sweet Sugar (Chen and Chang, 2000b) culture of young leaf producing direct and callus-formed PLBs (Chen and Chang, 2000a), proliferation of PLBs of O. Gower Ramsey (Kusumoto et al, 1998), regeneration of PLBs of O. Sharry Baby OM8 (Li et al, 2005) and O. Sweet Sugar (Hong et al, 2008).

Natural regeneration of Vu Nu is low about 1-3 shoots/cluster in one year. The culture of PLB occurs primarily in monocots such as orchids, which are directly regenerated from tissue, pollen, and orchid cells cultured in vitro. PLBs were proliferated and developed into complete plants in vitro (Arditti, 2008). By this method, a large number of plantlets of the same genetic origin can be obtained in a short time. The study of callus production, PLBs production, PLBs formed shoot regeneration and rapid multiplication of shoot need to be developed in order to rapidly multiplying Oncidium sp. orchids in vitro.

Materials and Methods

Vu Nu orchids (Oncidium sp.) in Vietnam are used as research materials for conservation and development purposes. The cultured samples are in vitro shoots of Vu Nu orchid. The research was conducted in the Plant Biotechnology Laboratory, International University.

The Murashige-Skoog nutrient medium (Murashige & Skoog, 1962) was added with BA (6-benzylaminopurin), NAA (α-naphthalenacetic acid), 2,4-dichloro-phenoxyactic acid, sucrose (20 g/l), Coconut water (10%), agar (Hai Phong).

The culture medium was adjusted to pH 5.8 before autoclaving at 121 °C and 1 atm for 40 minutes. The culture condition was set up with room temperature at 26 ± 2 °C, illumination intensity in 22.2 μmol/m²/s for 12 hours per day, relative humidity RH = 65%.

The experiment was set up in randomly complete block (RCB), with 3 replications, each with 3 Erlenmeyer flask (300 ml), each with 5 explants. Experimental data were recorded after 90 days of

culture and ANOVA was analyzed together with Turkey HSD (p = 0.05) with SPSS, version 16 (http://www-01.ibm.com/). Software/analytics/spss/)

**Experiment Design**

Experiment 1: Callus culture of Vu Nu orchid: MS medium was supplemented with 2,4-D in 6 treatments from C1 to C6 (0, 0.1, 0.25, 0, 5, 0.75, 1 and 2 mg/l). The cultured explants were shoot clusters (3-5 buds/cluster). The culture time is 90 days. Observed indicators: the rate of callus formation (%) and diameter of callus are recorded (mm). The best callus in one of these six treatments will be used as a material for experiment 2.

Experiment 2: Effect of NAA on PLB formation from callus: The PLB production from the best callus in one of the six treatments of experiment 1. MS medium was supplemented with NAA in 5 treatments from A1 to A6 (0, 0.1, 0.25, 0.5, 0.75, 1 mg/l). Cultured explants were callus (5 clusters of calli/Erlen). The observed indicator was PLBs/callus. The best PLBs in one of the five treatments will be used as material experiment 4.

Experiment 3: Effect of NAA and BA on PLB formation from bud cluster: MS medium was supplemented with BA in 6 treatments from G1 to G6 (0, 0.1, 0.25, 0.5 mg/l) and NAA (0, 0.5, 1 mg/l). The cultured explants were shoot cluster (3-5 buds/cluster). Observed indicator: number of PLBs/shoot cluster. PLBs in one of six treatments will be used as a material for experiment 4.

Experiment 4: Effect of NAA on proliferation of PLB biomass: MS medium was supplemented with NAA in 5 treatments from E1 to E5 (0.10, 0.25, 0.50, 0.75, 1 mg/l). The cultured explants were PLB clusters (3-5 PLB/cluster). The observed indicator is PLB number/cluster. PLBs in one of five treatments will be used as materials for Experiment 5.

Experiment 5: Effect of BA on shoot regeneration from PLBs: PLBs were formed from treatment E5 used as culture material. MS medium was supplemented with NAA in 5 treatments from B1 to B5 (0, 0.1, 0.25, 0.5, 0.75, 1 mg/l). The cultured explants were PLB clusters (3-5 PLB/cluster). The observed indicator was the number of shoots/cluster.

Experiment 6: The combined effect of BA and NAA on bud proliferation: The PLBs was formed from treatment E5 used as the culture material. MS medium was supplemented with BA (0, 0.1, 0.25, 0.5 mg/l) and NAA (0, 0.1, 0.25 mg/l) in six treatments ranging from D1 to D6. The cultured explants were shoot clusters (3-4 buds/cluster). The observed indicator was the number of shoots/cluster.

Experiment 7: Effect of NAA on root formation: MS medium was supplemented with NAA in six treatments from F1 to F6 (0, 0.1, 0.25, 0.5, 0.75, 1 mg/l). The culture explants were single shoots (> 30 cm). Observed indicators were the number of roots/shoots and root length.

**Results and Discussion**

**Culture of Callus Formation of Vu Nu Orchid**

Callus formation was carried out on MS medium containing different concentrations of 2,4-D. The effect of 2,4-D on callus formation is shown in Table 1. Callus is formed at the base of the Vu Nu orchid bud after 90 days of culture. The incidence of callus formation varies depending on the different concentrations of 2,4-D added to the culture medium. Observations show that there are three kinds of callus: (i) cream color, fragile, and lumps; (ii) light blue, and sticky; (iii) blue and sticky.

On MS medium without 2,4-D supplement (control), callus formation did not occur. On the MS medium supplemented with 2,4-D, shoot clusters produced callus-formed response significantly. The highest incidence of callus formation was 76.19% recorded in treatment A5 supplemented with 1 mg/l 2,4-D and two kinds of callus formed were (ii) light green and (iii) blue, compact with 5.57 mm in cluster size. In A2 treatment supplemented with 0.25 mg/l 2,4-D, the diameter of the callus reached the maximum size of 8.02 mm/cluster.

Wu et al. (2004) investigated the effects of two groups of auxins and cytokinins on embryo formation from calluses obtained from the root sample, the authors noted that there was no PLB on the MS medium without 2,4-D, but they still induced callus from this medium. Our results are similar to the rate of callus formation of 76.19% on MS medium supplemented with 1 mg/l 2,4-D. Jheng et al. (2006) added with 2,4-D in the lower concentration to culture medium affected cell proliferation, which was similar to that obtained with low concentrations of 2,4-D in this study. Experimentally on
callus formation, high concentrations of 2,4-D should be not used as it was the cause of mutant formation (Arditti, 2008) and the callus appeared to mutate in long-term culture (Jheng et al, 2006).

Effect of NAA on PLB Formation from Callus

Study on PLBs formation by callus culture on MS medium supplemented with NAA was performed. In Table 2, NAA was not added to medium showed no PLB was formed. The NAA in the higher concentration favoured the greater number of PLBs produced. Addition of 0.5 mg/l and 0.75 mg/l NAA into MS medium was for formation of 67.25-98 PLB/clusters. The MS medium supplemented with 0.75 mg/l NAA was suitable for the embryo PLB culture.

Chen and Chang (2000b) reported on MS medium supplemented with appropriate concentrations of NAA and TDZ will speed up the formation of PLBs. In this study, we tested the influence of NAA on the formation and growth of PLB biomass. The results recorded that supplemented with NAA in culture medium at a concentration of 0.1-1 mg/l had a significant effect. In a few other studies by other scientists, auxin and cytokinin have also been incorporated (Juliana et al., 2010).

Effect of NAA and BA on PLB Formation from Shoots

On the MS medium, the addition of a combination of NAA and BA concentrations has had some effects. After 90 days of culture, all treatments had PLB formation, except the control medium without NAA plus BA with no PLB formation. Most of the cultured shoots produced PLB and the highest number of PLB/ bud cluster were recorded in treatment C3 (with the addition of 0.5 mg/l NAA and 0.5 mg/l BA) for the formation of 28.18 PLB/ shoot cluster, PLBs are blue and well-developed. Table 3 shows that the NAA and BA in MS culture medium significantly influenced production and morphology of PLBs. When combined with NAA (1 mg/l) and BA (0.1-0.5 mg/l), the PLBs formed with a low rate. MS medium supplemented with 0.5 mg/l NAA and 0.5 mg/l BA was suitable for the production of PLBs.

Rahman et al. (2005) recorded a combination of 1 mg/l BA and 0.05 mg/l NAA obtained the highest rate of Vu Nu PLB formation (90%). Juliana et al. (2010) also recorded a combination of 0.25 μM NAA and 13.5 μM TDZ for up to 80% of the PLB formation. In the results of this study, 28,18
PLB/shoots per cluster were also obtained on MS supplemented with NAA (0.50 mg/l) and BA (0.50 mg/l). Arditti (2008) concludes that PLBs from callus and shoots have both the nature and structure of cells capable of producing the same embryos, so PLBs from callus and shoots are used as raw material for proliferation culture research.

**Effect of NAA on PLB Proliferation**

The objective of this study was to accelerate the multiplication of PLBs to provide the material for subsequent experiments. Results showed that NAA was added to the appropriate MS culture medium for embryos PLB. Treatments supplemented with NAA had a good response during the proliferation process. After 90 days of culture, MS medium supplemented with 1 mg/l NAA (treatment D5) produced the highest PLB with 79.21.

**Effect of BA on Shoot Regeneration from PLBs**

Cytokinins play an important role in the reproduction of shoots. The culture medium of MS with different BA concentrations achieved effective regeneration (Table 5). On medium MS supplemented with 1 mg/l, BA yielded highly with 12.42 shoots/cluster after 90 days of culture. Shoots are green and have strong vigor with a height of 3-5 cm and 6-9 leaves.

The Combined Effect of BA and NAA on Shoot Proliferation

The research of shoot proliferation in vitro of Vu Nu is an important determinant of multiplication. Amongst the MS medium with BA and NAA after 90 days of culture, the supplemented treatment with 0.25 mg/l BA and 0.25 mg/l NAA gave best results with 11.66 shoots/cluster (Table 6).

Effect of NAA on Rooting

MS medium was supplemented with NAA at different concentrations to study root shoots in vitro. The results of Table 7 show that there is no difference in rooting ability in the treatments. The addition of 0.75 mg/l NAA to the MS medium resulted in the highest number of roots with 2.64 roots/shoot and 1 mg/l NAA for the longest root length with 12.58 mm.

The experimental results achieved was similar to Rahman et al. (2005). The highest number of roots at 1.5 mg/l NAA of 3.2 roots and the longest root length of 25 mm on the culture medium with supplementation of 1 mg/l NAA.

Conclusion

The culture of the shoot cluster on MS medium supplemented with 1 mg/l 2,4-D gave the highest incidence of formed callus with 76.19%. The PLB culture from callus on medium supplemented with 0.75 mg/l NAA gave PLB as much as 98 PLB/callus.

The culture of the shoot cluster on MS medium supplemented with 0.5 mg/l NAA and 0.5 mg/l BA for direct generation of PLBs was 28.18 PLB/shoot cluster.

PLB proliferation was cultured on MS medium supplemented with 1 mg/l NAA reached 79.21 PLB/shoots.

On MS medium supplemented with 1 mg/l BA for shoot regeneration with 12.42 shoot/PLB cluster. Shoots were rapidly multiplicated on medium supplemented with 0.25 mg/l BA and 0.25 mg/l NAA reached 11.66 shoots/cluster. These shoots are 3-5 cm tall and have 6-9 leaves. On the MS medium supplemented with 0.75 mg/l NAA, root formation was stimulated with a maximum number of roots of 2.64 roots and supplemented at 1 mg/l NAA for the longest root length of 12.58 mm.

From the callus or the shoot cluster, we are capable of forming PLBs. The ability of the cell culture to proliferate is faster than PLBs and the ability to regenerate PLB high or low depends on the cultivar, so it is necessary to select appropriate culture techniques for each species in breeding. The process of rapid multiplication of Vu Nu orchids in vitro has been elaborated using the technique of tissue culture: from shoot cluster → callus → PLBs → PLBs multiplication → regenerate complete plants.

APPLICATION OF SOMATIC EMBRYOGENESIS AND BIOREACTOR TECHNIQUES IN MICROPROPAGATION OF TROPICAL LILY CONCA D’OR (ORIENT X TRUMPET)

Nguyen Thanh Quang,1 Tran Van Minh2

Abstract: The lily is considered one of the highest value cutting flowers as well as is popular to the majority. Bulbs are often imported from the Netherland with an expensive price. Thus, it is difficult to sell commercial lily flowers in the domestic market and international trade. This study focused on mass producing the source of somatic embryos with a high regeneration ability used for the lily micropropagation. Internodes were cultured on MS medium and supplemented with 0.1 mg/l BA and 0.5 mg/l NAA to induce callus, while embryogenic cells reached the highest value at 98.2% before such embryogenic callus was then multiplied on the same media within 5 weeks. The suitable media for somatic embryos regeneration was MS medium supplemented with 0.5 mg/l BA and 0.25 mg/l NAA which after 5 weeks of culture gave us a shoot number of 3.7 shoots/clusters, a shoot height of 87.3 mm, a leaf diameter of 7.7 mm. Multiple shoots regenerated from embryogenic cells were then used as materials for micropropagation. Results showed that the highest data for multiple shoot multiplication was reached in the bioreactor culture system with the maximum number of shoot height (100.25 mm), shoot number (7.1 shoot/cluster) and fresh weight of shoots (1470.94 mg/cluster). The suitable medium for rooting was MS medium supplemented with 0.5 mg/l NAA.

UDC Classification: 57.01; DOI: http://dx.doi.org/10.12955/cbup.v5.1104

Keywords: Conca D’or, bulb, somatic embryo, induction, proliferation, regeneration

Introduction

The lily flower belongs to the Liliaceae family which consists of around 200 genus and 3000 species, originates from South – West Asia and North America and were imported to Vietnam in the French colonial period (Blaney and Roberts, 1966; McRae, 1988; Lian et al, 2003; Woodcock and Stearn, 1950; Zhang et al, 2014). In Vietnam, the lily is now considered as one of the highest value cutting flower as well as being popular to the majority of people thanks to its pure beauty, passionate perfumes and long shelf life.

Lily cultivation more often than not has strong economic potential and brings with it higher profit than other flowers. However, lily cultivation in Vietnam has had many difficulties especially the lack of a source of bulb with high quality and which still hasn’t had a lily propagation system. Thus, almost all bulbs that are used today must be imported from the Netherland with an expensive price. Therefore, it is very difficult to sell commercial lily flower in the domestic and international market.

Lilies can be propagated by some traditional methods, in particular, natural divisions, stem bulblets, bulbs and scaling (Zhang et al., 2014). However, with such ways exist some disadvantages such as: a low amplification coefficient, slow growth rate, the appearance of variability in the next generations, etc…

There are many organs that can be used as starting material in lily micropropagation such as: the bulb scale, shoot tip, petal and receptacle (Bong et al., 2004; Hoshi et al., 2004, Lan et al., 2009; Pelkonen, 2005; Suzuki et al., 2002). Stem (Suzuki et al., 2002; Zhang et al., 2014), thin cell layer culture (Nhu et al., 2002) and bioreactor techniques (Lian et al., 2003) are used in somatic embryogenesis. The high concentration of auxin is really necessary to induce callus and the embryo in the starting stage (Komamine et al., 2005; Pierik, 1987). Almost all studies use 2,4-D and picloram to induce callus and embryo in the starting stage and improve the regenerative ability through using plant growth regulators belonged to the cytokinin group such as: BAP, TDZ and kin etin (Nhu et al., 2002).

Building up a lily micropropagation system by using a somatic embryo culture technique and using regenerated shoots from an embryo in the in vitro propagation is examined as the permanent solution to mass produce starting materials serving for the lily bulb production with high quality.

Materials and Methods

The bulbs of Lilium oriental hybrid ‘Conca Dor’ (Orient x Trumpet) were purchased from the De Jong Lelies Holland and bloomed in HCMC and Sa Dec (Dong Thap province, Mekong River Delta). Such

1 International University, Vietnam National University Ho Chi Minh City, Viet Nam, nguyenthanhquang1411@gmail.com
2 International University, Vietnam National University Ho Chi Minh City, Viet Nam, drminh.ptntd@yahoo.com
bulbs were put into a tray and covered by a layer of coconut fiber at 28°C, developed stems of approximately 7 cm long within two weeks.

Explant sterilization: 6 external leaves of each stem approximately 4-5 cm in length were removed. Next, the stems were submerged in detergent solution and this followed by rinsing continuously with running tap water. Under sterile conditions in a flow-cabinet, the surface of stems was sterilized in 70% ethanol in 30 seconds and then washed 3 times with sterile distilled water before they were disinfected continuously for 6 minutes in 0.1% HgCl₂ solution, to which two drops of Tween 20 (Fulika, Germany) had been added and then washed 5 times with sterile distilled water.

Cultural materials: young leaves (10-12 young leaves per stem) and nodes (5-6 nodes per stem) were excised from stems and used as cultural materials in the experiments.

Cultural medium: MS basal medium (Murashige and Skoog, 1962) supplemented with 10% coconut water, 0.1% AC, 0.8% agar, 3% sucrose and plant growth regulators such as: BA and NAA in different concentrations. The medium was adjusted to pH 5.8 before being autoclaved at 121°C, 1 atm for 20 minutes.

All cultures were incubated at 24±2°C with a photoperiod of 16 h per day at a light intensity of 11.1 µmol m⁻² s⁻¹ fluorescent light and 60±5% relative humidity.

Data was analyzed by using one way ANOVA. Each experiment had 3 replicates, each replicate had 4 bottles and each bottle had 5 explants. All analysis of the results was carried out by using MSTATC software version 2.0 of the Michigan University, USA. The level of significance in the experiments was set at 0.05 and will be classified into the LSD test.

**Experiment Design**

**Experiment 1:** The effect of explants on the embryogenic callus induction: MS basal medium supplemented with 0.1 mg/l BA and 0.5 mg/l NAA. Culture material: Areca leaf and internode. Data collection: callus induction rate, somatic embryo induction rate, callus and somatic embryo induction rate. Data was recorded 4 weeks after culture.

**Experiment 2:** The effect of NAA on the multiplication of embryogenic callus: Culture medium: MS basal medium supplemented with 0.1 mg/l BA and NAA (0, 0.1, 0.25, 0.5, 0.75 mg/l). Culture material: Friable and compact embryogenic callus (1 g embryogenic callus per cluster). Data collection: fresh weight of embryogenic callus per cluster (mgFW/cluster), proliferation rate of embryogenic callus and number of shoot (shoots/cluster). Data was recorded 5 weeks after culture.

**Experiment 3:** The effect of BA and NAA on somatic embryos regeneration: Culture medium: MS basal medium supplemented with the combination of NAA (0, 0.1, 0.25 mg/l) and various concentrations of BA (0, 0.1, 0.25, 0.5, 0.75 mg/l). Culture material: Friable and compact embryogenic callus (1 g embryogenic callus per cluster). Data collection: number of shoot per cluster, height of shoot (mm) and leaf diameter (mm). Data was recorded 5 weeks after culture.

**Experiment 4:** The effect of NAA, IAA, IBA on shoot multiplication: Culture medium: MS basal medium supplemented with the combination of 0.5 mg/l BA and different concentrations of NAA (0, 0.1, 0.2, 0.3 mg/l), IAA (0, 0.1, 0.2, 0.3 mg/l) and IBA (0, 0.1, 0.2, 0.3 mg/l). Culture material: in vitro shoots. Data collection: number of shoot per cluster, number of leaf per cluster, height of shoot (mm) and leaf diameter (mm). Data was recorded 5 weeks after culture.

**Experiment 5:** The effect of the temporary immersion bioreactor system on shoot multiplication. Culture medium: MS basal medium supplemented with 0.5 mg/l BA, 0.2 mg/l NAA and various immersion frequencies (1 minute each 4 hours, 2 minutes each 4 hours, 3 minutes each 4 hours and 4 minutes each 4 hours). Cultural materials: in vitro shoots. Data collection: number of shoot per cluster, height of shoot (mm), fresh weight of shoot per cluster (mg) and proliferation rate of shoot. Data was recorded 5 weeks after culture.

**Experiment 6:** The effect of NAA on the rooting: Culture medium: MS basal medium supplemented with 10% coconut water, 0.8% agar, 0.1% AC, 3% sucrose and difference concentrations of NAA (0, 0.1, 0.3, 0.5 mg/l). Culture material: in vitro shoots. Data collection: rooting rate, number of roots and length of root (mm). Data was recorded 4 weeks after culture.
Results and Discussion

Effect of Explants on Embryogenic Callus Induction

Effects of explants on the induction of embryogenic callus were described in Table 1 after 4 weeks of the culture. According to the result, internode was the most suitable starting material in the embryogenic callus induction with the maximum number of callus induction rate (18.7%), somatic embryo induction rate (79.5%) and callus and somatic embryo induction rate (98.2%) after 4 weeks of the culture (Table 1). The results were far higher than those using areca leaf as a starting material which only reached 14.7% in callus induction rate, 16.0% in embryo induction rate and 22.7% in callus and somatic embryo induction rate after 4 weeks of the culture.

Effect of NAA on Multiplication of Embryogenic Callus

The effects of NAA on the embryogenic callus multiplication were described in Table 2 after 5 weeks of culture. The results showed that on hormone – free basal MS fresh weight of embryogenic callus per cluster, proliferation rate of embryogenic callus fresh weight and number of shoot per cluster only reached at the low rate, standing at 1089.7 mg FW/cluster, 1.1 fold and 1.3 shoots/cluster respectively. However, the highest value was observed at the treatment using culture medium supplemented with 0.1 mg/l BA and 0.5 mg/l NAA with the maximum number of fresh weight of embryogenic callus per cluster (2719.7 mg FW/cluster), proliferation rate of embryogenic callus fresh weight (2.6 folds) and number of shoot per cluster (2.7 shoots/cluster). According to the analysis above, it can be concluded that NAA plays an instrumental role on the embryogenic callus multiplication (Table 2).

Effect of BA and NAA on Somatic Embryos Regeneration

The effects of BA and NAA on the embryogenic callus regeneration were described in Table 3 after 5 weeks of culture. The results showed that on hormone – free basal MS number of shoot per cluster, height of shoot (mm) and leaf diameter (mm) only reached at the low rate, standing at 1.0 shoot/cluster, 35.3 mm and 1.7 mm respectively. However, the highest value was observed at the treatment using culture medium supplemented with 0.5 mg/l BA and 0.25 mg/l NAA with the maximum number of shoot number (3.7 shoots/cluster), height of shoot (87.3 mm) and leaf diameter (7.7 mm). According to the analysis above, it can be concluded that the appropriate medium for the somatic embryos regeneration under in vitro condition is MS basal medium with the combined concentration of 0.5 mg/l BA and 0.25 mg/l NAA (Table 3).

Effect of NAA, IAA, IBA on Shoot Multiplication

The effects of the NAA/IAA/IBA on the shoot multiplication were described in Table 4 after 5 weeks of culture. The results showed that on hormone–free basal MS number of shoot per cluster, height of shoot (mm), number of leaf per cluster and leaf diameter (mm) only reached at the low rate, standing at 1.3 shoots/cluster, 60.3 mm, 3.3 leaves per cluster and 4.7 mm, respectively.

Data collections reached the highest value, accounting for 6.7 shoots per cluster, 96.7 mm in height of shoot, 7.7 leaves per cluster and 11.3 mm in leaf diameter when using culture medium supplemented with 0.5 mg/l BA and 0.2 mg/l NAA.

The combination of 0.5 mg/l BA and 0.2 mg/l IAA demonstrated 5.0 shoot/cluster, 92.7 mm height of shoot, 5.7 leaf/cluster and 10.7 mm leaf diameter.

Additionally, the combination of 0.5 mg/l BA and 0.2 mg/l IBA also reached 4.7 shoots per cluster, 91.0 mm in height of shoot, 6.0 leaves per cluster and 9.7 mm in leaf diameter.

Therefore, the appropriate medium for the shoot multiplication under in vitro conditions is MS basal medium with the combined concentration of 0.5 mg/l BA and 0.2 mg/l NAA after 5 weeks of culture (Table 4).

Effect of the Temporary Immersion Bioreactor System on Shoot Multiplication

The effects of the temporary immersion bioreactor system on the shoot multiplication were described in Table 5 after 5 weeks of culture. The results showed that using the temporary immersion bioreactor with the immersion frequencies (1 minute each 4 hours, 2 minutes each 4 hours, 3 minutes each 4
hours and 4 minutes each 4 hours) on the liquid culture medium had positive effects on the shoot multiplication and reached the highest value at treatment using immersion frequency (3 minutes each 4 hours) with a maximum for the height of shoots (100.25 mm), number of shoot per cluster (7.1 shoots per cluster), fresh weight of shoot per cluster (1470.94 mg/cluster) and proliferation rate of shoot (3.55 fold), compared with culturing on the semi-solid MS. Thus, immersion frequency (3 minutes each 4 hours) is the most effective treatment for shoot multiplication.

Effect of NAA on Rooting

The effects of NAA on the rooting were described in Table 6 after 4 weeks of culture. The results showed that on hormone – free basal MS rooting rate, number of roots and length of root (mm) only reached at the low rate, standing at 3.3%, 0.3 root per shoot and 5.0 mm respectively. However, a higher concentration of NAA has greater data values and the highest value was observed at the treatment using culture medium supplemented with 0.5 mg/l NAA with the maximum number of rooting rate (78.3%), number of roots (3.7 roots per shoot) and length of root (23.3 mm).

Conclusion

The suitable starting material for the induction of embryogenic callus was internodes culturing on the MS basal medium with the combined concentration of 0.1 mg/l BA and 0.5 mg/l NAA with the maximum number of callus and somatic embryo induction rate (98.2 %) after 4 weeks of culture. The appropriate medium for the multiplication of embryogenic cells was MS supplemented with 0.1 mg/l BA and 0.5 mg/l NAA giving a fresh weight of embryogenic cell 2719.7 mg/cluster, proliferation rate 2.6 fold and number of shoot per cluster 2.7 shoots/cluster after 5 weeks of culture. The suitable media for regeneration of embryogenic cells was MS supplemented with 0.5 mg/l BA and 0.25 mg/l NAA giving 3.7 shoots/cluster, shoot height 87.3 mm, leaf diameter 7.7 mm after 5 weeks of culture. Multiple shoots regenerated from embryogenic cells were used as materials for micropropagation. Results showed that the highest data for multiple shoot multiplication was on semi-solid MS supplemented with 0.2 mg/l NAA and 0.5 mg/l BA giving a proliferation rate of 6.7 shoots/cluster, shoot height 96.7 mm and leaf number 7.7. In the bioreactor culture, results reached the highest value with the maximum number of shoot height (100.25 mm), shoot number (7.1 shoot/cluster) and fresh weight of shoots (1470.94 mg/cluster). The suitable media for rooting was MS medium supplemented
with 0.5 mg/l NAA with the maximum rooting rate (78.3%), number of roots (3.7 roots per shoot) and length of root (23.3mm).

Abstract: Floods continue to be the most economically devastating natural disaster in the world. Worldwide, there are a lot of laws and regulations addressing this problem, as well as different models and approaches developed for flooding risk assessment at different stages of urban planning. The aim of this work is to review the existing measures for prevention of floods that threaten the security of the human population, flora and fauna. The study focuses on the necessary measures which must be implemented to tackle the problem, and early warning of population in emergency and disaster situations in order to reduce damage from floods. Existing statistical data is reviewed and analyzed and, as a consequence, recommendations are proposed.

Keywords: floods, prevention, risk assessment, Bulgaria

Introduction

Of all environmental disasters, floods are the most studied (Mardirosyan, 2002). According to United Nations data, every year about 10,000 floods happen worldwide, having different parameters and causing various types of large-scale damage and losses.

Long-term studies have been conducted, aiming to analyze past floods throughout the country, their causes, consequences, and measures which are taken to limit their effects in urban systems.

The Ministry of Environment and Water, the Ministry of Emergency Situations, the "Civil Protection" agency, the official pages of the press and several internet sites were used as sources of information for this paper. The data is summarised by conventional methods.

The aim of this study is to examine the nature and consequences of flooding for ecosystems and urban systems in Bulgaria.

Floods are natural phenomena that are unavoidable. For Bulgaria, they are identified as the most significant type of natural disasters, which have inflicted damage reaching hundreds of thousands of euros in the last few years.

The majority of floods are natural processes, and can occur at any time and anywhere. Different types of floods create different dangers to humans and to objects of residential, industrial or critical infrastructure, and the environment. This is due to varying water level, speed and degree of occurrence, and some other hazards associated with them.

Along with the damage they cause, floods, as natural phenomenon, play an important role in maintaining the balance of nature. They are important environmental factors for the maintenance of aquatic ecosystems. Unlike other natural disasters, floods are subject to a significant degree of foresight in terms of generation and distribution, and in terms of possible consequences. Although they are natural phenomena, their appearance is largely influenced by human activity and human interference in natural processes.

The damage caused by the floods in the recent years is an indication that society is not sufficiently prepared to confront this growing risk. It has been found that the activities performed in flood protection are insufficient and need to move to a policy of comprehensive management of flood risks in terms of „coexistence“ with the floods. The aim is to achieve a reduction of future risks through research, evaluation and impact of all factors that influence the onset of the floods, and the importance of their impact on human health, business and the environment. Such a comprehensive approach to managing flood risks was introduced by the 2007/60/EU Directive – European Floods Directive.

The 2007/60/EU Directive on the assessment and management of flood risks, also known as the Floods Directive, regulates the framework for assessment and management of flood risks in the...
Member States of the European Union. It aims to create conditions for reducing the adverse impact floods have on human health and the environment.

Careful planning of the management of flood risk allows governing bodies to develop a better system for flood risk reduction stemming from all available sources, and to set the priorities for management. The main objective of the plan is to prepare and protect the public and the environment which are at risk by fulfilling the strategic aims and by the implementation of the provided measures,

**Preliminary assessment of flood risk**

In compliance with the requirements of Directive 2007/60/EU, which are fully implemented in Chapter 9, Section II of the Bulgarian Water Act, for each region of basin governance, a preliminary assessment of flood risks is made. The assessment includes:

1. Maps of the region for basin governance of water in appropriate scale, which show the topography and land use and also the boundaries of:
   a) river basins and sub-basins
   b) coastal regions
2. Description of occurrence of past floods with significant adverse effects on the human health, the environment, the cultural heritage, the infrastructure and business, and for which there are indications for future repetition.
3. Scale of the floods, their distribution, and assessment of their adverse effects
4. Assessment of eventual adverse effects of future floods on the human health, the environment, the cultural heritage, the infrastructure and business and taking into account as much as possible:
   a) Topography, the position of watercourses and their general hydrological and geomorphological characteristics, including the retention lowlands as natural water retention areas;
   b) Efficiency of man-made infrastructures (systems and equipment) for flood protection, location of populated areas, and long-term development plans;
   c) Influence of climate change on flood occurrence.

According to the Water Act, in Bulgaria there are defined spate areas called “Project units.” The methodology sets criteria for determining the boundaries of the project units with aim to optimize the work. Bases for determining the project units are major river basins, some of which are divided into two or more units. The main criteria for separation of project units are the areas of the basins (fig.1).

**Figure 1: Map of the Basin Districts in Bulgaria**

Source: Authors

The main steps according to methodology include:
  - Collection of information on past floods and processing the collected data
  - Determination of areas affected by floods - distribution of potential future floods
Determination of potential significant flood damage – based on the information of past floods and on the potential threat of future floods.

The methodology identifies possible sources of information on past floods, and also provides a standardized questionnaire for gathering information from the municipalities. Sources and recommendations regarding the requirements and use of information on damage assessment in the four categories “Human Health,” “Human Activity,” Environment” and “Cultural Heritage” are given as well (Fig.2):

Figure 2: Scheme for indicators in categories to determine significant floods

Source: Authors

It is assumed that the threshold is exceeded if at least one of the indicators in any of the categories determines the flood as significant. The assessment of the significance of the effects of past floods is done separately for each populated place if information for registered floods according to presented data is available.

**Past floods in Bulgaria**

European Commission’s guidelines contained in the”Draft list of flood types and stand consequence” form 16.02.2011 distinguish five types of floods according to their source:

- river – caused by rain and snowmelt
- slope-caused by rain
- lake-caused from rain water inflowing in lakes
- sea – caused by sea storms
- infrastructure – caused by insufficient conductivity of sewer and drainage systems due to rainfall, and wave transferring seawater over protective embankments in the coastal areas of cities

The collected information for floods in Bulgaria covers the period 2000-2010 and refers to 2211 past floods. The reasons for their development, distributed by major river basins, are given in figures 3-6. (Management plan for flood risk for Black Sea Basin District, Management plan for flood risk for Danube Region basin District, Management plan for flood risk for West Aegean Region Basin District, Management plan for flood risk for East Aegean Region Basin District)
Figure 3: West Aegean Region

**Measures of risk management**

Measures for risk management of floods are determined on the bases of:

- the identified aims and priorities for risk management of floods
- national catalogue of measures for risk management of floods
- maps of the threatened regions, and maps of the regions with risk of floods.

In the context of national priorities and aims, the choice of one measure is determined by the effect that it is expected to render in following categories: “Human Health,” “Human activities,” “Environment” and “Cultural Heritage.” The aim is to avoid new risks, reduce existing risks, improve endurance and increase the awareness.

In the process of selecting these measures, a general approach according to the logical scheme shown in Figure 7 is followed.

Figure 7: Logical scheme of choice of measures

![Logical scheme of choice of measures](image)

Source: Authors

**Stage 1. Description of the state** - at this stage the information available for preliminary assessment of floods in the regions with significant potential risk of floods is presented:

- maps of threat and risk of floods
- aims and priorities based on water infrastructure, as well the information gathered and processed in connection with past floods conclusions which are drawn from them.

**Stage 2. Defining main problems** – at this stage, the main problems associated with flood protection are identified and put into perspective of national priorities

**Stage 3 – Formulation of possible alternatives** that present several possible solutions of the problem.

**Stage 4 – Selection of alternatives** – Criteria for selection of alternatives are chosen, and a selection of the best alternative for each problem is made. This is linked to national priorities where level of importance of each measure is determined, and on this basis the choice of alternative evaluation criteria is made.
Stage 5 – Selection of measures – based on the selected alternatives, filters and set of measures are selected.

Conclusion
Floods represent 40% of natural disasters worldwide. Natural floods are the results of heavy rainfall, intensive snow melting, stagnation of watercourses, etc.

In the preventive organizational activities, derived from experiences with the serious consequences of the floods in Bulgaria in the recent years, are included the adoption of new laws and instructions, strengthening the role of the Integrated Rescue System, and operational communication – information centers in the territories of each region are under construction. However, there is a need for the development of more measures for prevention, control and scientific prediction of possible disasters related to water storms, or floods.

REMOVAL OF As (V) BY USING BOTTOM ASH AS ADSORBENT

Meral Yıldırım,¹ Nevin Karamahmut Mermer,² Funda Demir,³ Emek Moroydor Derun⁴

Abstract: Industrial development brings waste problem which is a challenge for both human health and ecological cycle. Arsenic is a toxic and carcinogenic heavy metal that should be removed from drinking or waste water. In this study, an industrial waste of bottom ash was used as an adsorbent to remove As (V). To find an appropriate adsorption conditions, the adsorption temperatures and contact time were varied between 30 °C-50 °C and 5-180 min, respectively. The experimental results were fitted to the Langmuir and Freundlich isotherms. The highest values of n and Kf for Freundlich isotherm were obtained for 30 °C and calculated as 0.432 and 0.006, respectively. According to kinetic studies, the kinetics of these experiments could be explained by pseudo-second order kinetic model, and the pseudo-second order rate constant was calculated as 0.034 g/mg.min, 0.033 g/mg.min and 0.030 g/mg.min for 30 °C, 40 °C and 50 °C, respectively. According to experimental results, bottom ash can be used for removal of As (V) from water sources.

UDC Classification: 66.03; DOI: http://dx.doi.org/10.12955/cbup.v5.1106

Keywords: Adsorption, arsenic, bottom ash, ICP-OES.

Introduction

Heavy metal pollution is a remarkable threat for both human health and environment which is resulted by increasing in industrial activities and urbanization. The trace elements like lead (Pb), cadmium (Cd), zinc (Zn), mercury (Hg), arsenic (As), silver (Ag), chromium (Cr), copper (Cu), and iron (Fe) can accumulate unnoticed to toxic levels and cause many diseases and even death (Duruibe et al., 2007; Yang et al., 2016).

Arsenic is a hazardous, toxic and carcinogenic metalloid which can get into drinking water, underground water, etc. and causes environmental problems by soil erosion and leaching. Additionally, industrial applications such as mining, fuel combustion, using arsenic as pesticide bring about arsenic pollution. Because of its toxicity, the World Health Organization (WHO) limit the occurrence of arsenic in drinking water as 10 mg/L (Mohan et al., 2007; El-Moselhy et al., 2017; Banerji & Chaudhari, 2016). Thus, an effective removal of arsenic from aqueous solutions, as well as other heavy metals, is an important issue to investigate.

There are many approaches to remove arsenic from drinking and waste water including electrocoagulation (Banerji & Chaudhari, 2016), ion exchange, membrane separation, adsorption and precipitation (Zhou et al., 2016; Mohan & Pittman, 2007). Being a low cost, easy to operate and efficient method, adsorption process is widely studied for the removal of arsenic from aqueous solutions by use of adsorbent materials such as activated carbon and zeolites.

In recent years, studies have been focused on alternative adsorbents which are derived from industrial wastes. Industrial wastes like rice husk, peanut shells, fly ash, coconut husk, waste coffee and tea has been recycled to low-cost biosorbents (Cheraghi et al., 2015; Yang et al., 2016; Uddin et al., 2009).

Coal-fired thermal power plants have led to an increase in the occurrence of many solid wastes such as fly ash and bottom ash (Fonteboa et al., 2017; Noh & Son, 2017). When bottom ash is obtained from bottom chamber and contains mineral impurities, fly ash is collected in the electrostatic precipitators or the filters. Because of the high energy demand, the production of these industrial wastes is increasing. On the other hand, the chemical and physical properties of these materials provide their use in many different sectors. Fly ash and bottom ash are widely evaluated in the cement, ceramic, paint, plastic, agriculture, environment and construction applications (Eliche-Quesada et al., 2017). However, there are a few studies that used bottom ash as an adsorbent for removing heavy metals from water. In the study conducted by Lin & Yang (2002), the adsorption of Cu(II) was carried out by coal bottom ash and results showed that coal bottom ash could be an excellent adsorbent for the pollutant in the waste water (Lin & Yang, 2002). Orakwue (2016) compared the adsorption capacities of fly ash, bottom ash and bentonite for adsorption of Iron(II) from acid mine drainage contaminated ground

water and found out that adsorption capacity value of bottom ash was higher than other adsorbents (Orakwue et al., 2016).

The main objective of this study was to investigate the removal of As (V) from the aqueous medium through batch adsorption by bottom ash as a low-cost adsorbent. The adsorption capacity of bottom ash was determined by varying adsorption parameters of contact time and adsorption temperature.

**Experimental Studies**

**Materials**

Bottom ash was supplied from Çelikler Seyitömer Electricity Generation Plant (Kutahya, Turkey). Before use in experimental studies, the supplied bottom ash was dried in an incubator (Ecocell 111, Germany) at 105 °C for 12 hours to eliminate its moisture. After drying, the adsorbent was grounded and sieved by vibratory sieve-shaker (Fritsch, Germany) to access a particle size of below 90 µm. The elemental composition of prepared adsorbent was determined by X-ray fluorescence (XRF) (Rigaku, NEX CG, Canada) in the range of Na-U elements. The BET surface area of bottom ash was measured on a Micromeritics ASAP 2020 instrument using N₂ adsorption after degassing adsorbents at 400 °C for 12 hours. The properties of bottom ash are given in Table 1.

50 ppm synthetic As (V) solution was prepared from standard arsenic solution (Merck KGaA, Darmstadt, Germany) with double deionized water.

**Batch Adsorption Experiments**

The batch adsorption experiments were conducted to decide optimum adsorption parameters by changing experimental parameters. The amount adsorbent was set to 0.5 g after preliminary studies and temperature had controlled magnetic stirrer was used during studies. When initial As (V) concentration (50 ppm), adsorbent weight (0.5 g), pH (2) and the stirring speed were kept constant, the contact time and adsorption temperature were varied between 5-180 min and 30-50 °C, respectively. After determined adsorption time, the residual As (V) concentration was determined by Inductively Coupled Plasma - Optical Emission Spectrometer (ICP-OES) (Optima DV 2100, Perkin Elmer, USA). The concentration of As (V) remained in the adsorbent phase (qₑ, mg/g) was calculated by the equation (1) (Qiu et al., 2015):

$$q_e = \frac{C_i - C_f}{m} \times V$$

(1)

where V is the volume of solution (mL), m is the weight of adsorbent (g), Cᵢ and Cᶠ are the initial and final concentration of As (V) (mg/L), respectively (Qiu et al., 2015). The As (V) removal efficiency of bottom ash (R %) was calculated by following equation (2) (Cheraghi et al., 2015):

$$R(\%) = \frac{C_i - C_f}{C_i} \times 100$$

(2)
Adsorption Isotherms

Adsorption isotherms give information about the interaction between solute and adsorbent surface at a constant temperature. Langmuir and Freundlich’s isotherms were used to analyze equilibrium data. According to Langmuir isotherm theory, adsorption takes place by monolayer coverage of adsorbate onto the homogenous adsorbent surface (Hameed, 2009). Langmuir isotherm is given as:

\[ q_e = \frac{q_{max} K_L C_e}{1 + K_L C_e} xV \]  

(3)

where \( q_{max} \) is maximum adsorption capacity of adsorbent (mg/g), \( C_e \) is the concentration of As (V) in the solution at equilibrium (mg/L) and \( K_L \) is Langmuir constant related to the affinity of the binding sites (Bhattacharya et al., 2008; Hameed, 2009). In Langmuir isotherms, the separation factor of RL is used to indicate the essential characteristics of the isotherm. When RL is between 0 and 1, it expresses that the adsorption is favorable (Hameed, 2009).

\[ R_L = \frac{1}{1 + K_L C_i} \]  

(4)

Freundlich’s isotherm is expressed as equation (5),

\[ \ln q_e = \ln K_F + \frac{1}{n} \ln C_e \]  

(5)

where \( K_F \) is Freundlich constant related adsorption capacity of adsorbents, \( n \) is constant about the intensity of adsorption. The values of \( K_F \) and \( n \) can be determined from the plot of \( \ln q_e \) versus \( \ln C_e \) (Qui et al., 2015; Uddin et al., 2009).

Adsorption Kinetics

The experimental results were fitted to the two common kinetic models, namely Lagergren pseudo-first order kinetic model, pseudo-second order kinetic model, to investigate kinetic parameters and mechanism of As (V) adsorption onto the bottom ash. Lagergren pseudo-first order kinetic model is represented as following form (6),

\[ \frac{dq_t}{dt} = k_1 (q_e - q_t) \]  

(6)

where \( k_1 \) is the pseudo-first order rate constant (min\(^{-1}\)), \( q_t \) and \( q_e \) are amounts of adsorbed As (V) per unit mass of adsorbent at time \( t \) and equilibrium time (mg/g), respectively. Pseudo-second order kinetic model can be expressed as given in the equation (7),

\[ \frac{dq_t}{dt} = k_2 (q_e - q_t)^2 \]  

(7)

and \( k_2 \) is the pseudo-second order rate constant (g/mg.min).

The appropriate kinetic model which explains kinetics and mechanisms of As (V) adsorption onto the bottom ash can be determined by drawing linear plots for each kinetic models and calculation correlation coefficient of \( R^2 \).
Results and Discussions

Adsorption results

The effects of contact time and adsorption temperature on the As (V) adsorption and removal percentage of As (V) are shown in Figure 1 and Figure 2, respectively. It can be seen that the amount of adsorbed As (V) per unit mass of adsorbent increased by increasing contact time. In the initial stages, the removal of As (V) was rapid. However, after 60 minutes of contact time, the system reached the equilibrium, and the adsorbed amount did not show a significant difference. This phenomenon can be explained by the higher amounts of the available adsorbent surface for As (V) at the initial adsorption times.

The adsorption capacity of bottom ash showed similarity for each adsorption temperatures. On the other hand, the values of $q_e$ at 30 °C were bigger than those at higher temperatures, from which it can be deduced that the adsorption behavior of As (V) is more efficient at low temperature.
Adsorption Isotherms

The calculated isotherm parameters and correlation coefficients ($R^2$) are given in Table 2. The equilibrium data were better fitted by the Freundlich isotherm model than done by Langmuir isotherm equation. For all studied temperatures, high $R^2$ values were indicating that the obtained data were in good agreement with the Freundlich model, which implies that the surface of adsorption is heterogeneous and there are many types of active adsorption sites on the adsorbent. The obtained $n$ values were smaller than one which means the adsorption carried out by a chemical process which is associated with a higher adsorption enthalpy and slower kinetics of adsorption than physical adsorption (Orakwue et al., 2016).

Adsorption Kinetics

Table 3 represents the summary of data calculated for pseudo first-order and pseudo-second order model. Also, Figure 3 and Figure 4 show the pseudo-first order and pseudo second order plots for different adsorption temperatures ranging from 30 to 50 °C. According to the correlation coefficients ($R^2= 0.998$), it could be concluded that the pseudo-second order kinetic model can be used to describe the adsorption process of As (V). It shows that the chemisorption of As(V) ions was the rate-determining step of the adsorption process. This process contains the chemical interaction between As(V) ions and polar groups on the adsorbent, such as ion exchange and chelating reaction (Zhou et al., 2016; Yang et al., 2016). For 50 °C, 40 °C, 30 °C the pseudo second order rate constant $k_2$ were calculated as 0.034 g/mg.min, 0.033 g/mg.min and 0.030 g/mg.min.

Source: Authors

According to the pseudo-second order kinetic model, the predicted adsorption density $q_e$ at equilibrium values were close to the experimental $q_e$ values. The good agreement between the predicted and experimental values of $q_e$ shows that the pseudo-second order kinetic model represents the adsorption kinetics of As (V) onto the bottom ash.
Figure 3: The fitting of pseudo-first-order model for As (V) adsorption onto the bottom ash

Source: Authors

Figure 4: The fitting of pseudo-second-order model for As (V) adsorption onto the bottom ash

Source: Authors
Conclusion

The present investigation showed that bottom ash could be an effective adsorbent for the removal of As (V) ions from the aqueous solution. The experimental study with different parameters showed that adsorption temperature did not have a significant effect on the removal of As (V) onto the bottom ash when increasing contact time increased the adsorbed amount of As (V) up to 60 minutes. The equilibrium data were fitted to the different isotherm models, and the equilibrium data were best described by Freundlich’s isotherm. Kinetics for the removal of As (V) were obtained and fitted to various kinetics models. The pseudo-second order kinetic model provided a good correlation for the adsorption process, and the result showed that this process is suggesting that chemisorption controlled the adsorption process.

STABILITY EVALUATION OF CAFFEINE-8-THIOGLICOLIC ACID AMIDES, WITH DETERMINED ANTIHYPOXIC EFFECTS

Javor Mitkov,¹ Maya Georgieva,² Alexander Zlatkov³

Abstract: This study evaluates a series of caffeine-8-thioglycolic acid amides that were synthesized in the study, for signs of possible degradation. The chemical stability of the test compounds was examined under different conditions of pH and temperature over time. A modified reversed phase-high-performance liquid chromatography method was applied to determine stability and identify possible degradation products. The study identified a new product from oxidative destruction of the test compound through controlled synthesis.

Keywords: caffeine-8-thioglycolic acid amides, stability, RP-HPLC

Introduction
Substituted xanthine derivatives are a class of biologically active substances that are well-defined and widely studied in terms of their pharmacological activity as adenosine receptor antagonists, phosphodiesterase inhibitors, and inducers of histone deacetylase activity (Kalla et al., 2006; Lin et al., 2006; Ito et al., 2002). Due to these and several other known factors, this group have become broadly used in medicine not only as agents affecting the central nervous system, but also as active substances in the field of asthma, bronchitis, and chronic obstructive pulmonary diseases and as diuretics, cardiac stimulants, and renal protective agents (Caramori et al., 2003; Dal Piaz & Giavannoni, 2000; Kiesman et al., 2006).

In developing pharmacologically active substances, the stability of an agent is highly relevant because it relates to the duration in which the product maintains its physical, chemical, microbiological, and toxicological properties within previously established limits (Almeida et al., 2013). To evaluate stability, samples of the designed structures are subjected to conditions of temperature, humidity, and light that are known to accelerate the rate of chemical degradation and thus interfere with the microbiological and toxicological quality of the substances (Baby et al., 2004). A preliminary stability study provides information on the behavior of the synthesized molecules for a given period while subjected to different environmental conditions (Almeida et al., 2013).

The subject of our study is to evaluate the chemical stability of caffeine-8-thioglycolic acid amides (that were synthesized in the study) under certain conditions of temperature, pH, and presence and absence of air.

Materials and Methods
Chemistry
Melting points were determined in Celsius (°C) using an electrothermal apparatus (B-535, BUCHI Switzerland) in an open capillary tube and uncorrected values recorded. Using Fourier transform infrared spectroscopy (FTIR), the spectra 400 – 4000 cm⁻¹ were recorded using a Nicolet™ iS™10 FT-IR spectrometer (Thermo Fisher Scientific) with an attenuated total reflectance (ATR). The ¹H- and ¹³C-Nuclear Magnetic Resonance (NMR) spectra were recorded at ambient temperatures, with dimethyl sulfoxide-d₆ (DMSO-d₆) as the solvent, using a Bruker-250 WM (250 MHz) spectrometer (Germany). The ¹H-NMR spectra were measured with solutions of approximately 0.03 M and the ¹³C-NMR spectra with solutions of approximately 0.05 M, both using DMSO-d₆ as solvent, and chemical shifts were expressed as δ values in parts per million (ppm) against tetramethylsilane (TMS) as an internal standard. Splitting patterns were designed as follows: s, singlet; d, doublet; t, triplet; and m, multiplet. Mass spectra were recorded using a liquid chromatography-mass spectrometry (LC-MS)/MS Thermo Scientific Q Exactive Plus - Dionex 3000 Rapid Separation liquid chromatography (RSLC) system. Preparative thin layer chromatography (TLC) was performed using a DC-Alufolien

Kieselgel 60 F254, with 0.20 mm (Merck, Germany) sheets in the mobile phase: chloroform–acetone–ethanol (3:3:4; v/v). The spots were detected at UV 254 nm. Elemental analyses were performed by the microanalytical laboratory of the Faculty of Pharmacy (Medical University-Sofia) using a EuroEA3000-Single analyzer (EuroVector S.p.A, Milan). Synthetic grade chemicals procured from Merck, Germany, were used for the synthesis of the target compounds, as received. All solutions were dried over anhydrous sodium sulfate and evaporated on a BUCHI rotary evaporator at reduced pressure. The given yields were for the analytically pure product. No efforts were made to optimize the yields. „Nomenclature” was generated by using structure-to-name and name-to-structure algorithms of the software, ChemBioDraw Ultra 11.0 (CambridgeSoft).

**Synthesis of N-(2-phenylethyl-2-((1,3,7-trimethyl-2,6-dioxo-2,3,6,7-tetrahydro-1H-purine-8-yl)-sulfanyl)-acetamide, 3**

A solution of 3.87 g (0.01 mol) of a caffeine-8-thioglycolic acid amide 2b, (Figure 1) in 50 ml of methylene chloride was placed in a three-necked reaction flask equipped with a thermometer and a reflux condenser. The reaction flask was placed in a water bath (at 10 °C) with 1.9 g (0.011 mol) m-Chloroperoxybenzoic acid (m-CPBA), dissolved in 20 ml of methylene chloride, which was added slowly while stirring the solution. The temperature of the reaction mixture was kept within the range 10–15 °C, with ice pieces added to the bath when necessary to maintain this range. After complete addition of m-CPBA, the reaction mixture was stirred at room temperature for one hour (controlled using the TLC in system 2). Then, the solvent was removed under reduced pressure, and the crude product was recrystallized from methanol. Yield 3.06 g (76%) m.p. 187 - 189 °C; FT-IR (ATR) 3275 (νNH), 3102 (νCH - aromatic), 1704 (νCO - xanthine), 1668 with shoulders at 1601 and 1627 (νCO - xanthine, νCO – amide I, νC= –NH, νC=–C - aromatic), 1552 and 1534 (νC= – xanthine, νC=– aromatic, νNH – amide II), 1062 (νSO), 754 and 746 (νCH - aromatic). The ¹H–NMR: 7.28–7.10 (m, 5H, aromatic); 4.81 (s, 2H, CH₂); 3.80 (s, 3H, CH₃); 3.49 (s, 3H, CH₃); 3.32 (s, 3H, CH₃); 3.27(d, 2H, CH₂, J = 6.7 Hz); 2.82 (d, 2H, CH₂, J = 6.7 Hz); ¹³C–NMR: 163.9 (CO–NH)160.4 (C₈ₓanth CO); 151.4 (C₂ₓanth CO); 139.1, 128.5, 128.7, 129.9 (6 × C aromatic ring); 148.8 (Cₓanth); 107.1 (Cₓanth); 59.7 (SO–CH₂), 41.4 (NH–CH₂); 35.75 (CHₓPh side chain), 32.5 (N₇ₓanth CH₂), 29.8 (N³ₓanth CH₃), 27.9 (N¹ₓanth CH₂); MS m/z: 167 (100), 445 (M+1). Microanalysis: Calc. C 53.59%, H 5.25%, N 17.36%, S 7.95%; Found C 53.55%, H 5.25%, N 17.39%, S 7.98%.

**Instrumentation and Chromatographic Conditions**

The chromatographic analysis was performed on a liquid chromatography (LC) system (LC-10ADvp, Shimadzu, Kyoto, Japan), equipped with temperature control unit (CTO-10ASvp, Shimadzu, Kyoto, Japan), an isocratic pump, and a UV-VIS detector (SPD-10AVp, Shimadzu, Kyoto, Japan). The following chromatographic columns: TRACER EXCEL™ (Teknokroma, Spain) Reverse-Phase (RP) 18 (ODS 250 mm × 4.6 mm, 5.5 μm) and Luna® (Phenomenex, California) 5 μC18(2) 100A (4.6 i.d. × 250 mm), were chosen for method validation and stability testing. The UV-VIS detector was set to wavelengths of 240 and 254 nm. Isocratic elution with a flow rate of 2.0 ml min⁻¹ was used. A column oven was conditioned at 20 °C. The injection volume was 20 μl with an analysis time of 15 minutes. The following chromatographic procedure was developed for obtaining best separation for the analyzed model compound from its degradation products, based on the application of a polar mobile phase for isocratic flow with no additional buffering (Table 1).

**Preparation of the Mobile Phase**

In a 1-litre volumetric flask, a 98/2 v/v solvent mixture of acetonitrile/water was prepared. The obtained solution was degassed through a 45-μm membrane filter.
Preparation of Buffer pH 1.0
A 0.01 mol l⁻¹ HCl solution was prepared with a pH of 1.0.

Preparation of Buffer pH 12.0
A 0.01 mol l⁻¹ NaOH solution was prepared with a pH of 12.0.

Results and Discussion
The test products were synthesized according to a procedure described elsewhere (Mitkov et al., 2007, 2010; Figure 1).

Evaluation of the Stability of the Synthesized Caffeine-8-Thioglycolic Acid Amides
To study the properties of the resulting amide derivatives, the behavior of the structures was followed for degradation processes at different values of pH over time.

For this purpose, compound 2b (Figure 1) was selected as a model structure, since it was the least spatially hindered amide. The lack of shielding substituents indicated that this amide would be the most susceptible to hydrolysis.

Based on the synthesis approach for obtaining the desired caffeine-8-thioglycolic acid amides and the chemical properties of the amide group, a hydrolytic cleavage of the amide bond and formation of the first caffeine-8-thioglycolic acid was expected.

The analyzed product, 2b, and the expected caffeine-8-thioglycolic acid, were chromatographically analyzed, individually as well as in a model mixture, to validate the applicability of the RP-HPLC method modified by this study.

Validation of the Modified RP-HPLC Analytical Procedure
The method was validated according to guidelines of the International Conil for Harmonisation (ICH) of Technical Requirements for Pharmaceuticals for Human Use (ICH, Q2(R1), Harmonised Tripartite Guideline, 2005). The system suitability (i.e., repeatability of retention times and areas, the number of theoretical plates, and resolution), precision, linearity, accuracy, and selectivity were evaluated during
the method validation (Table 2). The test products were evaluated for accuracy, precision, and selectivity.

*Six injections per product.

\( ^{\dagger} \)Two samples of each product, three injections of each sample.

\( ^{\dagger} \)At 50, 100, 150, 200 and 250 % concentration level.

% RSD: Relative standard deviation in %

**Source:** Authors

**Precision**

Six sample solutions (three of Caffeine-8-thioglycolic acid and three of 2b) were prepared and each sample was injected three times. The final results were reported as relative standard deviation (% RSD) of the ratios of the peak area of the tested compound.

**Linearity**

A 5-point calibration curve was created, covering the concentration range of 2b, from 0.02 mg ml\(^{-1}\) to 0.1 mg ml\(^{-1}\). A linear regression of the calibration data was performed. The correlation coefficient of linearity was 0.998 (Figure 2), which indicated a high correlation between the peak areas and the range of concentrations studied.

**Accuracy**

A solution of Caffeine-8-thioglycolic acid and a stock solution of compound 2b were prepared. From these, six subsamples (three of the Caffeine-8-thioglycolic acid and three of the stock solution), allowed each solution to be injected onto the column three times. Accuracy is reported as a parameter recovery with relative standard deviations.
Selectivity
The selectivity was determined by the corresponding selectivity factor \((\alpha)\), measured as a ratio of the retention factors \((k)\) of the two peaks in question and visualized as the distance between the apices of the two peaks.

Determination of Stability at Different pH
Chemical Stability
By definition, chemical stability is the tendency of a substance to sustain changes or decay caused by internal reactions or effects of air, humidity, heat, light, pressure, or other external factors. The compound presented in this paper had been stored for six months at room temperature with access to air and light. The physical and chemical properties of the compound were determined to be unchanged under these conditions. Hence, the test compound was considered chemically stable.

An important factor influencing the performance of the molecules in an organism is the hydrolytic stability of the molecules under the following conditions: temperature of 38 °C and pH of 1.0 and 12.0 (ICH Guidance for industry, Q2A (R2), 2003).

Hydrolytic Stability Study at a Temperature of 38 °C, pH of 1.0 and 12.0, and in Oxygen-Free Media

For evaluating stability, corresponding buffer solutions of the test compound, 2b, were prepared to obtain the desired pH values. A 10-mg sample of the model compound was weighed and dissolved under oxygen-free conditions in corresponding buffers of pH 1.0 and 12.0, respectively. The obtained solutions were stirred while being maintained at 38 °C for a total of 1440 min (24 hours) using liquid nitrogen to assure the absence of air. Aliquots of 20 \(\mu\)l of the analyzed solutions were drawn at 30-minute intervals and injected into the apparatus. The corresponding chromatograms were obtained (Figures 3–4).

Stability Determination of Compound 2b at pH 1.0

A 10-mg sample of the model compound was weighed and dissolved in 100 ml of 0.01 mol \(\text{HCl}\) (pH 1.0). This solution was stirred at 38 °C for a total time of 1440 min using liquid nitrogen to assure the absence of air. Aliquots of 20 \(\mu\)l samples were drawn at 30-minute intervals and injected into the RP-HPLC system. Figure 3 presents a representative chromatogram.

As presented, no additional peaks were visible for the total 1440 min evaluation period under these conditions.
Stability Determination of Compound 2b at pH 12.0

A 10-mg sample of the model compound was weighed and dissolved in 100 ml of 0.01 mol l⁻¹ NaOH (pH 12.0). The obtained solution was stirred at 38 °C for a total time of 1440 min using liquid nitrogen to assure the absence of air. Aliquots of 20 μl samples were drawn at 30-min intervals and injected into the RP-HPLC system. Figure 4 displays a representative chromatogram.

![Representative chromatogram](image)

Source: Authors

As presented, no additional peaks were visible for the total 1440 min evaluation period under these conditions. These results lead to the conclusion that in both media no hydrolysis occurred within 24 hours. These evaluations were conducted in oxygen-free media.

To identify the influence of oxygen on the stability of the target product, evaluations were performed in oxygenated media. The chosen model compound was incubated in both acid and alkali media for 1440 min using the above-discussed conditions, as follows: A 10-mg sample of the model compound was weighed and dissolved in corresponding buffers of pH 1.0 and 12.0, respectively. The obtained solutions were temperature-controlled and stirred in oxygenated media at 38 °C for a total time of 1440 min (24 hours). Aliquot samples of 20 μl of the analyzed solutions were drawn at 30-minute intervals and injected into the apparatus. The corresponding chromatograms were obtained (Fig. 5 & 6).

Stability Determination of Compound 2b at pH 1.0 in the Presence of Air

Fig. 5 shows the effects of incubating the test compound in acid media, pH 1.0, in the presence of air. An unidentified peak with a retention time close to that of the analyzed structure was observed under the test conditions. The calculated relative retention of the unidentified peak and that of 2b were close to 1. This showed that no separation was achieved under the applied chromatographic conditions.

Stability Determination of Compound 2b at pH 12.0 in the Presence of Air

After a 16-hour incubation of the test compound in alkali media, pH 12.0, in the presence of air, the same results to those for the acid media presented. Again, no separation was achieved.

In an attempt to separate and identify the new product, the chromatographic procedure was modified, by changing the mobile phase as shown in Table 3.
**Figure 5:** A representative chromatogram of 2b in acid media (pH 1.0) after 10 hours in the presence of oxygen

In applying the new conditions, a good separation was achieved, as shown in Figure 6.

**Fig.6:** A representative chromatogram of 2b in acid media (pH 1.0) after 10 hours in the presence of oxygen

![Chromatogram](image)

Source: Authors
Based on the identified degradation product having a similar chromatographic behavior to that found for 2b, it appears the targeted amides are oxidized through exposure to air into corresponding sulfines. This process is similar to the derivation of corresponding esters from caffeine-8-thioglycolic acid (Mitkov et al., 2007).

To demonstrate this, we synthesized the probable sulfine product, according to the procedure, summarized in Figure 7.

### Figure 7: Synthesis of the sulfoxide via oxidation of 2b with m-CPBA

The synthesized compound was found to be freely soluble in chloroform, dichloromethane, Dimethylformamide (DMF), and DMSO, but insoluble in non-polar solvents, such as n-hexane. The structure of the synthesized S-oxide was confirmed by FTIR, ¹H– and ¹³C–NMR, MS spectra, and elemental analysis. The results were consistent with the assigned structure. The ¹H–NMR spectrum of the compound revealed the signals of the respective protons, which were verified by chemical shifts, multiplicities, and coupling constants.

The chemical shifts of the protons and carbon atoms, registered by ¹H– and ¹³C–NMR spectra, were compared with simulated values (Banfi et al., 2008, Andrés et al., 2011, Aires-de-Sousa et al., 2002). A strong correlation between the registered and computed values was observed.

The obtained product was analyzed individually and in a model mixture with the initial 2b. Figure 8 shows the result of the analysis.

### Figure 8: A chromatogram of 2b (A), its sulfine 3 (B) and a model mixture of these (C)

An unidentified peak as a result of the degradation under acid (pH 1.0) and alkali (pH 12.0) media in the presence of oxygen is shown at the same retention time as that for the sulfine product (B; Fig.8).

### Conclusion

The stability of an amide derivative of caffeine-8-thioglycolic acid, 2b, was determined under acid (pH 1.0) and alkali (pH 12.0) conditions, at a temperature of 38 °C and in the presence and absence of oxygen. A sulfine degradation product resulted in both pH condition, in the presence of oxygen only.
The structure of the degradation product was determined through controlled synthesis. The findings lead to the conclusion that the only possible degradation process for the test structure is via oxidation at 38 °C in strong acid and alkali media with exposure to air. We propose this to be the most probable metabolic process of the target compound.

Sources of Air Pollution, Environmental Impacts and Exploitation of Natural Resources in Kosovo

Adem Dreshaj,1 Bedri Millaku,2 Sabiha Shala,3 Afrim Selimaj,4 Halit Shabanë5

Abstract: Concerns and uncertainty about the life on Earth are constantly growing, today greater than ever before, as a result of human activity. In this regard, the major dangers that threaten our planet include uncontrolled utilization of natural resources, environmental deterioration and environmental pollution over Earth's regenerating possibilities. Whereas, the main causes of pollution are deforestation, erosion, greenhouse gas emissions, poor urban and industrial waste control and uncontrolled mining activities. All of these lead to serious consequences for life on Earth, because of the natural resources of the soil and its capacity to absorb waste gases (CH₄), and the release of heavy metals such as Pb, Zn, Cd, Cu, Fe and As, which are the biggest soil pollutants. The Earth is being cemented, and its regenerating capacities are being diminished every day.

UDC Classification: 502/504; DOI: http://dx.doi.org/10.12955/cbup.v5.1111

Keywords: Emission, pollution, tourism, sustainability

Introduction

As Shehu (2006) claims, the non-regenerating natural resources are the ones that when used cannot be replaced. This is the case with fuels and mineral exploitation. But in practice, it has been stated that even renewable resources, such as forests, waters, etc., when used irrationally might have consequences on the environment.

Certain human activities might lead to significant environmental damage, irreversible, to the disorder of natural balances (Law No. 03/1-233 on nature protection, 2013). Additionally, the rapid growth of the global population, followed by the desire for a higher standard of material living has led to the environmental damages on a global scale (Qullaj, 2010).

On the one hand, industrialized countries that comprise only ¼ of the world's population consume about 82% of natural resources. On the other hand, the capacities of Earth to keep people and other living things safe have been considerably diminished (Lajci & Kalaj, 1998). In less than 180 years, our planet has lost about 6.2 million km² of forests, while the extraction of water has been increased from 100 to 3600 km³ per year (Daci, 1978).

Therefore, air and soil pollution and the shortage of drinking water and natural waters have become a serious and persistent threat to the health of human beings and the living world in general.

Environmental Pollution with Heavy Metals

According to the UN report (2005), about ½ of the global population of 6.3 billion people live in cities, and this number might increase to 5 billion or 61% of the population by 2030 (Law Nr. 04/ L-147 on Water, 2013).

In addition, a dramatic rise in population marked a number of cities. Today, there are more than 22 cities with populations of over 11 million (Lajci & Kalaj, 1998). It is estimated that three-quarters of the population in developed countries live in cities. Our civilization is endangered today because people abuse natural resources and damage the natural systems of the Earth while pushing the limits of the earth’s capacity (Shehu, 2006). This situation has concerned not only scientists and politicians but also citizens, wherever they are on the globe (Dreshaj, 2013).

In general, nowadays, atmospheric air pollution has become a great concern (Daci, 1978). The main causes are economic and industrial development, and also living conditions (Qullaj, 2010).

Also, the pollution of air has been affected by the undeveloped industry, the introduction of obsolete technologies, the growth of cities, the unplanned and illegal construction, the approach of residential

areas near industrial sites, the reduction of green areas (parks and gardens), increased vehicle traffic, and use of high-content lead fuels (Dreshaj, 2013).

**Geographical position and the development of tourism in Kosovo**

According to Qullaj (2010), Kosovo is characterized by a suitable geographic position. It lies in the southeast Europe and in the central part of the Balkan Peninsula, thus being an important crossroad of transitional roads connecting various parts of Europe and beyond it since the ancient times to the present day.

The geographic position gained particular importance after the construction of the Thessaloniki-Skopje-Kosovo Polje-Mitrovica railroad in 1874, which connected the southern and northern parts of the Balkans and Europe (Besa, 2015).

The transit function increased further with the construction of the Ferizaj - Pristina - Mitrovica road which continued along the valley of Iber by creating links with central and western Europe, whereas, through Kacanik connected to the south and - Corridor 8, Durres-Skopje-Sofia-Varna (Besa, 2015). Construction of the Adriatic highway (1971) increased the transitory links of Kosovo with the Adriatic coast and widened the Dalmatian corridor turning Kosovo into an important regional crossroad (Shehu, 2006).

The Relief

The most important forms of relief are hollows (Kosovo, Dukagjin, etc.), and mountains (Sharri, Albanian Alps – Rugova Mountains, Koponik), etc. Mountains account for 64%, while the hollows account for 36% of Kosovo's territory (Law on waste, 2012). The average altitude of Kosovo is 810 m with the extremes between 270 m, the lowest point in Vermica, and 2656 m, the highest point in Gjeravica (Besa, 2015).

In terms of hypsometric aspect, areas under 700 m comprise more than half of the territory of Kosovo (52.6%), 700-1000 m areas comprise more than a quarter (26.6%), while surfaces over 1000 m account over 1/5 (20.8%), of the territory of Kosovo (Law No. 03/L-160 on air protection from pollution, 2010). The relief represents a very important influential element of the climate, hydrograph, the establishment, and development of dwelling places or settlements, etc. (Qullaj, 2010).

The climate of Kosovo is under the influence of macro-climate factors: geographic latitude, land position, water, based on the macro – climate factors. Thus, Kosovo is characterized by a moderate continental climate, but local factors also affect the situation of other climate types (Shehu, 2006). Depending on these factors, the eastern part (Kosovo Plain) is characterized by a continental climate, whereas, the western part (Dukagjin Plain) is characterized by an average continental climate with a significant influence of the Mediterranean climate of the Adriatic Sea through the Drini Valley.

Hilly mountainous areas (750-1000 m), as transitional areas are characterized by subalpine climate and mountainous areas (over 1000 m), are characterized by alpine climate (Besa, 2015). Kosovo’s average temperatures are around 11 °C with the minimum temperature - 25.2 °C and the maximum up to 39.2 °C. Maximum average annual rainfall is 591 mm. Due to the impact of local factors, the western part of Kosovo is characterized by a higher temperature (average for 1 °C higher), and a higher average amount of precipitation (by around 100 mm) than the eastern part of Kosovo.

**Air pollution**

The air is an important environmental factor and a necessity for life. Its pollution is caused by mixed substances that come in the natural or artificial ways and become the main reason of deterioration of its quality, causing a series of illnesses, and degradation of other environmental elements (Lajči & Kalaj, 1998).

Air pollution poses a great danger to the population, particularly to high-risk groups, such as children and the elderly (Shehu, 2006). Air quality deterioration is caused by the presence of pollutants such as SO₂, NOx, and particulate matter in abeyance (PMA), troposphere ozone, carbon monoxide, volatile organic compounds and heavy metals (Daci, 1978). Also, transport growth is accompanied by increased pollution from NOx, PM, O₃, carbon monoxide, and hydrocarbons.
Cycles of air pollution

Three cycles are considered as the most important regarding the air pollutants on the environment:

- The first cycle is the process of emission, that is characterized by parameters such as the type of pollutants, the quantity of pollutants, the scale of the source of discharge, the temperature of the material emitted, the speed and time of the emitted material;
- The second cycle is the atmospheric transport of pollutants. It includes possible physical or chemical factors, for example, photochemical reactions and the spatial distance between the source of the discharged pollutant and the area which the pollutant affects.
- The deposition process is the third cycle. The deposition means the local impact of pollutants on the environment. It depends on the weather conditions or climate change, such as the inversion of temperature or precipitation and their duration (Lajçi & Kalaj, 1998).

Air pollution modeling

Modelling techniques are some of the most important instruments dealing with air quality. The models are useful for predicting the behavior of systems, which are too complex for accurate analysis of the subject. Likewise, models are used to predict the worst cases of pollution (Qullaj, 2010).

Factors in the spread of polluting particles are:

- Wind, which is dependent on the shape (roughness) of the surface of the Earth;
- The effect of friction between the air and the earth's surface, wind speed, and turbulence;
- Wind speed decreases significantly closer to ground level, if the surface is relatively rough, for example. With trees and buildings, airflow tends to turn into turbulence, and increasing wind speed with height from ground level is relatively small (Davis & Mc Entire, 2006).

Sources of air pollution in the Republic of Kosovo

Resources of mining and energy in Kosovo are used in an uncontrolled manner, neglecting the condition of the environment, without adequate environmental projects and adequate professional treatment of the case. Hence, this situation is causing major damage to human health and the environment in general (air, water, soil and natural landscapes). In 1988/99, energy, non-ferrous metals and processing of metals comprised about 65% of the industrial production in Kosovo (Law No. 04/L-06 on waste, 2012).

According to reports, the concentration of lead in the air in 1980/91 was increased from 22.9 to 25.2 micrograms for m³. Except for SO₂, NOₓ, the organic substances that were emitted in the air in 1990 and further on, are as follows:

- Dust 4910 t/year;
- Lead 1120 t/year.

Great potential pollutants are found from other metals such as Ag, As, Cd, Cu, Fe, Pb, Zn, etc.

Whereas, a particular problem derives from the following indicators:

- Slag of smelters in million tonnes;
- Wastes from electrolysis of approximately 560,000 tones Zn;
- Waste of frying concentrates nearly 760 000 tonnes;
- Trash flotation;
- Old landfill near the smelter in Zvecan about 6.47 million t / pyrite, 3.31 million t / Pirot and 566 000 t / oligo.

Heavy metal pollution from road traffic

The main processes through which vehicles emit pollutants into the environment are combustion processes of fuel, vehicle depreciation (engine, tires, and brakes), and oil leakage or anti-freeze, and also corrosion (Lajçi & Kalaj, 1998). While emission control regulations have led to a substantial reduction in emissions coming from road traffic, it has recently been noticed that emissions from other vehicles were not affected (Damek-Poprawa & Sawicka-Kapusta, 2003). Accordingly, lead is released during fuel combustion processes, zinc dust is derived from tires (zinc catalyst used in the manufacture of tires), and copper is derived from the corrosion of the radiator and brakes; other heavy metals are
from mixed backgrounds (Ferguson, 1989). Then origin of Zn of road traffic is from corrosion of ABS braking system (Dakonta, 2009). Today, most important heavy metals related to road traffic are: Cu, Pb, and Zn. Historically, lead has been related to road traffic. Other metals coming from road traffic include, Cd, Cr, Cu, Ni, Sb and Zn from amortization of brakes, Zn and traces of Cd, Co, Cr, Cu, Hg, Mn, Mo, Ni and Pb from tires and Cd, Cr, Cu, Ni, lead and V, from gases released by burning fossil fuels (Qullaj, 2010).

The effects of pollution on health are of particular concern for the population of Kosovo. These effects are often significant and lead to major public debates. Therefore, the effects of pollution vary depending on the pollutants and include:

- Acute respiratory diseases;
- Worsening of patients condition who suffers from heart diseases, respiratory diseases, and asthma;
- Cancer caused directly by pollutants;
- Impacts on the eye or nose irritation and stress or loss of general welfare.

While in most cases, the effects are small, in some cases, the impact may be bigger and in extreme cases, the consequences are life-threatening. In 2016, 1045 people have been diagnosed with cancer, and half of them died. The government of Kosovo is paying 5 million for the chemotherapy chemicals treatment of persons diagnosed with CA.

**Short and long term exposure to PM particles**

According to (Dreshaj, 2014) exposure to PM particles always refers to a respiratory disease, cardiovascular disease, and other consequences. PM10 particles are smaller than 10 micrometers in diameter, so they easily infiltrate into the respiratory tract (Law No. 04/L-197 on chemicals, 2014). It was found that an exposure to very small fractions of particles PM2.5, which account for about two-thirds of PM10 emissions, results in an even stronger association of the observed effects on disease, but also warn that there are fractions between PM10 and PM2.5 which may have some influence on health (Qullaj, 2010).
Research Methodology and Materials

The samples for the research have been taken at various stations in the center of Pristina, and in Kosovo Polje near the roadway.

After transporting the samples to the laboratory, the instruments used to measure the analysis were: Turnkey’s - equipment for the measurement of particles. The photometry used in the Turnkey’ instruments as Tapas, Osiris and the Dust mate provides a continuous and simultaneous overview of mass fractions PM 2.5, PM 10 and GPM (Dreshaj, 2013).

The dust mate portable monitor is a monitor laser detector and is ideal for sampling in the field. This device analyses the total particulate matter (TPM), the particulate matter with a diameter of 10 μm (PM10), subject particles 2.5 μm in diameter (PM 2.5), and the PM10 in a simultaneous way (Dreshaj, 2014). The monitor is equipped with software which is used for reading, receiving, management and interpretation of the data based on the relevant assessment criteria.

These results have been shown in Table 1.

The dynamics of the particles in the air-air measurements for indicators in Pristina are focused on two important stations representative to assess the impact of pollution sources in this city (Dreshaj, 2013).

Conclusions

The main goal of this research has been to provide the necessary information in order to make correct decisions regarding the management and improvement of air quality. Based on the findings presented above, it can be concluded that the three polluting sources are characterized by differentiated emissions of air pollutants with particulate matters: PM10, PM 2.5, as well as SO₂, NOₓ, and CO.

The power plants/stations, Kosovo A and Kosovo B are powerful emitters into the air as well as of particulate material emissions. Emission of particulates on the annual average is about 9-16 times higher than AAV, while NOx emissions are 34-62% higher than AAV. Pristina is characterized by a high load of particulate material. As for PM10 particulates and PM2.5 particulates, their annual average is 50-60% higher than the critical limits.
Despite the fact that the Kosovo authorities have passed laws protecting air, water, forest and other environmental related areas, the management and improvement of air quality remain a serious concern for the life of people. Thus, the fundamental right of Kosovo citizens such as the right to healthy life continues to be at risk.

Recommendations

As a starting point, citizens should be aware that environmental protection protects health and well-being. In this regard, it should be initiated as soon as possible, since tomorrow it might be late. In order to improve the conditions, we recommend providing of funds for the maintenance of monitoring equipment. Also, based on the findings, we recommend increasing the number of monitoring parameters as required by the guidelines laid down by laws which regulate issues of air pollution. Moreover, to take concrete steps on the part of institutions in reducing pollution from PK 10 and PM 2.5. As regulated by legislation, to conduct control of fuels derivatives that enter Kosovo and become certified companies which deal with this business, to carry out technical inspection of vehicles and issuing gases and to adopt standards set by the European legislation level, discard vehicles that do not meet requirements, establishment of electrostatic filters in the chimneys of power plants/stations, and increase green areas inside and outside the cities.

Finally, Kosovo authorities might concentrate and orient their actions on controlling the enforcement of already passed legislation that regulates all the above mentioned aspects.
